Os vídeos e a teleconferência, por sua vez, têm sido usados em caráter informativo. Merecem destaque, neste contexto, dentre outros, os ciclos de teleconferências coordenados e/ou dirigidos pelo autor, como os do projeto Engenheiro 2001, do Projeto E – Educação para o Emprego e o Empreendedorismo, e os Ciclos de Teleconferências sobre Segurança e Saúde no Trabalho executados para a Fundacentro. Mais informações são encontradas em [4] e [5].

AS PALAVRAS-CHAVE EM EAD

Consideramos serem três as principais palavras-chave em educação à distância: **mudança de paradigma, interatividade e economia de escala**. Comentemos cada uma.

A mudança do paradigma instrucional responde à pergunta, feita pelos céticos, de como pode a EAD funcionar tão bem, e amíude até melhor, que a educação tradicional, presencial. Isto se deve à mudança de paradigma, sem o que a EAD fracassaria.

O paradigma clássico da educação, vigente deste Platão e Aristóteles, é centrado na figura do professor e no verbo ensinar. O douto mestre, como um sol, irradia seus conhecimentos, repassando-os aos humildes alunos, que aprenderão ou não. Estudos recentes mostram que, em geral, os alunos absorvem cerca de 15% do que se lhes tentou transmitir.

No novo paradigma, a figura central passa a ser o aluno, evidentemente instalado em um adequado e meticulosamente planejado ambiente instrucional, e o verbo-chave é aprender, ou, melhor ainda, aprender a aprender. Não significa que os professores deixem de ter importância; pelo contrário, amplia-se o seu papel: além de transmitir conhecimento, devem fazê-lo da melhor forma compatível com o veículo de comunicação utilizado.

Do exposto, conclui-se que a primeira palavra-chave da EAD tem cunho claramente pedagógico.

A segunda palavra-chave é a interatividade, sem a qual a EAD também fracassará. A ausência física do professor deve ser compensada por um eficaz sistema de comunicação com a coordenação, sem o que o aluno sentir-se-á abandonado, frustrado, inseguro, e tenderá a desistir do curso. As suas dúvidas devem ser prontamente esclarecidas, o seu aprendizado permanentemente avaliado, a sua participação no processo educacional sistematicamente incentivada.

Note-se que a interatividade deve ocorrer nos dois sentidos, os alunos acessando a fonte do conhecimento e o professor acompanhando o desenvolvimento dos seus alunos. Para isso, mecanismos de *chat* e *forum*, monitores, uso de fax e telefone têm sido usados e, doravante no Brasil, o sistema que descrevemos adiante.

A interatividade é, portanto, uma palavra-chave de cunho comunicacional e, diríamos também, psicológico.

A economia de escala, por sua vez, é obviamente uma palavra-chave de natureza econômica. Está relacionada com a viabilidade econômica dos projetos de EAD.

De fato, as iniciativas recentes de EAD que conhecemos no Brasil são quase sempre, de uma forma ou outra, pagas com recursos governamentais ou institucionais, sem produzir lucro. Fazer EAD envolve custos, em geral elevados, o que exige que se tenha, para a viabilização econômica do empreendimento, que atingir uma escala de operação suficiente para ultrapassar o ponto de equilíbrio financeiro do processo. Isto vem de encontro à nossa percepção de que projetos abrangentes de EAD se fazem com parcerias e não praticando competição predatória entre as partes.

[1]*Professor de pós-graduação da Escola Politécnica da USP, da Universidade Paulista e das Faculdades Tancredo Neves - Rua Alves Guimarães, 408/104 - 05410-000 - São Paulo - SP, Brasil, politeleia@uol.com.br*

A VIA SATELITAL

Esta via tem sido usada, até recentemente, para a realização de teleconferências. Uma resenha crítica a respeito, incluindo as vantagens e dificuldades do processo, é dada em [6]. Sendo as teleconferências eventos claramente informativos, não configuram, a rigor, educação à distância.

Entretanto, estão surgindo, recentemente, iniciativas pedagógicas por essa via, como a da Facinter – Faculdade Internacional de Curitiba, que está realizando cursos à distância por via satelital com interatividade por voz, e a da DTCom, instalada em Quatro Barras, PR, que oferece extensa programação de cursos em vídeos para os seus assinantes empresariais.

Na seqüência, relatamos a experiência objeto deste texto, que inova por introduzir a interatividade via *hardware* e *software*, em iniciativa pioneira no Brasil.

O PROJETO FUNDACENTRO

O autor participa, há quase dois anos, como coordenador de ensino à distância em projetos na Fundacentro - Fundação Jorge Duprat Figueiredo de Segurança e Medicina do Trabalho, que têm levado a 14 tele-salas espalhadas pelo Brasil a discussão da problemática da Segurança e Saúde no Trabalho através de 16 teleconferências e, de outubro a dezembro de 2002, seis cursos à distância de 12 horas cada, usando o processo que denominamos "teleconferência interativa", para cerca de 500 alunos por curso, que participam freqüentando as tele-salas da instituição.

As tele-salas estão localizadas em cidades espalhadas pelo país, de Belém a Porto Alegre. Por outro lado, uma comparação entre a teleconferência interativa e outros veículos pode ser vista em [7].

A programação sendo executada é dada no Quadro I. Mais informações podem ser vistas em [8].

DATAS	DISCIPLINAS
14/10 a 17/10	Atualização para Membros de CIPA
21/10 a 24/10	Estresse no Trabalho: Abordagem Individual e Organizacional
04/11 a 07/11	Prevenção da Silicose
11/11 a 14/11	PCMAT – Programa de Condições e Meio Ambiente de Trabalho na Indústria da Construção
25/11 a 28/11	Ergonomia e LER/DORT
02/12 a 05/12	Legislação em Segurança e Saúde no Trabalho

Quadro I – Programação dos cursos à distância

A geração das tele-aulas é feita em um pequeno estúdio instalado nas dependências da TV Cultura de São Paulo (ver Figura 1), que também faz o *up-link* para o satélite Brasilsat B1. Nesse estúdio, há um computador que abriga o *software* de comando do sistema.

Figura 1
Professor no estúdio

Em cada tele-sala há um computador dotado de um *software* de apoio incumbido de enviar ao estúdio, via Internet, as informações emanadas dos alunos no processo de interatividade. Essas informações são digitadas em um terminal interativo que cada aluno recebe e enviadas por rádio a uma base acoplada ao computador. O terminal interativo e a base são mostrados na Figura 2. Uma descrição pormenorizada pode ser vista em [9].

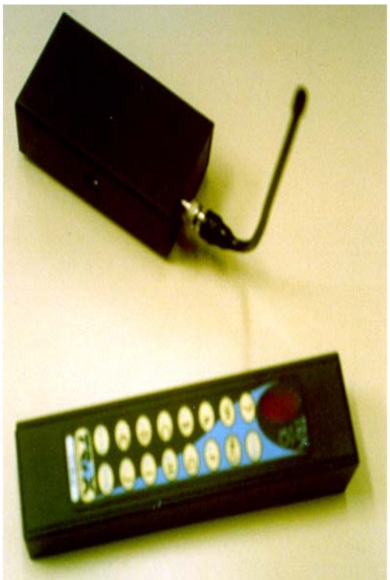

Figura 2
Base e terminal interativo

Há três tipos de interatividade nesse processo:

1) **Interatividade professor-alunos-professor**: o professor, em momentos planejados de sua planejada aula, insere perguntas de múltipla escolha (ou tipo sim ou não) que aparecem na tela e devem ser respondidas pelos alunos em dado tempo, acompanhado por uma barra móvel; as respostas dos alunos são informadas ao *software* de comando, que envia para a tela os percentuais das respostas. Este processo, portanto, permite a realização de três funções:

a) *Feedback* ao professor quanto ao aproveitamento dos alunos;
b) Avaliação do conhecimento adquirido pelos alunos para efeito de nota, quando aplicável;
c) Animação, estabelecendo uma sistemática de participação que elude possível tédio dos alunos.

2) **Interatividade aluno-professor-alunos**: o aluno pode apertar a tecla "?" do seu terminal, informando ao professor que deseja fazer uma pergunta verbal. Seu nome e localidade, junto com outros, aparece no monitor do professor que, em momentos planejados, concederá voz aos alunos que escolher. Estes dialogarão com o professor usando telefone sem fio, sendo os demais candidatos a pergunta instruídos a desistir de fazê-la se sua dúvida foi esclarecida, apertando a tecla "cancela".

3) **Interatividade aluno-monitor-aluno**: alunos que não tenham suas dúvidas esclarecidas durante a aula poderão fazê-lo em seguida, enviando *e-mail* a um dos monitores disponíveis, que procurarão responder em até 24 horas ou, caso se julguem incapazes, remeterão a dúvida ao professor.

No momento em que encerramos este artigo, haviam sido realizados os cinco primeiros cursos, com aceitação altamente favorável por parte dos alunos, mormente em regiões mais afastadas da Sudeste, onde as carências por informações e conhecimento são mais acentudas.

VANTAGENS E DIFICULDADES

Enumeramos as principais vantagens deste processo:

a) É absolutamente amigável aos alunos, por buscar reproduzir, com vantagens, as condições da sala de aula tradicional, num sistema que poderíamos chamar "presencial-virtual";

b) Em consequência, o ambiente de grupo tão caro a muitos alunos é preservado, permitindo a interação sinergética dos componentes da classe;

c) A preparação das aulas não exige nenhum esforço do professor além de uma organização prévia do material, do planejamento da sessão e da inserção das perguntas;

d) O custo dos equipamentos a serem instalados para a recepção do sinal nas tele-salas é pequeno.

Dentre as dificuldades, citamos:

e) O custo da transmissão por satélite, fazendo com que o processo somente seja economicamente viável acima de determinada escala de utilização;

f) A decorrente dificuldade de gestão de um sistema de grande porte;

g) O custo dos terminais interativos que, entretanto, se dilui se a utilização for continuada;

h) Problemas com a Internet, que podem acarretar perda de respostas dos alunos.

Evidentemente, nessa experiência piloto, foi necessário ultrapassar diversas dificuldades pontuais que não cabe relatar neste espaço, dentro de um processo sucessivo de aprendizagem, tanto no campo técnico como no pedagógico.

Entretanto, o projeto revestiu-se de pleno sucesso, demonstrando que a teleconferência interativa pode ser considerada uma alternativa válida e, conforme o caso, muito vantajosa para atender às necessidades de EAD no Brasil.

CONCLUSÃO

O objetivo deste trabalho foi apresentar o sistema que desenvolvemos para suprir uma lacuna que identificávamos no Brasil em EAD. Sua realização foi possível devido ao espírito pioneiro da Fundacentro que, preocupada em levar conhecimentos no campo de Segurança e Saúde no Trabalho aos diversos cantos do País, nos proporcionou a oportunidade de viabilizar essa experiência piloto.

É nossa intenção seguir aperfeiçoando o processo que, temos certeza, será de muita utilidade na educação à distância tanto aberta quanto corporativa, sempre que a escala de operação justifique a sua utilização.

A PEDAGOGIA DAS COMPETÊNCIAS NOS CURSOS DE ENGENHARIA

Diva Marília Flemming[1]

Resumo *— O processo de formação do Engenheiro pressupõe o desenvolvimento do indivíduo como particularidade e como generalidade. É necessário que as experiências individuais sejam estimuladas, pois cada estudante constrói o seu próprio conhecimento. As competências são adquiridas no decorrer da caminhada e precisam ser reconhecidas individualmente. Neste artigo, discute-se a pedagogia das competências no contexto dos Cursos de Engenharia, partindo-se de uma retrospectiva histórica da relação entre competência e ação. A teoria cognitiva é escolhida para alicerçar as considerações pedagógicas e as propostas apresentadas são sustentadas por quatro saberes: saber, saber fazer, saber ser e saber conviver. Discute-se a importância de romper com a dicotomia teoria-prática para efetivar a aquisição de competências, pois estas, estão sempre associadas à capacidade de o sujeito desempenhar-se satisfatoriamente em reais situações de trabalho, mobilizando os recursos sócio-afetivos e cognitivos além de conhecimentos de áreas específicas. Exemplifica-se o desenvolvimento de projetos nas disciplinas básicas de Matemática. Os resultados apresentados mostram a importância de mudanças no dia-a-dia nas salas de aula. É necessário inovar com situações problemas reais que podem ser resolvidos com os inúmeros recursos tecnológicos disponíveis na sociedade.*

Palavras Chaves — competências; disciplinas básicas de Matemática; ensino-aprendizagem; teoria e prática.

INTRODUÇÃO

O ensino superior é, em qualquer parte do mundo, um dos pilares do desenvolvimento econômico e contribui para a formação continuada dos indivíduos.

No relatório para a UNESCO da Comissão Internacional sobre Educação para o século XXI as tradicionais e as novas missões do ensino superior são discutidas, constatando-se que "o ensino superior está em crise há cerca de dez anos", numa grande parte do mundo em desenvolvimento [1]. Dentre as diferentes causas discutidas destaca-se a atração excessiva pelas ciências sociais, que conduz o desequilíbrio no mercado de trabalho.

Observa-se assim, a necessidade de uma abertura para o ensino de ciências exatas (caso das Engenharias) para que não se tenham "torres culturais", produzindo pesquisas acadêmicas que pouco contribuem para o desenvolvimento da sociedade.

Os cursos de engenharia são os responsáveis por espaços de formação científica e tecnológica gerando sistemas complexos que devem atender à sociedade.

Dentre as pistas e recomendações destaca-se o estudo de "novas formas de certificação que levem em conta o conjunto das competências adquiridas".

Para que se criem certificados pessoais de competências nos cursos de Engenharia é necessário que as competências adquiridas possam ser reconhecidas pelas empresas e pelo sistema educativo formal (universidades).

Evidentemente faz-se necessário discutir a pedagogia das competências. Neste trabalho, algumas reflexões são introduzidas, geradas no meio acadêmico, pela autora, enquanto professora de disciplinas de Matemática em cursos de Engenharia.

Discute-se um recorte, pois a dimensão do texto não permite aprofundar o tema, ainda tão pouco discutido no contexto das Engenharias.

PEDAGOGIA DAS COMPETÊNCIAS

O termo pedagogia, no contexto deste artigo é entendido como um conjunto de princípios que visam um programa de ação. Diante de uma concepção de vida, definem-se os princípios e idéias que devem ser adotados. Para tal, é necessário escolher os meios mais eficientes para realizar o programa de ação estabelecido.

Dois grandes grupos de teorias, que alicerçam as pedagogias, são estabelecidos em [2]: teorias críticas e teorias não críticas. Sua classificação está baseada na variável "marginalização". As teorias críticas baseiam-se na concepção de que a educação é um instrumento de superação da marginalidade, pois promovem a equalização social.

As teorias não críticas entendem que a educação é um instrumento de discriminação social, logo um fator de marginalização. O termo marginalização passa a ter diferentes significados, conforme os pressupostos de cada teoria.

Dentre as pedagogias não críticas pode-se citar: pedagogia tradicional, pedagogia nova e pedagogia tecnicista. A organização da pedagogia tradicional está baseada no princípio de que a educação é direita de todos e dever do Estado. O programa de ação dessa pedagogia reflete bem a sociedade da época (meados do século XIX), com a visão de que era necessário vencer a barreira da ignorância, ou seja, transformar súditos em cidadãos. A ignorância era entendida como marginalidade, assim, a escola deveria combater a ignorância, difundindo a instrução

[1] Diva Marília Flemming, UNISUL - Universidade do Sul de Santa Catarina, Rua Alfredo Daura Jorge, 148, Village II, Lagoa da Conceição, 88062-220, Florianópolis, SC, Brasil, diva@unisul.br

e transmitindo os conhecimentos acumulados pela humanidade e sistematizados logicamente. O professor torna-se figura central, pois domina os conhecimentos que devem ser transmitidos aos alunos.

A pedagogia nova apresenta um novo programa a partir da idéia de que os homens são essencialmente diferentes, portanto, advoga-se um tratamento diferencial a partir da descoberta das diferenças individuais. Assim, a marginalidade passa a ser vista como rejeição. As questões pedagógicas são centradas no aluno e os experimentos são baseados nas contribuições da biologia e da psicologia. A sociedade continua influenciando o contexto da pedagogia e a comparação entre o trabalho fabril e o trabalho pedagógico gera uma nova visão para a educação. visualiza-se a necessidade de operacionalizar os objetivos e mecanizar alguns processos. A marginalização é vista como incompetência, assim, o programa de ação deve ter como elemento principal à organização racional dos meios.

Ao comparar essas pedagogias observa-se que na pedagogia tradicional é necessário aprender, na pedagogia nova tem-se aprender a aprender e na tecnicista é importante aprender a fazer.

A origem da pedagogia das competências é analisada, em geral associada aos objetivos de ensino. Ao discutir sua origem pode-se associar à pedagogia baseada no desempenho ou pedagogia do domínio. A difusão dessa pedagogia aconteceu de forma diferenciada (ver [3]). Na França, por exemplo, difundiu-se como pedagogia por objetivos, e teve várias críticas, pois a referência teórica é o behaviorismo de Skinner.

No Brasil, as atuais políticas educacionais afastam-se do behaviorismo e incorporam a noção de competência com base no construtivismo.

A NOÇÃO DE COMPETÊNCIA

A noção de competência pode ser analisada nas relações de trabalho, no interior das empresas e nas relações educativas. Pretende-se neste artigo analisar a noção de competência nas relações educativas tendo como foco o interior das empresas, pois se considera a competência indissociável da ação, portanto, um caminho para romper com a dicotomia teoria-prática.

Perrenoud [4] esclarece que "competência é a faculdade de mobilizar um conjunto de recursos cognitivos (saberes, capacidades, informações etc) para solucionar com pertinência e eficácia uma série de situações". Por exemplo, um Engenheiro para projetar uma estrada precisar saber toda as etapas de desenvolvimento do projeto mobilizando as capacidades de ler levantamentos topográficos, aplicar conhecimentos matemáticos e físicos, etc. Isso implica diferentes saberes em diferentes áreas do conhecimento (matemática, física, desenho, etc.).

As diretrizes curriculares [5] para os cursos de Engenharia em seu Art 4º. estabelece uma extensa lista de competências e habilidades gerais a serem adquiridas no decorrer da formação do Engenheiro.

O desafio das universidades está na implementação de novos projetos pedagógicos estruturados para garantir o perfil requerido pelas diretrizes e pela sociedade. Pode-se questionar: Como garantir o perfil desejado e o desenvolvimento das competências e habilidades esperadas? Como reduzir o tempo em sala de aula, favorecendo o trabalho individual e em grupos (Art.5º.)?

Para garantir a aquisição das competências requeridas é preciso trabalhá-las e treiná-las. Isso exige tempo, seqüências e situações didáticas inovadoras e adequadas a cada área da Engenharia e a cada região. É usual os alunos acumularem saberes, serem aprovados nas disciplinas curriculares, mas não conseguem mobilizar o que aprenderam em situações reais do trabalho. É importante não marginalizar os problemas práticos, principalmente nas disciplinas básicas (matemática, física, etc.), assim como não perder tempo em treinamento dos saberes condizentes para situações complexas. Por exemplo, fazer deduções matemáticas de todos os teoremas que alicerçam o cálculo diferencial e integral.

Os projetos pedagógicos dos cursos de Engenharia devem reconstruir a transposição didática para que se possa otimizar o tempo e propiciar ao futuro Engenheiro as competências necessárias para mobilizar conhecimentos, transformando-os em ação.

A construção de competências para se efetivar, deve passar por um processo de reflexão sobre: os objetos de estudos, a escolha dos conteúdos, a organização das atividades didáticas, a criação de diferentes ambientes de trabalho e a avaliação. A proposta didática do curso deve estar focada em ações teóricas-práticas. Essas ações devem estar articuladas com "o fazer" e todo fazer deve estar articulado com a reflexão.

A ESCOLHA DE CAMINHOS

A realidade, no Brasil, aponta alguns caminhos para serem trilhados. Por exemplo, os atuais projetos pedagógicos que contemplam as diretrizes curriculares continuam com a estrutura disciplinar. Portanto, na realidade são currículos formatados na forma de disciplinas. Machado [6] discute a questão dos espaços e tempos escolares ocupados pelas disciplinas, e a idéia radical que "uma valorização do conhecimento científico disciplinar teria como contrapartida o menosprezo da noção de competência".

As experiências realizadas delineiam que a dicotomia disciplina-competência não existe. É possível fazer escolhas didáticas para cobrir os conhecimentos disciplinares importantes a partir de situações concretas. Evidentemente isto requer estratégias didáticas bem diferenciadas das tradicionais.

Partindo-se do princípio de que as disciplinas são importantes para o desenvolvimento das competências e habilidades dos alunos, sugere-se o seguinte roteiro didático:

- Buscar problemas práticos de interesse coletivo, da sociedade ou de interesse pessoal.
- Discutir os problemas apresentados sob o contexto dos conteúdos disciplinares, gerando projetos de estudo.
- Gerar prioridades a partir dos interesses do grupo e a partir da experiência do professor.
- Trabalhar a solução do problema resgatando todos os conhecimentos disciplinares através de recursos tecnológicos.
- Estabelecer um contrato didático envolvendo professor aluno e universidade (oferta dos recursos humanos e financeiros).

Para discutir as etapas listadas utilizam-se experimentos realizados em sala de aula, pela autora, em turmas de Engenharia Civil e Engenharia Elétrica - Telemática da UNISUL - Universidade do Sul de Santa Catarina.

Inicialmente tem-se a busca de problemas práticos. Essa busca pode ser feita de duas diferentes maneiras: trazidas pelos alunos ou apresentadas pelo professor. Quando os alunos são incentivados a busca de situações práticas de interesse de seu curso ou de seu interesse pessoal, surgem situações bastante variadas. Por exemplo, na turma de Engenharia Civil, na disciplina de Cálculo III, foi apresentado o projeto de estudo do túnel em construção na cidade de Florianópolis, do caminhão betoneira, da retirada de uma ponte na BR 101, da construção de um piso e do dimensionamento de janelas de uma sala.

Observar que são obtidos um conjunto diversificado de problemas. Essa diversificação não aconteceu quando o experimento foi realizado na Engenharia de Telemática na disciplina Matemática Aplicada à Engenharia, quando os problemas foram apresentados pelo professor utilizado somente situações de análise de circuitos.

É importante destacar que a multidisciplinaridade aconteceu e ambas as situações. No caso do problema do túnel, buscou-se a ajuda de outras disciplinas para o melhor entendimento de algumas partes do problema e no caso da Engenharia elétrica os problemas utilizados foram sugeridos pelo professor de análise de circuitos.

Na segunda etapa, os problemas foram apresentados e discutidos sob a ótica das respectivas disciplinas. A geração de projetos de estudos acontece naturalmente para que se tenha uma organização didática dos conteúdos envolvidos. Ao elaborar o projeto de estudo, contempla-se o dimensionamento de objetivos, etapas de desenvolvimento, recursos, estratégias adotadas e avaliação. É uma construção compartilhada entre professor e alunos, para que se tenha o envolvimento esperado e conseqüentemente a construção das competências e habilidades requeridas. Ao elaborar os projetos, verifica-se automaticamente, a necessidade de gerar prioridades e alguns problemas podem ser priorizados, podendo inclusive acontecer o descarte de problemas. Para exemplificar tem-se no caso da Engenharia Civil, com a priorização o problema do túnel e do problema do caminhão betoneira. Salienta-se que a mediação do professor é fundamental, pois este tem a visão macro da disciplina e argumentos para auxiliar as escolhas dos alunos. No exemplo citado os problemas priorizados propiciaram a discussão do cálculo de volume de sólidos através do uso das integrais duplas e triplas (conteúdos disciplinares). Esses problemas facilitaram também a construção, por exemplo, das competências: aplicar conhecimentos matemático, científicos e tecnológicos à Engenharia; resolver problemas de Engenharia; interpretar resultados e assumir a postura de permanente busca.

Para analisar, refletir, discutir, buscar soluções, fazer escolhas, resolver e validar soluções no caso dos problemas exemplificados foi necessário o desenvolvimento de todos os conteúdos disciplinares previstos acrescidos da busca e resgate de conteúdos de disciplinas já cursadas. Surgem, às vezes, a necessidade de conteúdos disciplinares mais abrangentes de outras disciplinas mais avançadas. O procedimento adotado nestes casos é a discussão informal, resgatando-se soluções mais intuitivas e menos científicas. Espera-se que em momentos posteriormente o aluno possa resgatar as soluções intuitivas de maneira mais formal.

CONCLUSÕES

Os experimentos desenvolvidos comprovam que a competência é indissociável da ação. À medida que o aluno vai refletindo e analisando a situação problema, com a mediação do professor, a necessidade de aprofundar conteúdos surge imediatamente. Assim, é possível nortear os estudos e discutir todos os conteúdos previstos na disciplina num processo contínuo de ação-reflexão-ação.

O mapeamento dos conteúdos curriculares norteou o desenvolvimento dos projetos de estudos, permitindo a construção das competências e das habilidades específicas em acordo com os interesses individuais e grupais. Observou-se o desenvolvimento da capacidade de argumentar, apesar da visão errônea de que as disciplinas de matemática devem preocupar-se mais com o raciocínio lógico.

É possível caminhar para um processo mais dinâmico a medida que se busca a interdisciplinaridade e a medida que se assume alguns pressupostos metodológicos inovadores. Por exemplo, a idéia de não linearidade do conhecimento pode ser abraçada, apesar da difícil implementação quando se têm grades curriculares fechadas através de muitos pré-requisitos disciplinares.

A mobilização de saberes, através da virtualização de ações e através da capacidade de buscar recursos para atingir os objetivos previstos nos projetos, facilitou o desenvolvimento das competências requeridas.

Os relatos aqui colocados são pontuais e recortados, podendo ter lacunas ou não propiciando a visão de pequenos detalhes que surgem no dia-a-dia de sala de aula. Espera-se que a visão macro dos procedimentos tragam a reflexão didática tão urgente no contexto das Engenharias.

Uma Abordagem do Uso das Ferramentas ERP e ISA Visando o Apoio às Atividades de Ensino

Ricardo Villarroel Dávalos[1] and Oscar Ciro Vaca López[2]

Resumo *— A Com a finalidade de auxiliar os usuários, proporcionando recursos e procedimentos para um gerenciamento eficiente das informações, a Universidade do Sul de Santa Catarina – Unisul implantou um Sistema Integrado de Gestão (Enterprise Resources Planning - ERP), apoiado por uma Arquitetura de Sistemas de Informação (Information Systems Architecture - ISA). Este artigo apresenta algumas experiências da implantação do SAP/R3 e do uso do ARIS na reestruturação da Unisul, para promover uma melhor integração dos alunos, docentes e colaboradores aos processos de gestão universitária, sendo que o aperfeiçoamento e a manutenção destes sistemas é apoiada por um grupo de pesquisa, que também proporciona suporte e inovação aos processos de aprendizagem que se vem praticando. Além disso, descreve-se neste trabalho, uma abordagem do ensino de Reengenharia de Processos de Negócios (Business Process Re-engineering - BPR), considerando que mudanças tecnológicas têm tornado possível executar tarefas de maneira bem diferente daquela anteriormente utilizada. Tendo em vista que a reestruturação da universidade e a implantação do ERP são tarefas de longo prazo e que exigem melhorias contínuas, o principal objetivo deste artigo é contribuir com a aplicação de conceitos de integração, mudanças organizacionais e tecnológicas nos procedimentos de ensino.*

Palavras Chave — Arquitetura de Sistemas de Informação, Estratégias de Ensino/Aprendizagem, Reengenharia de Processos de Negócios, Sistemas Integrados de Gestão.

I. INTRODUÇÃO

O rápido crescimento da Universidade do Sul de Santa Catarina - Unisul, nestes últimos anos, levou à procura de alternativas para agilizar os processos de planejamento, controle e tomada de decisões, além do cuidado em estabelecer uma base para futuros projetos de melhoria. A iniciativa de implantação de um Sistema Integrado de Gestão (Enterprise Resources Planning - ERP) surgiu como ferramenta para proporcionar soluções e também como oportunidade para introduzir mudanças tecnológicas.

Pode-se definir um ERP de diversas maneiras, dependendo do ponto de vista do estudioso do assunto: como um sistema de informações para uma organização; como uma arquitetura de *software*, que facilita o fluxo de informações entre todas as áreas como, por exemplo, manufatura, logística, finanças, recursos humanos, etc.; como um banco de dados único, que interage com um conjunto integrado de aplicativos e que consolida todas as operações da organização em um único ambiente computacional.

Como forma de contribuir para o processo de desenvolvimento e implantação de ERP, neste cenário surge a abordagem da Arquitetura de Sistemas de Informação (Information Systems Architecture – ISA). Uma arquitetura não deve ser vista como uma solução formal para todo problema tecnológico e que a mesma pode dinamizar processos de negócios, reduzir a complexidade dos ERP, capacitar a integração nas organizações através do compartilhamento dos dados e habilitar a evolução mais rápida para novas tecnologias através do uso de ferramentas automatizadas que facilitam a elaboração de uma arquitetura [5].

Os ERP estão ocupando um espaço amplo no mercado de *software,* sendo uma das razões, o fato da reorganização das instituições em torno de processos, idéia básica da Reengenharia de Processos de Negócios (Business Process Re-engineering - BPR), que consiste em redesenhar processos de negócios e que a Tecnologia de Informação (TI) é o elemento capaz de materializar este novo conceito nas organizações, ou seja esta tecnologia é ao mesmo tempo um habilitador e implementador de processos, fornecendo a sustentação necessária à implementação e gerenciamento de novos processos.

As universidades, conscientizadas da importância do assunto, têm celebrado acordos com fornecedores de *hardware* e *software*, recebendo recursos geralmente a custos simbólicos. Professores são treinados, laboratórios equipados e a ISA, juntamente com o ERP, passam a ser temas de grande importância, a ponto de gerar alterações curriculares (Ex.: Louisiana State University, California State University, Massachusett Institute of Technology, Universidade de São Paulo, Universidade Newton Paiva, etc).

A Unisul celebrou uma parceria acadêmica com a fornecedora de equipamentos IBM (International Business Machines), com a fornecedora do Sistema Integrado de

[1] Ricardo Villarroel Dávalos é professor da Universidade do Sul de Santa Catarina – UNISUL e pesquisador do Grupo de Sistemas Computacionais Inteligentes – GSCI e do Grupo de Sistemas Integrados de Gestão – GPSIG, Campus Universitário – Grande Florianópolis; Ponte Imaruim – 88130-000 – Palhoça - SC – Brasil (e-mail: rdavalos@unisul.br).
[2] Oscar Ciro Vaca López é professor da Universidade do Sul de Santa Catarina – UNISUL e pesquisador do Grupo de Sistemas Computacionais Inteligentes – GSCI, Campus Universitário – Grande Florianópolis; Ponte Imaruim – 88130-000 – Palhoça - SC – Brasil (e-mail: oscar@unisul.br).

Gestão SAP (Systeme Anwendungen Produkte in der Datenverarbeitung ou Systems Aplication Products in Data Processing) e com a fornecedora da Arquitetura de Sistemas de Informação ARIS (Architeture of Integrated Information System) da IDS – Scheer (Integrierte Datenverarbeitunssysteme ou Integrated Information Systems), que objetiva equipar um laboratório onde serão desenvolvidas atividades acadêmicas que atendam as necessidades dos cursos de graduação e pós-graduação, bem como a área de pesquisa.

Além disso, a Unisul implantou o SAP/R3 com a expectativa de disponibilizar informações, fornecer meios para uma integração, diminuir o esforço gerencial e operacional, oferecer transparência e estruturação do planejamento operacional, e apoiar aos processos de gestão universitária. Pretende-se também analisar as mudanças organizacionais e redesenhar os principais processos que as suportam mediante o uso da ferramenta ARIS.

Dado que o compromisso de uma instituição com sua vocação universitária se revela através do dinamismo de suas atividades de pesquisa, a Unisul tem criado como fruto desta parceria, o Grupo de Pesquisa em Sistemas Integrados de Gestão – GPSIG, que procura gerar conhecimentos em BPR e tecnologia em ERP, para a melhoria das práticas acadêmicas e administrativas.

A integração do grupo com as atividades de ensino e pesquisa vem sendo trabalhada e o objetivo principal deste artigo é contribuir com a aplicação dos conceitos de integração, mudanças organizacionais e tecnológicas nos procedimentos de ensino, através das experiências aqui descritas.

II. SISTEMAS INTEGRADOS DE GESTÃO

Com o avanço da TI, as organizações passaram a utilizar Sistemas de Informação (SI) para apoiar suas atividades. Vários destes sistemas foram desenvolvidos para atender aos requisitos específicos das diversas unidades de negócio, plantas, departamentos e escritórios. Um SI poderia ser compreendido como um conjunto de componentes inter-relacionados, desenvolvidos para coletar, processar, armazenar e distribuir informações, facilitando a coordenação, o controle, a análise, a visualização e o processo decisório nas organizações.

Os ERP são SI que integram informações e processos entre as diversas áreas funcionais da organização, proporcionando recursos e procedimentos, para um gerenciamento eficiente destas informações.

Os ERP representam o estágio mais avançado dos sistemas tradicionalmente chamados MRP II (Manufacturing Resource Planning –MRP*).* É composto basicamente de módulos que atendem as necessidades de informação, ligados a todos os processos operacionais, produtivos, administrativos e comerciais. A Figura 1 ilustra a estrutura típica de funcionamento integrado de um ERP, a partir de uma base de dados única [6].

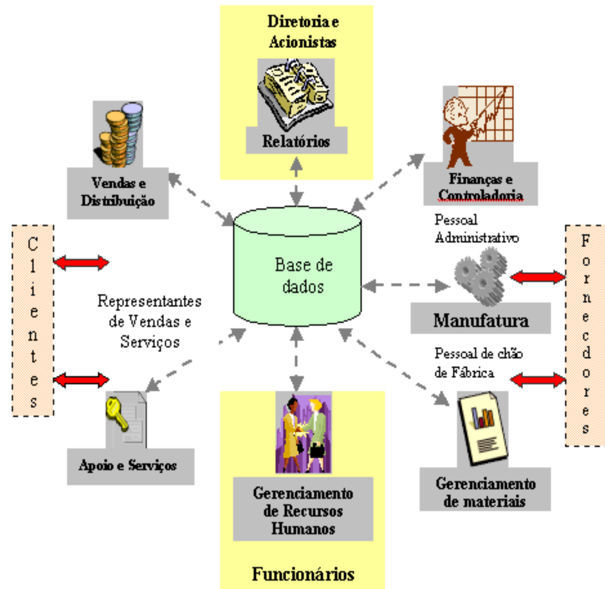

FIGURA. 1
ESTRUTURA TÍPICA DE FUNCIONAMENTO DE UM ERP

Os ERP abrangem uma gama de funcionalidades e processos empresariais. Logicamente, de acordo com o fornecedor do sistema, existe variação em amplitude (número de atividades e processos contemplados pelo sistema) e em profundidade (grau de especificidade e flexibilidade com que trata um processo determinado). De forma geral, estes sistemas fornecem suporte às atividades administrativas (finanças, recursos humanos, contabilidade e tributário), comerciais (pedidos, faturamento, logística e distribuição) e produtivas (projeto, manufatura, controle de estoques e custos).

Muitos ERP são comercializados em pacotes contendo módulos básicos para a gestão do negócio. Módulos adicionais podem ser adquiridos individualmente, em função do interesse e da estratégia da empresa. Todos esses aplicativos são completamente integrados, a fim de propiciar consistência e visibilidade a todas as atividades inerentes aos processos da organização. Nomes comerciais de ERP como SAP, BAAN, *Oracle Aplications*, BPCS, *Peoplesoft, JDEdwards*, MFG/Pro, Microsiga, Datasul, dentre outros, passaram a fazer parte das empresas de médio a grande porte no Brasil e no exterior.

Atualmente, os ERP se encontram cada vez mais ofuscados por: portais de negócios; cadeias de suprimento sincronizadas; sofisticados sistemas de logística; comercio eletrônico (*e-commerce*); provedores de ASP (Active Server Pages) e, principalmente, pelas ferramentas que irão possibilitar a integração de todos os processos de negócios.

Considerando as dificuldades que apresentam os ERP, os principais fornecedores já começaram a providenciar mudanças em seus produtos, tendo em vista a integração sintonizada de todos os processos internos e a conectividade da cadeia de suprimentos. Estes novos produtos estão sendo chamados de ERP II e sua evolução tecnológica vem sendo considerada como um fato natural, em decorrência das necessidades geradas pelos clientes. Assim, as principais características destes novos sistemas são a incorporação de módulos adicionais dentro dos módulos básicos ou também definidos como "*componentização*", a facilidade de troca de informações comerciais com outros sistemas concorrentes, a utilização de aplicações SCM (gestão da cadeia de suprimentos) e CRM (gestão de relacionamento com os clientes) de um outro fabricante e a orientação total para a *internet* [3].

III. Reengenharia de Processos de Negócios

Atualmente tem-se notado um grande interesse por parte dos empresários em assegurar que seus processos mais importantes sejam operados de maneira eficiente e eficaz, e este tem sido o objetivo da BPR. A idéia básica da reengenharia é estudar os processos fundamentais das organizações para efetuar inovações competitivas na qualidade, nas responsabilidades, nos custos, na flexibilidade e na satisfação.

Estas idéias estão em voga porque mudanças tecnológicas têm tornado possível imaginar maneiras de cumprir tarefas, radicalmente diferentes daquelas pelas quais eram executadas no passado. A modelagem de processos de negócios faz grande sentido para descobrir os componentes essenciais e sensíveis em que as melhorias farão diferença.

Nestes últimos anos a ênfase na definição de BPR vem sendo revista principalmente em suas definições de aspectos radicais e uso de TI. Assim, considerando estes aspectos, são indicadas algumas definições: o repensar fundamental e a reestruturação radical dos processos de negócios que visam alcançar drásticas melhorias em indicadores críticos e contemporâneos de desempenho, tais como custos, qualidade, atendimento e velocidade; uma abordagem utilizada no planejamento e controle da mudança; ferramenta gerencial que prega o questionamento e a inovação de processos produtivos; uma iniciativa organizacional para acompanhar uma estratégia orientada de (re)desenho de processos de negócios com a finalidade de atingir inovações competitivas na qualidade, responsabilidades, custos, flexibilidade e satisfação; etc [13].

Considerando a capacidade de captar informações de um processo de negócio e dar apoio às atividades de um projeto de BPR, os métodos de modelagem mais utilizados são: *Flowcharts; Workflow;* Metodologia de Definição Integrada; Modelagem de Negócios CIMOSA, Modelagem Orientada a Objeto; Linguagem de Modelagem Unificada - UML; Modelos de Simulação Dinâmica; Modelos de Relação entre Entidades; Diagramas de Causa e Efeito; Diagramas de Pareto; etc [10].

Os modelos de processos de negócios constituem uma referência para a implantação de SI, considerando-se que mediante os processos, estes sistemas estruturam suas funções. Um bom modelo poderá capturar informações em relação a processos utilizando quatro perspectivas: funcional, procedimental, organizacional e informativo. Além disso, revelou-se também que os modelos deveriam incorporar informações relacionadas com a importância da estratégia de um processo de negócio e seu valor para clientes.

As metodologias de BPR utilizam uma variedade de métodos de modelagem para dar suporte as suas atividades e em geral, consideram os aspectos: estratégia orientada e iniciativa de mudança organizacional; realização de objetivos organizacionais; consideração de limitações ou restrições; procura de mudanças radicais na performance de processos focalizando o cliente; avaliação da forma do trabalho, da estrutura organizacional e dos recursos humanos; uso da TI como facilitador de mudança e; manutenção e melhoria continua dos processos redesenhados [13].

O processo de desenvolvimento e implantação de SI é auxiliado pela ISA. O termo arquitetura foi inicialmente tratado como arquitetura de dados e como este termo tem acompanhado a evolução dos SI, apresenta uma visão mais abrangente, com a inclusão da perspectiva de negócios, da visão organizacional, dos próprios SI, da tecnologia disponível e o envolvimento dos usuários [17].

As perspectivas em ISA têm evoluído com a apresentação de modelos com enfoques diferenciados e envolvem de modo geral: a integração entre organização, negócios, sistemas, tecnologia e usuários; a apresentação de ferramenta de ISA; e a arquitetura tecnológica.

No final dos anos 80, o termo arquitetura, vinculado à área de *hardware,* passa a ser utilizado na área de *software* considerando toda a estrutura dos SI, desde o planejamento estratégico até o armazenamento de dados, inclusive a vinculação da ISA com a estratégia de SI.

Associadas à evolução do termo arquitetura, uma série de interpretações começa a surgir e passam a ser consideradas em quatro visões: arquitetura de dados; arquitetura tecnológica; arquitetura voltada para negócios; e arquitetura abrangente.

Contudo, o conceito que mais tem se destacado é o de arquitetura abrangente, que coloca a ISA como sendo o estabelecimento de um conjunto de elementos, cuja finalidade é proporcionar um mapeamento da organização, no tocante aos elementos envolvidos com o processo de desenvolvimento/implantação de SI.

Nesta linha de conceito abrangente, estão as pesquisas que trabalham com a integração dos SI e organização, denominados ERP. Os principais modelos de ISA encontrados na literatura são a estrutura proposta por Zachman, a arquitetura ARIS, a arquitetura CIM-OSA (Computer Integrated Manufacturing – Open System Architecture), a arquitetura SA2001 (System Architect 2001), dentre outros [5].

Enfim, a ISA abrangente, possibilita para os ERP, as contribuições básicas: aprimorar as atividades do planejamento estratégico, melhorar o desenvolvimento e a implantação, racionalizar a execução das atividades, economizar tempo, estabelecer ordem e controle no investimento de recursos, definir e inter-relacionar dados, fornecer comunicação clara entre os membros da organização, permitir melhorar e integrar ferramentas e metodologias de desenvolvimento de *software*, estabelecer credibilidade e confiança no investimento de recursos do sistema, e fornecer condições para aumentar a vantagem competitiva [17].

Assim, por exemplo, para poder entender um modelo ISA abrangente, a seguir será explicada, de forma geral, a arquitetura ARIS, que tem como característica principal refletir os componentes principais integrados de um SI e a perspectiva de negócios representada por uma seqüência de processos.

A arquitetura ARIS constitui uma estrutura na qual os SI integrados possam ser desenvolvidos, otimizados e convertidos em implementações técnicas EDP (Electronic Data Processing). Funções, organização, dados e controle compõem esta arquitetura, e usa como modelo para a modelagem dos dados, a abordagem ERM (entidade-relacionamento) estendida [16].

O modelo das cadeias de processos é tomado como ponto inicial para o desenvolvimento da arquitetura tornando-se difícil, entretanto, realizar uma análise sistemática destas cadeias, devido às suas complexas inter-relações e dependências, sendo que esta complexidade pode ser reduzida pela introdução de diferentes visões de processos de negócio que agrupam as informações.

Na visão funcional, um conjunto de processos de negócios é decomposto numa estrutura hierárquica de funções. Na visão baseada em dados, as classes de informação são definidas incluindo seus relacionamentos. Na visão organizacional, os relacionamentos entre as unidades da organização são descritos, unidades estas que são envolvidas em processos de negócios e que são responsáveis pelas informações e funções.

A complexidade é consideravelmente reduzida pela separação do problema original em visões diferentes mas, por outro lado, a descrição das relações entre estas se perde. Portanto, as diferentes visões são integradas em uma única, de controle, que liga as funções, os dados e a organização em um único processo e permite descrever a seqüência ou cadeia de processos.

A fim de enfatizar a diferença entre informação relacionada ao negócio e a informação relacionada ao suporte técnico, incorporou-se à arquitetura uma separação em três camadas diferentes: conceitual, técnica e de implementação.

A camada conceitual descreve um processo de negócio, independentemente das considerações técnicas. A linguagem usada para descrever o problema na camada conceitual é formalizada a ponto de poder ser usada como uma base para uma transformação consistente em uma linguagem de tecnologia de informação. As outras duas camadas, a técnica e a de implementação, são usadas para derivar a implementação técnica.

Considerando-se as diferentes visões de processos e a separação da arquitetura em camadas, foi desenvolvido o conceito ARIS, ilustrado na Figura 2. A visão de controle representa um componente essencial, resultando daí, a diferença entre esta e outras abordagens de arquitetura [16].

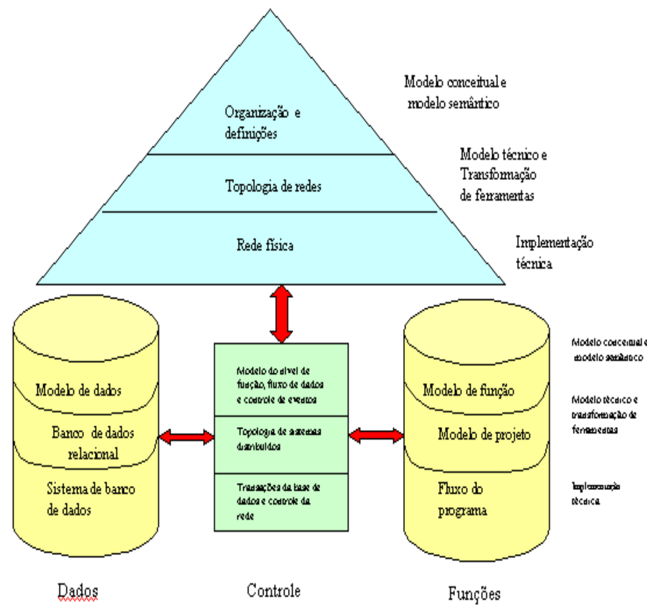

FIGURA. 2
O CONCEITO DA ARQUITETURA ARIS

A arquitetura ARIS, em conjunto com a metodologia BPI (Business Process Improvement), viabiliza a execução de projetos de BPR e oferece às organizações empresariais, a possibilidade de gerar uma base de dados de processos/procedimentos, que viabilizem implementar a melhoria contínua em ambiente corporativo, ou seja, a execução de uma ou várias atividades nos processos: análise de produtividade, redesenho, simulação dinâmica, otimização, especificação de sistemas, seleção de *software* de gestão, uso de modelos de referência, *benchmarking* de processos, implantação e gestão da qualidade, custos por atividade (Activity Based Costing - ABC), gestão do conhecimento e disponibilizar documentação via *internet/intranet*.

A abrangência das funcionalidades disponíveis pressupõe o uso da arquitetura por diversos departamentos/áreas da organização. Para que usuários de setores diferentes possam utilizar a mesma base de dados, compartilhando objetos e modelos, é necessário que todos os que geram documentação, tomem alguns cuidados, utilizando um "dicionário" de objetos válido em nível de corporação. O raciocínio se estende aos prestadores de serviço externo, que ao desenvolverem projetos, também geram documentação corporativa.

IV. IMPLANTAÇÃO DO SISTEMA INTEGRADO DE GESTÃO NA UNISUL

A seguir é descrito de forma geral, o processo de implantação do SAP/R3 mediante a descrição do "Projeto Visão" e a criação de um grupo de pesquisa para dar suporte a este sistema.

A. Projeto Visão

Na busca de um gerenciamento eficiente das informações, a Unisul implantou o SAP/R3 mediante o "Projeto Visão". O objetivo deste projeto foi reestruturar a universidade para promover uma melhor integração dos alunos, docentes e colaboradores nos processos de gestão universitária.

Inicialmente foram estudadas duas alternativas: comprar uma solução padrão e adequar a organização a este sistema ou reestruturar e normalizar processos antes de implantá-lo. Como a segunda alternativa demandaria grandes esforços (tempo, recursos humanos e financeiros, etc.), que culminariam, provavelmente, numa sistemática única de gerenciamento, levando à necessidade de uma grande parametrização do *software*, optou-se pela primeira alternativa, principalmente em função de que apenas alguns módulos relacionados com as atividades administrativas, financeiras e de controle de materiais seriam contemplados.

A primeira etapa do projeto contemplava a integração dos processos administrativos e financeiros, com a implantação dos módulos: financeiro (contabilidade geral, contas a pagar e receber, e tesouraria); administração (administração de ativo fixo); controladoria (contabilidade por centro de custo e por centro de lucro); suprimentos, logística e materiais (compras, controle de inventário, gerenciamento de estoques, verificação de faturas e planejamento de materiais baseado no consumo).

Esta primeira etapa foi definida por quatro fases: preparação do projeto; planejamento da implantação; implantação do sistema; início produtivo e suporte.

Nas primeiras duas fases foram realizadas cuidadosamente as análises de adequação para comprovar que, de fato, a solução atende minimamente às necessidades específicas da universidade. Nas últimas fases do procedimento de implantação, estão inseridas as atividades de: treinamento conceitual na lógica do SAP/R3, treinamento operacional, redesenho de processos, gestão da mudança organizacional, garantia das informações envolvidas, eventuais *customizações* e parametrização do sistema, entre outras.

A implantação do SAP/R3 contou com o comprometimento da direção e foi realizada por professores e funcionários da universidade, com a participação de consultores designados pelas empresas envolvidas na parceria. A importância desta implantação se justifica pela capacidade de apoio aos procedimentos de gestão e à tomada de decisões. Como a universidade apresenta uma grande quantidade de dados e processos, existe a necessidade de contar com procedimentos de tratamento da informação, mais precisos e rápidos.

A análise de adequação, da implantação, da manutenção e do uso do SAP/R3, demonstrou ser este, um procedimento de mudança organizacional, bastante abrangente e multifuncional, que está alterando toda a rotina com que a universidade desenvolve suas atividades.

As principais vantagens apresentadas pelo SAP/R3 são: a unificação da base de dados, eliminando-se o re-trabalho e a redundância de dados, trazendo maior confiabilidade às informações e o acesso em tempo real; melhor controle dos lançamentos do sistema; maior interação entre as áreas; diminuição da carga de atividades; redução do tempo total de andamento dos processos.

Em entrevistas realizadas com os usuários, além de constatadas as vantagens anteriormente descritas, os funcionários do setor administrativo, financeiro e de materiais demonstraram maior confiança e interesse em utilizar outros recursos que o SAP/R3 dispõe.

As principais dificuldades encontradas na implantação deste sistema foram: resistência à mudança por parte de alguns usuários quanto aos processos; morosidade na realização das atividades em função da insegurança dos usuários; ausência de informação normativa sobre os novos procedimentos de gestão; adequação ao novo ambiente de trabalho; administração das constantes exceções existentes nos processos.

Estas dificuldades foram contornadas mediante explanações e discussões sobre o andamento do procedimento de implantação, reconhecimento e remoção de resistências e mediante a participação dos integrantes do projeto.

A segunda etapa do projeto, a ser iniciada em breve, contempla a implantação dos módulos relacionados com: recursos humanos, projetos, gestão acadêmica e relacionamento com o acadêmico e parceiros.

B. Criação do Grupo de Pesquisa

Um grupo de pesquisa é composto por indivíduos organizados hierarquicamente, onde o fundamento organizador da hierarquia é a experiência, o destaque e a liderança no terreno científico e/ou tecnológico, apresentando envolvimento profissional e permanente com atividades de pesquisa, trabalho organizado em torno de umas poucas linhas comuns de investigação e compartilhando – de algum modo – instalações e equipamentos.

O GPSIG foi criado como um grupo estratégico de pesquisa para dar suporte às ações acadêmicas e administrativas na Unisul, integrado por professores e funcionários e liderados pelo Diretor de Pesquisa.

Os membros do Grupo possuem grande experiência, liderança e destaque no campo científico e apresentam envolvimento profissional e permanente com atividades de pesquisa. As suas histórias acadêmicas mostram que possuem formações diferentes e algumas convergências na especialização, nas pesquisas realizadas e nas disciplinas ministradas.

Considerando a abrangência e a complexidade dos assuntos abordados, o Grupo iniciou suas atividades com o nivelamento dos principais temas: planejamento estratégico e o programa de qualidade da Unisul; características das organizações universitárias; os processos nas organizações; sistemas de informação; implantação e usos do ERP na Unisul; prêmio Malcolm Balgrige de qualidade na educação; proposta de modelos de avaliação institucional para as universidades brasileiras; gestão da mudança através do *balanced scorecard.*

Os temas foram apresentados pelos integrantes do Grupo e por funcionários da Unisul, em forma de seminário. Adicionou-se a isto, os cursos e palestras dados pelos consultores da SAP e IDS-Scheer, assim como as discussões de artigos e as pesquisas realizadas na *internet*.

Uma vez estudados os assuntos, foram definidas duas áreas de atuação: Sistemas Integrados de Gestão por Processos e Gestão Universitária, sendo efetuado para cada uma, um planejamento estratégico, conduzido pelos objetivos e pelas necessidades do Grupo.

A seguir é apresentada a missão de cada área, respectivamente:

- gerar conhecimento e tecnologia em sistemas integrados de gestão por processos, para a melhoria da prática acadêmica e administrativa;
- gerar conhecimento em gestão universitária, para criar diferenciais competitivos para a Unisul.

Cada área tem por fim:

- ser referência como grupo de pesquisa aplicada em sistemas integrados de gestão por processos;
- ser um grupo de pesquisa de referência em gestão, gerando conhecimento para o alto desempenho de uma instituição de ensino superior.

Os participantes de cada área vêm realizando pesquisas e, nas freqüentes reuniões, os resultados são avaliados de acordo com os objetivos inicialmente propostos no planejamento estratégico e, além disso, dedicam-se à organização e a manutenção do laboratório.

V. Incorporação de Conceitos de BPR e ERP no Ensino

A BPR enfatiza a necessidade de se redesenhar os processos de negócios e que a TI disponível é o elemento capaz de materializar este novo conceito nas organizações, assim, estes processos são a referência para a implantação de um ERP. Considerando a abrangência dos assuntos relativos a BPR e ERP, são apresentadas a seguir algumas iniciativas a serem consideradas no ensino.

A. Iniciativas do ensino de BPR

Existem vários estágios na evolução de uma empresa em direção à organização por processos. Cada empresa atualmente se encontra em algum desses estágios e pode decidir passar para outro estágio que seja mais adequado às suas operações e perspectivas.

A idéia básica das iniciativas do ensino de BPR na universidade é de estudar os processos das organizações para efetuar inovações. É importante enfatizar que a automação dos processos de negócios já existentes, somente em raras ocasiões conduz a ganhos de produtividade superiores. A chave para o sucesso quase sempre jaz na modificação substancial e na melhoria dos processos de negócios, a qual é suportada por um sistema ERP muito bem afinado.

Quando se fala do ensino de BPR se tem dificuldade em responder as perguntas: o que, como e em que cursos ensinar?. Certamente os cursos voltados a SI são candidatos para ensinar este assunto. Em universidades onde este assunto tem-se desenvolvido, como por exemplo no Massachusett Institute of Technology - MIT, existem cursos novos em BPR, tais como, comportamento organizacional (com ênfase no desenho do trabalho), administração de operações (com ênfase nos procedimentos industriais), e contabilidade plena (com ênfase em sistemas financeiros), todos considerando a TI como base de estudos. Como outra alternativa, se poderia considerar que a BPR não deveria ocupar um curso inteiro, devendo ser combinado com outros tópicos para formar cursos como por exemplo: TI e Transformação Organizacional ou Mudanças nos Negócios e nos Sistemas [Davenport 2002].

O ensino de reengenharia em todos os cursos deveria transmitir: antecedentes históricos; tópicos de qualidade, melhoria contínua, TI, novas formas de análise de sistemas; as melhorias operacionais que tem a ver com o uso de TI, lidar com o fato de que se tornou um sinônimo de demissões, análise de empreendimentos realizados, a validade e outros assuntos relacionados com a BPR.

Uma prática que se vem aplicando na universidade para introduzir conceitos de BPR é a modelagem e simulação do funcionamento de novas formas operacionais de obtenção de resultados nas organizações, sejam eles produtos ou conquistas de qualquer outro tipo. Devido a sua interface gráfica, recursos de animação e a facilidade de modelagem de sistemas, o uso da simulação se traduz numa maior motivação dos alunos em aprender e aplicar os conceitos estudados [19].

Com a finalidade de estender estas práticas, o GPSIG se encontra preparando disciplinas voltadas à analise e redesenho de processos de negócios com o ARIS (ferramenta que surgiu através das experiências do sistema SAP/R3), para os cursos de graduação e de pós-graduação.

Espera-se mediante estas iniciativas mostrar as ligações entre a cadeia de suprimentos e o gerenciamento econômico/financeiro, entre os processos de fabricação e comercialização, etc. A experiência adquirida na implantação do ERP e as abordagens teóricas dos módulos Financeiro; Administrativo; Controladoria e Suprimentos, Logística e Materiais, também vêm contribuindo com este propósito.

Para contribuir ainda mais com o aprendizado experimental, pretende-se efetuar análises de estudos de caso, com modelos já existentes no ARIS. Este recurso pedagógico é usado satisfatoriamente em várias disciplinas, porém, as análises de equipes podem ser desvirtuadas pela falta de participação, pouca experiência em analisar coletivamente informações complexas e pela dominância exercida por alguns participantes.

Para contornar esta dificuldade é importante conhecer os alunos e, combinando as habilidades dos participantes, formar as equipes. Desta forma estaria sendo criado um ambiente de colaboração efetiva. As organizações em crescimento esperam que os profissionais trabalhem em várias equipes, realizando múltiplas funções. Esta experiência mostra que estudantes experimentam um ambiente de aprendizagem que melhor os prepara para ambientes de colaboração do mundo real [14].

B. Iniciativas de uso do ERP nos procedimentos de ensino

As alianças da SAP nasceram na Alemanha, na década do 80. Lá, mais do que aqui, o intercâmbio de conhecimento entre a iniciativa privada e o setor acadêmico é uma cultura fortemente arraigada. No Brasil, esta história começou há pouco tempo, nos primeiros meses de 1997, sendo que as primeiras instituições decidiram empregar este sistema no ensino de graduação, especialização e pós-graduação. As pesquisas que se vem desenvolvendo vão, desde a criação de *templetes* mais adequados à realidade de uma empresa brasileira do mercado agrícola nacional, até a produção integrada e gestão da cadeia de suprimentos.

A versão acadêmica do SAP/R3 está constituída por uma base de dados de uma companhia hipotética e seu uso está voltado para executar transações (centro de custo, ordens de compra, faturas, requisições, etc.), analisar desempenhos (rentabilidade, análise de vendas, planejamento da produção e compras, análise financeira, etc.) e avaliar a estrutura global da companhia. Os exemplos desta versão incluem Contabilidade Financeira (definição de dados para a estrutura organizacional da companhia), Tesouraria (disponibilidade de caixa e dados da administração), Controladoria (controle e definição áreas operacionais), Logística (estoques, linhas de produto, instalações, etc), Vendas e Distribuição (organização de vendas, registros de cliente, distribuição de produtos, etc.). Esta versão com a finalidade de dar suporte ao ensino na Universidade do Estado de Louisiana (Louisiana State University), vem sendo usada de forma satisfatória [20].

Mediante as atividades de ensino comentadas a seguir, o GPSIG pretende introduzir, através da versão acadêmica SAP/R3, o entendimento amplo da forma como a empresa opera, a integração de conceitos estudados nos diferentes cursos e sua relação com mudança organizacional e tecnológica; desafios envolvidos em sua implantação e desenvolvimento destes sistemas. Além disso, sabe-se que os processos de negócios nas organizações mudam, implicando também mudanças no sistema e modelo que os suporta. Pretende-se, para isto proporcionar uma cobertura significativa de ERP, através de um aprendizado experimental e estudos comparativos de impactos produzidos em diferentes organizações.

Considerando o recente início de atividades de pesquisa do GPSIG e a pouca literatura voltada para o ensino, as principais iniciativas de uso de ERP no ensino são: elaboração de uma apostila com descrição das principais pesquisas; organização de eventos; publicação de artigos; apoio às atividades administrativas; visitas a empresas e instituições que trabalhem com ERP; estudos de aplicação do sistema em sala de aula.

As iniciativas no ensino estão vinculadas a quais cursos serão envolvidos, quais disciplinas afetadas, eventuais inclusões de novas disciplinas, etc. Desta forma, nos cursos ligados às áreas de negócios (Administração, Contabilidade, Economia, Marketing), seriam utilizados estes sistemas para o entendimento amplo da forma como a empresa opera e a integração de conceitos dos diferentes cursos [11].

Também, nos cursos ligados às áreas de tecnologia (Computação, Sistemas de Informação e Engenharias), além da utilização anteriormente comentada, se mostraria aos alunos o papel dos SI na empresa e os desafios envolvidos em sua implantação e gerenciamento, podendo-se chegar até mesmo ao desenvolvimento de projetos integrados, envolvendo alunos de diversos cursos e de outros grupos de pesquisa. O Grupo de Sistemas Computacionais Inteligentes da Unisul, por exemplo, com o apoio do Governo do Estado de Santa Catarina e Ministério da Ciência e Tecnologia, vem implementando um SI para micro e pequenas empresas da região.

Além disso, professores em formação vêm desenvolvendo teses de doutorado relacionadas a metodologias de ensino baseados em conceitos de BPR e ERP. Contatos com professores e grupos de pesquisadores de outras instituições vêm sendo aprimorados, para intercâmbio de informações sobre trabalhos em andamento.

VI. CONCLUSÕES

Este trabalho apresentou um conjunto de experiências da implantação do SAP/R3 e o uso do ARIS como ferramenta de redesenho de processos de negócios. Além disso, foi descrita a formação de um grupo de pesquisa para dar suporte a estes sistemas e propor a incorporação de conceitos de BPR e ERP nos procedimentos de ensino, sendo que esta proposta pode ser aplicada em universidades que buscam soluções deste tipo.

O emprego dos sistemas abordados aqui proporcionam um grande apoio aos processos de aprendizagem, mediante a aplicação de estudos de caso e experiências de uso. Desta forma, a visão holística transmitida aos alunos contribui para a concepção de uma imagem única e sintética de todos os elementos da empresa, que normalmente estão relacionados com visões parciais, abrangendo suas estratégias, atividades, informações, recursos e organização. Esta prática está sendo melhorada, com o desenvolvimento de aplicações mais completas e detalhadas, nos cursos de pós-graduação.

A utilização de conceitos de integração, mudanças organizacionais e tecnológicas, propostas neste artigo, considerou características básicas em virtude da recente implantação do SAP/R3 e uso do ARIS. Estas iniciativas se tornam importantes pela disponibilidade de novas tecnologias em habilitar inovações educacionais e por esta razão, propõem-se discussões para definir procedimentos de aprendizagem mais adequados, com base nas experiências aqui relatadas .

Para introduzir conceitos de BPR e ERP nos currículos universitários é importante que a visão para sua utilização esteja focalizada nos processos de aprendizagem experimental e não como treinamento para profissionais. Algumas universidades vêm oferecendo cursos totalmente voltados para sistemas específicos. Evidentemente, esta proposta poderia funcionar como uma estrutura de treinamento para técnicos que iriam auxiliar na implantação e/ou utilização daquele sistema, mas foge dos objetivos da universidade. Por isso, recomenda-se cuidado especial ao introduzir estas iniciativas.

A experiência adquirida na implantação do SAP/R3 e uso do ARIS, vem sendo utilizada para modelar e simular processos de situações reais das organizações. A partir disto, pretende-se pesquisar metodologias que tragam inovações educacionais, baseados nos conceitos aqui abordados.

O GPSIG é consciente de que o trabalho não está concluído com a implantação do SAP/R3, apenas inicia, pois estes sempre terão novas versões e ajustes para que correspondam as mudanças organizacionais que vem sofrendo a Unisul. Além disso, a carência de pessoal treinado e os problemas decorrentes, fortalecem ainda mais as pesquisas que o grupo vem desenvolvendo.

Considerando a abrangência dos assuntos relativos a BPR e ERP, a reestruturação organizacional que ocorre na universidade e o início de atividades do GPSIG, espera-se contar, em curto prazo, com resultados mais consistentes e com a possibilidade de dar suporte mais eficiente às ações acadêmicas e administrativas.

Abstract *— Durante muito tempo o cerne de muitos processos de ensino e aprendizagem têm sido o "aprender a aprender". As mudanças são características estáveis na dinâmica mercadológica atual e é necessário adequar o processo de ensino/aprendizagem para desenvolver profissionais capacitados a interagir nesse ambiente. O mercado atual provoca valorização de profissionais diferenciados (além da necessidade "tecnicista") como aplicação de certas técnicas de gestão moderna que exige competências específicas, desenvolvimento de novas tecnologias que requer, eventualmente, uma cooperação e uma colaboração por equipes virtuais, dentre outras. Estas e outra são características que devem ser estimuladas no ambiente formal de aprendizagem (sala de aula). Nesse trabalho a incorporação da Teoria das Inteligências Múltiplas à estratégia de ensino aula expositiva dentro do curso de graduação, tem como objetivo refletir sobre novas possibilidades que auxiliará o processo de aprendizagem e o desenvolvimento de habilidades pessoais e técnicas necessárias ao profissional em formação.*

Index Terms — Aula expositiva, estratégia de ensino, processo de ensino aprendizagem, inteligências múltiplas.

ESTRATÉGIAS DE ENSINO

O termo estratégia de ensino designa um conjunto de atividades didáticas, selecionadas e organizadas pelo docente, que servirão como meios de ajuda para que os objetivos sejam alcançados. A estratégia abrange métodos, técnicas e recursos institucionais a ser usado durante parte ou todo desenvolvimento de uma disciplina. [12] [17]

Em outras palavras, estratégia de ensino é o conjunto de métodos e técnicas que serão utilizados a fim de que o processo de ensino/aprendizagem se realize com êxito, levando em consideração o momento do ensino e a motivação necessária para o sucesso da metodologia escolhida. Focaliza a aprendizagem do educando respeitando sua liberdade e levando-o à assimilação de diretrizes, atitudes e valores que o tornarão melhor em seus múltiplos aspectos.

Dentre os métodos, que podem ser chamados de técnicas e estratégias, os mais utilizados no ensino de ciências exatas são: aula expositiva, projeto, seminário, trabalho em grupo, estágios, aulas em laboratórios e cada um deles apropriado para cada situação. [1]

Toda estratégia tem por objetivo o direcionamento da aprendizagem.

Várias das estratégias de ensino existentes e que podem ser utilizadas, de acordo com a necessidade, para alcançar aos objetivos planejados podem ser implementadas de duas formas: individualizada ou em grupo, de acordo com o tipo de habilidade e conteúdo que deverá ser trabalhado e a opção por cada uma delas está diretamente ligada aos objetivos a serem alcançados assim como à preferência do educador.

Na TABELAI encontra-se uma descrição dos tipos e categorias das estratégias existentes.

TABELA I
RESUMO DAS CATEGORIAS E ESTRATÉGIAS DE ENSINO
(ADAPTADO [16] E [14])

Categoria	Estratégias
Situações simuladas que reproduzem ou se assemelham à realidade pela equivalência	Dramatização, desempenho de papéis, jogos dramáticos, Estudo de caso.
Situações que colocam os estudantes em confronto com situações reais	Estágios, Visitas Técnicas, Projeto de final de curso
Estratégias que dividem a classe em pequenos grupos	Pequenos grupos com uma só tarefa, Pequenos grupos com tarefas diversas, Grupo de integração horizontal e vertical Grupo de verbalização e grupo de observação, Diálogos sucessivos, Pequenos grupos para formular questões, Grupos de oposição
Situações que exigem a presença de um especialista e/ou uma preparação prévia	Painel ,Simpósio,Seminário
Estratégias em que o educador centraliza a ação	Aula Expositiva,Debate com a classe toda
Pesquisas e Projetos	

Independentemente da estratégia a ser utilizada, a consciência de que existem diferentes estilos de ensino e aprendizagem e que há um número maior de habilidades pessoais e profissionais que podem e devem ser desenvolvidas de acordo com a abordagem da disciplina, deve estar presente durante toda o processo.

A flexibilidade de utilização de diferentes estratégias para um mesmo assunto ou dentro de uma determinada disciplina serve de uma importante ferramenta para a construção do conhecimento e desenvolvimento de

determinadas habilidades, assim como um meio de avaliação de desempenho pessoal de todos envolvidos.

Essa situação propicia a um constante aprimoramento e um repensar de como um determinado conteúdo poderia ser trabalhado, num próximo momento.

Embora cada conteúdo tenha sua particularidade, todas as estratégias devem auxiliar a busca para ampliação dos conhecimentos, destrezas, aptidões técnicas, de comunicações e relações humanas pelos indivíduos; [2]

Como, além do repasse do conteúdo específico, deve haver também a finalidade a de se desenvolver habilidades e competências profissionais necessárias, Howard Gardner, professor doutor da Universidade de Harvard, a partir de um estudo científico, classificou quais habilidades poderiam ser desenvolvidas e consideradas fundamentais para a perfeita atuação do Homem na sociedade atual.

Nessa classificação das habilidades, definidas como inteligência, nota-se que muitas das classificadas por ele são as necessárias e fundamentais para a perfeita adaptação do profissional no mercado atual.

Ao utilizar determinadas estratégias, desenvolvendo inteligências específicas e objetivando a uma melhor preparação do indivíduo como um todo – pessoal e profissional – todos os envolvidos e instituições ligadas, direta ou indiretamente ao processo de ensino/aprendizagem , estariam alcançando uma de suas metas – ajudando na construção do conhecimento técnico assim como desenvolvendo habilidades e competências específicas para inserção do profissional no mercado de trabalho forma efetiva e competitiva.

TEORIA DAS INTELIGÊNCIAS MÚLTIPLAS SEGUNDO HOWARD GARDNER

O quociente de inteligência (QI) e o modo como era utilizado – meio para medição da inteligência – teve indiscutivelmente sua contribuição positiva nos meios científicos, acadêmicos e profissionais, mas agregado às suas vantagens veio à conseqüência de exercer um considerável efeito sobre a futura predisposição do um indivíduo à aprendizagem e ao seu desenvolvimento, dependendo do resultado alcançado. Determinado o valor do quociente de inteligência e comunicado à pessoa que havia se submetido ao teste, era como se a este valor fosse agregado um ‘ destino’.

A importância vinculada ao valor não é inteiramente inadequada. O escore em um teste de inteligência de fato prevê a habilidade da pessoa em relação à assimilação do conteúdo, mas não prevê sobre seu desempenho relacionado a habilidades e competências. [2]

Através da observação da existência de uma diferença entre o sucesso em assimilar matérias escolares (conteúdos) e sucesso na ‘vida pessoal e profissional’ do indivíduo, percebeu-se que inteligência era um conceito muito mais amplo do que o previsto nos testes de QI.

Com o desenvolvimento dos estudos sobre a pluralização da inteligência e fatos comprovantes de que nem sempre o melhor aluno da classe é o melhor profissional, houve a constatação de que desempenho pessoal escolar e profissional vai além da capacidade de assimilação de conteúdos proposta pelos meios acadêmicos.

Nesse contexto, houve o desenvolvimento de várias teorias e dentre elas a elaborada pelo Prof. Dr. Howard Gardner, que concebeu uma nova e diferente visão sobre as competências intelectuais humanas, baseando-se em muitos anos de pesquisa em psicologia cognitiva e neuropsicológica, levando em consideração a influência e a quantidade de informações existentes no contexto social, econômico e cultural em que a pessoa vive.

A Teoria das Inteligências Múltiplas é uma nova teoria de competências intelectuais humanas. Ela desafia a visão clássica da inteligência que muitos assimilaram explicitamente pela psicologia ou através dos testes de educação ou implicitamente - vivendo numa cultura com uma concepção forte, mas possivelmente circunscrita, de inteligência. [20]

Para chegarem a definição da pluralidade da inteligência, todas as definições de inteligência e meios de cognições humanas foram pesquisadas e estudadas [15].

Esta pesquisa envolveu tanto os relacionamentos a nível comportamental como os fisiológicos e está constantemente sendo reavaliada.

As inteligências presentes na Teoria das Inteligências Múltiplas, comprovadas pelos critérios relacionados são:

- **Inteligência Lingüística**: Capacidade de lidar bem com a linguagem, tanto na expressão verbal quanto escrita. A linguagem é considerada um exemplo preeminente da inteligência humana. Seja pra escrever ou para vencer um desafio verbal, a opção precisa das palavras prova o quão ela é importante. Na nossa sociedade ela chega a ser considerada como o melhor meio para executar negócios, tarefas, comunicar acontecimentos, etc. Características: gostar de ler; gostar de escrever; entender a ordem e o significado das palavras; fazer palavras cruzadas; convencer alguém sobre um fato; explicar, ensinar e aprender; contar estórias; senso de humor; etc.
- **Inteligência Musical**: Capacidade de interpretar, escrever, ler e expressar-se pela música. Características: reconhecimento de estrutura musical; esquemas para ouvir música; sensibilidade para sons; criação de melodias/ritmos; percepção das qualidades dos tons e sons; habilidade para tocar instrumentos, etc.
- **Inteligência Lógico-Matemática**: Competência em desenvolver e/ou acompanhar cadeias de raciocínios, resolver problemas lógicos e lidar bem com cálculos e números. É a mais conhecida faculdade cognitiva e normalmente associada à habilidade de desenvolver raciocínios dedutivos, construir ou acompanhar cadeias causais, m vislumbrar soluções para problemas, etc. Não requer articulação verbal, uma vez que pode resolver problemas ‘mentalmente’, sendo necessário somente à articulação verbal na comunicação dos resultados. Características: reconhecimento de padrões abstratos; raciocínio indutivo e dedutivo; discernimento de relações/conexões; preferências por jogos estratégicos e experimentos, etc.

- **Inteligência Espacial:** Competência relacionada à capacidade de extrapolar situações espaciais para o concreto e vice-versa Possui grande percepção e relacionamento com o espaço. Características: percepção acurada de diferentes ângulos; reconhecimento de relações entre objetos e espaços; representação gráfica; descoberta de caminhos no espaço tridimensional; imaginação ativa; gosto por jogos do tipo quebra-cabeça, etc.
- **Inteligência Corporal-Cinestésica**: Está relacionada à perfeita forma de expressão corporal, assim com a resolução de determinada dificuldade por meio de movimentos do corpo. Características: funções corporais desenvolvidas (danças, esportes, etc.); conexão corpo-mente; alerta através do corpo (sentidos); controle dos movimentos pré-programados; controles dos movimentos voluntários, etc.
- **Inteligências Pessoais** a) **Intrapessoal** → capacidade de se conhecer, de entrar em contato com seu próprio ' self', de se auto-avaliar. Reconhecendo seus pontos positivos e negativos, ficando desta forma mais fácil trabalhá-los. Está associado aos aspectos internos de uma pessoa, é o acesso à sua própria vida sentimental – a gama de afeto e emoções. Características: Concentração total da mente; Preocupação; Metacoginição; Percepção e expressão de diferentes sentimentos íntimos; Senso de autoconhecimento; Capacidade de abstração e raciocínio. b) **Interpessoal** → revela-se através de uma habilidade especial em relacionar-se bem com os outros, em perceber seus humores, suas motivações, em captar suas intenções, mesmo as menos evidentes e utilizar esta habilidade para agir com coerência e cooperativamente. Características: criação e manutenção de sinergia; superação e entendimento da perspectiva do outro; trabalho cooperativo; percepção e distinção dos diferentes estados 'emocionais'; comunicação verbal e não-verbal; capacidade de liderança e motivação, etc.
- **Inteligência Naturalista**: capacidade de observação, entendimento e organização de padrões no ambiente natural (reconhecer a flora e fauna). Características: gostar da natureza e sentir conforto ao ar livre; colecionar objetos do mundo natural; observar a natureza; notar as diferenças e mudanças na natureza; facilidade em guardar nomes de fenômenos naturais; etc.
- **Inteligência Existencial**: responsável pela necessidade do homem fazer perguntas sobre si mesmo, sua origem e seu fim.

A Utilização da Teoria das Inteligências Múltiplas Agregada a Estratégias de Ensino: Aula Expositiva

No momento da escolha de um dos métodos de ensino existentes, o educador deve ter em mente que o "ensinar" caracteriza-se pela combinação de atividades e deveres entre todos os envolvidos no processo de ensino e aprendizagem.

Nesse processo, sob a direção do educador, os estudantes vão atingindo gradativamente o desenvolvimento de suas capacidades mentais. O sucesso do desenvolvimento está diretamente ligado à capacidade do educador de sistematizar, tanto no planejamento quanto no desenvolvimento das aulas, os objetivos, conteúdos e as estratégias com a finalidade de facilitar o processo de ensino [13]

A estratégia utilizada dentro da sala de aula funciona como uma técnica insuperável para transmitir a informação necessária do assunto a ser trabalhado. Mas ajudar a transformá-lo em conhecimento e em mudanças de atitudes requer uma percepção maior por parte do responsável pelo processo de ensino e aprendizagem. Essa percepção pode ser desenvolvida num grau maior se houver a possibilidade de utilizar um referencial como forma de monitoramento de atividades didáticas .

A teoria das Inteligências Múltiplas e não um método estruturado, dessa forma, ajuda neste direcionamento, cujo objetivo é desenvolver um profissional o mais próximo possível do solicitado pelo mercado. Leva em consideração características pessoais individuais e aponta, sem classificar, para formas de desenvolver determinadas características pessoais. Por isso, tê-la como uma variável ativa durante a atividade da utilização das estratégias (seminário, aula expositiva, projeto) é uma forma de garantir o sucesso do desenvolvimento de características pessoais - capacidade de trabalhar em equipe, capacidade de escrever, ler e falar em público, capacidade de trabalhar de forma individual e a capacidade de utilizar as habilidades lógico-matemáticas desenvolvidas dentro dos cursos de exatas - de forma integrada às características técnicas.

Aula Expositiva

A aula expositiva consiste numa preleção verbal e escrita, utilizada pelos professores com o objetivo de transmitir informações sobre um determinado conteúdo específico. É uma estratégia antiga e, no Brasil, constitui seguramente a mais empregada no ensino de graduação. Em muitos cursos universitários é utilizado quase que de forma exclusiva e são em grande número as pessoas que identificam ensino com exposição de conteúdos. [9]

A aula expositiva, no sentido clássico, fundamenta-se na idéia de que é possível ensinar por meio da explicação oral, ou seja, condensar o conhecimento e expô-lo, verbalmente ou por meio da escrita, de forma lógica e clara. Assim, nesta técnica, a comunicação é importante para que ocorra a transmissão da informação e a recepção dela de forma correta.

Na aula expositiva, como o próprio nome diz, o foco está na exposição, feita por pessoas que tenham um conhecimento satisfatório sobre o assunto, e por isso, pode ocorrer o negligenciamento da importância do interesse e da atenção do aluno. Uma palavra desconhecida mencionada, um ritmo de fala maior do que o habitual, muitas idéias expostas ao mesmo tempo pode fazer com que a informação a ser transmitida não seja retida.

A aula expositiva e sua relação com a Teoria das Inteligências Múltiplas

Minimizar o descompasso existente no ensino superior, entre a preparação técnica e no desenvolvimento de suas habilidades e competências direciona a iniciativas pedagógicas inovadoras objetivando elevar a excelência do ensino.

A utilização da Teoria das Inteligências Múltiplas como direcionamento, dentro do contexto da estratégia aula expositiva, visa a diminuir esse descompasso, enquanto serve de ferramenta no desenvolvimento consciente de características e posturas exigidas atualmente.

Dentre as várias características necessárias para o bom desempenho profissional nos dias de hoje, pode-se destacar: Habilidade técnica específica da área de atuação da profissão escolhida; Capacidade de trabalhar em equipe (aprender a trabalhar em equipe); Facilidade e capacidade de "aprender a aprender", desenvolvendo a autonomia do aprendizado; Desenvolvimento de trabalhos individuais sem, contudo, perder a dimensão do todo; Capacidade de expressão oral e escrita.

Essas características poderão ser largamente estimuladas, durante as aulas expositivas, se forem direcionadas pela Teoria das Inteligências Múltiplas, mesmo sendo, essa estratégica, totalmente centralizada e direcionada pelo responsável pela transmissão do conteúdo técnico.

Ao fazer um paralelo entre a Teoria das Inteligências Múltiplas e as características pessoais/técnicas necessárias ao profissional de engenharia, pode-se observar que elas estão diretamente interligadas, por definição. Ou seja, ao estimular determinadas inteligências, o que se consegue é um desenvolvimento melhor da técnica e das características pessoais/profissionais da área. TABELA II.

A aula expositiva pode ser dividida em vários momentos interligados, que se repetem durante toda a atividade, dentre eles e o cuidado e coordenação desses momentos de forma consciente nos leva a uma melhor capacitação pessoal/profissional dos educandos.

Na Tabela II, encontra-se uma possibilidade de divisão das atividades relacionadas à aula expositiva e como e em qual momento as inteligências, objetivando o desenvolvimento das competências específicas são estimuladas.

Durante a atividade, o educador deverá fazer uma abordagem sobre o espírito de cooperação em equipe, de acordo com sua habilidade, de modo que os próprios participantes do processo tomem consciência de que já pertencem a um grupo e a conduta de uns influencia diretamente o desempenho de todos. Essa percepção induzida é o começo do desenvolvimento das inteligências pessoais.

A partir da percepção individual (inteligência intrapessoal – ao fazer com que as condutas alheias não tragam grandes transtornos ao seu processo de aprendizagem) e do grupo (inteligência interpessoal – ajudando o outro a tomar consciência da sua responsabilidade no desenvolvimento do grupo), é desenvolvido o espírito de cooperação e as conversas paralelas tendem a ser minimizadas devido ao fato de entenderem que há determinados "conhecimentos" que não serão adquiridos em livros ou em outros momentos.

A responsabilidade de integração do grupo e o desenvolvimento do senso de responsabilidade individual e grupal não é do educador. A ele cabe apenas expor que pessoas diferentes, trabalhando dentro do mesmo ambiente, com condutas e interesses individuais sempre existirá. Ou seja, estimula a consciência de que a sala de aula deve ser encarada com um laboratório para atividades e condutas futuras e que todos pertencem a um mesmo ambiente com alguns objetivos comuns.

Enquanto ocorre a explicação oral e escrita, a inteligência lógica é estimulada, pois, conforme o assunto vai sendo abordadas novas associações cognitivas vão sendo desenvolvidas e interiorizadas.

Muitas vezes, questões que trabalham essas associações podem ser formuladas e os estudantes terão que recorrer a conceitos pré-estabelecidos para respondê-las.

Durante todo processo da aula expositiva, a inteligência lingüística é estimulada. Por isso, é crucial que o educador tome todo cuidado com sua postura escrita e falada porque dela dependerá todo o desenvolvimento por parte dos estudantes. A utilização correta do vocabulário da área, assim como uma expressão clara e objetiva de todos os assuntos servirá de exemplo e de subsídios para uma posterior avaliação do desenvolvimento da postura profissional.

A expressão oral e escrito é fundamental para o bom desempenho profissional de qualquer área, e especificamente dentro do ensino de engenharia deverá ser estimulada de forma diferenciada uma vez que a maior ênfase está no desenvolvimento lógico e técnico do indivíduo, dando-se muita pouca ênfase à postura escrita e falada do estudante, como se não as fosse utilizar nunca na vida profissional. Nesse contexto, o exemplo torna-se fundamental, bem como o estímulo diferenciado em direção à inteligência lingüística. A discussão de textos relacionados à área e ao conteúdo a serem trabalhados pode servir como aliada nesse momento, fazendo que, além da capacidade de leitura e abstração de um texto escrito relacionado a um assunto técnico, seja desenvolvida a capacidade crítica individual de utilização prática e efetiva do conteúdo.

Devido à imaturidade, nas atividades iniciais, os estudantes devem ser constantemente monitorados para que ocorra o efetivo desenvolvimento.

Como pode ser observado, não se trata de acabar com a estrutura de sala de aula ou com a aula expositiva, mas simplesmente revitalizá-la, contando inclusive com o suporte dos recursos (giz, quadro negro, equipamentos tecnológicos, etc) e tendo como colaboradora para o sucesso pedagógico da disciplina a Teoria das Inteligências Múltiplas.

TABELA II

RELAÇÃO ENTRE COMPETÊNCIAS, INTELIGÊNCIAS ESTIMULADAS E MOMENTOS EXISTENTES NA AULA EXPOSITIVA

Competências	Inteligências	Momento
Habilidade técnica específica da área de atuação da profissão escolhida	Inteligência Lógica Inteligência pessoal (inter e intrapessoal) Inteligência Lingüística	Todos os momentos da utilização da estratégia
Capacidade de trabalhar em equipe. (aprender a trabalhar em equipe);	Inteligência pessoal (inter e intrapessoal) Inteligência lingüística	Expressão Oral (educador e educando) Expressão Escrita (educador) Pesquisas em assuntos relacionados (educando)
Facilidade e capacidade de "aprender a aprender";	Inteligência pessoal (inter e intrapessoal) Inteligência lingüística Inteligência lógica	Solicitação de feedback (educador) Expressão Oral (educador) Pesquisas bibliográficas (educando)
Desenvolvimento de trabalhos individuais sem, contudo, perder a dimensão do todo;	Inteligência Intrapessoal Inteligência lógica Inteligência Lingüística	Expressão Oral (educador, educando) Expressão Escrita Exercícios (educando) Solicitação de feedback (educador, educando)
Capacidade de expressão oral e escrita;	Inteligência pessoal (inter e intrapessoal) Inteligência lógica Inteligência lingüística	Exercícios (educando) Expressão Escrita (educador, educando) Solicitação de feedback (educador, educando) Pesquisas em assuntos relacionados (educando) Reprodução de textos escritos sobre o assunto (educando)

CONCLUSÃO

A estratégia utilizada dentro da sala de aula funciona como uma técnica insuperável para transmitir a informação necessária do assunto a ser trabalhado. Mas ajudar a transformá-lo em conhecimento e em mudanças de atitudes requer uma percepção maior por parte do responsável pelo processo de ensino e aprendizagem. Essa percepção pode ser desenvolvida num grau maior se houver a possibilidade de utilizar um referencial como forma de monitoramento de atividades didáticas.

A Teoria das Inteligências Múltiplas, por ser uma teoria e não um método estruturado, ajuda neste direcionamento, cujo objetivo é desenvolver um profissional o mais próximo possível do solicitado pelo mercado.

A teoria leva em consideração características pessoais individuais e aponta, sem classificar, para formas de desenvolver determinadas características pessoais. Por isso, tê-la como uma variável ativa durante a atividade da utilização das estratégias (seminário, aula expositiva, projeto) é uma forma de garantir o sucesso do desenvolvimento de características pessoais - capacidade de trabalhar em equipe, capacidade de escrever, ler e falar em público, capacidade de trabalhar de forma individual e a capacidade de utilizar as habilidades lógico-matemáticas desenvolvidas dentro dos cursos de exatas - de forma integrada às características técnicas.

Portanto, agregar a Teoria das Inteligências Múltiplas às estratégias de ensino, especificamente à aula expositiva, em cursos de 3º grau tem como objetivo revitalizar o ensino e facilitar a aprendizagem de forma a suprir as necessidades de mercado por um profissional que saiba inter-relacionar as habilidades técnicas e pessoais.

Implementando um mecanismo de processamento de conhecimento em um ambiente de aprendizado baseado na Web

Ricardo Duarte Taveira[1], Antonio Mauro Barbosa de Oliveira [2] e Roberto Wagner Silva Rodrigues[3]

Abstract *— The evolution of paradigm's related to epistemology, didactic and cognitive science has allowed the implementation of computational model's called cognitive architecture. This article describes an implementation of a cognitive architecture with the objective of increasing and sharing the constructed knowledge based on PBL (Problem-Based Learning). The architecture is used as a knowledge processing strategy in an learning environment that uses web technology, called INVENTE, which is integrated to a knowledge processing system called WITTY. While the WITTY system allows the making of applications of wide spectrum, particularly learning systems, the INVENTE is a WBLE (Web-Based Learning Environment) designed to support distance learning in technological teaching schools using Internet. Our cognitive architecture is implemented by incorporating the INVENTE functionalities, such as dynamic navigation, virtual environment metaphor, meaning and collaboration, and video conference together with WITTY knowledge acquisition capabilities. These functionalities can be used remotely via WEB SERVICES protocols (SOAP, WSDL, UDDI).*

Index Terms — Artificial Intelligence, Cognitive Architecture, Distance Learning, Web Based Learning Environment, Web Services.

I. Introdução

A pesquisa da utilização de ambientes de aprendizagem e ensino baseados na tecnologia Web têm sido objeto de estudo a partir dos serviços oferecidos pela Internet através do HTTP (Hiper Text Transfer Protocol)[1]. A maioria dos ambientes de WBLE (Web Based Learning Environment) têm como característica fundamental a oferta de conteúdos disponibilizados na forma de hipertextos[2].

Tal característica é insuficiente se considerarmos os conceitos e modelos que despontam a partir de uma análise dos processos envolvidos na aprendizagem e no ensino. Tais processos têm seus conceitos abordados na Epistemologia e nas Ciências Cognitivas (Psicologia Cognitiva, Didática e Ciências da Computação)[3].

O momento atual em que vivemos exige do profissional um novo perfil que exige uma série de competências, principalmente relacionadas a capacidade de desenvolver projetos, resolver problemas e a capacidade de aprender a aprender. Tais competências só são possíveis a partir da melhoria dos processos cognitivos envolvidos na aprendizagem. A incorporação de uma arquitetura cognitiva [4] a um ambiente de WBLE cria um diferencial na medida em que transforma a informação em conhecimento. A partir dessas considerações, este trabalho propõe que ambientes WBLE devam agregar funcionalidades a fim de prover suporte a uma abordagem educacional que utilize uma representação do conhecimento elaborado, de modo a incrementar o processo de aprendizagem. Essas funcionalidades propostas podem ser viabilizadas a partir da agregação de novas tecnologias para Web e de softwares para processamento do conhecimento. Em particular apresentamos uma proposta para ensino tecnológico a distância dentro do contexto do projeto INVENTE(INVestigação no Ensino TEcnológico à Distancia).

II. Ambiente de Ensino Tecnológico a Distância – O caso INVENTE

O Projeto INVENTE como uma solução para o ensino tecnológico a distância tem sido objeto de pesquisa no LAR (Laboratório de Redes) no Centro Federal de Educação Tecnológica do Ceará (CEFET-CE). Como produto do projeto, vários protótipos foram desenvolvidos, os quais têm evoluído através de várias versões descritas a seguir.

INVENTE 1.0

O Projeto INVENTE teve início com a investigação dos requisitos que diferenciam o ensino tecnológico do ensino convencional a distância[5]. Concluiu-se que a arquitetura inicial teria que considerar alguns pressupostos básicos que um ambiente para a educação tecnológica a distância deveria incorporar:

- Pressuposto 1: Os sistemas elaborados para a educação profissional a Distância podem e devem beneficiar-se do aporte da tecnologia de Realidade Virtual.

[1] Ricardo Duarte Taveira, Mestrando, (Mestrado Profissional de Informática Universidade Estadual do Ceará -UECE), Centro Federal de Educação Tecnológica do Estado do Ceará - CEFET-CE, Av. 13 de Maio, 2081, 60.040-531, Fortaleza, CE, Brasil, taveira@cefetce.br.
[2] Antonio Mauro Barbosa de Oliveira, Doctie Paris IV,Centro Federal de Educação Tecnológica do Estado do Ceará - CEFET-CE, Av. 13 de Maio, 2081, 60.040-531, Benfica, Fortaleza, CE, Brasil, mauro@cefetce.br.
[3] Roberto Wagner Silva Rodrigues, PhD Imperial College, Centro Federal de Educação Tecnológica do Estado do Ceará - CEFET-CE, Av. 13 de Maio, 2081, 60.040-531, Fortaleza, CE, Brasil, rwsr@cefetce.br.

- Pressuposto 2: É desejável que um sistema para a educação profissional a distância faça uso da capacidade de controle de QoS das redes, onde for possível.
- Pressuposto 3: É desejável que um sistema voltado para a educação profissional a distância utilize os recursos de vídeo e áudio sempre que necessário, garantindo uma qualidade mínima.
- Pressuposto 4: É desejável que um sistema para a educação profissional a distância permita a agregação de programas específicos das áreas de maneira amigável.
- Pressuposto 5: É desejável que um sistema para a educação profissional a distância possibilite a criação de novos ambientes não previstos na sua concepção original, de modo a se adequar à diversidade de instituições de ensino básico, técnico e tecnológico.

Esta versão 1.0 assume então como pressupostos básicos: o uso da realidade virtual, a exploração de recursos de áudio e vídeo, a utilização de infra-estrutura com provisão de qualidade de serviço (QoS) e a possibilidade de agregação de aplicações de domínio específico e de outras não previstas durante a concepção do ambiente virtual.

INVENTE 2.0

A introdução de programas de Educação a Distância despendem grandes quantidades de recursos (tempo e dinheiro) no treinamento de habilidades sobre novos aspectos técnicos e administrativos, o que não é suficiente. Há a necessidade ainda de desenvolver habilidades para gerenciar outras dimensões do novo ambiente à distancia, tais como a *navegação dinâmica*, a *metáfora*, o *significado*, a *cultura*, os *protagonistas e seus papéis*, o *tempo e o espaço*, a *consciência* e a *colaboração*.

Na proposta da versão 2.0 foi realizada uma reflexão sobre estes conceitos, chamados de dimensões críticas da Educação Tecnológica a Distância, dos quais ressaltamos como principais: a adaptação cultural, a exploração adequada dos sentidos e a flexibilização do ambiente virtual [6].

Como resultado dessa reflexão, a proposta da arquitetura da versão 2.0 foi concebida dentro de uma perspectiva mais conceitual e não de uma visão orientada somente à tecnologia. Isto levou a implementação de um Núcleo de Gestão que substitui o bloco "Framework WWW" da arquitetura anterior.

O Núcleo de Gestão é baseado em tecnologia Web e é responsável pela administração dos recursos do ambiente, pela gerência da base de dados, manutenção e administração das publicações e pelo controle de acesso aos recursos. A *Interface de Operação e Navegação*, contida no núcleo de gestão, fornece a interface necessária entre os usuários e os recursos do ambiente. As aplicações foram divididas em *aplicações genéricas* e *de domínio específico*, visando tornar mais clara a possibilidade da arquitetura agregar diferentes aplicações, sem induzir a predefinição de um tipo particular ou tecnologia a ser utilizada.

INVENTE 3.0

A versão 3.0 [7] foi implementada após investigarmos as principais características de uma aplicação de vídeo-conferência, onde chegou-se a conclusão de que outras funcionalidades precisavam ser agregadas a uma videoconferência padrão para que ela atendesse aos propósitos da educação tecnológica à distância. As principais funcionalidades agregadas foram:

- Capacidade de apresentação e manipulação de hipermídias: a transmissão em tempo real de documentos hipermídia entre os participantes de uma videoconferência enriquece a interação.
- Uso de laboratórios virtuais para realização de experiências e simulações: o uso da realidade virtual é um dos pressupostos do ensino tecnológico ressaltadas em [1]. Realizar experimentos em um ambiente de educação a distância não é uma tarefa simples. Uma das formas encontradas para realização de experiências de forma colaborativa à distância é através de simulações utilizando realidade virtual.
- Priorização no uso dos Recursos: é importante que as mídias transmitidas durante uma videoconferência possam ter níveis diferentes de prioridade. No ambiente de videoconferência proposto, o foco das atenções não é o áudio e o vídeo do transmissor, mas sim o funcionamento do ambiente como um todo na tentativa de promover o melhor aprendizado possível.

Com esta versão 3.0 e suas novas funcionalidades agregadas, e o fato da ferramenta ter sido construída numa abordagem conceitual, o INVENTE passou a incorporar recursos tecnológicos que permitem dar suporte a novas práticas pedagógicas o que nos levou a constatar que para viabilizar essa possibilidade é necessário uma reflexão dos processos envolvidos na cognição dentro de um contexto de ensino tecnológico.

III. A ANÁLISE COGNITIVA

Em geral, o cerne das atividades escolares encontra-se na produção de significações. Esse processo é alimentado de informações e dados provenientes de seu exterior, os quais foram acumulados historicamente e/ou gerados continuamente, em permanente transformação, procurando construir e/ou desenvolver o conhecimento e a inteligência das novas gerações[8].

As mudanças tecnológicas nos processos de trabalho industrial exigem uma reorganização da escola, no sentido da diminuição da importância das habilidades manuais em favor das habilidades cognitivas. Há portanto a necessidade de rever a concepção de conhecimento, o qual tem suas raízes na Epistemologia, onde é concebido como uma rede de significados em um espaço de representações; uma teia de relações cuja construção não se inicia na escola[8].

A idéia de rede de significados tem sido abordada pelas Ciências Cognitivas, que abrangem, dentre outras áreas de interesse, a Inteligência Artificial, a Psicologia Cognitiva e a Neurociência. Cada uma destas áreas tem contribuído com modelos computacionais construídos para aumentar a compreensão sobre a cognição humana[8], tais como Redes Semânticas, Sistemas de Produção e Redes Conexionistas[3].

Porém, antes de definir qualquer modelo computacional há a necessidade de se caracterizar níveis de cognição. A Pirâmide Informacional[9] (Figura 1) é um modelo que pode servir como instrumento para avaliar estes níveis de cognição num ambiente educacional. Isto nos permite evidenciar a necessidade de considerar conjuntamente componentes como dados, informação, conhecimento e inteligência, bem como o movimento de ir-e-vir, de sobe-desce , desce-sobe, que caracterizam as inter-relações entre tais componentes.

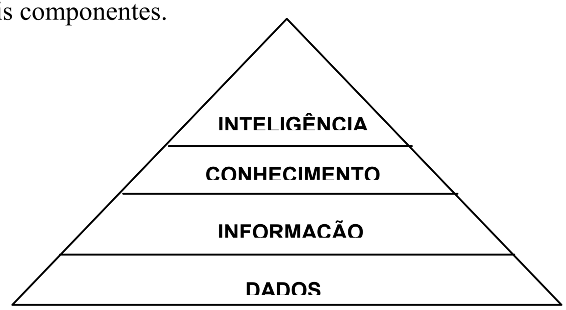

FIGURA 1
PIRÂMIDE INFORMACIONAL

Os níveis da pirâmide são caracterizados a seguir:

- Primeiro Nível - Dados : Os dados tanto qualitativos como quantitativos, às vezes acumulados sob a forma de supostas observações “desinteressadas”, embora potencialmente úteis, isolados são desprovidos de interesse.
- Segundo Nível – Informações : Informações são dados analisados, processados, inicialmente articulados. Apesar da informação ser uma matéria-prima fundamental na escola, o cerne das atividades desenvolvidas na escola não estão situadas nesse nível.
- Terceiro Nível – Conhecimento **:** O conhecimento é resultado da capacidade de estabelecer conexões entre elementos informacionais aparentemente desconexos, processar informações, analisá-las, relacioná-las, armazená-las, organizá-las em sistemas, avaliá-las segundo critérios de relevância.
- Quarto Nível – Inteligência : Este nível representa a competência de uma organização (um indivíduo, uma empresa, uma organização social, um governo) para administrar conhecimentos disponíveis, construir novos conhecimentos, administrar dados ou informações disponíveis, organizar-se para produzir novos dados e informações, sempre em razão de uma ação intencional tendo em vista atingir objetivos previamente traçados, ou seja, visando a realização de um projeto. A inteligência encontra-se diretamente associada à capacidade de ter projetos; a partir deles, dados, informações, conhecimentos são mobilizados ou produzidos.

A partir da análise da Pirâmide Informacional podemos concluir que :

- Os dois níveis iniciais da Pirâmide Informacional (Dados e Informação) caracterizam uma Didática e uma Epistemologia behaviorista enquanto que os demais Níveis (Conhecimento e Inteligência) caracterizam uma Didática e um Epistemologia sócio-construtivista;
- Para alcançar os níveis superiores da Pirâmide Informacional deverá ser adotado uma abordagem educacional que viabilize o seu alcance.

Sendo o INVENTE um ambiente para o ensino tecnológico que é caracterizado por atividades direcionadas a resolução de problemas e desenvolvimento de projetos[5][10], é desejável que incorpore funcionalidades que atendam a requisitos relacionados a estas características.

Dentre as várias abordagens educacionais que viabilizam o alcance de níveis cognitivos que caracterizam a produção de projetos destaca-se a Aprendizagem Baseada em Problemas[11].

IV. Aprendizagem Baseadas em Problemas

A Aprendizagem Baseada em Problemas (Problem-Based Learning/PBL) têm se firmado como uma das mais importantes inovações no campo da educação tornando-se em diversos países, um poderoso instrumento para a reflexão e o questionamento acerca da razão de ser, das finalidades da formação profissional e das mudanças que a ela devem ser imprimidas. PBL produz no processo de aprendizagem dos estudantes, os seguintes efeitos cognitivos:

- Ativação do conhecimento prévio – A análise inicial do problema estimula a recuperação de conhecimentos adquiridos previamente. O conhecimento prévio facilita a compreensão das novas informações.
- Reestruturação do Conhecimento – A maneira como o conhecimento é estruturado na memória torna-o mais ou menos acessível para utilização. A reestruturação do conhecimento se dá a partir da análise do problema. O conhecimento consiste de proposições que são estruturadas em redes semânticas. Uma proposição é uma afirmação que contém dois conceitos e sua inter-relação. Redes semânticas[12] consistem em um amplo número de proposições que se inter-relacionam umas com as outras. A Retenção das informações é melhor quando estão associadas a situações ou domínios de conhecimento que é familiar ao aprendiz. A lembrança é melhor daquilo que é pesquisado, ou da informação que resultou de um esforço ativo de interpretação[13].
- A elaboração sobre os conhecimentos prévios – Processamento ativo das novas informações e da discussão em pequenos grupos antes e depois da aquisição de novos conhecimentos. A elaboração

enriquece as redes semânticas desenvolvidas facilitando a recuperação do conhecimento.

- Aprendizagem em um contexto – O armazenamento de informações na memória e a sua recuperação podem ser significativamente aprimorados grandemente, quando ocorre uma elaboração do material durante o seu aprendizado. O problema serve como uma estrutura para armazenagem de pistas que podem auxiliar a recuperação de conhecimentos relevantes, quando necessários para problemas similares encontrados posteriormente.
- A motivação para aprender aumenta a quantidade de estudo – Como os estudantes são responsáveis pelo que deve ser aprendido, a motivação intrínseca para a aprendizagem cresce.

A criação de um nova versão do INVENTE propõe a agregação de mecanismos computacionais à atual arquitetura, justificados aqui a partir de uma análise epistemológica e cognitiva bem como na abordagem de aprendizagem baseada em problemas. O projeto da nova versão oferece um suporte a uma prática educacional que irá viabilizar um incremento do aporte cognitivo do aprendiz a partir de uma abordagem construtivista baseada em PBL.

V. INVENTE 4.0

A nova versão 4.0 (Figura 2) pressupõe a incorporação de uma interface para a diagramação de Redes Semânticas, produto da estruturação do conhecimento conduzido pelos aprendizes na metodologia do PBL, e do posterior armazenamento da rede semântica em uma base de conhecimento no servidor Witty usando WebServices.

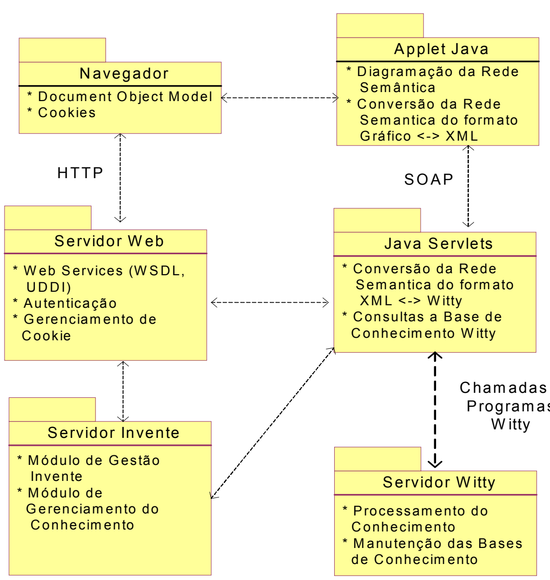

FIGURA 2
VISÃO LÓGICA DA ARQUITETURA DO INVENTE 4.0

A Rede Semântica que representa o conhecimento é traduzida em mensagem no formato XML[14] o qual é enviada ao servidor e em seguida é convertida para a representação em Lógica de Predicados[15].

Como uma Rede Semântica é uma classe de formalismo para representação do conhecimento em forma de grafo, na proposta da implementação do INVENTE 4.0, Redes Semânticas serão utilizadas para representar o modelo do conhecimento pelo aluno usando a interface Web. Os Nós do grafo representam entidades e links (predicados) que por sua vez representam relacionamentos entre essas entidades[16]. Observar que inicialmente usada para desenvolver um modelo psicológico da memória associativa humana[17][18], Redes Semânticas são úteis para codificar o conhecimento taxonômico de um domínio através de entidades, suas propriedades e relações[19]. O conhecimento incorporado em uma Rede Semântica pode ser convertido para Lógica de Primeira Ordem[19].

O emprego da Inteligência Artificial em aplicações de educação ocorre basicamente onde o computador funciona como máquina de ensinar (Tutores Inteligentes), ferramenta, simulador, assistente(Sistema Especialista)[20][21]. No INVENTE 4.0 será agregado a ferramenta Witty que é um software testado e estabilizado[22] desenvolvido para executar as tarefas de uma Máquina de Inferência que opera Bases de Conhecimento concebidas segundo a Lógica de Predicados.

A Ferramenta Witty é um ambiente de desenvolvimento de sistemas baseados em conhecimento, que permite a confecção de aplicações de amplo espectro, particularmente sistemas voltados ao aprendizado, organização de informações e aquisição de conhecimento. Para isso, dispõe de uma máquina de inferência que permite efetuar deduções sobre uma ou mais bases de conhecimento, de um conjunto de centenas de primitivas em uma linguagem ao estilo do Prolog, de um processo de casamento de padrões e de métodos comunicação com outros processos ou com a Internet [23].

Além da Ferramenta Witty será agregada a tecnologia WebServices[24], o qual tem sido apontada como solução para atender requisitos principalmente ligados a processamento distribuído, segurança e interoperabilidade. Web Services são componentes de software que são acessados de qualquer dispositivo conectado a Web usando um conjunto de protocolos de mensagens, padrões de programação, e facilidades de rede para registrar e descobrir recursos. Mais detalhadamente, um Web Service encapsula um processo discreto de uma organização que:

- (i) Se expõe e descreve-se – Um Web Service define suas funcionalidades a atributos assim outra aplicação pode entendê-lo, e tornar essas funcionalidades facilmente disponíveis para outras aplicações usando WSDL (Web Services Description Language)[25].
- (ii) Permite que outros serviços localizem-o na Web – um Web Service pode ser registrado em um serviço tipo "pagina amarela", assim uma aplicação pode localizá-lo

usando registros UDDI (Universal Description, Discovery, and Integration)[26].

- (iii) Pode ser chamado – uma vez que um Web Service é localizado e examinado, a aplicação remota pode chamar esse serviço usando um protocolo padrão da Internet como o SOAP (Simple Object Access Protocol)[27].
- (iv) Retornar uma resposta – Quando o serviço for fornecido os resultados são retornados para a aplicação que chamou usando o mesmo protocolo padrão da Internet [28].

A agregação que caracteriza a nova arquitetura do INVENTE 4.0 (Figura 2) possui os seguintes componentes:

- Navegador – Executa a função de Interface entre o aprendiz e o INVENTE.
- Apllet Java – Executa as funções de Diagramação de Redes Semânticas, conversão de documentos XML enviados pelo Java Servlet para o formato de diagrama, conversão do diagrama da Rede Semântica em documento XML, envia consultas para a Rede Semântica que serão executadas no servidor Witty.
- Servidor Web – Aceita as requisições feitas a partir do Navegador. Disponibiliza e registra os serviços executados pelos Servlets.
- Servidor Invente – Executa as funções de autenticação dos usuários, gerenciamento do INVENTE e do Controle ao acesso às bases de conhecimento.
- Java Servlets – Executa as funções de conversão das redes semânticas vindas do navegador no formato XML para o formato de lógica de predicados, e do formato de lógica de predicados para o formato XML. Faz chamada a programas armazenados no servidor Witty que executam funções de acesso à base de conhecimento. Interage com o Applet Java que roda no browser através do protocolo SOAP.
- Servidor Witty – Realiza a função de máquina de inferência, representa o conhecimento na forma de lógica de predicados permitindo a execução de consultas à base de conhecimento. Todas as funções de acesso e manutenção às bases de conhecimento são executadas através de programas escritos em uma linguagem similar ao Prolog e que são executadas pelo ambiente Witty. O acesso ao servidor Witty é feito através de TCP/IP.

Finalmente, é importante destacar que as novas funcionalidades agregadas ao INVENTE são caracterizadas como uma aplicação genérica segundo a especificação dada na versão 2.0[6].

VI. Trabalhos Relacionados

A conjunção de abordagens educacionais, Psicologia Cognitiva, Inteligência Artificial e Aplicações de Redes de Computadores tem sido objeto de investigação e desenvolvimento em todos os grandes centros de pesquisa no mundo[29][30][31].

Os trabalhos relacionados ao tema reforçam a tese do valor e da importância do desenvolvimento do conhecimento e da sua aplicação como um diferencial nas instituições de ensino, nas organizações empresariais e nas nações.

A proposta da nova arquitetura do INVENTE está relacionada a várias pesquisas que vêm sendo realizadas. A incorporação de mecanismos de inteligência artificial em ambientes de Ensino baseados na Web são propostos em [32]. A Representação do Conhecimento através de Ontologias e sua representação usando bases de conhecimento é tratado em [33], e a integração de Ontologias em ambientes de Educação com Inteligência Artificial em[34]. A utilização de Redes Semânticas em um software educacional baseado na Web é abordada em [35]. Atualmente, o projeto Web Semântica conduzido pelo W3C[36] tem como proposta a padronização de Ontologias nos mais diversos domínios do conhecimento para viabilizar o intercambio de documentos XML usando a especificação RDF[37].

A arquitetura do INVENTE 4.0 se diferencia pela agregação de WebServices ao suporte a uma ferramenta que reforça uma prática educacional peculiar ao ensino tecnológico.

VII. Conclusões

Ao mesmo tempo em que as abordagens de educação devem buscar um aumento do nível de cognição dos aprendizes, os Ambientes de Educação a Distancia baseados na WEB deverão fazê-lo incorporando ferramentas que auxiliem essas novas abordagens no alcance desses objetivos. O atual estágio de implementação do INVENTE reproduz as abordagens tradicionais de educação. A proposta do INVENTE 4.0 mostrada neste trabalho inicia um processo de melhoria na medida em que dá suporte a práticas educacionais que incorporam processos de construção do conhecimento em níveis cognitivos relacionados a capacidade de resolver problemas e desenvolver projetos. Isto permitirá que atividades relacionadas a resolução de problemas levem ao desenvolvimento de importantes habilidades próprias do ensino tecnológico a distância. Sómente assim os aprendizes terão a oportunidade de pensar e criar oportunidades para experimentar a procura de conhecimento, seleção, aplicação usando uma ferramenta de ETD.

A COMPUTAÇÃO GRÁFICA E O DESENVOLVIMENTO DE PRODUTOS

Eduardo Félix Ribeiro Romaneli, Dr. Eng. [1]

Abstract *— This paper tries to show to undergraduate students of Engineering, how Graphics Computing can help in the design of a product regarding quality and security issues. The research was limited the mechanical, electrical and thermal analysis of an ordinary electrical coffeemaker in order to evaluate its thermal safety from the user point of view. As a practical approach it was selected the softwares OrCad 9.2 and RadTherm to perform the required simulations. These programs were chosen due to their friendly operation, reliability and availability. It was observed the behavior of the virtual model under normal operation conditions through a quantitative analysis regarding parametric surface temperature. Finally, based on the experimental results, the safety requirements of the coffeemaker was analyzed..*

Index Terms — Graphics Computing, Product Development, Simulation, Teaching-Learning.

INTRODUÇÃO

No gerenciamento e controle do processo de desenvolvimento de um produto, a questão da inovação é cercada de incertezas exigindo decisões baseadas em variáveis de previsão difícil [1]. Por outro lado as novas tecnologias imprimem um ritmo mais rápido de inovações necessitando que as empresas dominem o processo de inovação para manter-se no mercado.

A atividade de desenvolvimento de novos produtos ou de redesign não é tarefa simples nem direta, mas antes envolve diversos interesses e habilidades necessitando uma excelente sinergia entre as áreas de tecnologia, ciências sociais e design. Enquanto a tecnologia visa simplicidade na fabricação, facilidade de montagem e eficiência do produto, a área das ciências sociais ou de *marketing* deseja novidade, pouco investimento e vantagem competitiva. Por sua vez, a área de design almeja um produto que cumpra seu papel, porém dotado de estética e estilo [1].

O DESIGN DAS CAFETEIRAS MODERNAS

A forma de se fazer café tem modernizado-se muito nas últimas décadas e, particularmente depois da II Guerra Mundial, tem alterado significativamente os hábitos alimentares de milhões de pessoas. A evolução deste aparelho está intimamente ligada às mudanças sociais e comportamentais da sociedade do século passado. A evolução da cafeteira seguiu duas linhas mestras, o estilo e técnica.

Segundo a definição de BAXTER (1998) o estilo original das cafeteiras foi fortemente influenciado por fatores intrínsecos, adquirindo um simbolismo especial, uma identificação com um estilo de vida, o *american way of life.* Do ponto de vista da técnica os esforços foram centrados na melhoria da qualidade do produto. O produto final, em um conceito mais elaborado, é o café pronto para se servido. Os projetistas incorporam as inovações técnicas a medida que se tornavam economicamente viáveis. Dois pontos marcaram esta evolução: a eletrificação urbana e as mudanças do paladar da população. O resultado deste esforço é a moderna cafeteira elétrica, totalmente automática e de acordo com a técnica atual de ser preparar o melhor café.

A medida que o café popularizou-se, a cafeteira elétrica tornou-se um fenômeno cultural. A moderna cafeteira é um equipamento surpreendentemente simples, considerando-se o esforço despendido durante décadas para seu desenvolvimento e as leis da física envolvidas no seu funcionamento. Apesar da simplicidade, todo eletrodoméstico está submetido a normas rígidas quanto a segurança do usuário, principalmente no quesito segurança contra incêndio. A cafeteira elétrica, adicionalmente, por processar água em elevada temperatura representa um risco para o usuário caso seja mal projetada, daí a importância da simulação na fase de projeto.

A revisão cronológica do desenvolvimento das cafeteiras [3] mostra uma profunda ligação com o desenvolvimento econômico das regiões, especificamente com o processo de eletrificação. As mudanças sociais, assim como as mudanças comportamentais exerceram uma influência determinante na evolução das cafeteiras. O design não poderia deixar de acompanhar estas mudanças e ao mesmo tempo que tentou suprir as necessidades subconscientes de uma classe média que experimentava uma grande prosperidade econômica não deixou de incorporar os avanços tecnológicos disponíveis.

O crescimento da concorrência, porém, tornou o ciclo de vida dos produtos muito curto e a necessidade de lançar produtos com diferenciais funcionais em relação aos competidores gerou a demanda por técnicas que encurtassem o processo de concepção de um produto. Entre estas técnicas

[1] Eduardo Felix Ribeiro Romaneli , CEFET-PR Engenharia Elétrica DAELT, Curitiba, Paraná, Brasil romaneli@ieg.com.br

a prototipagem virtual é uma ferramenta essencial para a redução dos esforços de projeto.

Observando-se o interior de uma cafeteira é fácil compreender que a física por trás do funcionamento do equipamento não é muito complicada. Observando-se a parte superior (Fig. 1) notam-se: um pequeno reservatório que armazena a água para iniciar o ciclo de preparo do café; um tubo (preto no exemplo) que conduz a água do reservatório até a área de gotejamento; e a área de gotejamento onde a água passa por pequenos orifícios e simplesmente cai sobre o pó de café.

FIGURA 1
VISTA SUPERIOR DA CAFETEIRA [2]

A força por trás deste sistema é a gravidade. A gravidade empurra a água para baixo através do filtro e dos grãos de café moído para dentro do bule. Esta é a engenhosidade do gotejador, a cafeteira produz café sem contato manual utilizando-se da gravidade. Este foi o marco principal da evolução do design das cafeteiras.

FIGURA 2
O ELEMENTO DE AQUECIMENTO E BASE [2]

O aspecto físico envolvido no processo de gotejamento da cafeteira é o aquecedor. Trata-se de um fio com característica de dissipar uma quantidade determinada de calor quando suas extremidades são submetidas a uma diferença de potencial elétrico conhecida. Este elemento tem duas funções, primeira é ferver a água e a segunda é manter o café aquecido depois de pronto. Tecnicamente o aquecedor transfere energia térmica para a água fria. O calor naturalmente vai do objeto mais aquecido para o mais frio. Na Fig. 2 é apresentada a conexão entre o elemento de aquecimento e o prato que mantém o café quente. O elemento é pressionado diretamente contra a parte inferior do prato com a ajuda de um pasta condutora de calor que ajuda a melhorar a transferência do calor.

Outro elemento essencial para o funcionamento é o interruptor. O interruptor está conectado a sensores de temperatura que desliga o aparelho quando a temperatura da base torna-se muito elevada. Através da alternância ora ligado, ora desligado, o aquecedor mantém-se em temperatura constante (Fig. 3.)

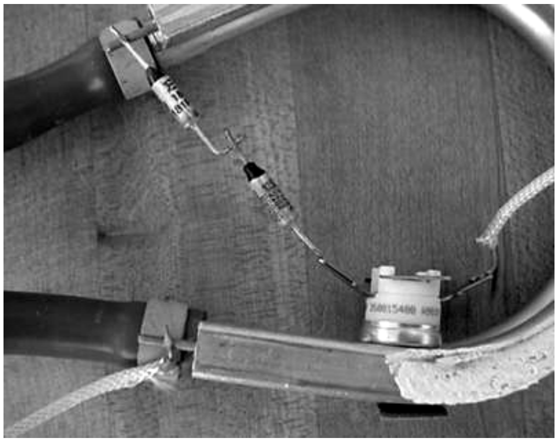

FIGURA 3
SENSOR DE TEMPERATURA [2]

A parte mais importante para o correto funcionamento da cafeteira, porém, é invisível. Trata-se de uma válvula unidirecional de controle de fluxo que tem como função evitar que a água quente retorne para o recipiente de armazenagem e forçar as bolhas, que se formam a partir da água fervente, a seguirem para o gotejador na parte superior.

Aplicação de Recursos Computacionais no Projeto de uma Cafeteira Moderna

Os programas de CAD/CAE têm a função de auxiliar no projeto das cafeteiras durante o estágio de desenvolvimento para investigação de fenômenos térmicos, mecânicos, fadiga, assim como características relacionadas com o fluxo de água, transferência de calor entre outros.

Existem diversos programas para o desenvolvimento de produtos disponíveis no mercado. Provavelmente, o método de análise mais utilizado na engenharia seja a Análise por Elementos Finitos. Esta análise é um conjunto de algoritmos complexos que utilizam métodos matemáticos para dividir um objeto heterogêneo em partes menores, porém, homogêneas e de modelagem mais simples. Ele é utilizado nas áreas de simulação estrutural, design automotivo e aeroespacial, design eletroeletrônico, design de máquinas e equipamentos mecânicos, etc. Geralmente o método é utilizado para resolver problemas de esforço, deformação, transferência de calor, distribuição de campos magnéticos e outros problemas que envolvam elementos contínuos que seriam insolúveis de outra forma. A correta aplicação de recursos da computação gráfica tem como objetivo otimizar a visualização científica destes dados.

APLICAÇÃO DOS RECURSOS DE DESIGN COMPUTADORIZADO

A primeira etapa para o desenvolvimento de um protótipo virtual é a preparação de modelos matemáticos que representem fielmente o comportamento físico do equipamento. Este modelo global geralmente incorpora diversos modelos mais simples que podem representar as características elétricas, mecânicas, termodinâmicas ou químicas do protótipo. Durante o desenvolvimento a escolha de um ou mais modelos podem representar o equipamento em determinada análise. O principal modelo para a manipulação "física" em ambiente virtual é o arquivo com a representação espacial tridimensional do objeto em estudo.
A aplicação do modelo em CAD permite que os materiais aplicados na construção do protótipo sejam avaliados em relação a aspectos fisico-químicos nos quesitos de segurança, usabilidade, manufaturabilidade, manutenção, etc. A disposição mecânica de interruptores, fios, aquecedores, termostatos, canos, reservatórios, entre outros, é feita com a ajuda do CAD.

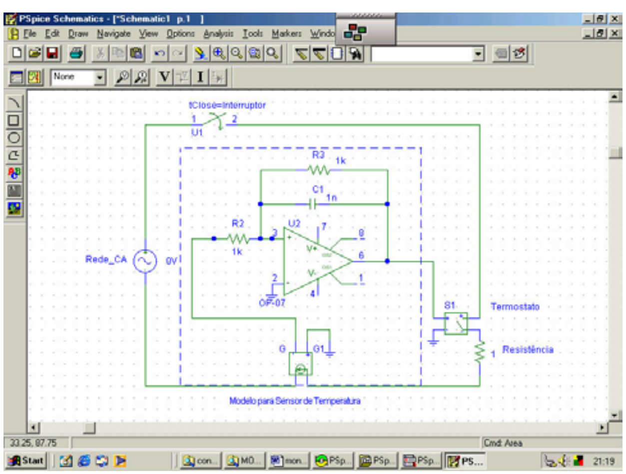

FIGURA 4
SIMULADOR PARA CIRCUITO ELETRÔNICO DE CAFETEIRA.

A utilização de programas de simulação digital pode, a partir do modelo tridimensional gerado pelo CAD, mostrar o funcionamento da cafeteira em situações críticas como a operação em um ambiente com alta temperatura e/ou com oscilações de tensão de rede. Para atingir-se este objetivo, pode-se optar pela utilização de dois programas do tipo Computer Aided Engineering (CAE). O primeiro seria um simulador de circuitos eletrônicos que tem como tarefa determinar a dissipação de energia na resistência da cafeteira sob diversas situações podendo simular alterações paramétricas na tensão de entrada e o efeito dos desvios na curva normal de produção da resistência de aquecimento, assim como do ponto de operação do elemento sensor de temperatura. A Fig. 4 apresenta o circuito elétrico equivalente da cafeteira simulado no programa OrCad 9.2.

O resultado é visualizado através de gráficos bidimensionais onde as variáveis podem ser tensões ou correntes que podem ser parametrizadas em função da temperatura ambiente. A Fig. 5 mostra um exemplo de cafeteira com um elemento de aquecimento de 280 W operando em uma rede CA (CORRENTE ALTERNADA) de 220 V.

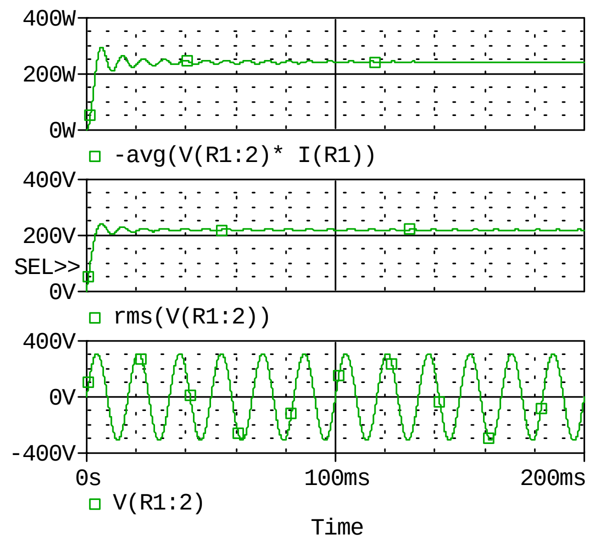

FIGURA 5
TENSÃO DE REDE E POTÊNCIA MÉDIA DISSIPADA

Esta etapa permite que se estude o comportamento da cafeteira quando submetida a fatores externos agressivos, como tensão de rede acima ou abaixo do valor nominal, surtos de tensão devido a fenômenos metereológicos ou por manutenção da rede de distribuição por parte da concessionária de energia elétrica. Para a etapa seguinte, é necessário identificar qual a situação mais desfavorável de funcionamento.

Uma vez determinados os pontos de geração de calor e escolhidos os tipos de materiais que seriam empregados na estrutura física da cafeteira, o próximo passo é a simulação da distribuição de calor por toda a estrutura. Esta etapa é de fundamental importância para interação entre o equipamento e o usuário, pois determina se em algum ponto da cafeteira haverá risco potencial do usuário se ferir devido a alta temperatura.

Um dos programas dedicados à esta tarefa é o RadTherm que tem como objetivo executar uma análise por elementos finitos (dividindo o objeto em pequenas partes com propriedades homogêneas, conforme a Figura 6) para a determinação do gradiente de distribuição das temperaturas na cafeteira. O programa tem como modelo de entrada, a maquete gerada através do CAD. O resultado é a uma animação tridimensional do comportamento da temperatura da cafeteira no tempo (entre sua efetiva ativação e a operação em regime permanente) e em todas as partes. Este filme tridimensional pode ser dividido em cenas principais de forma que possa ser impresso e analisado detalhadamente. Assim, é possível se identificar os pontos críticos de controle da estrutura e corrigir estes problemas a um custo bastante reduzido.

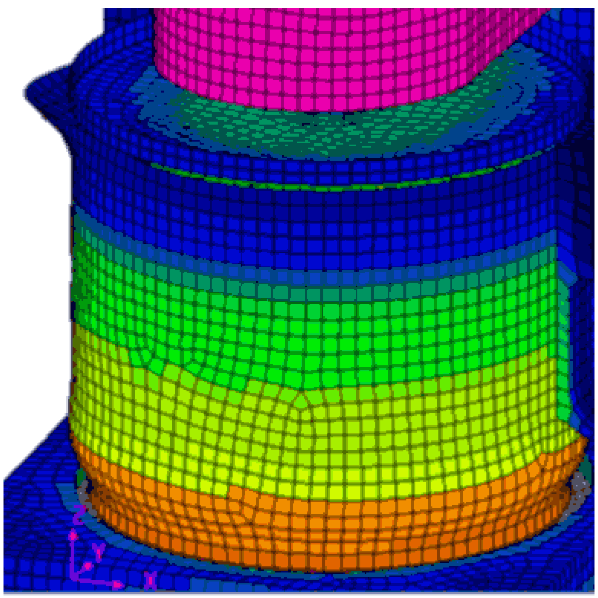

FIGURA 6
DIVISÃO DA CAFETEIRA EM ELEMENTOS FINITOS.

O resultado final da simulação para este caso é muito satisfatório pois em nenhum momento os elementos que compõem a cafeteira apresentaram temperatura superior a 165 ^{o}F ou 73.8 ^{o}C conforme escala que correlaciona as cores com as temperaturas apresentada na Fig. 7. A estrutura de plástico de engenharia da qual o corpo da cafeteira é composto apresenta uma temperatura máxima de 115 ^{o}F o que equivale a 46^{o}C. Deve observar que a temperatura ambiente é de 65^{o}F o que equivale a 18^{o}C. Para regiões tropicais onde a temperatura ambiente chega a 40^{o}C, estes números devem ser revistos. Todas as temperaturas devem ser deslocadas linearmente pois na realidade estas grandezas são variações em relação à temperatura inicial.

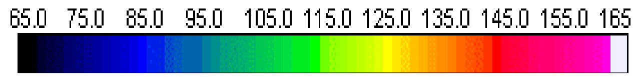

FIGURA 7
ESCALA DE TEMPERATURA EM GRAUS FAREINHEIT

CONCLUSÕES

A evolução das cafeteiras acompanhou o processo de eletrificação das diversas regiões, de forma natural, as cafeteiras à fogareiro foram substituídas por suas concorrentes elétricas. À esta evolução funcional associou-se uma evolução no design exterior do aparelho que passou a fazer parte do conjunto de eletrodomésticos essenciais para o perfeito funcionamento de uma casa segundo apregoavam as campanhas de marketing da época.

À evolução técnica seguiu-se uma mudança da técnica de elaboração do café, primeiro ferviam-se o pó e a água, em seguida os métodos de recirculação tornaram-se dominantes e finalmente a técnica de gotejamento, presente até os dias atuais, veio para tornar-se padrão.

A popularização do plástico derivado de petróleo na manufatura de artefatos domésticos foi a barreira final para que a cafeteira tomasse o formato atual. A popularização dos recursos de computação gráfica ajudou a baixar os custos e deu aos fabricantes uma versatilidade enorme para alterar formas, cores e materiais dos quais estes eletrodomésticos são fabricados. O consumidor foi sem dúvida o maior beneficiário desta revolução do design, sendo que atualmente, ele tem equipamentos melhores, mais bonitos, mais funcionais e principalmente mais seguros do que a algumas décadas. Tudo isto, em grande parte, graças aos novos recursos de design de produto disponíveis à grande maioria dos engenheiros e designers envolvidos no processo produtivo industrial.

INOVAÇÃO TECNOLÓGICA VERSUS PROCESSO PEDAGÓGICO

José Heleno Ferreira [1],Leandra Ulbricht[2] e Vania Ribas Ulbricht [3]

Abstract *— This paper tries to make a reflection about changing and innovations that the 20th Century brought to humankind, especially in the knowledge area. In face of these transformations, the Virtual World, accessed by the new technologies, has been used in different ways and served different interests. It can rebuild social relations or boost an educational revolution, helping the creation of new teaching processes.*
Index Terms — Virtual Evironments, Teaching-Learning, New Technologies

INTRODUÇÃO

O século XX foi sem dúvida o século das grandes transformações na história da humanidade. Embora toda a história seja um contínuo de transformações e inovações, há diferenciais importantes entre o século XX e os anteriores. Além de ser esse, seguramente, um tempo de transformações mais rápidas, num ritmo, às vezes, alucinante, é também o período em que as inovações técnicas, culturais e sociais atingiram, em menor espaço de tempo, grande parcela da humanidade.

O volume e a intensidade das transformações técnicas, nem sempre, porém, são devidamente proporcionais às necessárias mudanças sociais para que todos tenham acesso às primeiras. Essa situação provoca, de acordo com Feliz Guattari [1], uma dicotomia entre o avanço técnico e o avanço social, o que resultará em contradições sociais, conflitos e marginalização de um crescente número de pessoas. A respeito do momento histórico atual, o autor afirma que enquanto as transformações técnico-científicas contêm possibilidades de criação e concretização de novas e diferentes formas de pensar e agir, as condições sociais e subjetivas para a implantação das mesmas encontram-se ainda em estado de devir.

Da técnica, esperava-se, no "Século das Luzes", o advento de um mundo novo, onde os seres humanos estariam livres das dores e do sofrimento, da miséria e da fome, da violência, das tarefas braçais e do trabalho pesado, podendo então se dedicar ao ócio e aos prazeres sensíveis e intelectuais. Essa foi a tônica dominante durante os séculos XVIII e XIX, no período histórico conhecido como Iluminismo, quando pensadores de diversos países e correntes filosóficas afirmavam estarem os seres humanos diante de uma nova forma de organizar o mundo, apregoando a capacidade de a ciência resolver todos os males até então vividos pela humanidade [2].

Os protagonistas do "Século das Luzes", porém, não viveriam o bastante para presenciar os desastres ecológicos, as bombas atômicas, as guerras e tantos outros "benefícios" trazidos pelo progresso científico. Não veriam ou não teriam tempo suficiente para analisar as conseqüências do avanço industrial para os trabalhadores e não tiveram ainda o distanciamento necessário para perceber que as inovações técnicas, embora tenham trazido benefícios para uma parcela da humanidade, também aumentaram as desigualdades sociais, aumentaram a fome e a miséria e que, muito embora permitissem ao mundo contemporâneo produzir alimento além do necessário para atender as necessidades básicas da população mundial, mais de um terço do planeta vive em condições miseráveis, subalimentado e faminto.

O abalo da razão instrumental trouxe consigo uma crise epistemológica, ou crise dos paradigmas que não se restringe à esfera da produção científica, atingindo também a produção do conhecimento, as relações pedagógicas, o processo de ensino-aprendizagem, o espaço escolar. Assim, entre todas as grandes mudanças que marcam o século que há pouco findou-se, seguramente, a relação com o conhecimento é a maior delas. Num mundo repleto de objetos descartáveis, em que a ordem imperativa é consumir, experimentar, substituir, descartar... as informações e o conhecimento são também interpelados a partir de seu valor utilitário, a partir da possibilidade de uso e desuso.

A relação da humanidade com o saber: quatro estágios históricos

A relação dos homens e mulheres com o saber passa por quatro longos estágios durante a história da humanidade. Antes da escrita, nas sociedades de cultura oral, o saber era ritual, místico e encarnado por uma sociedade viva. As informações e o conhecimento eram repassados oralmente e a tradição assegurava a cultura e dava sentido à organização social de uma comunidade. O provérbio africano – "Quando um velho morre, incendeia-se uma biblioteca" – explicita essa situação em que o saber é resguardado por aqueles que viveram muitas experiências sociais, que ouviram as histórias dos seus antepassados e que, por isso, encontram-se

1 José Heleno Ferreira, M. Eng. joseheleno@divinet.com.br
2 Leandra Ulbricht, Doutoranda do Programa de Pós-Graduação em Engenharia de Produção/UFSC, Florianópolis, Brazil, leandraulbricht@floripa.com.br
3 Vania Ribas Ulbricht, UFSC, Departamento de Expressão Gráfica, Campus Universitário Trindade, Florianópolis,Santa Catarina, Brasil ulbricht@mbox1.ufsc.br

em condições de propagar o conhecimento. Esse seria o primeiro e mais longo estágio da história da relação da humanidade com o saber. Com o advento da escrita ter-se-ia então um segundo estágio. A figura emblemática do conhecimento não é mais o velho, mas o livro. Um único livro que narraria a história de um povo, as experiências de um grupo social e asseguraria o sentido para a vida e a organização social. A bíblia, o alcorão seriam exemplos desse estágio da relação da humanidade com o saber. A figura do velho, que contava a história dos grupos sociais, é substituída pela figura do intérprete, que comenta o saber expresso no livro sagrado [3].

O terceiro estágio teria início com o advento da imprensa. A possibilidade e necessidade de imprimir um número maior de livros faz surgir as enciclopédias e as bibliotecas. O intérprete do livro do saber será então substituído pelo sábio, pelo erudito.

Num mundo em que o processo de transformação se dá sempre com maior rapidez, o terceiro estágio será infinitamente mais curto que os anteriores e dará lugar ao quarto e atual estágio: a desterritorialização da biblioteca, possibilitada pelos avanços da informática, a dinâmica de rede mundial de computadores, a possível conexão simultânea entre milhões de pessoas dos mais diferentes lugares e a criação dos hipertextos e hiperdocumentos. Tem-se então a divulgação simultânea de uma infinidade de textos e informações sobre os quais ninguém tem absoluto controle, que podem ser acessados, lidos, recortados, enviados para outrem, que podem ter trechos suprimidos ou acrescentados, que podem, enfim, ser modificados e apropriados por milhões de pessoas ao mesmo tempo. A informação torna-se fluxo contínuo.

CULTURA, TÉCNICA E SOCIEDADE: A NECESSIDADE DE SUPERAR O MANIQUEÍSMO

Atualmente vive-se uma crise de sentido, como resultado da passagem de uma cultura identidária para uma cultura planetária. Se na cultura identidária clássica, o ser humano identificava-se como membro de uma comunidade que dava sentido ao ser fazer histórico-cultural, na cultura planetária essa condição encontra-se ameaçada, não sendo possível ao indivíduo identificar-se como membro de uma comunidade, uma vez que a produção de sentido não lhe é assegurada comunitariamente, mas planetariamente [3].

Todo sentido se produz dentro de uma determinada cultura e é, portanto, convencional, histórico, em contínua transformação. Em toda e qualquer sociedade são estabelecidas redes semânticas que estruturam o espírito das pessoas em comunicação e é isso que permite aos membros de uma determinada cultura se reconhecerem entre si.

O avanço tecnológico, a possibilidade de indivíduos de diferentes lugares e culturas se comunicarem simultaneamente geram uma crise na produção de sentido cultural das sociedades identitárias. Se, virtualmente, todos e tudo podem estar em contato, a base do universo se fragmenta e se recompõe continuamente. O fundo simbólico que sustenta as várias tradições culturais se parte, vislumbrando o vazio. As pessoas tornam-se, cada vez mais, estrangeiras em sua própria cultura e a crise de sentido torna-se crônica, podendo ser denominada de 'pós-cultura' [4]. Não há como escamotear as transformações que o contexto pós-cultural traz para as relações humanas, o que afetará, logicamente, o sistema educacional. Os conhecimentos tornam-se obsoletos cada vez mais rapidamente, a noção de uma carreira, escolha de uma profissão encontram-se abaladas diante de uma mercado sempre mais movediço, a noção de saber estoque é substituída pela noção de saber fluxo e o processo de transmissão do mesmo precisa ser definitivamente repensado:

O estado de pós-cultura, apesar de representar o caos (no sentido de que todas as estruturas e redes semânticas encontram-se abaladas ou em constante modificação), representa também progresso, no sentido de que encontram-se abertas novas e crescentes possibilidades de exploração sistemática de diversos espaços culturais possíveis. É com esse otimismo que o autor cunha a expressão "cultura desperta", afirmando a necessidade de se colocar com prudência diante do mundo, mas também de se estar abertos às novas possibilidades, sem preconceitos ou recusas e cegueiras diante do movimento e das mutações contemporâneas, sob o risco, para aqueles que não conseguirem navegar nesse novo mundo de informações, de ficarem cada vez mais à margem dos acontecimentos e das possibilidades infinitas de exploração cultural abertas pelo processo de transformação tecnológica que vivenciam todos os seres humanos, isolados e alheios a essa cultura da impermanência, da qual todos são convidados a participar [3].

O IMPACTO DAS NOVAS TECNOLOGIAS

É comum encontrarmos a expressão "impacto das novas tecnologias", largamente utilizado na literatura específica sobre o tema, em textos e obras que analisam o mundo contemporâneo e as novas relações entre os seres humanos, o saber e a informação. Essa sensação de impacto se justificaria pelo aceleramento das transformações técnicas, pelo volume de informações a que somos submetidos a todo instante e pelo estado de desapossamento em que nos encontramos diante dessa realidade. Na verdade, nem mesmo aqueles que se esforçam quotidianamente para estarem ligados (plugados) à realidade, conseguem acompanhar o ritmo das transformações e nem estar completamente informados acerca de tudo o que se cria e se escreve e se diz sobre o mundo como um todo.

Pierre Lévy [3] critica a expressão "impacto das novas tecnologias" fundamentando-se na impossibilidade de se separar técnica, cultura e sociedade. A cultura (a dinâmica das representações que dá sentido à vida de uma comunidade), a sociedade (os seres humanos, as relações que estabelecem entre si) e a técnica (artefatos produzidos pelos seres humanos) estariam de tal forma imbricados que, afirmar o impacto de um sobre o outro seria compreendê-los separadamente, o que o autor afirma ser impossível.

Esse ponto de vista busca negar uma relação de causa e efeito entre a tecnologia (que seria entendida como causa) e a cultura (que sofreria os efeitos das inovações tecnológicas). Ao contrário, exige um análise global, dialética: os seres humanos (a sociedade), a partir das relações que estabelecem entre si, a partir de suas necessidades e da interpretação que têm do mundo (a cultura), inventam, produzem, utilizam e interpretam de diferentes formas as técnicas. Nesse sentido, a tecnologia é entendida como condicionante e não determinante da vida social. Esta é uma questão fundamental para a análise do mundo atual: a sociedade encontra-se condicionada por suas técnicas, mas não determinada.

Desta maneira, o ciberespaço não determina o desenvolvimento da inteligência coletiva, mas cria condições para isso, assim como cria condições para o desenvolvimento do seu oposto, ao qual o autor se refere como "bobagens coletivas" [3]. A possibilidade de comunicação simultânea com pessoas de vários lugares do planeta, os serviços que podem ser prestados através desse canal de informação e comunicação e os desserviços que o mesmo pode prestar. Nesse sentido, vale lembrar, de um lado, as denúncias de pedofilia e racismo praticados e divulgados via Internet e, de outro, projetos sociais desenvolvidos com o objetivo de socializar e diminuir a exclusão social, elaborados a partir da utilização da informática e dos mais altos recursos tecnológicos, como o Projeto Capilaridade (apresentado neste texto).

A ENGENHARIA DO CONHECIMENTO RECONSTRUINDO LAÇOS SOCIAIS: O PROJETO CAPILARIDADE

Deisimer Gorczevski e Nize Pellanda [4] apresentam a experiência do Projeto Capilaridade, desenvolvido em Porto Alegre em 1999, onde o público alvo do projeto foi composto por 75 jovens do Morro da Cruz e da Vila Grande Cruzeiro (Porto Alegre) em situação de completa exclusão social e fundamentou-se no objetivo de utilizar a tecnologia como ferramenta ou alavanca para desenvolvimento do potencial criativo.

O projeto fundamentou-se teoricamente nos filósofos Félix Guattari e Pierre Lévy, e nos biólogos Francisco Varela e Humberto Naturana, além de Jean Piaget.

Os jovens, público alvo do projeto, tinham em comum uma realidade de exclusão, advinda de suas condições sociais, raciais, culturais e sexuais. Essas condições fizeram com que a grande maioria deles fosse rotulada, quotidianamente, como "marginal", "louco", "moleque de rua", "viciado", "aidético", "prostituta" entre outros. A marginalidade se concretizava também pelo não acesso aos bens culturais e necessidades básicas: moradia, educação, saúde, emprego, etc. Como resultado da exclusão, a violência nas relações cotidianas e o autodesprezo marcavam esses jovens, além de uma postura de resistência a qualquer proposta que lhes fosse apresentada como possível ajuda.

Assim, a maneira encontrada para sensibilizar e recuperar a auto-estima dos jovens envolvidos no projeto passou necessariamente pelo autoconhecimento e pelo conhecimento da realidade que os cercava, não se admitindo a separação entre conhecer e ser, ou seja: a compreensão de que os jovens eram o que conheciam e como conheciam. Nesse sentido, o espaço cibernético ofereceu a possibilidade de cada sujeito se inventar e inventar a realidade que quisesse, sempre em contato com outros sujeitos sociais. O uso do computador possibilitou a esses jovens pensar sobre o pensar.

Estabelecendo uma rede com o Movimento de Crianças e Adolescentes e a ONG Novo Mundo do Trabalho, o projeto foi se desenvolvendo, sempre buscando possibilitar aos jovens que se expressassem e que mostrassem a forma como enxergavam a realidade social que viviam. Além da produção de textos que eram escritos e enviados a diversas ONG's, órgãos públicos e imprensa, utilizou-se largamente o computador para expressar sentimentos, para contatar namorados(as) e outras questões ligadas aos interesses e anseios próprios da faixa etária dos envolvidos no projeto. A utilização da fotografia, que depois era escaneada e trabalhada pelos jovens foi outro instrumento detonador do processo de restabelecimento de laços sociais. Se no início, os jovens se recusavam a fotografar o local em que viviam, alegando não haver nada ali que merecesse o feito, algum tempo depois, aceitavam, ainda relutantes, a proposta, mas fotografavam apenas as mazelas dos seus locais de moradia. Ao final, já fotografam, por exemplo, o pôr do Sol visto do morro, o rio Guaíba, que corta a cidade de Porto Alegre e cuja sinuosidade pode ser avistada do alto do Morro da Cruz.

Todo o projeto se baseou na certeza de que é impossível transmitir conhecimento e que o saber não surge do campo da transmissão, mas do da invenção, certeza essa que questiona radicalmente o processo de ensino-aprendizagem que tradicionalmente se efetua nas escolas. Assim, avaliando o projeto, suas autoras afirmam que a utilização do computador foi determinante no sentido de instigar a inteligência, de possibilitar que o sujeito agisse sobre sua própria realidade e, ao mesmo tempo em que acompanhava o produto de seu fazer e apropriava-se do seu trabalho, podendo tornar-se sujeito de sua própria aprendizagem.

MAS SERIA PAPEL DA EDUCAÇÃO FORMAR PROFISSIONAIS?

Ao descrever a história da educação escolar a partir do princípio do trabalho, (SAVIANI, *apud* [5]) não afirma ser esse o papel da educação. Ao mesmo tempo, ao analisar os desafios que as novas tecnologias impõem à educação e o perfil do trabalhador que interessa às empresas no mundo contemporâneo, não se discute o papel da educação e, sim, as exigências que fazem à mesma um grupo social: os grandes empresários. É preciso pensar a educação de forma mais ampla, buscando pensar o ser humano como um todo e o processo social no qual ele se insere, bem como a construção de uma sociedade em que homens e mulheres possam realizar todo o seu potencial criativo.

Atualmente há um consenso de que as finalidades básicas da educação (não da escola) são formar o indivíduo, formar o cidadão e formar o profissional. Afirma ainda que historicamente, pelo menos até o advento da Revolução Industrial, a escola tem se dedicado à formação do indivíduo, capacitando-o a compreender a si mesmo e ao mundo que o cerca, a definir objetivos e metas e os meios de alcançá-los, a produzir e/ou apreciar objetos de artes, a usufruir do lazer. Percebe-se uma perfeita sintonia entre a afirmação de Chaves e a análise histórica da educação escolar como espaço para as classes ociosas, de Dermeval Saviani [6].

Após a Revolução Industrial e, no Brasil, após a lei 5692/71, a escola assume também a tarefa de preparação do profissional. Essa tarefa é entendida, por vezes, dentro de uma lógica estreita, compreendendo formação do profissional como preparação para o exercício de uma profissão específica. Essa forma de compreender a função da escola se evidencia, no caso brasileiro, nos cursos médios com habilitações técnicas e nos cursos universitários profissionalizantes desde o seu ingresso. Uma outra lógica, mais ampla, entende a formação profissional como formação para o mundo do trabalho, buscando uma superação da visão negativa das atividades manuais e do esforço físico, presente, por exemplo, na bíblia e em toda a tradição judaico-cristã.

Quanto ao terceiro item, a formação do cidadão, CHAVES afirma ter a escola falhado sistematicamente, mais por omissão que por comissão. Para assumir essa função, a escola teria que se deparar com valores morais, políticos e econômicos, e a fuga desse debate tem sido a tônica da formação oferecida pelas escolas ao longo da história da educação. As conseqüências dessa falha se fazem notar na presença de profissionais tecnicamente bem formados, porém sem habilidades para pensar a sociedade globalmente e contribuir para um melhor convívio social entre os seres humanos [6]. O autor mostra ainda a necessidade de a escola assumir a formação para a cidadania e acredita estar presente essa preocupação nos temas transversais definidos pelo Ministério da Educação do Brasil, uma vez que todos eles têm cunho ético-moral-valorativo: globalização, pluralidade cultural e diversidade; saúde e meio ambiente, drogas; sexualidade e as questões ligadas à gravidez na adolescência, homossexualidade, prostituição, pornografia, exploração do sexo nos meios de comunicação de massa e outros; trabalho, desemprego, consumo, lazer; violência urbana e entre grupos étnicos; desigualdades socioeconômicas e miséria.

Diante dos graves problemas que a sociedade brasileira enfrenta, tais como a miséria e a violência urbana, a crise da família, desestruturada em função de pressões econômicas (necessidade de pais e filhos trabalharem para o sustento da família) e novos valores sociais (aceitação de filhos antes e fora do casamento, ênfase na liberdade e autonomia do indivíduo etc), ausência de uma postura ética de vários governantes e uma sucessão de escândalos políticos e financeiros que abalam o país nos últimos anos, a desprivatização da vida, através da televisão que mostra as tragédias sociais e familiares de personagens anônimos em programas cada vez mais popularescos e expõe a vida dos famosos (atores e atrizes, por exemplo) como se fossem íntimos de todos os telespectadores, o fato de a religião estar se tornando, a cada dia mais, um espetáculo e tantos outros, CHAVES [6] preconiza a educação humanística e a formação para o convívio social como principal contribuição que a escola pode dar aos alunos para que estejam aptos para o enfrentamento das mazelas sociais que nos afligem. Logicamente, isso não significa que a escola deva abrir mão da formação científica, mas, sim, não se eximir de responsabilidade diante do debate ético, político e econômico que envolve a vida social.

Para isso, afirma ainda o autor, ser necessário não apenas a instrução acadêmica, mas, sim, a formação prática. Praticar a cidadania e a democracia na escola seria então fundamental para esse processo de formação do cidadão. Aqueles alunos que participam da vida escolar, que têm possibilidade e responsabilidade de decidir os rumos da vida escolar, que são chamados ao debate diante dos problemas que surgem no dia a dia, estariam se preparando para serem futuros cidadãos. Uma escola em que as questões raciais e de gênero são tratadas de forma aberta e sem preconceitos, em que a diversidade cultural e sexual sejam respeitadas na prática, estará preparando futuros cidadãos capazes de respeitar a diversidade presente no mundo contemporâneo.

E que contribuição a tecnologia teria nesse contexto? Cabe-nos questionar a forma como os computadores estão sendo absorvidos pelas escolas públicas e privadas. A ausência de uma reflexão aprofundada e de pesquisas sistemáticas acerca das condições em que a utilização da informática no processo de ensino-aprendizagem se tornariam mais ou menos eficazes traz o perigo da mistificação das reais possibilidades da informática no processo de aprendizagem, bem como questionamentos infundados.

Apesar de todos os questionamentos possíveis e necessários, não se pode negar o fato de que a humanidade vive hoje a era da informática ou do conhecimento, o que traz uma responsabilidade ainda maior à instituição escolar. Negar aos educandos, principalmente àqueles oriundos das classes populares, o manuseio e uma relação reflexivo-crítica com as novas tecnologias poderá, no futuro, significar uma ainda maior exclusão social.

Vários autores, entre eles PAPERT [7] e SCHAFF [8], afirmam que a escola "parou no tempo" e que as grandes transformações sociais não a atingiram em sua estrutura. PAPERT [7], para afirmar o caráter anacrônico das escolas em geral diante das inovações tecnológicas, conta uma história em que um grupo de viajantes do tempo, vindos do século XIX, chegou ao final do século XX para analisar as transformações ocorridas em suas profissões. Entre esses viajantes, estariam cirurgiões e professores. Enquanto os primeiros se espantam diante de tantas inovações, chegando a não reconhecer o trabalho dos cirurgiões contemporâneos como a profissão exercida por eles em meados do século XIX, os professores, mesmo admirados com a modernização do espaço, com uma ou outra inovação tecnológica, reconhecem o processo de ensino-aprendizagem, que se desenvolve, em sua essência, da mesma forma que há 150 anos.

Essa história, que possui muitas variantes, ilustra perfeitamente as condições estruturais de nossas escolas. Para fugir a esse estereótipo, não bastaria modernizá-las, nem dotá-las dos mais avançados instrumentos tecnológicos. Seria preciso, antes de tudo, uma profunda transformação nos processos psicológicos e pedagógicos postulados pela escola tradicional. De nada adiantará a escola possuir recursos tecnológicos avançados se os mesmos forem utilizados, pedagogicamente, como antes, assim como o professor que distribui a seus alunos um texto mimeografado e aquele que prepara seu texto didático num computador estão, em termos didáticos, exercendo o mesmo trabalho. O computador pode também ser usado de forma a que o aluno seja um mero receptor de informações, tal qual o é na tradicional aula em que se copia as informações do quadro negro.

CONCLUSÃO

É necessário investir na formação dos professores e em pesquisas e estudos acerca das possibilidades de utilização das inovações tecnológicas num trabalho pedagógico e na elaboração de softwares educativos. Só assim será possível enfrentar a anacronia estrutural da escola brasileira e, ao mesmo tempo, enfrentar academicamente posturas infundadas acerca das novas tecnologias no processo de ensino-aprendizagem, tais como as que afirmam ser o computador uma máquina fria, tirânica, que conduz o aluno à passividade, ou aquelas que vêem no computador uma solução milagrosa, uma máquina perfeita e inquestionável.

Não sendo possível ignorar o fato de que se vive atualmente a Revolução da Informação e que a informática, o computador, principalmente, está sendo um elemento importante nesse processo, é preciso que os educadores em geral se instrumentalizem para a discussão em torno de sua utilização em sala de aula. Se é verdade, que a informática aplicada à educação tende a ser um mecanismo para a rearticulação do poder e do controle da burguesia sobre as massas, é também verdade que ela pode ser utilizada e apropriada pelas classes populares no sentido de dilapidar a hegemonia da classe dominante. Afinal, a escola, como nenhum outro espaço social, não é um feudo em que esteja presente os interesses de apenas de um grupo social. Em todos os espaços sociais estão se enfrentando diuturnamente, interesses sociais, políticos, econômicos e culturais contraditórios, não sendo possível, nem moralmente aceitável, não se posicionar diante dos mesmos!

O APRENDIZADO INFORMATIZADO

Vania Ribas Ulbricht[1] e Sergio Murilo Ulbricht[2]

Abstract — *It's hard to realize that when the student is performing a task, he is doing a mental work. This paper makes considerations about computer aided learning, setting up its main characteristics, steps and environmental conditions.*

Index Terms — mental work, teaching-learning, computerization.

INTRODUÇÃO

A partir das crescentes transferências de tecnologia, os sistemas produtivos modificaram-se substancialmente, assim como os postos de trabalho. A educação continuada passou a ser uma necessidade premente. Por outro lado, no decorrer do dia-a-dia, o indivíduo também necessita mudar a forma de realizar seu trabalho, tendo em vista que as diiversas tarefas a serem executadas exigem modos operativos, às vezes, bastante diferentes.

Muito se fala dos novos papéis de indivíduos e organizadores em decorrência dos chamados "tempos modernos". O "fio condutor" para atendimento a essa modernidade que se traduz pela incorporação de novas tecnologias, no cotidiano das pessoas e em diferentes cenários, deve impulsionar ações que permitam aos indivíduos participar com propriedade e conhecimento desta modernização.

É necessário que a escola e principalmente as universidades priorizem a formação de competências específicas relativas às necessidades que se vislimbra no mercado de trabalho.

Todo trabalho realizado pelo homem possui componentes físicos e mentais. Richard [1] considera que a tarefa é resultado da construção das interpretações, que leva necessariamente a diferentes atividades de compreensão, pois o ser humano compreende para aprender (modifica a rede de conhecimentos existentes) e ainda compreende para agir (elabora um plano de ação para obter um resultado).

Em sistemas informatizados é necessário que sejam considerados as habilidades e capacidades perceptivas e cognitivas humanas assim como os aspectos ligados a tarefa a ser desenvolvida.

CONDIÇÕES DE EXECUÇÃO E ANÁLISE DO TRABALHO MENTAL

As condições de execução do trabalho mental realizado por um aluno no ato da aprendizagem, diz respeito essencialmente ao próprio educando: repousado ou fatigado, iniciante ou experiente, motivado ou desinteressado, atento ou distraído, etc. Porém, outras condições são identificáveis como: as condições em que as informações são percebidas como: freqüência, intensidade, lisibilidade, etc.; o desenvolvimento cronológico do trabalho, isto é, se o rítmo é livre ou imposto; prazo de respostas; atenção obrigatória ou não entre as diversas operações; a coerência do exercício solicitado - trabalho global ou parcial; possibilidade de controlar ou não o resultado.

Com relação à análise do trabalho, realizado pelo estudante, esta deve seguir a dois métodos clássicos que são: a observação do aluno ao realizar a tarefa e a análise dos protocolos verbais.

Como o trabalho mental não possui gestos próprios para observação, deve-se observar o movimento das mãos e dos olhos que procuram e fixam a informação na tela do computador.

Na análise dos protocolos solicitar-se-á para que o aluno verbalize todas as operações que desenvolve explicitando o porque de determinada ação, dando importância a cada troca de estratégia e separando cada operação feita identificando suas exigências. Enfim deve-se procurar estabelecer uma síntese de comunicação entre o aluno e seu posto de trabalho, que é o computador.

É importante ainda levar em consideração a carga mental a qual o aluno é submetido. O trabalho mental não é visto a não ser os resultados que dele advém, porém, estes não refletem exatamente o esforço feito, que é somente percebido pelo aluno ao desenvolver a atividade.

O trabalho mental pode ser analisado como um fluxo contínuo das operações que contribuem para sua realização. Considerando o trabalho desenvolvido pelo aluno ao realizar uma aprendizagem, pode-se tentar organizá-lo e ordená-la como a que segue:

- percepção da informação - principalmente através da visão e audição;
- integrar a nova informação com outras já conhecidas;

[1] Vania Ribas Ulbricht, UFSC, Departamento de Expressão Gráfica, Campus Universitário Trindade, Florianópolis, Santa Catarina, Brasil ulbricht@mbox1.ufsc.br
[2] Sergio Murilo Ulbricht, UFSC, Departamento de Expressão Gráfica, Campus Universitário Trindade, Florianópolis, Santa Catarina, Brasil sermul@cce.ufsc.br

- tratamento da informação - confrontar, comparar e se necessário procurar informações complementares;
- construir ou complementar as representações mentais;
- decidir e agir - escolher uma estratégia para por em prática ou ainda, mais raramente, escolher uma dentre as múltiplas soluções;
- verificar o resultado - se positivo, integrá-lo as demais soluções, caso contrário testar uma segunda solução [2].

É importante salientar que estas operações são, na maioria das vezes, realizadas simultaneamente uma vez que o trabalho mental possui continuadamente fechamentos e interações. Da mesma forma um estudante, colocado para resolver um problema já resolvido anteriormente, dificilmente vai realizá-lo como o fez da primeira vez, pois as operações realizadas contribuirão para resolver melhor e mais eficientemente a operação seguinte. Maiores diferenças serão percebidas entre uma mesma operação realizada por diversos alunos.

Segundo Guittet [3], o indivíduo quando é colocado frente a uma mensagem, primeiramente percebe sua forma, o todo, antes de observar detalhes. Desta maneira, a informação necessita de uma apresentação global (esqueleto, a intenção principal, pontos chaves) antes de se deter em uma análise detalhada do assunto. Como a memória retém, sobretudo, as formas globais, os detalhes devem estar impregnados de significação e utilizados dentro de um contexto.

O trabalho mental não pode ser estritamente modelizado ou estabelecido. Impor ou mesmo definir métodos para o trabalho mental, como foi feito, e ainda hoje o é pelo ensino tradicional, tem pouco sentido; seria o mesmo que reduzi-lo a um trabalho manual, onde dificilmente se adquire qualquer estrutura nova, numa época em que a tecnologia propicia amplos canais de se obter a informação para o aprendizado.

A FADIGA MENTAL

A fadiga mental não cessa pela interrupção da atividade, como acontece no esforço físico, pois ela continua até o próximo sono.

As principais fontes de sobrecarga mental estão ligadas:

- ao próprio trabalho desenvolvido (deve-se fornecer ao aluno tarefas de acordo com suas capacidades, elas não devem ser muito inferiores a sua capacidade, pois provocaria fadiga por monotonia e desinteresse, nem muito superiores pois ocorreria processo idêntico);
- as limitações provocadas pelo tempo dado para realizar a tarefa (pois pode exceder ao rítmo de trabalho do aluno, em cada tarefa deve ser respeitada as suas diferenças individuais);
- as necessidades frequentes de troca de atividade (responder a perguntas, abrir porta, pegar bloco de papel, etc.);
- as condições do ambiente (climatização, ruído, espaço disponível, iluminação, decoração);
- a quantidade de informações a memorizar para a realização da tarefa (quantidade de teclas a serem digitadas, sinais a serem fornecidos, etc.).

ASPECTOS RELACIONADOS AO *SOFTWARE*

O programa informático vai realizar a comunicação do estudante com o computador. Logo é importante escolher corretamente o *software* a ser utilizado para a aprendizagem.

O *software* que será utilizado para a aprendizagem deve respeitar algumas regras como:

- sua concepção deve ser feita a partir das capacidades, competências, lógica e vocabulário conhecidos pelos estudantes;
- deve ser fácil de ser assimilado pelos estudantes iniciantes em informática, porém deve ter facilidades de utilização para os alunos que estão habituados a usar computador. Desta forma o programa utilizado estará apto para contribuir na progressão dos alunos e acompanhar seu desenvolvimento.

No aspecto de interação com o estudante, os projetos de ensino assistido devem incluir uma variedade de critérios como os propostos por COAD [4]:

- usar termos, passos e ações consistentes;
- minimizar o número de digitações ou cliques de *mouse* necessários para a obtenção da execução de uma tarefa;
- minimizar o tempo necessário para obter resultados significativos nos diferentes níveis de conhecimento;
- as respostas devem ser rápidas e prontas (uma pessoa não deve ser deixada sem resposta sobre o progresso que está esta fazendo e esperar até que um sistema complete uma de suas ações);
- utilização de passos curtos, levando a uma ação bem definida;
- revisão e aperfeiçoamento da interação (as pessoas cometem erros que outras devem corrigir e o mesmo acontece com as ações executadas na interação homem-máquina. Se a taxa de correções é alta, então a interação deve ser revista e aperfeiçoada);
- os usuários não tem a obrigação de lembrar ou escrever informações de uma janela, para então aplicá-las em outra janela. Programa-se o computador, não a pessoa**.** Da mesma forma, tudo que o usuário necessita lembrar da disposição das sequências e teclas especiais deve ser organizado para facilitar sua resposta;
- manter reduzido o tempo e esforço para aprender. Não se deve esperar que o usuário leia a documentação impressa, deixando-o estudar sozinho suas sutilezas e nuances.

Deve ser fornecida referência *on-line* para os recursos mais avançados;

- lembrar sempre que as pessoas só usam o *software* que lhes é agradável. Em caso contrário só o tolerarão enquanto forem obrigadas [5].

CONSIDERAÇÕES FINAIS

No desenvolvimento da aprendizagem, como em qualquer outra tarefa, não é suficiente que o professor forneça cada vez mais informação ao estudante, para desenvolver no aluno a competência requerida. A aquisição do saber e do saber-fazer pode facilitar as relações entre professor e aluno mas não modificará a motivação e os valores do estudante. É necessário que seja criado um ambiente propício ao desenvolvimento da motivação do aluno. Este ambiente deve dar um sentido a aprendizagem, fazer o aluno dialogar, participar efetivamente, desenvolvendo desta forma a confiança em si mesmo.

É ainda necessário, ter em mente, que todo indivíduo diante de novos conhecimentos, possui uma memória de imagens e experiências que vão guiar sua ação e permitir a compreensão do que lhe é apresentado como novo, pois todo conhecimento para ser assimilado deve se reequilibrar com os conhecimentos existentes.

Em uma sala de aula recebemos estudantes com personalidades diferentes, que no momento destinado à aprendizagem ainda podem estar repousados ou não, motivados ou desinteressados, fatores que irão influenciar diretamente em seu processo de adquirir um novo conhecimento. Em se tratando de aprendizagem com o auxílio do computador ainda teremos como variante os que são iniciantes no uso da máquina e aqueles experientes, dos quais se destacam os especialistas em informática.

Neste sentido os programas computacionais que serão utilizados para aprendizagem devem buscar mais eficiência do ponto de vista da didática, da motivação, e principalmente dos objetivos que devem ser alcançados, que é a aprendizagem do aluno.

Para nos auxiliar nesta tarefa contamos com o auxílio das diversas ergonomias que nos auxiliam desde a hora da concepção do *softwares* até a fase de testagem e que resultam produtos mais atrativos e amigáveis para o usuário.

No ensino auxiliado pela informática existem pelos menos dois objetivos: um é a aprendizagem de um determinado conteúdo de forma muito mais autônoma que na aprendizagem tradicional e o um segundo objetivo é o uso da ferramenta computacional e ambos são deveras importante, para que aconteça a aprendizagem.

Neste sentido cabe aos professores um outro papel que é o de examinar os programas computacionais que farão uso para verificar se eles auxiliarão realmente seus alunos em suas atividades de aprendizagem.

Este trabalho teve o objetivo de chamar a atenção dos professores para alguns aspectos que nos passam despercebidos em nossas atividades diárias e lembrar-lhes que a informática alterou também seu campo de trabalho, dando-lhes mais uma incumbência que é fazer uma análise prévia dos *softwres* que irão utilizar em suas aulas.

O ENSINO DA MATEMÁTICA NAS FASES INICIAIS DOS CURSOS DE ENGENHARIA

Diva Marília Flemming[1], *Claudio Coelho* [2] *e Elisa Flemming Luz* [3]

Resumo — *As novas tecnologias da informação e comunicação têm gerado mudanças nos processos vivenciados pela sociedade do novo século. No contexto educacional, as Instituições de Ensino Superior assumem o compromisso de formar profissionais criativos, pró-ativos, com sólidos conhecimentos em sua área de atuação e com visão interdisciplinar. Este é um grande desafio, principalmente quando se constata o perfil dos alunos ingressantes nas universidades do Brasil. Por um lado, interessados na tecnologia e no uso de computadores, por outro, com sérias lacunas em conceitos básicos. Na UNISUL o NEEM trabalha no levantamento do perfil do aluno ingressante no contexto da matemática. Várias ações foram implantadas no sentido de superar os problemas detectados, como por exemplo, plantão pedagógico, monitorias, cursos extraclasse, cursos a distância. Neste artigo as estratégias adotadas são discutidas e os respectivos referenciais teóricos são apresentados. Os dados apresentados apontam caminhos que minimizam as lacunas e norteiam reflexões no contexto didático-pedagógico.*

Palavras-chaves — *Educação matemática, dificuldades de aprendizagem, ações didáticas, recursos tecnológicos.*

INTRODUÇÃO

Em decorrência da inserção das novas tecnologias da informação e comunicação em setores da sociedade, passa-se por um momento de questionamentos sobre a formação do profissional do futuro. Em todos os níveis de ensino as reflexões já se fazem presentes, no entanto, ainda não está claro qual o melhor caminho a ser seguido.

Especificamente em cursos de engenharia, que propõem historicamente um ensino caracterizado por um grande enfoque às questões técnicas, as reflexões propostas acerca do problema levantado refletiram mudanças em estruturas curriculares bem como levantaram a necessidade da criação de uma política consistente de educação tecnológica (ver [1]).

Essa política constitui-se na formação de profissionais capazes de acompanhar e gerar mudanças tecnológicas. Entre pontos que precisam ser levados em consideração para a formação desse profissional, destaca-se a necessidade de uma maior interação entre os sistemas de ensino superior, médio e fundamental buscando preencher lacunas existentes com relação aos conhecimentos básicos necessários a um aluno ingressante de um curso de engenharia.

Na UNISUL – Universidade do Sul de Santa Catarina os pesquisadores do NEEM – Núcleo de Estudos em Educação Matemática realizam sondagens que, aplicadas no primeiro dia de aula, constatam a diversidade da formação do aluno no ensino médio (ver [2]). Aproximadamente metade dos alunos ingressantes concluiu o ensino médio há pouco mais de dois anos, possui computador, acesso à Internet e conhecimento regular de computação. A maioria possui pouca disponibilidade de horas para estudo extraclasse e classificam seus conhecimentos básicos de matemática como regulares.

Percebe-se que a tecnologia é uma realidade presente na vida dos alunos ingressantes. Esta constatação vai de encontro às competências, sugeridas por [3], a serem desenvolvidas no ensino médio para a garantia da qualidade do ingressante no ensino superior: competência na tecnologia da informação, competência na comunicação internacional e intercultural, competência na capacidade de aprendizado.

Surge a triste realidade: o aluno tem sérias dificuldades em matemática básica. Referência [4] destaca que muitos problemas relacionados com o ensino da matemática no ensino superior podem estar ligados às crenças transmitidas ao aluno desde o ensino fundamental.

Diante das constatações, o NEEM implantou ações extraclasse, detalhadas na próxima seção, que visam superar os problemas detectados. Destaca-se que o sucesso da implantação de ações extraclasse só existe se houver uma conexão com ações em sala de aula.

O PROJETO DO NEEM

O NEEM foi criado em dezembro de 1996 com os objetivos: formar grupos de pesquisas técnicas, aperfeiçoamento e/ou científicas dentro do contexto da Matemática e da educação Matemática; viabilizar a iniciação científica; promover seminários sobre conteúdos específicos da Matemática, ensino da Matemática e da educação Matemática; promover cursos de extensão em nível de ensino fundamental, médio e superior; criar fóruns de discussão e reflexão sobre o ensino da Matemática em todos os níveis; facilitar e promover a interdisciplinaridade no contexto da UNISUL.

Desde sua criação, a equipe de professores atuantes no NEEM constata as lacunas de conteúdos no processo de ensino-aprendizagem da matemática dos alunos ingressantes. Assim, surge o projeto "Ensino extraclasse: uma proposta emergencial para as disciplinas de matemática" com várias propostas de ações que, em conjunto, formariam um amplo programa de apoio a alunos que necessitassem de um reforço pedagógico ou de uma recuperação paralela.

Para constatar a problemática levantada, que diz respeito à falta de conhecimentos básicos dos alunos ingressantes em um curso superior, o NEEM, em 1998, iniciou a aplicação de sondagens no primeiro dia de aula com os alunos de primeira fase em cursos que possuem disciplinas de matemática em seu currículo. Desta forma, são levantados dados, como: ano de conclusão do ensino médio; nível de conhecimento que o aluno acredita possuir a respeito de alguns tópicos de matemática; o interesse em realizar um curso extraclasse, que envolva conteúdos de matemática básica, com o objetivo de reforçar e rever esses conhecimentos; o nível de conhecimento básico de computação e se utiliza a Internet e disponibilidade de horas de estudo extraclasse.

Juntamente com o questionário, os alunos respondem a um teste de conhecimentos básicos em matemática. O teste (sondagem) é composto de seis questões, divididas em: duas questões que tratam de operações básicas com números reais, duas questões que tratam de funções do segundo grau e duas questões que tratam de funções do primeiro grau.

Os resultados obtidos contém informações valiosas para o desenvolvimento do projeto. É possível acompanhar e dimensionar as ações semestralmente através dos relatórios gerados.

Para alicerçar as ações definiu-se como referencial teórico a concepção construtivista da aprendizagem e métodos de ensino validados empiricamente, pois estes são determinantes para estabelecer referencias e critérios para a análise da prática e da intervenção pedagógica (ver [5]).

Na visão construtivista pressupõe-se que a estrutura cognitiva dos indivíduos está configurada por uma rede de esquemas de conhecimentos. No decorrer da vida, estes esquemas são revisados, modificados, tornam-se mais complexos e mais ricos em relações.

O aluno, no processo de ensino-aprendizagem revisa seus esquemas mentais, considerando os novos conteúdos abordados e a partir daí ocorre a construção do conhecimento.

Nessas situações é importante um papel ativo por parte do aluno e também do professor como mediador do processo. É o professor que encaminha as ações e atividades educativas.

A complexidade dos processos educativos impede uma previsão do que vai acontecer em sala de aula. Assim, as atividades extraclasse apresentam-se como estratégias que podem atender dificuldades não resolvidas ou não detectadas em sala de aula.

Uma das ações implantadas de imediato chama-se *plantão pedagógico*, consistindo em atendimento individual e extraclasse, prestado por um conjunto de professores a alunos que necessitam de apoio em seus estudos. Vale destacar que não se trata apenas de um atendimento individualizado, mas sim uma atividade que é norteada por pressupostos pedagógicos refletindo as necessidades dos alunos e promovendo interações do tipo professor-aluno e professor-professor. Isso tem se mostrado altamente positivo para o contexto ensino-aprendizagem, pois a elaboração do conhecimento exige do aluno um envolvimento pessoal, tempo e esforço, assim como ajuda especializada, estímulo e novas motivações.

Outra ação, já implantada, é a *monitoria*, na qual alunos de fases mais adiantadas auxiliam os alunos que cursam as disciplinas de matemática. A atuação dos monitores não se restringe apenas ao atendimento de alunos, mas busca uma integração destes com a filosofia pedagógica seguida pelo NEEM, com a participação em atividades de estudos e pesquisas voltadas ao ensino-aprendizagem da matemática.

Essas duas ações são desenvolvidas numa sala ambiente, dispondo de material pedagógico desenvolvido em outros projetos e também de equipamentos computacionais. Esses recursos são usados com base em projetos de informatização de disciplinas, também desenvolvidos por pesquisadores do NEEM.

Para atender os alunos que têm a visão de que não estão preparados para as disciplinas de matemática, ou ainda necessitam melhorar o seu nível de maturidade, os *cursos extraclasse* de matemática básica são oferecidos. Esses cursos não têm o objetivo de revisar conteúdos ministrados em disciplinas da graduação, mas tratar de conteúdos defasados desde o ensino fundamental até o ensino médio.

Uma outra ação, que já está parcialmente implantada na forma de projeto piloto, é o oferecimento de *cursos a distância*. Por acreditar que a educação a distância pode atender uma boa parte dos alunos que possuem problemas de horários, os cursos a distância surgem como uma alternativa ao aluno que estuda em horários diversos, dependendo de sua disponibilidade. Estes cursos são oferecidos via *Internet* e o aluno tem o acompanhamento da equipe do projeto.

Observa-se que as universidades particulares têm um grande desafio, principalmente quando estão fisicamente próximas das universidades federais. Os altos custos da educação superior provocam inadimplências e evasão. Assim, é necessário desenvolver projetos criativos que produzam diferenciais. O atual projeto do NEEM já é reconhecido pelos alunos como uma atividade diferencial no contexto das disciplinas de Matemática.

As concepções e idéias adotadas pela equipe, permitem trabalhar de forma interdisciplinar, em que a matemática é vista não simplesmente como uma ferramenta, mas como um objeto de estudo.

Após alguns semestres de execução do projeto, pode-se enumerar vários resultados interessantes obtidos a partir de dados qualitativos e de concepções por parte dos alunos e dos professores envolvidos no processo.

Já se observa uma metodologia diferenciada de estudo - um processo mais humanizado. Isso porque os alunos sentem-se integrados numa equipe em que alunos e professores caminham juntos na concretização de objetivos bem delineados.

Alguns conteúdos de matemática podem ser apresentados de diversas formas aos alunos. Quando um aluno procura o professor de plantão, ou até mesmo o monitor para lhe auxiliar em algum conteúdo, muitas vezes ele se depara com outra maneira de resolver problemas, diferente da que lhe foi apresentada em sala de aula. Esse processo tem-se mostrado bastante rico sob dois aspectos. O aluno tem a oportunidade de entrar em contato com maneiras diferentes de resolver problemas e de escolher a que lhe for mais conveniente. Os professores, por sua vez, têm trocado idéias sobre as diferentes abordagens que podem ser discutidas em sala de aula, repensando a sua prática pedagógica, com o objetivo de atingir os anseios dos alunos.

É importante ter claro que as ações extraclasse devem estar conectadas com as ações em sala de aula para que se possam ter resultados positivos. Essa relação é uma busca incessante, pois envolve professores de diferentes disciplinas e sem compromissos diretos com os projetos do NEEM.

Para se atingir essa relação destacam-se três caminhos: resolução de problemas; a interação entre as diferentes linguagens usadas pelos professores e os recursos computacionais.

No contexto das engenharias é fundamental trabalhar com a metodologia de resolução de problemas. Vários experimentos dos pesquisadores (ver exemplos em [6] e [7]) mostram que a partir de problemas específicos de engenharia é possível trabalhar os conceitos de matemática definidos nas ementas curriculares. Não é uma tarefa simples, pois exige do professor pesquisas e ações de interação com profissionais de outras áreas do conhecimento. Quando os alunos são envolvidos na busca de problemas, novos desafios são destacados, pois é possível surgirem problemas cuja resolução exige interpretações físicas e técnicas que não são de domínio do professor de matemática. Entretanto, essa situação, de certa forma desafiadora, é produtiva pois, entende-se que o processo é de ensino-aprendizagem, e portanto, professor e aluno devem conjuntamente buscar a solução.

Sabe-se que cada área do conhecimento tem suas linguagens próprias e que na maioria das vezes são parcialmente diferentes das linguagens utilizadas pelo professor das disciplinas básicas de matemática. Por exemplo, o professor de matemática usa o termo "argumento de um número complexo" enquanto que o professor de análise de circuitos usa o termo "fasor". A unidade imaginária do campo dos complexos é representada pela letra "i" praticamente em todos os livros de Matemática, ao passo que nos livros de Engenharia Elétrica vamos encontrar a letra "j".

Essas diferenças de notações ou linguagens causam grandes conflitos para os alunos que podem deixar de existir a partir do momento que haja uma aproximação entre as disciplinas de Matemática e as demais disciplinas do curso. Considera-se esse um grande desafio, pois é necessário colocar efetivamente em prática um processo interdisciplinar.

A prática interdisciplinar, largamente falada e pouco praticada, exige uma forte interação entre professores de diferentes disciplinas e alunos, pois não basta utilizar a mesma linguagem, é necessário "trocar métodos".

O uso dos recursos computacionais tem se tornado um elo de interação entre as disciplinas de matemática e as demais disciplinas do curso. Por exemplo, o aluno ao necessitar desenvolver um método, analisado na matemática, inserido no contexto de uma disciplina específica da Engenharia pode usar os recursos computacionais para buscar encaminhamentos de resolução. É evidente que isto funciona desde que as disciplinas de Matemática tenham trabalhado de forma adequada os recursos computacionais. É necessário visualizar o computador como uma ferramenta de trabalho e como um objeto de estudo. Por exemplo, ao usar um software para resolver uma integral, não basta saber o resultado, é necessário construir computacionalmente o resultado.

CONCLUSÕES

É possível visualizar, no decorrer da experiência, em constante processo de construção, que as ações desenvolvidas dentro do projeto, podem ser discutidas sob dois pontos de vistas. Primeiramente têm-se resultados explícitos, quando o aluno procura a equipe de professores e monitores do NEEM, para discutir suas dúvidas e suas atividades de sala de aula. Essas atividades já estão consolidadas e incorporadas às atividades extraclasse do aluno, conforme comprova os dados avaliativos coletados (índices de atendimento, satisfação e outros).

Por outro lado, têm-se resultados não explícitos, visualizados e constatados através de diferentes ações. Por exemplo, a variedade de metodologias que circula no ambiente do NEEM, geram reflexões sobre métodos de ensino em sala de aula. Essas reflexões não resolvem tudo mas produzem um repensar constante da prática e, as estratégias geradas, os novos procedimentos e os novos modos de fazer, além de uma sólida cultura para atingir a qualidade, ajudam na superação das dificuldades de aprendizagens que surgem.

On the use of a constructivist framework to support Collaborative Learning in Teacher Life-Long training in Technical Areas[1]

Alex Sandro Gomes[2] , Apuena Vieira Gomes[2], Patricia Tedesco[2], Genésio Gomes Neto[3] and David Nadler Prata[2]

Abstract *— Brazilian math assessments are an important social problem nationwide. The teachers´ skills are one of the most important variables to consider in this situation and the use of educational technology contributes significantly to improve the students´ achievement. Moreover, if we can provide distant courses, we can reach a broader range of teachers. AMADeUs, our project, is based on the principle that a multi-dimensional learner evaluation is very important to build a better picture of students' development and participation. Design decisions are taken based on experiences with matematica.net; pilot studies are been conducted to orient the design processes and a methodology for this type of courses.*

Index Terms — Teaching, Learning and Assessment Strategy in Virtual Classroom, Intelligent Training Technology.

INTRODUCTION

Nowadays, computational environments for Distance Education (e.g. BlackBoard, WebCT) are mostly generic tools that allow for course creation without any link to the domain in question. Furthermore, they do not offer any specific support for neither the student nor the teacher.

A common way of designing and implementing environments is based on instructionism, which considers that good presentations of knowledge are enough to guarantee learning. This suffers from a serious limitation: little or no consideration for the learner's needs. Works in AIED (Artificial Intelligence in Education) have been striving to solve this problem for a long time.

As far as distance learning goes, there is a gap to be filled with the application of higher-level educational environments, which, not only provide better tools for the teacher, but also that provide adequate support for the learning process. As far as teaching is concerned, we should aim at providing support not only for the teacher to follow the learning of specific concepts, but also for him/her to follow the evolution of competencies such as organisation, group interest, and communication. Thus, methodologies for multi-level evaluations are of great interest.

The computational system we are proposing not only incorporates evaluation techniques, but also caters for the processes of negotiation (amongst learners, and learners and teacher) and mediation. This is achieved by the use of intelligent support agents that will help users. In its first application, our platform will be used for teacher formation.

The AMADeUs solution stems from the necessity of implementing an architecture that took the domain specific needs into consideration. The first domain was elementary math teacher continuous formation and computer science undergraduate students.

This paper is organised as follows. The first section describes our motivation. Then we present some environments used in teacher formation. The third section introduces a model for a collaborative learning support system including both traditional collaborative tools and content guided tools. The fourth section describes the intelligent support in development. We then describe a proposal for a multi-level assessment technology and present a user centered design approach. Finally, we present our conclusions and references to future work.

MOTIVATION

There are important assessment problems associated with maths learning in elementary levels [48]. In general, students finish secondary courses with minimal knowledge, (i.e. with competencies to solve primary maths problems). In the last three years of school, no more knowledge is acquired. The same report indicates that assessments improve significantly when educational technology is used in learning.

In this light, we can see that there is a clear need to better form maths teachers. Actually, formation courses occur in various ways, the main distinction being the number of teachers and distance from formation centers. In the first case, if the number of teachers is too large, administration prefers to organize single, short-duration events. In the second case, teachers are trained by private consultants. The interventions are usually brief and non-systematic. Graduate professionals, with short pos-graduate formation, conduct those courses. In both cases, teacher participate in short time courses without continued evaluation.

Many authors indicate that teacher's formation should be organized as a continuous process. Information technology can be an alternative solution to make it feasible. In our project, teachers are engaged in communities of practice and were accompanied with mixed methodology. Virtual and classroom activities are combined and distributed in a long-term formation program. Post-graduate tutors assisted the teachers. Also, teachers were able to work

and challenge peers from the same school and far from those work place.

SOME POSSIBLE SOLUTIONS

The socio-constructivist approach to learning [18] suggests that the learner is part of a social group, and, as such, should be able to question, discover and understand the world in which he/she is inserted. The boom of communication technologies has made it possible for us to implement computer environments that take advantage (and encourage) group interaction. Such environments are known as Computer Supported Collaborative Learning Environments (CSCLE). Amongst the various possibilities for CSCLE, we want to focus on the tecnology based on projects. The idea is to teach based on discovering solutions for real life problems. According to [39], knowledge and ideas emerge from situations where we need to learn from meaningful experiences. Boud, Keogh e Walker [25] define reflection as being the act of mulling things over, and trying to understand our own experiences. This is a fundamental skill in learning, and is also the one we lack most. When talking about reflection, we cannot leave out the process of articulation. Self, Karakirik, Kor, Tedesco and Dimitrova [33] define articulation as being the act of verbalising our thought processes. Amongst the main benefits of this are the fact that verbalising might help us develop our thought processes; articulating something brings its weaknesses to light, and may generate interesting discussions on the topic.

As a general rule, collaborative learning is more productive when participants are engaged into open-ended problem solving. A possible way of constructing these learning situations is to propose projects involving learner groups and to provide intelligent support that reinforces the ideas of reflection and articulation.

A project can be defined as a process that is divided into stages, related to one another, forming a flow. Each stage can be evaluated through the execution some tasks. The environment we are building is based on the idea of workflows – which allow us to visualise and evaluate the work being done in the different stages of the project. The idea is to provide tools for evaluating tasks, monitoring group interaction and evaluating the learning process.

THE AMADEUS USER CENTERED DESIGN

The AMADeUs´ initial architecture was based on a literature review together with the participants´ experiences in various areas. The AMADeUs team is multi-disciplinary, consisting of teachers, Educational specialists, Psychologists, and Computer Scientists.

The interface design is centered on users´ actual practices in a user centeder design routine [35] [36]. As the design progressed, we incorporated tools for intelligent support and group monitoring and formation. Part of our new insights came from the case studies we have carried out – as described below.

Case studies

We have carried out a first course to observe the parameters that could orient the interface and architecture design processes. The syllabus focused on maths´ teaching and learning with educational software. Ten (10) teachers from a public school in Recife participated in the study.

The course was focused on the use of educational technology in maths education. We organized interleaved sequences of theoretical meetings and experimental classes with educational software sessions. Both were conducted at the school. The course had six modules: introduction to educational technology in mathematical education, additive structures teaching and learning, multiplicative structures teaching and learning, fraction teaching and learning, function structures teaching and learning

We adopted a mixed methodology encompassing local and distant seminars. The course was programmed to last one year. The local meetings were conducted twice a month, lasting three (03) hours at a time. Those meetings were interleaved with virtual discussions through both synchronous and asynchronous communication tools. By observing the activity in the discussion list environment, we have concluded:

- This first experience was very hard. Teachers were really skeptic about distance learning.
- Participants´ engagement during chat was modest. Discussions were difficult to mediate and anonymous contributions confused participants.

User Needs and User Centered Design of Teaching Support Environments for E-learning

In order to investigate solutions that aid educators in their educational practice in e-learning environments, this paper presents the analysis of some of the Educators' activities to understand their tasks in executing their jobs. Thus, the complexity of the tool's appropriation tends to be reduced, centering the development of the whole design in the users, their needs and their tasks. We have chosen three teaching activities to start with: course planning, teaching materials creation and delivery and evaluation/tutoring. This choice is based on the fact that there is a shortage of tools to support these fundamental (and yet non trivial) tasks.

This work argues that Educators need to modify their activities in order to fit with some existing tools in e-learning environments. This sometimes promotes a restriction of what could be accomplished and limits the Educator´s creativity, thus entailing possible failures during the course development.

Questions such as: how these environments support real teachers' activities, which activities are exercised in these environments and whether the support available is carried out efficiently and in agreement with the educators' practice, are more and more necessary to aid educators to teach in a reflexive way, making their tasks more flexible and dynamic.

Based on a questionnaire that investigated teachers' procedures in planning, delivering and tutoring, we interviewed twenty Brazilian Educators experienced with e-learning environments and performed a qualitative data analysis with a software named NUD_IST (Non-numeric Unstructured Data Index Searching and Theorising). The reason for choosing NUD_IST was the difficulty classification and analysis of not structured data used in this research. This resulted in a classification of teachers' tasks which was used to build prototypes of tools to aid teachers in planning their courses, delivering their materials and tutoring the students. As argued in [35] [36], we believe that understanding users´ needs is a success factor in product development. This motivates us to use User-Centred Design (UCD) to guide our task on developing the tools´ prototypes.

At the time of writing we are specifying our systems use cases based on [35] [36], considering the user needs and requirements. The use cases elaborated in the specification will be validated in an e-learning environment named AMADeUs (Microworld Agents and analysis of the development in the use of instruments). The objective of AMADeUs is the construction of an e-learning environment based on the microworld concept [2], methodologies and tools that allow a significant progress of the reflections on teaching technologies [44] and an improvement in the use of those technologies in the teaching-learning process.

The planning and creation course use case resulted in set of procedures that would be performed by teachers, which include the elaboration of a course program, with its objectives, activities, bibliography, calendar, evaluations and communication tools. The teacher materials creation and delivery use case resulted in elaborating teaching materials guide and also in a set of procedures to complete the delivery according to their needs; and the results from the tutoring use case based on the task that students activities may be traced, driving the best way in their learning, aiding tasks execution and obtaining subsidies for its evaluation to define systems' tools.

User-Centered Design of Workflows in E-Learning

The socio-construtivist learning approach [18] suggests that the learner must have the initiative to question, discover, and understand the world through his interaction with the other elements of the historical context of which he is part. In this philosophy, we singled out the use of technology in cooperative learning based in projects [50], whose objective is not only to incorporate up-to-date access to information, but mainly to promote a new learning culture through the creation of environments that foster the making and exchange of knowledge. The method based in project was devised to teach through the discovery of solutions for real.

The development of a project can be defined as a process, divided in stages related one to another, forming a Workflow. Each stage is evaluated through the execution of one or more tasks that must fulfil certain objectives, and generate some products.

Some of the features of cooperative learning based on projects are [14] [15]: consider the expectations, potentialities, and needs of the students; build the necessary space where teachers and pupils have autonomy to develop the cooperative learning process with reciprocity, responsibility, and honesty; develop the ability to work as a team, make decisions, facilitate the communication, and formulate and solve problems, develop the ability to learn how to learn in such a way that each one may rebuild the knowledge through the integration of abilities according to his universe of concepts, beliefs, and values.

We believe the most natural way to promote the teaching based in projects in a web-based learning environment – using workflow technology as its base [Georgakopolous1995]. However, the existing Workflow (e.g., StaffWare [www.handysoft.com], LotusNotes [www.lotus.com], BizFlow [www.handysoft.com]) Management Systems were not conceived with educational environments in mind, which is why they do not satisfactorily tackle actions such as teaching, evaluating, and orientating. On the other hand, the majority of Virtual Learning Environments (VLE) (e.g., Blackboard [www.blackboard.com], LotusLearningSpace [www.lotus.com], WEBCT [www.webct.com]), don't offer management and automation tools for educational workflows. Generally, it's up to the teachers and students to externally plan a cooperative project, and to propose support mechanisms to make it feasible. Special instances are VLE with Workflow Flex-eL ([www.flex-el.com]) [44], and VLE based on Zebu Projects [14].

Our proposal aims at creating a virtual project-based learning environment whose cooperation process is promoted by the integration of comunication functionalities with an educational workflow. This environment, named AMADeUs [46], is a generic framework offering adaptative teaching tools centered in group work. Tools to allow the implementation of a constructivist evaluation proposal taking into account all the stages of the workflow are in the process of being developed. The basic idea is to create a structure to stimulate the emergence of the right distance-teaching actions through the most representative users, which are, teachers, pupils, parents, content-makers, coordinators, and managers.

The development process for this system takes into account methods and tools for the ethnographic analysis of formation activities [38] [40]. We used a Software Engineering undergraduate course as a use case. The first part presents a social analysis starting from data collected from transcriptions of interviews and dialogs between teachers and pupils in the presence of observers, and an e-mail list used to facilitate the communication between members of the group [45]. The first requirements are then produced from the classification of the information collected using Nud-Ist. In the second part, the system modelling using scenarios [37] and UML diagrams that embed qualitative information in each task to perform [35] begins.

Initially, we adopted a component-oriented development technique using JAVA and XML (eXtensible Markup Language) in a three-layered framework (adaptative interface components, workflow components, and communicaton middleware) [1] [42]. New ethnographic analysis is performed for the study of the structure of the activity using the new tool. The development cycle ends when the study of the social activities points to a satisfactorily employment of the tool by the user.

THE AMADEUS ARCHITECTURE

One of the main novelties about our project resides on our use of constructivism to allow the implementation of an assessment system that permits a continuous evaluation and diagnosis of the learning process, differently from most on-the-market learning environments. Furthermore, we also intend to promote effective collaboration by organising participants´groups in project teams, and guiding their interaction [31] in accordance with the guidelines for effective collaboration defined in [34]. We have also taken special care while designing the interface – we have used user centered design techniques [referência aqui] and taken users´ awareness into consideration.

Our initial model consists of several agents, three of them directly concerned with intelligent support. The idea is to evaluate the entities´ performance during construction of the first prototype. The results obtained then will show us whether we need to modify agents' funcionalities. The system's architecture is shown in Figure 1.

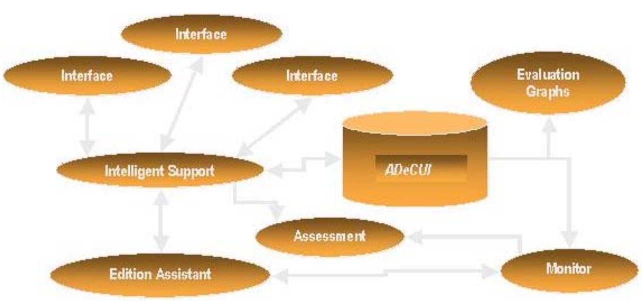

FIGURE 1
THE AMADEUS ARCHITECTURE.

Since we want AMADeUs to be as generic as possible, we have been also thinking about a way of using its core with computer science applications. To us, one of the best ways to do it is to build a tool for collaboratively carring out projects. According to [14] such environments must provide tools for: defining processes to account for collaborative process; selecting and implementing tools for performing project-related tasks; storing and retrieving information about past projects; using the internet as its basic platform. Thus, we will be incorporating tools for guiding the collaborative process in the AMADEUS framework [56]. One of the most effective ways of doing so is to incorporate intelligent support agents that help participants interact, reflect, and thus reach more refined solutions.

Cooperation Components

In AMADeUs, there are several environments students (and teachers) can interact in. We have provided environments for individual learning (interfaces, email box, pigeonhole), for group interaction (lists, chats, foruns, evaluation central, common workspaces) and so forth. We have paid special attention to group formation and negotiation issues and evaluation.

We have also provided space teachers to interact with one another and to find better ways to perform their activities (planning of courses, tutoring, evaluation). In fact, we are working on finding out a methodology to design tools for the teacher to use.

Awareness Interfaces

The first results obtained during a pilot study have indicated that asynchronous user component web interfaces are too complicate for use. Maths' teachers, as a significant number of teachers in elementary education, are not familiar with information technology. Our main intention concerning the interface is to create extremely simple web interfaces that approximate, as much as possible, users' models concerning cooperative learning to teach. Another principle adopted in web design was that signaling co-presence could improve cooperative initiatives and facilitate the users´ conceptualizing process [23].

Our aim is to create, through the interface, awareness of social participation, with specific roles and objectives, but interdependent with each other through social contracts.

The group's coordination, as promoted by expert tutors, intends to facilitate group conscience emergence. As we have already mentioned, the intelligent support provided will aim at reinforcing good collaboration – and that certainly involves group participation from all members. The main semiotic principle is the limited number of elements and signs in the web interface. The interface is also used to communicate co-presence in the web site. Participants can follows peers and tutors navigation through little signs on the pages.

User Software Component

The most important collaborative component is a middleware component, a shared workspace. Its architecture is open, what allows the use of different contents-oriented educational software in training situations.

Considering that one of the most important features of any educational groupware is the set of resources that deal with the interaction between the participants, and that the mere transmission of contents through the Web is not enough to the teaching of Mathematics; we propose to expand the notion of interaction to one that includes actions.

Since AMADeUs is an environment designed to educate teachers to teach Mathematics using computational tools, it is necessary to take into account a different interaction paradigm (frequent in games played on-line): interaction through action, which is based on the concept of micro-worlds. This interaction occurs through the use of virtual shared environments also called User Software Component, USC. These components allow the creation of more than one level of interaction, promoting situations fundamental to the teaching proposed by the environment. This component complements the proposal for communicative interaction through texts in communication tools.

There are two ways to instruct in VLE: directly and indirectly. In the first case, lessons are presented by the instructors who also pose questions and wait for the answers, give feedback, and evaluate the results. This makes a VLE independent of the type of contents in an generic environment. The second type adopted is synchronous and visual. Our proposal aims at increasing the possibilities of interaction through shared action. In this case, instead of following rules, the students explore the relations actively and cooperatively. Our idea is to overcome the limitations of the existing educational environments, combining the properties of intelligent tutors and micro-worlds through cooperative systems or tutored discovery. Besides, it was observed that the tools and environments should amplify the teachers´ abilities to produce situations and proper follow up to the pupils´ learning.

In the AMADeUs environment, the tools associated to the development of indirect instructions are non-web applications of the shared environment type, named user´ software components. These components are launched during the surfing of the environment, and support the shared use of up to four people, teachers or pupils. The advantage in using this type of collaboration tool is that the pupils use different strategies leading to the emergence of different kinds of knowledge [47] [49]. In previous studies, we have shown how the use of different interfaces determines the emergence of different properties of concepts. Users profited by participating of direct and indirect instructions [VBK1999].

The micro-world environments are conceived to favor the students´ activities. These systems seem to be the best adapted to the learning in situations of classroom mediation or in educational IT lab conditions, where pupils work in pairs, and are oriented by the teacher.

The notion of interaction through the Internet is related, in many cases, to processes mediated by text and image communication. The interaction can take place through other forms of action. From the point of view of cognitive development it is interesting to combine textual with imagistic and manipulative forms. In this case, we propose that the interaction between the actors of a learning group takes place through actions performed in the same shared workspace. An image tells more than a thousand words. Words are frequently ambiguous. However, sometimes, the meaning of a discourse is enhanced by some actions and vice versa.

The USC interface displays three parts: a map at the upper right corner, an educational software environment at the center, and a chat at the lower right corner. The game machine is shared among several educational applications. The machine has communication resources between applications, access resources to the server to send and receive information about the pupil´s development or about the interface quality, communication resources through chat, and the interface local control (statecharts). There are three layers of software: interface, mathematical modelling, and interface control.

The USC have two main parts. The first one is a client into each are that incorporated a communication component (chat), a coordination one that permits participants to program the time sharing strategy. The third part is educational software (micro-worlds) that are plugged and shared with the other students. There are three user software components under development: two in the domain of the teaching of Mathematics and another for Physics teaching.

Multi-Level Evaluation

Evaluation in e-learning is organized according to different strategies. Systems' design is typically guided by a priori effectiveness comparisons of different evaluation strategies. In this platform, our aim is to coordinate the positive contributions of specific evaluation strategies, taking advantage of the best features of each of them.

Our design principle is that comparing and combining different actors' points of view can substantiate evaluation results better that using single strategies. The idea is to take different strategies that focus on single actor's (students, tutors or graders) points of view and combine their results in order to produce a better picture of our users. In this light, we have proposed a combination of four strategies, namely: open-end evaluation (the traditional evaluation of production, exams or papers), continuous participation evaluation (grades, tutors and staff continually evaluating contributions on chats rooms, forums and e-mail list services; interface agents following and grading students activities, and intervening in the interaction), self-evaluation and peer-evaluation.

For each strategy, we have designed specific environments and support agents. All those points of view are integrated, processed and represented in simple reports and graphs. Results from different sources are compared and combined to produce a coherent and usable student evaluation. In this way, we are able to produce more consistent results. Active and passive units and environments compose this specific architecture.

Student's participations are monitored in chat rooms, discussion forums, e-mail lists, individual e-mail to tutors and teachers. Intelligent interfaces in user software components are responsible for modeling and evaluating students learning in action. Peer points of view are captured in specific environments where peers are invited to evaluate colleagues and judge their production.

We use the evaluation task as opportunities to promote learning. All material delivered is then adapted from the aspects students had learned and those they are still having problems with. All adaptative content is constructed dinamically and presented in the right time to studentes.

COLLABORATIVE LEARNING SUPPORT

Aiming at supporting more effective colaboration, AIED research has been trying to better understand the collaboration process and to build systems that support it. Learning collaboratively implies achieving solutions that would not be found otherwise and negotiating shared knowledge [26]. Dillenbourg [28] [29] argues that we can support collaboration by (1) fixing initial conditions; (2) constructing scenarios; (3) supporting productive interactions, by structuring the dialogue and (4) monitoring and regulating the learning process. In our platform, we intend to support collaboration in these four levels. The idea is to follow Dillenbourg's guidelines and structure the interaction (via tools that facilitate communication and agents tha monitor the dialogue) and through the presence of mediators (either the teacher or artificial ones).

Intelligent Support

As far as intelligent support goes, we have several agents working on different levels. In the following, we present each of them. In fact, in order to account for a multi-level evaluation and (subsequent) support, the student modelling component our system consists of a multi-agent society, whose members are described below.

A1 – Action Modelling Agent

This agent is initialised every time a new student logs onto the system, and follows him/her until the end of the interaction. A1 is basically responsible for collecting (and analysing) students´actions. When the agent finds out that the learner is having some difficulties with the syllabus, it sends the teacher a notification. A1 reasons about the actions following 3 criteria: (1) possible misconceptions; (2) correct actions and (3) strategies used for solving the current problem

A1 can also learn tutor´s actions, and can take the initiative with the tutor´s permission. That includes suggesting new learning situations and interacting with learners.

A2 - Student´s Production Agent

This agent analyses students´records (their production and teacher/instructor´s evaluations) in order to suggest the strengths and weaknesses of each student. It also uses information from A1. As we determine students´competencies, A2 accumulates a learner model. Besides performance and quality of production, the following parameters are also included: (1) can help in topic; (2) needs help in topic.

When it deems necessary, A2 asks A3 to form groups based on the contents needed by learner *x*.

A4 - Rithm Monitoring Agent

Sometimes, students in distance learner courses indicate their lack of motivation/ understanding by not doing their activities, and not logging on the system. Thus, A4 uses this information to try to assess whether there are problems and where they are, and thus inform the learner models. It can try to solve it by forming groups, sending communications to the leaners and informing the tutor that there are problems.

A5 – Interface Agents

This agent analyses users activities in the microworlds interfaces, and will try to help its charge by taking local decisions (which situation to present now? Does the interface need to be adapted?) It will base its decisions on a library of past situations faced by previous students of the system. A5 also provides feedback for the learning monitoring system A.De.C.U.I.. It also has functionalities to interpret situations and feedbacks.

The agent that monitors the microworld interfaces is responsible for monitoring whether the student has already seen all the available situations. It also helps the tutor to identify and propose new problem situatiosn for the students and to reinforce learning by assessing what has been done in each microworld. The first part of this agent design was recentelly obtained thur the identification of adequate learning algorithms best adapted to those specifique data strucuture **[ref reic ana emilia isbn**].

A6 – Editoring helper

This is responsible by helping the teacher to create new learning situations for the students. The teacher consults the production knowledge base and conceptual maps graph in order to assess what would be most beneficial for the student. The teacher can also see other teacher´s work for similar situations.

A7 – ADeCUI´s data Analyser

This agent will analyse the data present in A.De.C.U.I. in order to give feedback to the interface agents about what the learners know and what are their weaknesses. Data mining techniques are being applied here in order to guarantee that the relevant information will be available to the agent or to the teacher in due time.

Group Agents

A3 - Group Monitoring Agent

This agent works with information from A1 and A2 in order to form groups to learn given topics. When A3 needs to form a group, it asks the agents A2 to inform which learners could fit the profile, and sends them messages inviting them to join a group. Agents A1 and A3 then negotiate in order to find activities that are beneficial for all the group members.

Agent A3 also monitors the group interactiong, trying to keep the group motivated and collaborating effectively. In order to do so, A3 keeps track of the social roles played by group members, identifying the following: collaborator, tutor, competitor, leader, reflective, shy and idea generator.

A3 also has the following responsibilities: a) motivate members that are not participating as much, and trying to reinforce the guidelines for consensual decision making [34]; b) mediating possible conflicts; c) reminding participant of options not explored yet. A3 also keeps a group model, which includes a detailed log of the interaction, not only for users to see and reflect upon but also for the teacher to consult.

CONCLUSION AND FURTHER WORK

In this paper, we have briefly presented AMADeUs, our project of a computational distance learning platform that tries to address the deficiencies found in most on-the-market distance learning products: we provide mechanisms for multi-level evaluation; intelligent support that addresses not only the needs of the learner but also the needs of the teacher (in dire neglection these days); we take issues like motivation and effective collaboration into consideration.

We also have members working on methodologies to design environments that are adequate for the teachers´ pedagogical activities; we are also working on group formation and negotiation. Even though our project was conceived with maths in mind, we have already seen that it can be used in other domains. Our next idea is to adapt it to be used in Computer Science Education. The idea of collaborative projects can be widely used in computer science (for designing software, for example).

In the very near future we intend to carry out a couple more case studies to validate our design methodology. We also intend, as soon as we can, to put the system to good use, in order to evaluate it, and modify it accordingly.

ACKNOWLEDGMENT

We thank the teachers who participated in our pilot studies, engaging in formation practices and contributing to our system specification. We are indebted to C.E.S.A.R. for technical support. This work is part of a research programme supported with federal grants provided by CNPq (proc. n. 680210/01-6 e n. 477645/2001-1).

O DISCURSO DA QUALIDADE TOTAL EM EDUCAÇÃO
Um estudo no âmbito da Educação em Engenharia

Liane Ludwig Loder[1]

Resumo — *Esse trabalho pretende discutir a eficácia da implantação de Programas de Qualidade Total (PQT) em Educação em geral, e em Educação em Engenharia em particular, a partir da análise de experiência de implantação de um programa congênere no âmbito da Escola de Engenharia da Universidade Federal do Rio Grande do Sul-UFRGS, particularmente, no Curso de Engenharia Elétrica desta Instituição. Esse estudo aborda esse tema partindo da descrição dessa experiência. Na seqüência, é exposto o referencial teórico da análise pretendida, destacando-se, dentro de uma perspectiva histórica, a gênese da concepção dos Programas de Qualidade Total e os fundamentos que norteiam a aplicação desses princípios em processos educativos. Após, é feita uma análise crítica dessa experiência, a partir de conceitos da Análise do Discurso (AD). Ao final, são apresentados argumentos que justificam a inadequação e o previsível insucesso, em termos de melhoria da aprendizagem dos alunos em sala de aula, da aplicação desses Programas em Educação .*

Palavras chave —Qualidade Total em Educação, Educação em Engenharia.

DESCRIÇÃO DO CASO

O Programa da Qualidade Total (PQT) na Escola de Engenharia da Un. Fed. do Rio Grande do Sul (UFRGS)

O PQT implantado na Escola de Engenharia da UFRGS em 1998/2, em seu objetivo mais amplo, pretendia nortear e amparar as iniciativas administrativas e pedagógicas da Instituição tendo em vista a melhoria da qualidade de seus diferentes Cursos, tanto em nível de graduação como de pós-graduação.

A estimativa era de que essa melhoria teria reflexo na diminuição dos índices de evasão nos Cursos, bem como na readequação dos Currículos em função das demandas impostas pelo mercado de trabalho, e também no aumento do nível de satisfação dos professores, funcionários e dos próprios alunos com as suas condições de trabalho (infraestrutura física, recursos humanos e materiais disponíveis).

A complexidade da Instituição que abriga nove cursos de graduação (Eng^a Civil, Elétrica, de Materiais, Mecânica, Metalúrgica, de Minas, de Produção e Química), seis cursos de pós-graduação em nível de Mestrado e Doutorado, além de cursos de especialização, tendo cerca de 3000 alunos para um corpo docente de 167 professores e 112 funcionários, dificultou sobremaneira o trabalho de implantação do Programa de Qualidade, não permitindo atingir, na avaliação dos responsáveis por esse Programa, todas as metas inicialmente estabelecidas, dentro do prazo previsto. A partir dessa constatação, o campo de aplicação do Programa de Qualidade foi restrito a um dos Departamentos da Escola e o Departamento escolhido foi o de Engenharia Elétrica.

O Programa de Qualidade Total (PQT) no Departamento de Engenharia Elétrica (Delet)

O PQT na Engenharia Elétrica foi implementado com o objetivo geral de melhoria da qualidade do Curso. Para tanto, o Programa previa a implantação de uma metodologia de trabalho que otimizasse o uso de recursos disponíveis, obtendo uma maior eficiência nas ações administrativas do Departamento e uma maior eficiência pedagógica no cotidiano do Curso.

Foram feitas várias reuniões, assistidas e coordenadas pelos consultores, em que professores e funcionários se manifestaram, a partir do que foram levantados e descritos os problemas existentes no dia-a-dia do Departamento.

Em uma fase inicial, foram classificadas as atividades do Departamento nas seguintes categorias: Recursos, Processos, Produtos, Clientes. Os resultados obtidos estão resumidos na Tabela 1, a seguir:

TABELA I
ATIVIDADES DO DEPARTAMENTO POR CATEGORIA

Recursos	Professores, Alunos, Funcionários, Instalações prediais e Equipamentos.
Processos	Curso de graduação, Cursos de Extensão, Cursos de Pós-graduação, Pesquisas, Consultorias, Publicações, Capacitação de professores , Capacitação de funcionários, Comunicação interna.
Produtos	Formação de RH, Geração de conhecimento e Prestação de serviços.
Clientes	Alunos, Professores e Funcionários.

[1] Liane Ludwig Loder, UFRGS Escola de Engenharia, R. Osvaldo Aranha, 103, 051.33163517, Porto Alegre, RS, Brasil, lludwig@eletro.ufrgs.br

Feito esse levantamento, foram estabelecidas ações e formados grupos de trabalho para executá-las. Esses grupos foram categorizados, segundo as necessidades identificadas, em onze categorias e tinham por responsabilidade:

- Extensão - fomentar a criação de cursos de curta duração destinados a Empresas e Profissionais de Engenharia Elétrica;
- Graduação - compatibilizar os horários das diferentes disciplinas e definir as salas de aula a serem utilizadas;
- Reforma curricular;
- Pesquisa - divulgar para a comunidade interna dos calendários das agências de fomento, relatórios das atividades desenvolvidas pelos diferentes grupos do Departamento;
- Pós-graduação - acompanhar o processo de implantação do Doutorado em Eng^{a} Elétrica e estudo sobre a possibilidade de oferta de Mestrado profissional;
- Qualificação do espaço físico;
- Laboratórios - melhoria do espaço e dos equipamentos destinados às aulas de laboratório;
- Informatização - melhoria dos serviços prestados à rede interna de computadores do Departamento, criação de "home-pages", disponibilização de documentos e formulários eletrônicos via rede interna;
- Melhoria do ensino - estudo e implementação de novas metodologias de ensino;
- Avaliação - melhoria do sistema de avaliação interna da ação docente;
- Colóquio Delet - promoção de seminários internos visando uma integração das ações executadas pelos demais grupos.

Algumas das ações implementadas, total ou parcialmente, foram:

- Criação de "home-pages" dos diferentes laboratórios destinadas a registrar e disponibilizar informações a respeito das atividades de cada laboratório e, dessa forma, melhorar a troca de informações interna e possibilitar que a ação de cada grupo de professores seja acompanhada pelos demais e possa dar origem à ações conjuntas, intensificando a interação entre os diferentes grupos e, conseqüentemente, o desempenho geral do Departamento nas suas diferentes atividades;
- Diminuição do ruído sonoro ambiente (o prédio sede do Departamento de Engenharia, onde funciona o Curso homônimo, é margeado por avenidas de intenso tráfego de veículos). Melhoria da ventilação de um dos laboratório de ensino de graduação;
- Contratação de um assessor administrativo experiente objetivando desonerar a Chefia do Departamento de questões administrativas rotineiras. Dessa forma, possibilitando uma ação mais efetiva do Professor-Chefe não só como coordenador das várias ações em curso, mas também como agente principal da obtenção de recursos financeiros necessários para realizar essas ações;
- Acompanhamento de algumas aulas - essa ação, proposta e realizada pelo consultor do Programa de Qualidade, consistia na distribuição de questionários aos alunos, ao final das aulas, objetivando, conforme as palavras do consultor: "*avaliar o desempenho do Professor em sala de aula, identificando a velocidade em que os assuntos são expostos (ritmo), a capacidade do Professor manter o aluno motivado (auto-avaliação), se o objetivo principal foi alcançado (entendimento da matéria apresentada), a habilidade do professor associar os conhecimentos apresentados e a utilização desse para o aluno (utilidade).*"

Esse projeto teve seu fim decretado por falta de recursos financeiros em meados de 2000, após aproximadamente um ano de atividades.

FUNDAMENTAÇÃO TEÓRICA

Qualidade Total em Educação

Por Qualidade se entende uma característica, propriedade ou estado que torna um produto ou um serviço plenamente aceitável. Por sua vez, um produto ou serviço é considerado de boa qualidade se apresenta alto grau de conformidade a um custo compatível. Nesses termos, a Qualidade é pensada em função do cliente, a partir de suas necessidades. Segundo os teóricos da Qualidade esta definição de qualidade, com algumas adaptações, pode ser aplicada à educação.

William Glasser, médico e psiquiatra americano, autor de *Escola sem fracasso,* estabelece sete diretrizes para uma Escola de qualidade- *os sete pontos centrais de Glasser: 1. Gestão democrática ou por liderança da escola e das salas de aula; 2. O Diretor como líder da comunidade escolar; 3. O professor como líder dos alunos; 4. A escola como ambiente de satisfação das necessidades de seus membros; 5. O ensino baseado na aprendizagem cooperativa; 6. A participação do aluno na avaliação de seu próprio trabalho; 7. O trabalho escolar de alta qualidade como produto de uma escola de qualidade.*

Segundo Glasser, a Qualidade Total somente é alcançada quando toda a Escola, na integridade de seu corpo social: professores, alunos, administradores, orientadores, supervisores, equipe técnica e de apoio, pais e sociedade, tornaram-se partícipes reais num processo incessante de aperfeiçoamento dos serviços educativos prestados pela Instituição.

O professor, nesse contexto, é o administrador mais crucial para o sucesso da Escola. O professor visto como líder dos alunos cria esquemas para evitar que a tarefa escolar seja aborrecida, enfadonha ou sem sentido para o aluno, se interessa pelos estudantes, sabe que o sucesso de seu trabalho depende da cooperação dos que são dirigidos por ele e compreendendo que os estudantes só se dedicam se verificarem algum benefício no que irão fazer, se esforça para estruturar a atividade escolar de modo que os alunos percebam claramente este benefício.

Elementos da Análise do Discurso (AD)

Através de excertos de obra Helena Nagamine Brandão[1], abaixo transcritos, condensamos o estudo que fundamenta a análise a ser desenvolvida nesse artigo:

> *" a linguagem enquanto discurso é interação e um modo de produção social; ela não é neutra, inocente (na medida em que está engajada numa intencionalidade) e nem natural, por isso um lugar privilegiado de manifestação da ideologia ... a linguagem é o lugar de conflito, de confronto ideológico ... seu estudo não pode estar desvinculado das condições de produção."*

Segundo o mesmo texto de Helena Brandão, as dimensões a serem consideradas na AD são:

- quadro das instituições em que o discurso é produzido, as quais delimitam a enunciação;
- os embates históricos, sociais, etc. que se cristalizam no discurso;
- espaço próprio que cada discurso configura para si mesmo no interior de um interdiscurso.

A autora ainda destaca que para Michel Foucault, um dos expoentes da AD:

> *" o discurso é um jogo estratégico e polêmico, o discurso é o espaço em que saber e poder se articulam, pois quem fala fala de algum lugar."(p.30)*
>
> *"Se processo discursivo é produção de sentido, discurso passa a ser o espaço em que emergem as significações."(p. 35)*
>
> *" analisar o discurso é fazer desaparecer e reaparecer as contradições: é mostrar o jogo que* (elas) *jogam entre si." (p.40)*

Nas conclusões do texto de Brandão, encontramos::

> *"o discurso materializa o contato entre o ideológico e o lingüistico no sentido de que ele representa no interior da língua os efeitos das contradições ideológicas, o desafio a que a Análise do Discurso se propõe é o de realizar leituras críticas e reflexivas que não reduzam o discurso a análises de aspectos puramente lingüísticos nem o dissolvam num trabalho histórico sobre a ideologia." (p. 83)*

ANÁLISE DO CASO DE ACORDO COM OS PRECEITOS DA AD

O discurso da Qualidade Total (QT) em Educação

Analisando o discurso da Qualidade Total na Educação usando como fio condutor os preceitos da Análise do Discurso (AD), como apresentados anteriormente, podemos destacar os seguintes elementos:

Condições de produção desse discurso*:* analisando o contexto histórico-social, os interlocutores, o lugar de onde falam, a imagem que fazem de si e do outro e do referente, identificamos o surgimento do discurso da Qualidade Total na Educação como tendo origem no movimento mais amplo de reordenação do sistema produtivo em termos mundiais.

O impacto que a produção asiática teve sobre o mercado internacional, fez com que se começasse a estudar o modelo subjacente àquele sistema produtivo, os ocidentais começaram a constatar que havia algo de diferente na produção industrial asiática, ao se debruçarem sobre o processo adotado pelas organizações asiáticas e sua capacidade de oferecer mercadorias de interesse da clientela, o interesse pela GQT (Gerência da Qualidade Total) foi aumentando. Em pouco tempo, as preocupações quanto a qualidade começaram a surgir nas indústria e nas organizações ocidentais.

O princípio orientador da concepção da Qualidade Total está calcado no pressuposto de que quanto maior seja o entendimento que as pessoas tenham da organização que integram e maior for o poder decisório e o compromisso das mesmas com suas finalidades, maior a produção e melhor o produto. Assim, a participação, o compromisso e o poder decisório são elementos-chave neste modelo gerencial.

Paralelamente ao debate sobre as novas demandas de qualificação, surge o debate sobre as formas de gestão da educação. Sendo o modelo da Qualidade Total bem sucedido nas empresas, vingou a idéia de aplicá-lo na escola. Os defensores dessa idéia alegam que o discurso da Qualidade Total aplicado à Educação baseia-se no pressuposto de que, sendo a Qualidade Total um sistema gerencial que se apóia em conceitos e princípios aplicáveis a qualquer instituição e organização humana, independente de sua dimensão, especialidade ou característica, ela pode ser aplicada a: empresas, escolas, hospitais, etc.

Segundo esse discurso, a Gestão da Qualidade Total (GQT) aplicada à Educação contribui de forma efetiva para a qualidade de ensino na medida que introduz mecanismos e instrumentos que permitam reduzir desperdícios resultantes de um gerenciamento inadequado: desperdício de tempo, de idéias, de experiências, etc.

Formação discursiva*:* se refere ao conjunto de enunciados marcados pelas mesmas regularidades. Nesse aspecto, se inserem as idéias de que podemos conceber a Gestão da

Qualidade Total (GQT) como um conjunto estrategicamente organizado de princípios e métodos que visa à mobilização e à cooperação de todos os membros de uma unidade de produção, com intuito de melhorar a qualidade de seus produtos e serviços, de suas atividades e objetivos, para obter a satisfação do cliente e um acréscimo de bem estar para os seus membros, de acordo com as exigências da sociedade.

Há cinco imperativos fundamentais da qualidade que devem ser perseguidos num programa de GQT: conformidade, prevenção, excelência, responsabilidade e medição.

Todo o produto ou serviço deve atender uma necessidade, satisfazendo o cliente. Assim é necessário que haja uma adequada conformidade a especificações definidas com base em estudos sobre a satisfação dos alunos, pais e professores.

Por prevenção deve-se entender medidas para que erros, falhas ou defeitos sejam evitados. Por exemplo, devem ser considerados os dispositivos para auxiliar os alunos em dificuldade, ao longo do curso.

Fazer correto deste o princípio é o que constitui a base da excelência. O respeito às especificações, às exigências, aos engajamentos feitos devem conduzir ao êrro zero.

A medição tem a ver com desenvolver procedimentos de avaliação dos alunos, das políticas educacionais e da gestão escolar com o objetivo de identificar problemas e a não qualidade. Sem medida adequadamente feita, é impossível identificar corretamente os problemas.

Por responsabilidade deve ser entendido o respeito aos quatro imperativos citados acima: a conformidade, a prevenção, a excelência e a medição. Essa responsabilidade é individual e coletiva e perpassa todas as pessoas e todos os níveis da escola e também o ambiente externo à ela.

Para que um programa de GQT possa ser implementado, respeitando os cinco imperativos da qualidade, alguns pontos são chave, segundo seus defensores: convencer os dirigentes; implantar uma estrutura de qualidade, obter a adesão do pessoal no nível de gerência intermediária, elaborar e implementar programa de formação em todos os níveis.

Os obstáculos que devem ser evitados são: passividade das chefias, falta de constância de propósitos, resultados imediatos e mobilidades de administração.

Se os princípios aqui alinhavados forem seguidos pelas escolas, é razoável esperar que os resultados obtidos sejam melhores, afinal, indepenedente da aplicação ou não dos princípios da QT, uma gestão democrática da educação passa por uma maior participação dos atores na gestão da escola.

Diálogo*:* Do ponto de vista discursivo não há enunciado desprovido da dimensão dialógica, todo o discurso é fundamentalmente diálogo. O discurso é o efeito de sentido construído no processo de interlocução. Nesse aspecto, o discurso da Qualidade Total em Educação perde sua pretensa substância e talvez nem possa ser caracterizado como um discurso, efetivamente, pois diálogo é o que mais lhe falta.

Na verdade, a QT em Educação, como em qualquer outra área em que se a aplique, se impõe como uma solução para as mazelas da escola na forma de um bloco hegemônico de procedimentos cuja aplicação, total e extensiva, garante resultados positivos, segundo seus defensores. Não há espaço para dúvidas, para alternativas de percurso e isso justamente o desqualifica para aplicação a que se propõe: a educação, área de conhecimento necessariamente dinâmica e criativa, em constante reflexão e mudanças de rota, num movimento que é próprio da atividade humana, sua essência.

Sentido*:* para a Análise do Discurso, não existe um sentido *a priori*, mas um sentido que é construído, produzido pelo processo de interlocução. No caso da Qualidade Total em Educação, essa busca de sentido que pretende se dar através do processo de interlocução não ocorre, uma vez que essa interlocução simplesmente não existe. O PQT não vai sendo construído, à medida que é implantado, ele é imposto e sua aplicação na íntegra é a garantia para seu sucesso, segundo seus defensores. Por esse aspecto, novamente, temos dificuldade em caracterizá-lo *strictu sensu* como discurso.

No entanto, mesmo com a ausência tanto de diálogo como de sentido, se considerarmos a definição alargada de discurso de Laclau segundo o qual "*cada ato social tem um significado, e é constituído na forma de seqüências discursivas que articulam elementos lingüísticos e extralinguísticos"(Laclau, 1991, p137)*[2], ainda podemos falar em discurso da Qualidade Total.

Sujeito: para a AD a noção de sujeito deixa de ser uma noção idealista, imanente: o sujeito da linguagem não é o sujeito em si, mas tal como existe socialmente interpelado pela ideologia. Nesse aspecto, os sujeitos são os enunciadores desse discurso e os objetos desse discurso-comunidade, alunos, professores, apresentam-se como assujeitados nesse processo.

CONCLUSÕES E PROPOSTAS

Sob nosso ponto de vista, todas as iniciativas para tornar mais abrangente a formação dos alunos universitários, bem como propiciar que um número cada vez maior de indivíduos em nossa sociedade tenha acesso a esta modalidade de formação, com melhor qualidade, são válidos. No caso das Instituições brasileiras, têm sido comum, hoje em dia, as seguintes iniciativas: implantação de Programas de Qualidade Total, Ensino à Distância via Internet ou através de Videoconferências, uso de recursos de Informática no Ensino e assim por diante.

Entretanto, estas iniciativas têm se revelado insuficientes para dar conta das questões de ordem epistemológica envolvidas nos processos educativos em curso, justamente por não priorizá-las.

No caso específico dos PQT, algumas das objeções que podemos fazer em relação ao seu uso em Educação referem-se, em primeiro lugar, à aplicabilidade restrita desse modelo à área administrativa das escolas, contribuindo tão somente para a melhoria da administração da atividade escolar, sem possibilidade de qualquer repercussão no seu projeto pedagógico.

Uma segunda categoria de objeções reside na ingerência descabida pro(im)posta por esses PQT´s no fazer pedagógico da escola, através da substituição do trabalho de especialistas em educação por especialistas de áreas essencialmente tecnológicas, trazendo com isso a substituição da discussão necessária no âmbito pedagógico por métodos e técnicas essencialmente utilitárias.

Consonante com esse pensamento, Vieira[4] afirma que:

> *" um modelo adotado no intuito de obter maior retorno de capital não necessariamente se aplica à esfera do trabalho não material, como é o caso da educação. Assim, uma fábrica de componentes eletrônicos não é a mesma coisa que uma escola ou uma sala de aula. O trabalho que se desenvolve numa instituição educacional, qualquer que seja a sua complexidade, envolve um processo cujos resultados são apenas parcialmente mensuráveis. Isto porque a aprendizagem é um processo que envolve conhecimento, sentimento e ação, componentes nem sempre passíveis de medida.*
>
> *O produto da aprendizagem pode não apresentar resultados a curto prazo. do mesmo modo, um processo que produz resultados em determinada realidade, pode não surtir efeitos em outra, pela influência de fatores como a história da vida dos agentes envolvidos no processo educativo, determinações culturais, etc. Há que se considerar também que a educação não se restringe a uma questão de insumos... entende-se que a lógica da produção material não necessariamente se aplica à realidade educacional. Pensar em qualidade na educação, mesmo do ponto de vista de sua gestão é algo que ultrapassa uma perspectiva de qualidade total, muito embora existam aspectos que possam ser incorporados à gerencia de seus serviços.."*

Por que o discurso da Qualidade Total encontrou terreno fértil na Educação ? Segundo Paulo Volker[5]:

"A escola moderna assimila, em vários pontos, a tradição de ensino dos seus antepassados (a meritocracia, a erudição, a formação abstrata e desvinculada do real, etc.), tanto quanto assimila aspectos essenciais do mundo da produção (a compartimentação, a especialização, o tecnicismo, o positivismo, o pragmatismo, etc.). De uma forma ou de outra, como toda a instituição, padece também da falta de entusiasmo e adesão de seus membros. ... as estatísticas de fracasso escolar, da repetência, da evasão, da falta de produção de pesquisas e até de ensino se avolumam. Essa realidade justificou a adoção de um método que tentasse garantir a qualidade deste trabalho".

No caso específico da Engenharia Elétrica, os resultados obtidos pelo PQT estiveram muito aquém do esperado pelos incentivadores do mesmo, tanto em nível de qualificação das ações administrativas de rotina, quanto, e principalmente, das ações pedagógicas. Apesar das reuniões feitas terem servido como um momento de reflexão de todos os envolvidos sobre suas atividades, o que talvez tenha sido o resultado mais importante e significativo desse processo, a superficialidade de análise imposta pelas diretrizes da Qualidade Total, no nosso entendimento não permitiram e nem permitiriam, caso houvesse continuidade desse processo, um aprofundamento necessário principalmente sobre o aspecto do ensino, consistindo em um mais uma prova inequívoca da ineficiência e inadequação do uso dessa metodologia para essa finalidade.

Conforme Silva Jr[3]:

> *"o uso dos programas de Qualidade em Educação é uma ideologia administrativa que se constitui em impossibilidade teórica, pois ao transpor para propostas pedagógicas as teorias administrativas empresariais, temos, na realidade, uma psicologização dos problemas educacionais e um total desconhecimento das contradições sociais e ideológicas presentes na Universidade, enquanto unicidade institucional, na qual as identidades e individualidades se formam para o mundo do trabalho".*

EXPERIÊNCIAS EM EDUCAÇÃO A DISTÂNCIA EM DISCIPLINAS DE INFORMÁTICA E COMPUTAÇÃO PARA PÓS-GRADUAÇÃO

Carlos Miguel Tobar Toledo[1], Juan Manuel Adán Coello[2] e João Luís Garcia Rosa[3]

Abstract *— Discussions and more discussions about computer use in educational activities are taking the academia, schools and media. As a result of a new educational approach, which establishes the computer as a versatile information-communicator channel, systems that support course delivery and monitoring emerge, such as WebCT. This paper presents experiences using WebCT to offer classes to graduation courses related to computing and information systems. Each occasion taken into account in this report covers a full semester, when 75% of the activities are developed through computer mediation, at distance, and 25% are present activities, scattered through the semester. In this paper are presented the WebCT facilities that were employed, the pedagogical strategies, and an analysis of the obtained results.*

Index Terms — Distance education, computer aided learning, report on educational graduate experiences, WebCT.

INTRODUÇÃO

O aprendizado a distância suportado por computador tem um pouco de estudo por correspondência, ensino telemático, estudo a distância e aprendizado aberto e a distância. É uma forma para desenvolvimento de recursos humanos que prescinde de uma completa interação presencial entre estudante e instrutor, que remonta a experiências de aprendizado do início do século XVIII e ao espetacular *boom* do início do século XX, com as escolas e universidades por correspondência nos EUA. Forma esta que reaparece no fim do século XX como uma promessa de ser uma revolução na forma e substância do ensino superior.

Aprendizado mediado por computador cobre conceitos apresentados sob diferentes siglas abrangendo e mesmo combinando diferentes abordagens, tais como CAL (Computer Aided Learning) [1], ALN (Asynchronous Learning Networks) [2], ODL (Online Distance Learning) [3] e IBT (Internet-Based Training) [4].

Frente a esse novo paradigma educacional, que estabelece o computador como um canal para comunicação de informação, com variados graus de inteligência e participação, grande parte dos modelos educacionais em uso tem se mostrado inadequada e necessita ser melhorada.

A tecnologia que permite o oferecimento de aprendizado mediado por computador está centrada na comunicação e processamento da informação usando diferentes mídias (áudio, vídeo, hipertexto, voz, etc.), na existência de redes de comunicação e em metáforas educacionais construídas a partir de teoria educacional e psicologia cognitiva. A tecnologia é dada ao aprendiz para que a use na representação e expressão daquilo que sabe [5].

A WWW (World Wide Web) propicia o acesso e a transmissão de qualquer tipo de informação digitalizada, quase que instantaneamente, além de diferentes tipos de comunicação pessoa a pessoa. Assim, acabou, também, alavancando o aprendizado mediado por computador, tornando-se a espinha dorsal de ferramentas de comunicação efetivas, entre as quais destacam-se o correio eletrônico, as listas de discussão, as salas de conversação (*chat*) e a teleconferência, que integradas compõem sistemas de apoio para o oferecimento e acompanhamento de cursos.

Querer oferecer cursos a distância significa exigir que os atores participantes do processo de aprendizado, professor e aprendizes, necessitem interagir. Interação corresponde à comunicação, participação e retro-alimentação de resultados [6]. É a interação que permite o cultivo de habilidades instrucionais e um diálogo enriquecedor com seus pares.

Independente dos prós e contras, a educação a distância é uma realidade regulamentada na Lei de Diretrizes e Bases da Educação (LDB) e decretos federais, oferecida como opção para a obtenção de créditos em programas de Mestrado da PUC-Campinas, e que tem chamado a atenção de alunos e professores em toda a Universidade e em várias regiões do Brasil, apesar de objeto de controvérsias.

Este trabalho trata de relatar a experiência de uso da educação a distância para oferecimento de disciplinas de mestrado ligadas à área de informática e computação, durante seis ocasiões, cada qual com duração de um semestre, em que 75% da carga horária foi desenvolvida a distância, através de suporte computacional, e 25% consistiu de encontros presenciais dentro da PUC-Campinas. Os encontros presenciais foram espaçados durante o semestre. Inicialmente é apresentada a estratégia pedagógica usada. A seguir são apresentados comentários sobre as facilidades usadas no WebCT. Segue o critério de avaliação usado e a apresentação de técnicas para um desenrolar satisfatório das atividades, principalmente no que se relaciona à motivação e participação dos alunos. Para finalizar, são apontados

recursos que o WebCT não oferece e que seriam importantes, bem como observações finais e conclusões.

ESTRATÉGIA PEDAGÓGICA

A tecnologia que permite o oferecimento de educação a distância na PUC-Campinas está centrada no uso do WebCT[4], um dos sistemas de apoio para o oferecimento e acompanhamento de cursos existentes no mercado. O WebCT destaca-se pela sua propagada utilização em mais de 2500 instituições, em 81 países do mundo.

Segundo Schär e Krueger [1], o aprendizado não é um fenômeno unitário. Existem diferentes mecanismos de aprendizado, cada qual suportado de maneira diferente. Além disso, falta uma teoria comum para o aprendizado. Para o ensino com suporte computacional, filosofias contrastantes que vão do objetivismo ao construtivismo estabelecem extremos de um contínuo. O objetivismo está baseado na idéia de que estudantes aprendem por que se lhes falam, e que o conhecimento é objetivo e existe independentemente dos estudantes. O construtivismo presume que pessoas aprendem fazendo, ou seja, constróem conhecimento situando experiências cognitivas em atividades autênticas. Como resultado, o conhecimento emergente pode ser um tanto intuitivo, mas consolidado.

Nota-se na estratégia pedagógica escolhida um pouco da doutrina objetivista, principalmente na produção de material, e muito da construtivista, na dinâmica de preparação e discussão dos materiais produzidos. Considera-se que o conhecimento é uma produção social, cujo acesso por um sujeito implica a mediação de, pelo menos, outro sujeito.

Tal qual Ramal [7] preconiza, nas seis oportunidades relatadas, o professor procurou ser o dinamizador da inteligência coletiva do grupo, através da verificação tanto das respostas a que o aluno chegou, como dos caminhos utilizados para isso. Os percursos dizem muito mais sobre o desenvolvimento de habilidades e competências do que as respostas, vinculado a uma nova relação com o erro. Aprende-se no ensaio e no erro.

Em vez de acumular dados no arquivo mental, aprender é desenvolver competências, habilidades, procedimentos, visões de mundo, posturas de vida e de trabalho. A idéia básica é permitir que o conhecimento seja buscado e construído pelos alunos, a partir de pesquisas e experiências pessoais e coletivas. O acesso à informação dentro e fora da escola, torna ingênua a tentativa de estabelecer planejamentos rígidos e esquemas antecipados de aprendizagem. Todas as trajetórias são individuais e a educação necessita ser personalizada.

A estratégia usada consistiu das seguintes etapas:

- A definição, pelo professor, de temas que devem ser tratados, juntamente com uma bibliografia básica. Esses temas em conjunto compõem o programa para uma disciplina, tal como Tecnologia de Banco de Dados na Web ou Engenharia de Software. Em geral, são escolhidos de 8 a 10 temas, cada qual a ser tratado durante toda uma semana de atividades. Um grupo de dois a três alunos fica responsável por um dos temas e este grupo é formado em função de parcerias e projetos comuns, a partir da complementação de competências [7].
- Os alunos pesquisam, escolhem e propõem uma referência que aborde o tema definido para o grupo. O tempo limite para que haja uma referência aprovada pelo professor pode variar de uma a duas semanas, a partir do primeiro encontro presencial[5].
- Cada grupo fica responsável pelo desenvolvimento de um trabalho escrito sintetizando a referência escolhida. Não se trata de tradução. O trabalho deve seguir orientações de conteúdo e estrutura [6].
- Cada grupo prepara o material para uma "apresentação", baseada na referência escolhida, em uma semana previamente definida [7].
- Cada grupo conduz a discussão sobre a sua apresentação, bem como sobre assuntos correlatos, durante toda a semana agendada[8]. O aprendizado através de discussão e debate, segundo Bourne *et al.* [2], uma entre várias abordagens aplicáveis à educação a distância, pode ser muito demorado quando envolve muitos aprendizes, mas é potencialmente mais rico do que discussões em classe.
- Cada grupo de alunos revisa um dos trabalhos escritos por um outro grupo[9]. A revisão deve ser iniciada a partir da data de entrega do trabalho escrito e ser entregue e discutida na terceira aula presencial. Deve haver a preocupação de recomendar alterações ou correções relacionadas à estrutura, redação e conteúdo.

---

[4] WebCT pertence à WebCT Inc. provedor de soluções para *e-learning* - www.webct.com

[5] A origem da referência é aprovada pelo professor e, para isso, esta deve ser submetida a julgamento. A referência deve somar algo em torno de 10 páginas de texto, de maneira a evitar sobrecarga cognitiva nos demais alunos, que posteriormente têm como atividade obrigatória a sua leitura. Cada grupo fica responsável por colocar à disposição cópia digital (no WebCT) da referência aprovada.

[6] É marcada uma data para uma primeira versão do trabalho. Em geral, essa data é a mesma da segunda aula presencial para todos os grupos e deve ser disponibilizada cópia digital desse trabalho escrito.

[7] Deve-se gerar a apresentação usando PowerPoint (marca registrada da Microsoft Corp.), com mais ou menos 20 *slides*, cada qual contendo anotações do que seria dito durante uma apresentação presencial dos slides, se esta se realizasse. As anotações devem complementar o conteúdo dos *slides*. Na data estipulada, o material da apresentação deve ser colocado à disposição dos demais alunos no WebCT, em formato digital.

[8] Como resultado das discussões, o grupo responsável deve providenciar mudanças no material de apresentação para deixá-lo disponível, até uma semana depois de encerrada a discussão. Há também um acompanhamento mais cuidadoso por parte do professor, de maneira que haja uma revisão completa do material da apresentação, tanto em conteúdo como em forma. Uma cópia de cada apresentação, em formato HTML, é gerada pelo professor e é disponibilizada no WebCT.

[9] O trabalho de revisão deve ser realizado usando-se o recurso de controle de alterações disponível no editor Word (marca registrada da Microsoft Corp.). A revisão deve ser entregue impressa em papel na aula presencial e publicada em formato digital no WebCT.

- Individualmente, os alunos realizam a leitura de cada referência escolhida e se preparam para o respectivo período de discussão. Como resultado, devem confeccionar uma ficha bibliográfica[10].
- Cada aluno participa da discussão ocorrida em cada uma das apresentações. Todo tipo de contribuição é esperado nessas discussões e, para isso, deve-se utilizar a leitura realizada sobre a referência. Também são esperadas dúvidas e comentários sobre assuntos correlatos aos que estão em discussão, além da indicação de outras referências e fontes de informação interessantes.
- Cada aluno participa das atividades em grupo que ocorrem nas aulas presenciais.

USANDO O WEBCT

A ferramenta WebCT apresenta facilidades que dão suporte a diferentes formas de comunicação, colaboração e administração, acessíveis apenas a quem está cadastrado em um determinado curso, oferecidas de acordo com o tipo de usuário: administrador, estudante ou instrutor.

Um dos pontos importantes quando se prepara um curso a ser oferecido via WebCT é a escolha dos recursos que serão usados durante o curso. Quando se tem que decidir sobre esses recursos, depara-se com o conhecidíssimo dilema comunicação síncrona (aquela que ocorre em tempo real) vs. comunicação assíncrona.

Lembra Goldberg [8], um dos idealizadores do WebCT, que, em vários de seus contatos com educadores pelo mundo, há a preferência pela comunicação assíncrona. Isto porque, a comunicação síncrona acaba por não se tornar realidade, devido às limitações atuais da Internet, que não oferece a necessária qualidade de serviço, como largura de banda. Além disso, facilidades de comunicação e colaboração assíncronas, além de eliminar barreiras de distância, também permitem eliminar barreiras de tempo, o que no caso dos estudantes típicos de um mestrado profissional é quase um requisito. Isso porque a grande maioria trabalha e espaços em suas agendas são só encontrados nos fins de semana e em altos horários noturnos. Outra vantagem é o tempo ganho para se argumentar melhor quando requerido. Não há necessidade de respostas imediatas. Há chance para pesquisa e revisão, antes da resposta. Os estudantes têm a oportunidade de estabelecer diálogos provocativos. Isto ocasiona um certo grau de confiança que não existiria em uma sala de aula convencional. Essa possibilidade de reflexão constitui uma oportunidade de metacognição, atividade esta necessária para a realização de um pleno processo de aprendizado.

Foram colocadas à disposição listas de discussão como facilidades principais para comunicação e colaboração, separadas de acordo com o tema a ser tratado durante uma semana. Também foram usados o correio eletrônico e as salas de bate-papo. Solicitou-se aos estudantes a criação de páginas com os seus dados pessoais a fim de facilitar a comunicação entre pares e entre professor e aluno.

Opcionalmente, a facilidade síncrona de *chat* foi utilizada pelos estudantes em uma dezena de ocasiões, mas, em várias dessas ocasiões, os alunos desistiram devido à sua lentidão e a problemas com a execução do software.

Quanto ao material de curso, o WebCT oferece facilidades para autoria de páginas, mas preferencialmente deve-se optar por editores de documentos externos e depois importar o material.

CRITÉRIO DE AVALIAÇÃO

Além de materiais educacionais e estratégias diferentes, o aprendizado mediado por computador requer avaliações que devem ser vistas sob quatro prismas: o conteúdo ou conhecimento do domínio; habilidades heurísticas; habilidades metacognitivas; e estratégias de aprendizado [9].

Para cada uma das atividades desenvolvidas em grupo, a entrega dos respectivos produtos (trabalho escrito, revisão, preparação da apresentação e controle da discussão) teve que ser feita acompanhada de uma distribuição de trabalho, definida pelo próprio grupo, que representa uma oportunidade para reflexão sobre a atividade realizada.

O critério de avaliação considera que o rendimento final tem que ser igual ou superior a 70% e leva em conta os seguintes pontos: a pontualidade no cumprimento de tarefas; a adequação do conteúdo do trabalho desenvolvido ao tema definido; o desenvolvimento e correção da apresentação; encaminhamento das discussões da própria apresentação; o desenvolvimento e discussão da revisão; a participação nas aulas presenciais; e a constância, qualidade e prontidão nas participações.

MOTIVAÇÃO PARA PARTICIPAÇÃO E COLABORAÇÃO

Um ambiente como o WebCT permite que ocorra um aprendizado construtivista, o que, segundo Wilson [10], realiza-se através de um local onde aprendizes podem trabalhar juntos e dar suporte um ao outro, guiados por objetivos de aprendizado e atividades para solução de problemas, o que tenta-se concretizar através da estratégia pedagógica, apresentada anteriormente.

A concepção de espaços de aprendizagem suportados por computador, dentro de uma orientação colaborativa decorrente da natureza social do aprendizado, constitui uma proposta alternativa e contemporânea da prática pedagógica articulada à construção de pedagogias transformativas [11].

Várias técnicas podem ser usadas para encorajar a ocorrência de participação e colaboração, desde a coerção através do critério de avaliação até o modelo instrucional de Collins *et al*. [9], *Cognitive Apprenticeship*, no qual várias estratégias levam o estudante a receber exemplos prontos, a refletir sobre os mesmos e a praticar. Mesmo assim, vários

[10] Essa ficha deve ser encaminhada via WebCT para o professor, até o dia de início da apresentação.

são os alunos que não participam ou participam minimamente devido a diferentes razões. Segundo Hannafin *et al*. [12], a maioria dos aprendizes não apresenta as habilidades substanciais de auto-monitoração que a educação a distância exige. Por isso, recomenda-se que estes recebam mais suporte acadêmico dos pares e do professor. Aprendizes devem, através de uma interação que ofereça a oportunidade para reflexão, adquirir essas habilidades.

Entre as técnicas usadas durante o oferecimento das disciplinas de mestrado citam-se:

- A preparação das apresentações por parte do professor, com o cuidado de seguir as mesmas regras impostas aos estudantes, criadas e articuladas antes das primeiras apresentações dos alunos para servir de exemplo.
- A preparação dos trabalhos escritos seguindo uma metodologia para produção científica e a realização da revisão de trabalhos de pares, além de sua comparação com uma revisão produzida pelo professor.
- A semeadura de questões durante cada apresentação, algumas das quais são encaminhadas com a observação que devem ser respondidas por todos os alunos. Perguntas abertas, segundo Nunn [13], permitem aos alunos compartilharem suas perspectivas quanto à qualidade de suas experiências educacionais. A provocação de dissonância cognitiva (através da provocação de curiosidade, de desconforto, da negação de conceitos já estabelecidos e da colocação de problemas) segundo Peirce [14], ajuda no desenvolvimento de habilidades para raciocínio crítico.
- O acompanhamento das respostas dadas e não dadas, com a cobrança de melhoria e clareza, e o aprofundamento da discussão com novas questões, principalmente para elucidar o raciocínio do aluno, como ocorre em um bom diálogo socrático.
- O oferecimento de ajuda, através do canal de comunicação privado, para tirar dúvidas ou para o encaminhamento de questões colocadas por colegas.
- A cobrança periódica daqueles alunos que não cumpriram deveres, através de canal de comunicação privado, com o aviso sobre a sua situação em relação à avaliação, de maneira a sempre permitir que o aluno tenha condição de reverter uma situação ruim. A interação realizada deve promover uma retroalimentação efetiva que ajude ao aluno a refletir sobre a qualidade de seu trabalho [15].
- A consideração de uma auto avaliação dos elementos de um grupo, através da distribuição percentual do trabalho individual desenvolvido em uma atividade.

O QUE FALTA NO WEBCT

Um sistema para o apoio ao aprendizado deve poder suportar a personalização, ou seja, adaptar a apresentação do conteúdo e a operação da ferramenta, permitindo considerar os objetivos, conhecimento e outras informações, conforme o perfil do aprendiz (modelo do aprendiz).

Com relação ao WebCT, não há facilidades que se preocupem em estabelecer um perfil para os alunos. Como isso não ocorre, pode-se dizer que não há suporte à personalização. Nem mesmo para adaptação de suporte à navegação.

Informação que não pode ser encontrada ou usada de nada vale. Prover informação não significa educação [16]; faz-se necessária uma tecnologia educacional que exista para associar recursos de informação com ferramentas interativas e dinâmicas que guiem o aprendiz à criação de um conhecimento pessoal. O objetivo de um tutor oferecedor de seqüência de material é prover ao aprendiz a seqüência planejada individual mais adequada de unidades de conhecimento para aprendizado e realização de tarefas de aprendizado. Este tipo de facilidade pode se basear, entre outras coisas, no conhecimento do estudante e nas suas preferências (no tipo de mídia e de material); e procura solucionar o problema da perda no hiperespaço. Mais do que personalização, a tutoria significa a automatização dos aspectos pedagógicos envolvidos no aprendizado.

Dois tipos de seqüenciamento podem ser considerados. O seqüenciamento ativo que implica em ter um objetivo de aprendizado, um subconjunto de conceitos ou tópicos que se deve dominar. E o seqüenciamento passivo (remediação), que é uma tecnologia reativa que não requer um objetivo de aprendizado, mas sim oferece um subconjunto do material de aprendizado, que pode resolver um entendimento errado ou a falta de conhecimento.

Outro aspecto importante em um sistema tipo WebCT é o do suporte à solução de problemas, que infelizmente não existe. Esse suporte pode se realizar através da análise inteligente de soluções do aprendiz, que lida com as respostas do aprendiz, sem se preocupar em como estas foram obtidas. O sistema na figura de um tutor necessita saber se a solução está correta ou não, o que está falho ou faltando e, possivelmente, identificar qual conhecimento errôneo ou faltante é responsável pelo erro. Outro tipo de suporte se concretiza através da interação para solução de problemas, com passos da solução de problemas. O nível de ajuda pode variar desde a indicação de um passo errado, uma dica, até a execução do próximo passo para o aprendiz. Solução de problemas baseada em exemplos sugere ao aprendiz casos solucionados com sucesso a partir de sua experiência anterior.

É essencial a existência de facilidades que permitam reflexão pós-atuação, ou seja, o ambiente deve prover um registro da atividade desenvolvida, para aprendizado e solução de problemas. Até certo ponto, o WebCT oferece esse tipo de facilidade, ao registrar todas as discussões e trocas de informações havidas, indicações de tipos de atividades realizadas no tempo, tais como leituras e submissão de mensagens. Segundo Wilson [10], outros objetivos pedagógicos atingíveis através de metacognição compreendem, entre aqueles não suportados pelo WebCT: a provisão aos estudantes de experiência com o processo de construção de conhecimento; a provisão de experiência em, além de apreciação de, múltiplas perspectivas; e a permissão de um processo de aprendizado centrado no estudante, onde seja possível atuar em um papel importante de estabelecimento de objetivos para aprendizado.

CONCLUSÕES

Discussões e mais discussões sobre o uso do computador em atividades educacionais tomam conta da academia, das escolas e da mídia. De certo, apenas, é que o uso do computador e da WWW como ferramentas educacionais está ocorrendo em todas as escolas, colégios e universidades, algumas vezes até estabelecendo um ambiente educacional virtual, embora, pareça estar se perdendo uma ótima oportunidade para uma apreciação completa do relacionamento entre tecnologia e educação [17].

Este trabalho constitui uma síntese do uso de uma ferramenta de apoio para o oferecimento e acompanhamento de cursos, usada em disciplinas de programas de mestrado. Nesta síntese procura-se apresentar a estratégia usada em conjunto com a ferramenta e parte dos resultados obtidos, que se apresentam na forma de uma análise da ferramenta.

Nas seis oportunidades relatadas houve uma participação média por disciplina de 950 intervenções, chegando em uma das situações a haver mais de 1.300 intervenções. Com cada disciplina tendo sido oferecida durante 15 semanas, isto significa, que com média de dez estudantes, cada um contribuiu com 95 intervenções, o que dá uma média de seis intervenções semanais. Muito acima do que seria conseguido em classe.

O tempo de dedicação médio, por aluno, foi de duas horas e 35 minutos semanais, em contato com o WebCT. Nesse montante não estão incluídas as pesquisas e leituras feitas através da WWW ou em bibliotecas. Alguns alunos chegaram a reportar uma dedicação de mais de dez horas em algumas semanas. É interessante notar que, nas semanas de discussão, alguns dos apresentadores ficam empolgados e realizam excelente trabalho de pesquisa para poder responder a questões de seus pares. Experiências como essas permitem ao aluno ter o controle para influenciar o próprio processo de aprendizado.

A oportunidade para reflexão sobre o papel do professor, sobre a preparação de material e sobre a avaliação é um dos principais resultados, senão o principal resultado, de toda a experiência relatada. Essa oportunidade ocorre em quase todas as situações envolvidas. Educação a distância, e aprendizado suportado por computador em geral, baseia-se em um modelo aberto de aprendizado que traz momentos de ansiedade aos melhores professores, mesmo àqueles experientes com a tecnologia, como lembra Muirhead [6].

Finalizando, é importante lembrar o alerta do historiador David C. Noble [18] para o perigo da massificação desse tipo de processo educacional, pois, ao mesmo tempo em que o aprendizado suportado por computador é a última moda para várias instituições pelo mundo, a educação não prescinde de um relacionamento interpessoal entre professor e aluno, e aluno e aluno, que objetiva o auto-conhecimento individual e coletivo. Além disso, argumenta Noble, no bojo do que se oferece hoje como aprendizado suportado por computador encontram-se interesses econômicos e não educacionais, que acabarão por provocar o fim da instituição universitária.

FRAMEWORK DE BASE CONSTRUTIVISTA PARA UM AMBIENTE DE AVALIAÇÃO EM EDUCAÇÃO A DISTÂNCIA

David Nadler Prata[1] , Alex Sandro Gomes[1], Patricia Tedesco[1]

Resumo *— A EAD encontra-se, atualmente, em um processo avançado. Várias são as instituições de ensino que disponibilizam cursos a distancia. No caso da avaliação, normalmente, as instituições de ensino exigem que o professor forneça notas dos alunos, mas não definem "como" essas notas serão mensuradas. Fica a cargo do professor definir as formas de avaliação para atingir os objetivos institucionais. Por outro lado, no caso dos ambientes EAD do mercado, em geral, as formas de avaliação já são pré-determinadas e não levam em consideração as teorias e práticas pedagógicas que existem no mundo acadêmico. No nosso modelo, o professor é determinante central do processo de avaliação – centrado no professor. Para isso, temos uma abordagem de design centrado no usuário. Através de entrevistas, interações e prototipação, procuramos moldar um ambiente de avaliação construtivista. O modelo apresentado visa um ambiente mais flexível para avaliação.*

Palavras-chave: Avaliação, Educação a Distancia, centrado no usuário.

Abstract *— Nowadays, Distance Learning is going through an advanced process where many schools are offering this kind of learning. When the matter is assessment, generally the schools demand that teachers give a score to students, but usually they don't explain how to do this systematically and mainly they don't show a specific strategic measure that have to be used. Otherwise, the most of DLE is been created with a specific assessments' process disrespecting pedagogical theory and teachers' practices that are butress to academic world. On our model, the teacher is a central objective of assessments' process, so is a teacher-centered model that considers design approaches focus on user. Interviews, interactions and prototypation are used to develop an environment of contrutivism assessments which intend to be more flexible and to give improvement to DLE.*

Index terms: assessment, distance learning, user-centered-design.

INTRODUÇÃO

Não é difícil perceber que os princípios da escola construtivistas vêm ao encontro do modelo de EAD. Na teoria construtivista [4] a ênfase é estabelecida no aprendiz de preferência ao professor. É o aprendiz que interage com objetos e eventos e assim ganha um entendimento das características inclusas nesses objetos ou eventos. O aprendiz, assim, constrói suas próprias conceituações e soluções aos problemas. A autonomia e iniciativa do aprendiz são aceitas e encorajadas.

Há muita sobreposição entre construtivismo e a teoria construtivista social de Vygotsky. Porém, a teoria construtivista de Vygotsky, apresenta melhores condições para um professor mais ativo e envolvido com a aprendizagem. Alguns princípios Vygotskyanos podem ser aplicados em qualquer sala de aula, como [6]: (a) a aprendizagem é uma atividade social, colaborativa; (b) a zona de desenvolvimento proximal – diferença entre o nível de desenvolvimento atual (capacidade de solucionar problemas sozinho) e o nível de desenvolvimento potencial (capacidade de solucionar problemas com auxílio de um adulto ou pessoa mais qualificada) – pode servir como um guia para aulas e para o planejamento curricular.

A avaliação, até o início dos anos 80, tinha como objetivo medir os resultados do ensino como meio de responsabilidade em garantir a qualidade da aprendizagem produzida. Desde então, esta forma de avaliar recebeu novos papéis visando melhorar os atributos de ensino. A avaliação no processo ensino-aprendizagem caracteriza por ser utilizada, também, para aprimorar a qualidade e produtividade da aprendizagem. Esta nova forma de abordar a avaliação revolucionou-a em sua complexidade, sofrendo transformações e sendo incorporada como metodologia, de caráter intrínseco, acoplada a aprendizagem. Este processo de avaliação se desdobra aparecendo não somente como fim, mas também como meio, interagindo com técnicas e metodologias de aprendizagem.

Este artigo descreve um modelo construtivista para avaliação em EAD que se baseia em três estratégias; avaliação tradicional, ponto de vista dos estudantes e acompanhamento da aprendizagem.

AMBIENTES DE AVALIAÇÃO EM CURSOS A DISTÂNCIA

Existem vários ambientes em EAD. Esses ambientes provêm mecanismos para acompanhamento do aprendizado e elaboração de testes com estatísticas. Observando os

[1] Centro de Informática UFPE, Cx. Postal 7851 Cidade Universitária, 50732-970 Recife-PE Brazil, {asg, avg, pcart, ggn, dnp}@cin.ufpe.br

trabalhos de Morgan [10], Tarouco [14], Bergamo [1], Plugge et al. [11] e Silva [13], verificamos a relação de 18 ambientes para EAD com suas ferramentas de avaliação e acompanhamento do aprendizado.

Podemos observar a identificação de 4 mecanismos para suporte ao acompanhamento do aprendizado: rastreamento das ações do aluno, redirecionamento por teste, registros de chats e registros de listas de discussão. Para a avaliação tradicional contamos com: análise de texto, auto-avaliação, reuso de questões, testes temporizados, testes personalizados, testes pela Web, testes adaptáveis e trabalhos via Web. Os ambientes de EAD analisados foram: AulaNet, Blackboard, Carnegie, ClassNet, CyberQ, Docent, E-college, EduSystem, Embanet, FirstClass, IntraLearn, LearnLine, Learn Space, Serf, TopClass, Virtual-U, WebCourseInABox e WebCT.

O DESIGN DO AMBIENTE

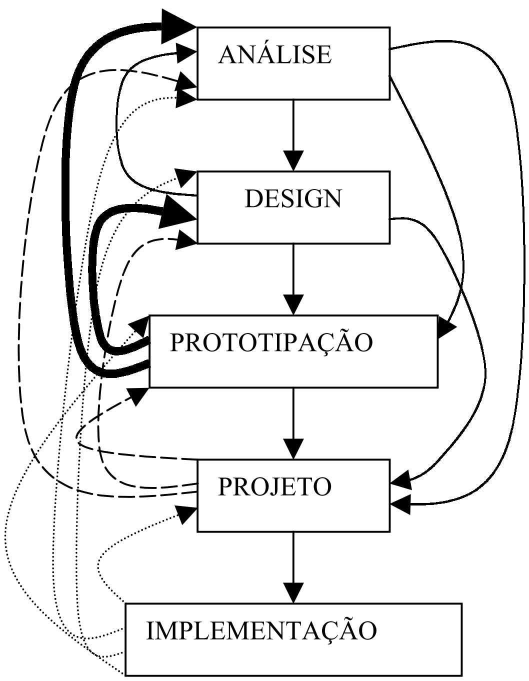

Figura 1-Ciclo deVida do desenvolvimento do Ambiente de Avaliação do AMADeUs

O modelo clássico do ciclo de vida da Engenharia de Software não prevê explicitamente o design de interface homem/computador. O design tende a ser tratado como um tópico de nível avançado, separado do modelo clássico de Engenharia de Software. Desta forma, o engenheiro de software tende a ver o design de interface como uma parte adicional a Engenharia de Software. Acontece que no ponto de vista do usuário, com as aplicações modernas que utilizam interface gráfica (GUI), a interface é o sistema. A interface é o que o usuário vê e trabalha interagindo. Qualquer coisa que não possa ser identificada como parte da interface tem menor significância para o usuário. As

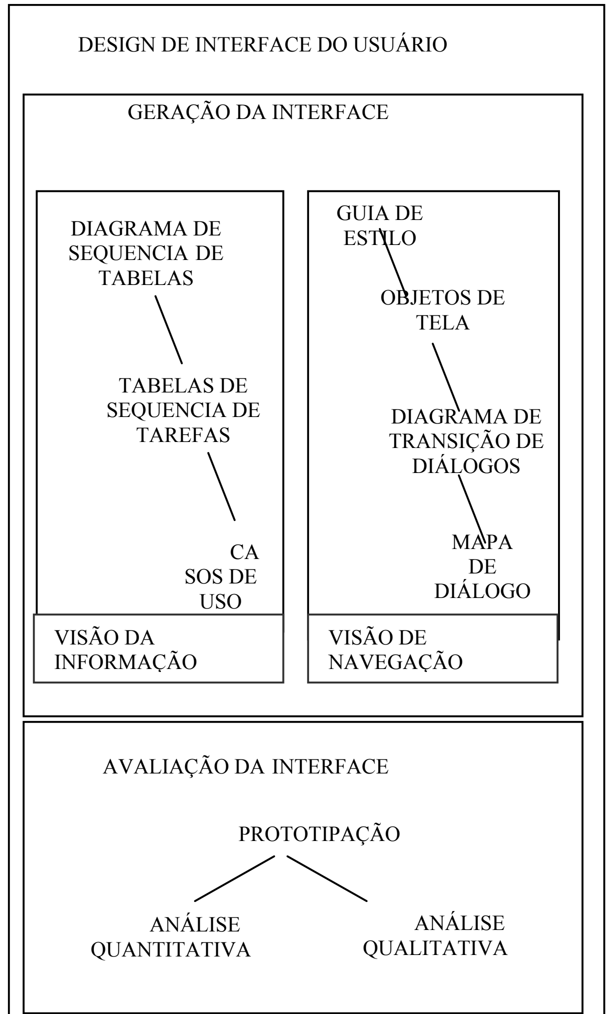

Figura 2-Design do Ambiente de Avaliação do AMADeUs

interfaces gráficas (GUI) juntamente com as ferramentas de prototipação levaram a um modo de fazer design mais experimental, que vem ao encontro dos modelos de design centrado no usuário. Essa maneira de se fazer engenharia de software requer uma nova visão em seu ciclo de vida. Na nossa visão, o desenvolvimento de software exige uma série de iterações em suas atividades (Figura 1). O design assume um papel bem definido no ciclo de vida da Engenharia de Software. Neste seu papel, o design não se preocupa somente com as telas do sistema, mas também com a seqüência de tarefas que o usuário terá que desempenhar para atingir seus objetivos.

Dentro do ciclo de vida de design da interface do usuário temos duas fases principais: a geração e a avaliação [8].

A geração da interface do usuário possui duas fases: a visão da informação e a visão de navegação.

A visão da informação se inicia com a construção de diagramas das seqüências de tarefas do usuário. Os diagramas das seqüências de tarefas produzirão as tabelas de seqüência de tarefas. As tabelas de seqüência de tarefas produzirão os casos de uso, que também serão usados, posteriormente, na fase de projeto da Engenharia de software.
A visão de navegação inicia-se com a definição de um Style Guide (Guia de estilo), guidelines (linhas de ação), padrões e convenções, a serem utilizadas no design. De posse do Style Guide pode-se construir a hierarquização dos objetos de tela, posteriormente, o diagrama de transição de diálogos, depois, o mapa de diálogo.
A fase de avaliação se inicia com a prototipação do design de interface do usuário. A análise quantitativa (tempo de aprendizado, número de erros, número de passos requeridos) pode ser feita utilizando técnicas como o modelo GOMS (Goal Operator Method Selection) [2]. A análise qualitativa (questionários, protocolo verbal, vídeo) pode ser feita utilizando o NUDIST, criando categorias hierarquizadas ou não, anexando materiais (documentos, imagens) a essas categorias (nodos), criando idéias, construindo e testando teorias sobre os dados.

PROPOSTA CONSTRUTIVISTA DE AVALIAÇÃO

Para se entender o processo de avaliação na modalidade de ensino a distância, torna-se necessário compreender como a Educação utiliza-se dessa prática. Dentro do campo educacional, a avaliação assume diferentes papéis. A classificação a seguir é definida por Bloom e seus colaboradores, onde a avaliação pode ser formativa, somativa ou diagnóstica. A avaliação formativa ocorre durante o processo de instrução; inclui todos os conteúdos importantes de uma etapa da instrução; fornece feedback ao aluno do que aprendeu e do que precisa aprender; fornece feedback ao professor, identificando as falhas dos alunos e quais os aspectos da instrução que devem ser modificados; busca o atendimento às diferenças individuais dos alunos e a prescrição de medidas alternativas de recuperação das falhas de aprendizagem. A avaliação somativa ocorre ao final da instrução com a finalidade de verificar o que o aluno efetivamente aprendeu; inclui conteúdos mais relevantes e os objetivos mais amplos do período de instrução; visa à atribuição de notas; fornece feedback ao aluno (informa-o quanto ao nível de aprendizagem alcançado), se este for o objetivo central da avaliação formativa; presta-se à comparação de resultados obtidos com diferentes alunos, métodos e materiais de ensino.

Na educação à distância, a avaliação deve ser contínua, realizada no processo enquanto o professor acompanha a construção do conhecimento e voltada a promover o progresso individual dos participantes. A avaliação deveria ser um ato dinâmico, implicando na tomada de decisão, servindo para identificar habilidades dos envolvidos no processo de aprendizagem, visando proporcionar um feedback útil aos mesmos e informações proveitosas para a comunidade escolar.

Grande parte dos ambientes de Educação a Distância reproduz formas somativas de avaliação, e logo reconhecem as limitações dessa transposição direta. Entendemos que realizar avaliações do desenvolvimento de alunos de um ambiente virtual implica em criar um novo paradigma de avaliação e o mesmo adaptado as características dos recursos disponíveis num ambiente virtual. Partimos da hipótese de que a avaliação em EaD não pode ocorrer mediante a produção de materiais isoladamente e posterior envio para avaliação. Além disso, considerar apenas a análise de um avaliador pode ser limitado, dados que há outros aspectos da aprendizagem que estão implicados na atividade em comunidades de aprendizagem.

A proposta de avaliação do A.M.A.De.Us é construtivista em sues princípios e na relação que é criada pela mesma entre alunos e professores. Ela é ao mesmo tempo proativa e continuada, realizada sobre toda a produção dos alunos, sob as diversas formas de participação dos alunos e sob múltiplos pontos de vista. A proposta construtivista é conseguida pois os resultados da avaliação servem de base à estruturação da intervenção dos professores e tutores do ambiente. A proposta pedagógica do ambiente AMADeUS para avaliação leva em consideração a observância de múltiplos parâmetros da atividade no ambiente destro de uma metodologia diagnóstica e suas avaliações a partir de pontos de vistas de usuários diferentes.

Com relação à avaliação por múltiplos parâmetros, entendemos uma avaliação que integra avaliações de diferentes atividades e produções engajadas e produzidas pelos participantes de um curso a distância. Um dos parâmetros analisados advém da análise das ações dos alunos nos componentes de interface (User software components). Esses componentes são monitorados por agentes de interface que enviam logs da atividade de resolução dos problemas para o servidor. A avaliação da aprendizagem de conceitos ocorre durante o uso dos micromundos e a resolução de instrumentos de avaliação. Essa avaliação particular apresenta para o professor uma representação gráfica do que um aluno sabe corretamente ou erroneamente.

Com relação à realização da avaliação por diferentes pontos de vista, entendemos como sendo a integração de pontos de vistas de diferentes usuários sobre o desenvolvimento de um único aluno. Analisamos três pontos de vista para produzir julgamento sobre um aluno: o ponto de vista de seu professor, o ponto de vista de seus pares e o seu ponto de vista pessoal.

No primeiro caso, o professor dispõe de vários mecanismos e ferramentas de avaliação que produzem uma nota correspondendo à integração dos vários parâmetros. A participação dos alunos é avaliada mediante monitoramento de suas atividades em diversos ambientes dos ambientes, como chat, fórum, listas e mediante o controle de entrega de materiais. Os critérios de avaliação, sendo negociados entre instrutores e alunos, podem ou não considerar essa dimensão da atividade. Uma estratégia de avaliar a participação dos alunos no curso pode ser mediante a medida proporcional de freqüência com relação ao total de participações ou a média de participações dos alunos.

Nessa direção o sistema AMADeUS permite o acompanhamento de diversas atividades, individuais e coletivas, como a participação na lista de discussão do ambiente e nas atividades realizadas de forma síncrona (eventos e encontros). O professor dispõe de ferramentas que permitem sistematizar os dados relativos à participação dos alunos nessas diferentes atividades.

No caso da avaliação por pares, os participantes de uma turma, ou comunidade de aprendizagem emitem pareceres e julgamentos sobre os colegas. Nos ambiente os pares podem avaliar a participação dos alunos. São avaliadas as participações em fóruns, e-mails, assim como trabalhos submetidos. Essa avaliação pode não ser obrigatória adotada pelo grupo mais pode ser uma alternativa de dinâmica de avaliação por parte de pares. O resultado dessa avaliação pode ou não ser incorporada pelo instrutor/tutor o resultado enquanto parte da avaliação final ou apenas para servir de parâmetro para avaliar a consistência da produção dos educandos. O tutor pode apenas utilizar-se dessa dinâmica para aumentar a participação dos alunos, ao mesmo tempo em que terá uma fonte alternativa de informações sobre a produção dos alunos.

No caso da auto-avaliação, os próprios alunos são solicitados a avaliarem-se autonomamente. A integração desses três conjuntos de avaliações, tratadas por agentes inteligentes autônomos, gera uma representação do processo de desenvolvimento vivido por cada participante de um curso.

MODELO CONCEITUAL DO AMBIENTE

Por questões minuciosas de entendimento do modelo, definiremos com antecedência o que consideramos ser o significado de alguns termos que usaremos nessa seção.
Existem diferentes definições para testar, medir e avaliar [3]. Testar significa submeter alguém a um teste verificando seu desempenho. Medir significa determinar para alguém uma quantidade, extensão ou grau, tendo por base um sistema de unidades convencionais. Avaliar significa julgar alguém, tendo por base uma escala de valores. Partindo dessa perspectiva, nosso modelo apresenta uma divisão conceitual da seguinte natureza:
Testes - elaboração de exames, definição de mecanismos de acompanhamento do aprendizado e pontos de vista.
Critérios - Definição de critérios, qual o grau de valor que terão os testes: provas, mecanismos de acompanhamento e pontos de vista.
Avaliação – julgamento dos resultados baseados nas definições dos critérios aplicados aos testes.
De acordo com Herman, Aschbacher e Winters [5], desenvolver avaliação qualitativa em um ambiente construtivista consiste em três passos:
Passo 1: Listar o conhecimento e habilidades que você deseja que os estudantes aprendam como resultado do fim de uma tarefa.
Passo 2. Projetar tarefas que requerem que os estudantes demonstrem essas habilidades e conhecimento.
Passo 3. Desenvolver critérios explícitos de performance que meçam a extensão a qual os estudantes devam dominar em relação às habilidades e conhecimento.
O modelo proposto proporciona ao professor um meio de sistematização desses passos permitindo-o adaptar o ambiente de acordo com seus objetivos.

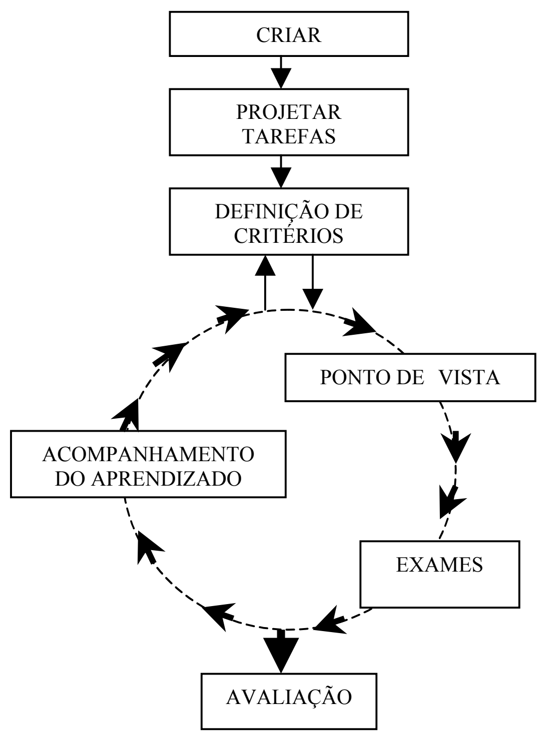

Figura 3-Modelo Conceitual do Ambiente de Avaliação do AMADeUs

Para isso, o ambiente disponibiliza diferentes estratégias de avaliação. O professor é capaz de coordenar especificamente quais contribuições serão avaliadas e definir o grau de cada medida. Nosso objetivo é que o professor possa comparar diferentes pontos de vistas do aluno, ou dos alunos (grupos), podendo avaliar os resultados substancialmente melhor do que em uma única estratégia.

Seguindo esse raciocínio, definimos a combinação separada de critérios para os seguintes testes:

Ponto de vista – auto-avaliação do estudante, avaliação intrapessoal dos estudantes, avaliação do professor por parte do estudante, avaliação do curso por parte do estudante.

Acompanhamento do aprendizado – avaliação continuada das contribuições em salas de bate-papo, fórum, mensagens, servidores de lista, portfólio; agentes de interface rastreiam e seguem as atividades dos estudantes.

Exames – a avaliação tradicional de provas, projetos ou artigos por parte dos instrutores.

Em nosso modelo sócio-construtivista, o uso estratégico do ponto de vista, faz com que o avaliador seja o próprio estudante. Nesse caso, chamaremos o indivíduo que avalia, em nosso ambiente, de "avaluador". Cada avaluador avalia individualmente, mas o sistema permite realizar médias de grupos de avaluadores projetando um consenso coletivo.

Para cada estratégia, ambientes e agentes são projetados. Todos os pontos de vista são integrados, processados e representados em relatórios simples e gráficos. Os resultados de origens diferentes são comparados e combinados para produzir uma avaliação coerente e útil do estudante. Essa estratégia parece expressar resultados mais consistentes e de consenso coletivo. Essa arquitetura é composta de unidades ativas e passivas do ambiente. A participação dos estudantes é rastreada em chat room, fórum, listas de e-mail, e-mails individuais para os professores. Interfaces inteligentes nos componentes de software do usuário são responsáveis pela modelagem e avaliação do aprendizado do estudante em ação. O ponto de vista do professor é construído por ele mesmo através da análise da produção dos estudantes da maneira tradicional. Esse ponto de vista é complementado pela avaliação participativa. O ponto de vista dos estudantes é capturado em ambientes específicos onde os estudantes são convidados a avaliar seus colegas e julgar suas produções.

CONCLUSÃO

A falta de contato visual entre alunos-alunos e professor-aluno no ambiente construtivista EAD faz com que a avaliação seja deficitária. O professor carece de mais informações para um melhor julgamento sobre o comportamento do aluno. Através do modelo apresentado, proporcionamos formas alternativas à avaliação formal para julgar o aprendizado do aluno. Essa abordagem flexibiliza a avaliação, adaptando ao estilo (modelo de avaliação) do professor, proporcionando estratégias diferentes de julgamento do estudante através da definição de critérios, como: ponto de vista, acompanhamento do aprendizado e teste.

Este trabalho faz parte do projeto AMADeUs, uma plataforma educacional para aprendizagem a distância que está sendo implementado no Cin da UFPe.

SISTEMA PROGRAMÁVEL PARA AULAS DE FÍSICA - SPAF

Vanildo Silva Meira[1], Manoel Eusébio de Lima[2], Alex Sandro Gomes[3]

Resumo. *Este trabalho apresenta uma proposta de desenvolvimento de uma plataforma hardware/software (hw/sw) reconfigurável, para aquisição e processamento de dados em aulas práticas de Física. Pesquisas têm demonstrado que simulações por computador facilitam enormemente o aprendizado de Física, no entanto, tais sistemas, na sua maioria, representam um alto de custo de investimento. Este projeto propõe portanto, uma plataforma reconfigurável de baixo custo, que sirva de interface para diversos experimentos da Física. A arquitetura da plataforma proposta baseia-se em um sistema microprogramado, composto por um microcontrolador, um dispositivo reconfigurável FPGA (Field Programmable Gate Array), memória, interfaces, assim como, bibliotecas de componentes de software e hardware (cores) customizados de acordo com os diferentes experimentos do usuário.*

Palavras Chaves: Ambientes Interativos de Aprendizagem, Ensino de Ciências, hardware/software codesign, FPGA.

INTRODUÇÃO

A melhoria da qualidade da maioria dos produtos e serviços oferecidos pelos diversos setores da sociedade moderna tem sido atribuída à entrada em cena de um ator coadjuvante: o computador. Da medicina à educação ele tem mostrado ser uma ferramenta extremamente útil. Na educação, por exemplo, o computador tem sido de grande valia no processo ensino-aprendizagem, não somente na construção, como também na disseminação do conhecimento. Por outro lado, há muito tempo, pesquisadores investigam o mecanismo de compreensão dos conceitos como os da Física pelos estudantes e como estes conceitos podem se repassados através de equipamentos como este. Temas como a eletricidade, ótica, termodinâmica e cinemática, por exemplo, têm apresentado grandes dificuldades de compreensão por parte destes alunos. Observa-se também que em áreas de ensino como a Física, muitas vezes, o custo dos equipamentos e acessórios para cada nova experiência é elevado, e que nem sempre apresentam a funcionalidade e flexibilidade desejadas. Novas tecnologias no entanto, podem permitir a um custo mais baixo, a fácil adaptação de novos acessórios e geração de interfaces mais rapidamente, sem a necessidade de aquisição ou modificação substancial da plataforma existente.

Paradigmas de projeto, como o hardware/software codesign, com dispositivos de hardware reconfiguráveis, podem ser extremamente úteis para este tipo de problema devido à facilidade de adaptação, não só no que diz respeito às rotinas de software, como também na adaptação de componentes de hardware para interfaceamento de acessórios, displays, sensores, etc.

Este trabalho propõe portanto, um modelo de uma plataforma para prototipação rápida para experimentos de física fundamentada no paradigma hardware/software codesign.

A seção 2 discute as dificuldades dos estudantes na compreensão de conteúdos da Física. Na seção 3 são analisadas estratégias didáticas para superar essas dificuldades através do uso de recursos computacionais. A seção 4 descreve alguns sistemas comerciais usados no ensino de Física. A seção 5 expõe o modelo proposto neste trabalho e a sexta seção apresenta algumas conclusões acerca do desenvolvimento que foi realizado.

AS DIFICULDADES DOS ESTUDANTES

Observa-se de um modo geral que os estudantes têm dificuldade em explicar principalmente os fenômenos que estão à sua volta como a queda dos corpos, o movimento de objetos, a luz, a eletricidade, os estados da matéria, etc. Muitos estudantes tendem a associar uma força com a velocidade de um objeto e não a sua aceleração. Não faltam aqueles que pensam que a gravidade terrestre só atua em objetos em queda. De onde viria tal dificuldade? Poderíamos imaginar que para um observador a 'olhos nus' é muito mais fácil supor que o sol gira em torno da terra do que o contrário. Trowbridge e McDermot[1] pesquisaram a compreensão de conceitos elementares como a velocidade de um objeto em uma dimensão e perceberam que muitos estudantes confundem velocidade com a posição do objeto.

Atualmente no ensino da Física, surge uma preocupação muito grande com relação às concepções pré-existentes dos alunos sobre determinados conceitos, concepções estas que atrapalham ou impedem a compreensão dos conceitos verdadeiros. Zylbersztajn[2] em seu trabalho mostra que durante muitos anos as idéias incorretas dos alunos ficaram conhecidas como 'misconceptions' ou 'misunderstandings', ou seja, concepções errôneas ou desconhecimento do assunto. Hoje, nota-se uma tendência entre os pesquisadores em usar expressões com uma conotação negativa menos acentuada: 'alternative frameworks', 'alternative conceptions', 'children's science' e 'concepções espontâneas'. Estas noções originam-se tanto através da experiência direta com o mundo físico, como também através de experiências indiretas com o mesmo, isto é, mediada pela interação social e lingüística com o círculo familiar, comunidade e meios de comunicação. Pesquisas têm demonstrado que estas concepções, na forma de expectativas, crenças, princípios intuitivos e significados atribuídos a palavras cobrem uma

[2] Manoel Eusebio de Lima, Centro de Informática – Universidade Federal de Pernambuco (UFPE), Caixa Postal 7851 – CEP – 50732-970 – Recife – PE – Brasil
[3] Alex Sandro Gomes, Centro de Informática – Universidade Federal de Pernambuco (UFPE), Caixa Postal 7851 – CEP – 50732-970 – Recife – PE – Brasil

vasta gama dos conceitos que fazem parte dos currículos de disciplinas científicas. É igualmente verdadeiro que, para muitos, algumas destas noções são fortemente incorporadas à sua estrutura cognitiva, tornando-se resistente à instrução. Tradicionalmente, professores e pesquisadores devotaram pouca atenção à existência de tais noções, considerando-as simplesmente como erros que seriam facilmente corrigidos. Por isso, problemas relativos ao ensino de Física tem sido mais comumente ligados ao uso de técnicas matemáticas e menos às dificuldades de nível conceitual. Apenas mais recentemente pesquisadores em Ensino de Ciências parecem ter se dado conta das implicações educacionais decorrentes do fato de que alunos constroem concepções a respeito da realidade que os cercam. Concepções estas que lhes proporcionam uma compreensão pessoal desta realidade, influindo na maneira pela qual estes alunos aprendem (ou deixam de aprender) os conceitos que lhes são ensinados. A crescente quantidade de estudos demonstrando a ocorrência de concepções espontâneas relativas a vários tópicos permitem aos pesquisadores na área afirmar que:

'*Na realidade há um confronto entre a física ensinada (oficial) e a espontânea e sem dúvida o objetivo do ensino é a aprendizagem da oficial; este confronto muitas vezes se realiza de forma pouco harmoniosa e seu resultado não é uma visão conceitual coerente e rica, mas a superposição e justaposição de conceitos de diferentes origens e alcance, que prejudicam qualquer pretensão de aprofundamento teórico do aluno*' [3].

Aceitando-se este ponto de vista, coloca-se então a questão prática sobre que implicações para o ensino poderiam daí se derivar. Uma conclusão a que poderíamos chegar é que:

'*... não é produtivo ignorar a bagagem cultural do aluno e todo o conjunto de noções espontâneas que ele carrega ao se deparar com o ensino formal na escola. Se não se cuidar adequadamente da física espontânea dos alunos sobrarão duas estruturas superpostas, entre as quais os alunos escolherão uma dependendo do contexto; em geral quando o problema envolver muitos elementos formais usarão a aprendizagem formal; quando o problema envolver elementos do dia-a-dia e com características bem figurativas ou capazes de estimular a percepção, usarão o esquema espontâneo*' [3].

As pesquisas sugerem também que a instrução convencional é ineficaz para tratar com certas concepções errôneas. As concepções alternativas dos estudantes de velocidade e de aceleração, por exemplo, são considerados não serem facilmente afetadas pelos tradicionais métodos instrutivos. Transformar idéias e/ou corrigir defeitos do conhecimento dos estudantes na física é além do alcance dos métodos tradicionais de ensino porque tendem a ignorar a possibilidade de que a percepção dos estudantes é possivelmente diferente daquela do professor.

COMO SUPERAR AS DIFICULDADES

O alvo principal de uma metodologia construtivista alternativa de ensino deve então ser o desenvolvimento de circunstâncias tais que facilitam o engajamento ativo dos estudantes na compreensão do aprendizado funcional da Física. Além disso, tal metodologia deve permitir aos estudantes aplicar eficazmente conceitos e princípios físicos em novas situações. É aí que as simulações de computador se encaixam como uma luva. Thornton e Sokoloff mostram em seus estudos [4] que ferramentas de *laboratório baseados em microcomputadores* (MBL) em tempo real são fundamentais para a solidificação dos conceitos básicos da cinemática. Uma das ferramentas discutidas é chamada de *MOTION DETECTOR* (Detector de Movimento), ela é composta por um conjunto de hardware e software específicos e é usada para a medição, exibição e gravação da posição, velocidade e aceleração de um objeto. Através das ferramentas de laboratório, os estudantes são ativamente envolvidos na sua aprendizagem. Eles são estimulados a fazer prognósticos (esboços) do movimento dos objetos, discutir com os demais alunos em grupo e a estabelecer suas próprias conclusões. Durante três anos, Thornton e Sokoloff, pesquisaram e estudaram se as ferramentas de computador efetivamente auxiliam no ensino da cinemática. A avaliação dos alunos consistiu na aplicação de um teste antes da aplicação das ferramentas no ensino e num teste posterior às mesmas. Estes testes eram compostos por questões de múltipla escolha e outros onde os alunos deveriam escrever as suas respostas e desenharem gráficos. Após o trabalho, concluíram que existem fortes evidências que o aprendizado assistido pelas ferramentas de computador tanto facilitam a compressão bem como a retenção dos conceitos da cinemática. Dentre os pontos positivos encontrados destacam-se: *Foco nos fenômenos reais* – Os estudantes aprendem os conceitos pela investigação dos fenômenos reais em comparação à simbologia e abstrações do ensino tradicional; *Feedback imediatamente disponível* – Os experimentos são fundamentais para entendimento dos conceitos básicos e ajudam na compreensão de conceitos mais abstratos. É uma característica importante das simulações em computador; *Engajamento dos estudantes* – Eles são estimulados a se engajar efetivamente nas experiências, a expressar suas opiniões e discutir suas expectativas de resultados. Este processo é considerado como um poderoso auxílio na aprendizagem dos estudantes; *Ferramentas poderosas reduzem trabalhos desnecessários* – Experiências que consomem muito tempo ou que acontecem muito rápido, experiências caras ou de difícil execução podem ser reproduzidas em computador. Os estudantes concentram-se apenas nos detalhes essenciais das experiências; *Compreensão de assuntos específicos e familiares antes de passar ao geral e abstrato* – O ambiente educacional guia os estudantes a entender do mais simples ao mais complexo. O nível de dificuldade pode ser controlado facilitando a abstração das leis físicas, de fenômenos complexos e processos reais.

Outra pesquisa feita na Grécia por Jimoyiannis e Komis investiga os efeitos de simulações de computador na compreensão dos estudantes dos conceitos cinemáticos [5]. As questões da pesquisa são: Quais as principais dificuldades enfrentadas por estudantes ao aplicar os conceitos de velocidade e de aceleração em movimentos simples no campo gravitacional? Quais são os efeitos do uso das simulações nas concepções alternativos dos estudantes? O uso das simulações ajuda desenvolver modelos científicos?

Participaram da pesquisa 90 estudantes do 1º ano do curso secundário do colégio Lyceum, na Grécia, com idade entre 15-16 anos. A maioria deles tinha experiência em computador. Os estudantes foram divididos em dois grupos, controle e experimental, o primeiro com 60 estudantes e o segundo com 30. A pesquisa ocorreu cinco meses depois que os estudantes tinham recebido o ensino dos conceitos básicos de cinemática (velocidade e aceleração, movimento linear, movimentos simples da trajetória como queda livre e o lançamento vertical e horizontal no campo gravitacional da terra). Aos estudantes do grupo experimental foram oferecidas duas lições em computador de 1h no laboratório. Ao grupo de controle foi ministrado apenas o ensino tradicional. Pediu-se a todos os estudantes para responder algumas tarefas (T1a, T1b, T2a, T2b, T3a e T3b) envolvendo velocidade e aceleração de objetos em queda livre. A Figura 1 mostra a comparação apenas das respostas corretas dos estudantes em ambos os grupos.

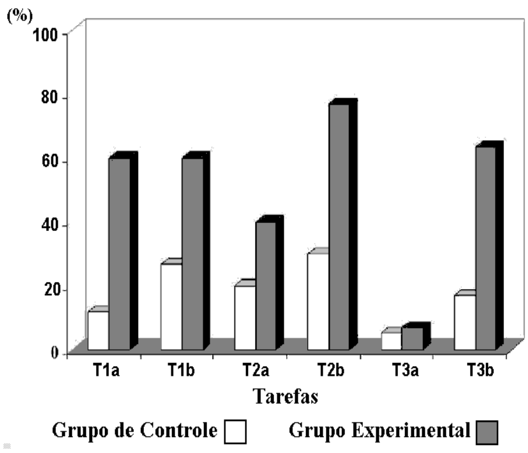

FIGURA 1.
RESPOSTA DOS ALUNOS

A análise estatística indica que há diferenças significativas de aprendizagem entre os dois grupos. De imediato ela sugere que os ambientes educacionais baseados em simulações ajudam a estudantes e superar seus constrangimentos cognitivos e as concepções errôneas sobre a trajetória. Observamos que em todas as perguntas a maior quantidade de acertos pertence ao grupo experimental. Somente em uma questão houve um certo equilíbrio. Uma análise mais profunda envolvendo todas as respostas dos alunos indica que há diferenças significativas na concepção dos estudantes a respeito dos conceitos de velocidade e de aceleração, dependendo se estiveram engajados nas tarefas que exigem o uso de representações estroboscópicas ('câmara lenta') da física interativa ou não. De um ponto de vista qualitativo, a escala dos tipos de respostas dos estudantes é similar para ambos os grupos indica concepções alternativas do mesmo tipo, mas é diferente quanto as suas freqüências. Entre as concepções alternativas mais freqüentes está a confusão entre velocidade e aceleração. Os estudantes no grupo experimental exibiram taxas significativamente melhoradas dos acertos. A hipótese sobre o papel de simulações de computador no ensino da física é confirmada fortemente com a análise da correlação múltipla entre os grupos. Isto indica que os ambientes educacionais baseados em simulações ajudam a estudantes a superar seus confinamentos cognitivos e refinar suas concepções alternativos sobre os conceitos básicos da cinemática.

SISTEMAS PARA AULAS DE FÍSICA

Existe uma grande variedade de sistemas comerciais que podem ser usados para aulas práticas de Física. A revista Pierron Science publicada na França, exibe Kits para aulas, como por exemplo, o Kit Expert mostrado na figura 2.

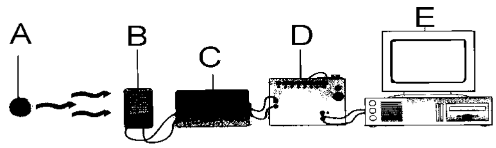

FIGURA 2.
COMPONENTES DO KIT EXPERT

Kits como este podem ser usados em diversas experiências, com recursos para conexão de instrumentos para captação de dados (B), condicionadores de sinais (C), conversores analógico/digital (D), todos, em geral, conectados a um microcomputador (E). Este computador por sua vez, através de softwares específicos processa os dados e os exibe na forma de gráficos, tabelas ou relatórios. Os acessórios para um conjunto de experimentos em termodinâmica, acústica, ótica e mecânica, inclusive com os componentes de softwares, sem considerar o custo do microcomputador, ficam um pouco acima de US$ 3,200.00 (três mil e duzentos dólares).

Empresas como a National Instruments também produzem kits (incluindo componentes e softwares) que podem ser úteis em aulas de Física, ou em sistemas reais, em automação industrial, porém seus preços estão acima de US$ 3.000.00 (três mil dólares).

Existem outros kits com aplicação especifica, cujo objetivo é desenvolver o raciocínio e a criatividade através de experiências na área de mecânica, através da construção de máquinas simples. Em geral estes sistemas apresentam um custo menor quando comparado com os anteriores, cerca de US$ 160.00 (cento e sessenta dólares), entretanto suas aplicações são bastante restritas.

O SISTEMA SPAF

A figura 3 mostra o esboço do Sistema Programável para aulas práticas de Física (SPAF) proposto neste trabalho. O KIT (C) é baseado em uma plataforma reconfigurável, ou seja, poderá ser programado e reprogramado via microcomputador (A) para executar uma série de experimentos com diferentes interfaces (D), dentre os quais destacamos: mecânica, termodinâmica, acústica, etc., permitindo a demonstração e análise dos resultados.

Um banco de dados (B) com *cores (módulos de software/ desenvolvidos para cada tipo de experiência)* e funções especiais juntamente com uma interface gráfica permitirão um gerenciamento amigável das experiências a serem realizadas em laboratório. Os pontos mais importantes deste sistema são a versatilidade e o baixo custo deste equipamento quando comparado àqueles apresentados no item 4. A previsão do preço kit envolvendo apenas a plataforma básica reconfigurável é em torno de US$200.00 (duzentos dólares).

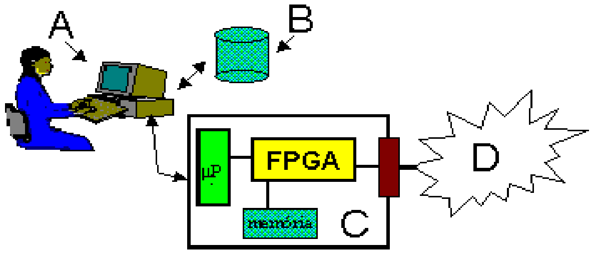

FIGURA 3.
ESBOÇO DO SISTEMA SPAF

O sistema SPAF utiliza como plataforma de desenvolvimento de sistemas a plataforma *Chameleon* [6]-[9], desenvolvida no Centro de Informática da Universidade Federal de Pernambuco (UFPE). Esta plataforma é direcionada para projetos baseados na metodologia Hw/Sw co-design. Seus componentes básicos são um microcontrolador (processador), um FPGA e dois bancos de memória (RAM e EPROM). A comunicação com o microcomputador (Host) é feita através de uma porta serial, como mostra a figura 4.

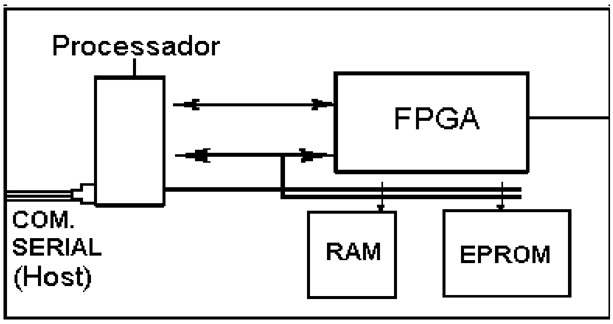

FIGURA 4.
COMPONENTES BÁSICOS DA PLATAFORMA SPAF

A arquitetura do Chameleon compreende uma placa de prototipação e ferramentas de CAD que ajudam no desenvolvimento e testes de sistemas digitais. A placa básica de prototipação é composta por componentes de software e de hardware que compartilham de uma memória comum e de canais de comunicação. Os processos do software são executados em um microprocessador da família compatível 8051, que pode, inclusive, executar processos em tempo real através do sistema operacional do tempo real de Keil Inc. [10]. Os processos de hardware serão implementados em um único componente FPGA, o XC4000 da empresa Xilinx [11]. Um barramento de dados 8-bits e um barramento de endereço 16-bits favorecem a troca de dados entre o processador, o FPGA e os bancos de memória. Uma interface de comunicação paralela assíncrona e bidirecional está também disponível para gerenciar os sinais de controle e dados comuns entre os componentes de hardware/software.

Um dos elementos chaves desta plataforma é a utilização de componentes de hardware reconfiguráveis, como o FPGA XC4000, o qual permite fácil geração de novas interfaces através de programação em software, para acoplamento de novos periféricos sem mudança ou adição de novo hardware.

SISTEMAS RECONFIGURÁVEIS

Em sistemas de computação tradicional existem dois métodos clássicos para a execução de algoritmos. O primeiro é a utilização de circuitos integrados de aplicação especifica (ASIC), que em geral, são específicos para uma única tarefa, são mais rápidos, mais exigem um alto custo de produção e não permitem mudança de sua funcionalidade. Um novo projeto, de um novo ASIC teria que ser feito para uma nova aplicação.

Solução baseada em software, por sua vez, apresenta vantagens, tais como flexibilidade, e baixo custo na implementação de funções complexas. No entanto, esta solução é limitada na exploração de paralelismo e aplicação de alta velocidade. Processos em software são implementados em dispositivos como microprocessadores e microcontroladores.

Computação Reconfigurável (CR) pretende preencher este espaço existente entre hardware e software, permitindo alcançar potencialmente muito mais performance que os componentes de software, mantendo um alto nível de flexibilidade em relação aos dispositivos de hardware (ASICs).

Arquiteturas reconfiguráveis têm sido desenvolvidas e aplicadas em uma série de áreas de ensino e pesquisa, além de produtos em processamento de imagens, biotecnologia, telecomunicações, controle, etc. Podemos entender um sistema reconfigurável [12]-[13] com aquele que atende às seguintes especificações: capacidade de implementar novas funções de hardware; executar novas operações de forma mais eficiente que os processadores de uso geral (computadores comuns); alterar sua arquitetura de acordo com novas necessidades, inclusive em tempo de execução, o que depende do tipo de dispositivo utilizado.

Dentre as vantagens presentes nos sistemas reconfiguráveis estão a geração rápida de protótipos de sistemas digitais, fácil adaptação de novas interfaces sem mudanças de componentes, desenvolvimento de projetos em alto-nível abstração.

Este tipo de arquitetura permite uma abstração maior da tecnologia na qual será implementada o sistema do usuário, desde que tudo pode ser desenvolvido em software através de ferramentas de CAD (Computer Aided Design). Estes sistemas permitem ainda que sistemas completos possam ser desenvolvidos e emulados remotamente via internet. Dentre dispositivos desta classe podemos citar os FPGAs, um dos dispositivos utilizadas na plataforma de desenvolvimento apresentada neste trabalho.

Dispositivos Lógicos Reconfiguráveis

O FPGA[13], como o próprio nome sugere, *conjunto de portas lógicas programáveis em campo*, é um componente que visa agilizar o desenvolvimento de sistemas digitais pela facilidade de confecção dos mesmos. Introduzidos pela Xilinx em 1985, atualmente possui uma vasta variedade de modelos e fabricantes. De uma maneira geral, a estrutura básica de um FPGA é composta por uma matriz bidimensional de blocos Lógicos, os quais podem implementar funções combinacionais e seqüenciais. Estes blocos lógicos, comumente chamados de CLBs (Configurable Logic Blocs) são interconectados através de canais de roteamento. Estes dispositivos possuem alta densidade de integração, VLSI (*Very Large Scale Integration*), podendo implementar funções lógicas com mais de 6 milhões de gates, integrando em único chip, núcleos (*cores*) de cpus, memória, barramentos, interfaces especiais, etc.. Estes circuitos podem ainda ser mapeados de maneira estática, na qual, a toda nova aplicação necessita-se de uma re-inicialização do chip através de um *reset*, ou de maneira dinâmica , através dos Gate Arrays Dinamicamente Reconfiguráveis (DPGAs), no qual os processos podem ser mapeados dinamicamente no chip sem a necessidade de *reset (reconfiguração on-the-fly)*. Estas características, fazem com que FPGAs se apresente como uma solução interessante para prototipação rápida de sistemas digitais, os quais podem ser modificados constantemente de acordo com a complexidade do problema a ser resolvido, tipo de interface, velocidade de processamento, etc., com a e flexibilidade de sistemas de software.

Metodologia do Projeto de Execução de Experiências

O sistema SPAF permite que diferentes experiências possam ser desenvolvidas e armazenadas em um banco de dados pelo usuário e facilmente plugadas ao sistema quando requeridas, em função de sua aplicação. Uma das principais características do sistema é a fácil reprogramabilidade do FPGA, ou seja, a mudança de sua funcionalidade (permuta de experiências). Isto é garantido através de arquivos de configuração gravados em sua memória. Os componentes de software bem como os arquivos de configuração podem ser armazenados no host ou na própria na plataforma, dependendo do tipo de aplicação requerida. Como pode ser observado na figura 5, um conjunto de *cores* (componentes A, B e C) de experiências estariam disponíveis em uma base de dados acessíveis através de um sistema que gerencia a configuração e reconfiguração do FPGA e dos componentes de software do microcontrolador.

O microcontrolador da placa é o responsável pela programação e reprogramação do sistema e pela comunicação com o host. O ambiente para desenvolvimento de componentes de software é o Keil e os módulos desenvolvidos em C. O sistema para o desenvolvimento do módulos de hardware é o sistema Xilinx Foundation[14] e os módulos descritos em VHDL[15]. Após a geração dos respectivos cores ou códigos executável do microcontrolador e de configuração do FPGA, com suas respectivas interfaces, de acordo com cada aplicação, estes arquivos são armazenados no banco de dados das experiências. Cores ou núcleos de interfaces podem ser re-usados por outras experiências ou aplicações.

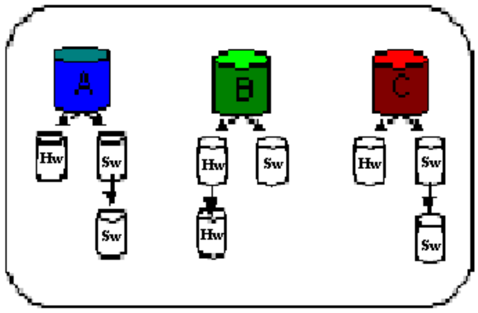

Figura 5.
Cores em banco de dados

Quando requisitados, de acordo com a experiência a ser implementada, estes arquivos são devidamente carregados pelo host à placa de prototipação através de um link serial.

A figura 6 mostra o fluxo de compilação e síntese destes componentes.

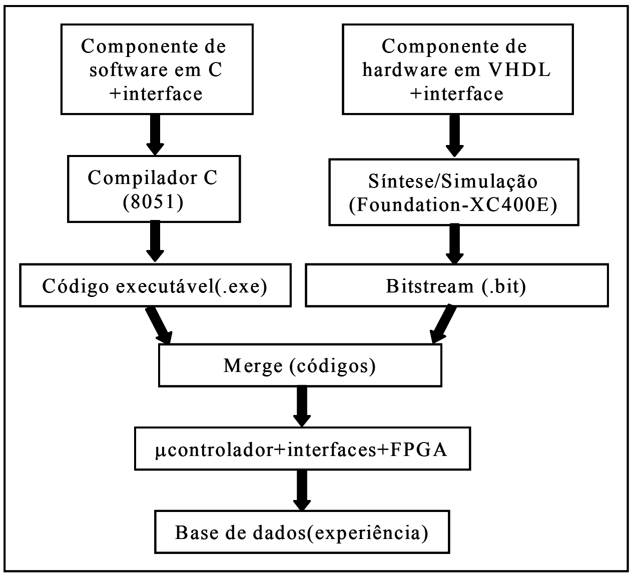

Figura 6.
Fluxograma da geração de código

Um programa monitor residente na placa prototipação é responsável pelo recebimento e armazenamento deste código na memória RAM presente na placa. Como mencionado anteriormente, um banco EPROM armazena um programa monitor responsável pela inicialização do sistema e controle dos programas de aplicação do usuário. Após a carga completa dos componentes de hardware e software, o monitor configura adequadamente o FPGA e executa a partição de software em RAM.

A figura 7 mostra o esboço do sistema para tipos diferentes de experiências. Observe que todo o sistema deve ser previamente especificado e verificado antes da implementação na plataforma.

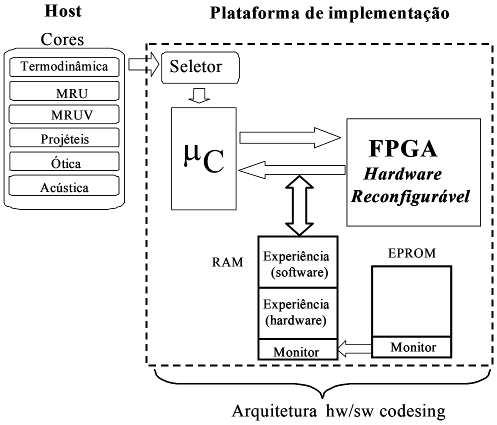

FIGURA 7.
INSERÇÃO DE EXPERIÊNCIAS

Dependendo do tipo experimento, diferentes cores de hardware podem ser substituídos ao longo de sua execução controlados por rotinas em software que podem reconfigurar no tempo diferentes interfaces ou módulos em hardware.

GERAÇÃO DE INTERFACES

A plataforma SPAF permite a conexão de diferentes módulos de hardware para a implementação de diferentes experiências de Física. Através de uma interface gráfica, o usuário pode, a nível de especificação do sistema, definir qual e onde determinada interface deve ser colocada e qual o seu driver apropriado. *Cores* de drivers de hardware, para conversores A/D e display LCD foram desenvolvidos. O driver A/D permite que um conversor compatível AD628, possa ser facilmente conectado ao sistema via FPGA, permitindo que sinais analógicos possam ser convertidos e tratados adequadamente de acordo com a experiência do usuário. Um *core* de LCD, modelo L2000, foi também desenvolvido e permite que leituras das experiências possam ser localmente visualizadas na placa de prototipação. Além dos *cores* que são implementados como componentes virtuais em hardware específicos, o modelo permite também que outros componentes de processamento rápido como FFTs, convolução, etc, possam também ser implementadas como *cores* de hardware. Os componentes de software podem ser usados como elementos que controlam parte do experimento, ou rotinas que implementem equações, funções especiais, etc., e que não requeiram alta performance.

Além das interfaces em componentes hw/sw na plataforma e demais interfaces especiais, uma interface gráfica permite fácil aquisição de dados, geração de gráficos, impressão, estatística, etc.

CONCLUSÕES

Este artigo descreve o desenvolvimento de um sistema reconfigurável de coleta, análise e apresentação de dados para o ensino de Física. Embora o computador tenha demonstrado ser uma ferramenta de grande importância no processo ensino/aprendizagem em diversas áreas do conhecimento humano, sua utilização na resolução de problemas deve ser feita de maneira criteriosa, de modo que o aluno possa correlacionar o prático e o teórico no decorrer do experimento. Não é o simples fato de resolver um problema, mas o modo como é resolvido. Deve-se destacar que o processo de condução das experiências por computador pode levar a dois extremos: Estimular o estudo quando a experiência pode ser detalhada de modo que haja uma participação do aluno na condução do processo, ou seja, ele é um agente ativo, por um outro lado, desestimular o aluno quando o processo é absolutamente mecânico, apenas digitação e obtenção dos resultados, tornando-o um agente passivo.

O objetivo deste projeto é desenvolver uma plataforma 'amigável', ou seja, que não exija nenhum pré-requisito em programação de computadores, mas que ao mesmo tempo necessite de uma participação ativa do aluno na condução, observação e obtenção dos resultados das experiências. Dentre os objetivos educacionais destacamos: *Desenvolvimento do Raciocínio Lógico* – Estimular o raciocínio lógico dos alunos à medida em que eles comparam os resultados obtidos nas experiências conduzidas com o auxílio do computador e com os resultados obtidos sem auxílio do computador, podendo então constatar efeitos na prática, muitas vezes desprezado; *Interdisciplinaridade* – Estabelecer um paralelo entre o prático (concreto) e o teórico (abstrato), bem como estudar conceitos de diversas áreas como: Informática, Matemática, Física (Eletricidade, Mecânica, Ótica), etc. e as relações entre elas; *Estímulo ao Planejamento* – Ao planejar a realização de uma experiência ele se prepara para estudar os resultados ao mesmo tempo que aprende aspectos relacionados à organização e disciplina; *Pesquisa* – Os resultados obtidos podem levar o aluno a questionamentos que só poderão ser elucidados com o seu empenho em pesquisar sobre o assunto em questão; *Criatividade* – Estimular o aluno a imaginar novas experiências, bem como a concepção de novos mecanismos de aquisição e manipulação de dados, que poderiam inclusive contar com o reaproveitamento de materiais, logicamente, sob a supervisão do professor.

Uma metodologia e uma plataforma de ensino está em desenvolvimento. A plataforma Chameleon baseada em uma arquitetura hw/sw codesign mostrou ser apropriada para este tipo de projeto, devido a sua flexibilidade, simplicidade de operação, facilidade de implementação de novos projetos e um custo acessível. O protótipo até aqui desenvolvido tem mostrado ser promissor e motivador na realização e implementação de experimentos de física.

Agradecimentos

À CAPES pela bolsa que permitiu a realização deste trabalho, à UESB, minha instituição de origem, aos professores do Centro de Informática e aos colegas do Mestrado que colaboraram na realização deste trabalho.

Applying Concept Maps in Education as a Metacognitive Tool

Tânia Barbosa Salles Gava[1] *and Crediné Silva de Menezes*[2]

Abstract — *This paper discusses the use of concept maps as a metacognitive tool in the educational context. It makes use of a reflection on ideas manifestation and its representation as maps. Besides it suggests three applications: 1) concept map as a tool for indexing contents of a virtual learning environment 2) as a support to bibliographic review, and 3) as a support to the development of learning project. Moreover, we point out some other possible applications where concept maps would bring good contributions by reducing the cognitive overload and amplifying our cognitive abilities.*

Index Terms — concept maps, knowledge organizers, computer in education.

Introduction

The teaching-learning process is carried out through several phases such as the student contact with the existing knowledge about his object of study (usually called content), the study and the analysis of that content, and the externalization of the student knowledge on a given subject. The student knowledge externalization is a process of changing his tacit knowledge into explicit knowledge. Because tacit knowledge is very difficult to be formalized, its transmission and sharing is also problematic. For example, conclusions, insights, and hints. On the other hand, the explicit knowledge refers to that knowledge easily transmissible in some formal or systematic language (NONAKA & TAKEUCHI, 1997).

The knowledge externalization may be done by different means as, for instance, the making of a synthesis where the student expresses his knowledge, reflections, and conclusions about the subject in question. There are many languages to represent knowledge but usually knowledge is represented in the form of a text. Concept map is another possible form to represent knowledge. We consider that in certain situations like, for instance, during the making of a synthesis, the use of concept maps has some advantages if compared with the classic text. The making of a text usually demands high cognitive overheads because it requires, besides the knowledge itself, sequential organization, adoption of a style, grammatical rules observance, care about form (font type, color, and size) etc. Moreover, its fragmented nature makes tacit knowledge very resistant to sequential organization.

This article presents our research path on the use of concept maps as a tool to support the knowledge verbalization. We are particularly interested in its pedagogic use.

What is a Concept Map?

Concept maps, as developed by Joseph Novak, are a tool to organize and to represent knowledge (NOVAK, 1977). They are used as a language to describe and to communicate concepts and their relationships. They were originally developed to give support to the *Meaningful Learning Theory* (AUSUBEL, 1968). Concept maps can, for example, be used to explain and to describe ideas people have about a given subject. They are graphic representations of concepts, similar to diagrams, in a specific domain of knowledge and constructed in a way that makes concepts and their relations very evident. In other words, they represent concepts and their links in a graph manner so that the points are concepts and the edges are relationships. These relationships are nominative, i.e., each relationship between two concepts forms a proposition. For example, in the sentence *whales are mammals*, "whales" and "mammals" are concepts that are connected by the relation "are". The simplest concept map would be constituted of two points connected by a link representing a proposition, i.e., "Bees visit Flowers". The Figure 2.1 shows the simplest form of a concept map, just as it defines what nodes are, what links are and the relationships between two concepts.

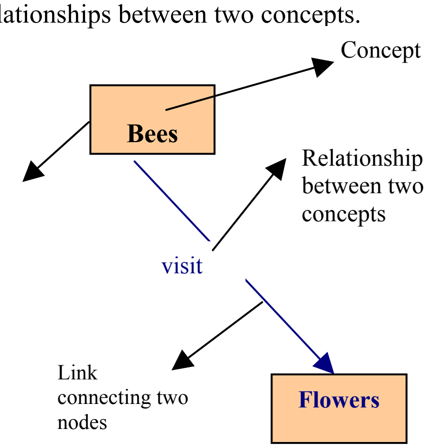

FIGURE 2.1
THE SIMPLEST FORM OF CONCEPT MAP

[1] Tânia Barbosa Salles Gava, Universidade Federal do Espírito Santo, Programa de Pós-Gaduação em Engenharia Elétrica, t_salles@zaz.com.br
[2] Crediné Silva de Menezes, Universidade Federal do Espírito Santo, Programa de Pós-Graduação em Engenharia Elétrica, credine@inf.ufes.br

Note that in this case the preposition is a simple sentence. But it is not always like that. Sentences and prepositions are different things. It may happen a case of a sentence embodying many propositions. For example: “whales live, like fishes, in the water, but they are mammals. From this unique sentence we can take the following propositions: 1. Whales are mammals. 2. Whales live in the water. 3. Fishes live in the water. 4. Animals 4) Animals can be mammals. 5. Animals can be fishes. Although the examples above show us very simple kinds of maps, they can be very large and may have a structure very personal to who is building it. Figure 2.2 presents one of a series of maps of the NASA’s MARS 2000 project, developed by the Institute for Human and Machine Cognition – IHMC (http://www.coginst.uwf.edu).

Editing Maps

Like in a hypermedia document, to each node (concept) we can associate different medias related to the concept, as long as we use suitable tools to map making. Two of these sort of tools are *CMap Tool* (http://www.coginst.uwf.edu), a map editor developed at the Institute for Human and Machine Cognition that allows to associate a node of a given map to other maps, to text, audio and video files, images and web pages. The *Software Inspiration* (http://www.inspiration.com) is another map editor with facilities to draw concepts, mapping thoughts, make diagrams, program studies and other activities, all that using a multimedia visual language that fosters creativity, lateral thinking, and user’s productivity. It was designed for the work with children. Figure 2.3 shows a map built with the CMap Tool.

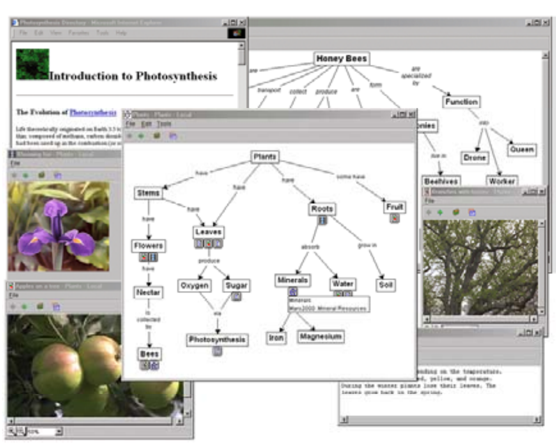

FIGURE 2.2
CONCEPT MAP BUILT USING THE CMAP TOOL SOFTWARE

Another important feature that must be observed when building concept maps is the inclusion of *cross-links*. They are relations between concepts of different sub-domains of knowledge of the map. Cross-links help us to see how some sub-domains represented in the map relate to one another. The following Figure shows an example.

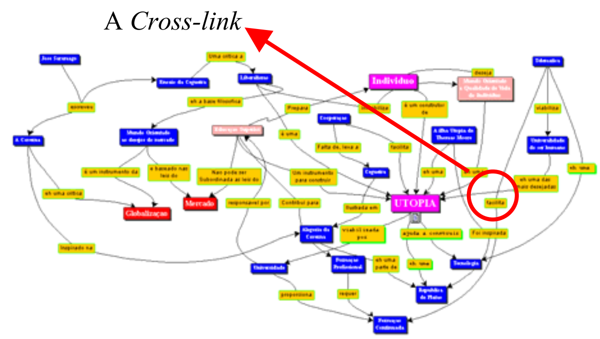

FIGURE 3.7
CONCEPT MAP WITH CROSS-LINKS

Expressing Ideas

When we are in a learning process, in several situations and in different moments, we need express our ideas (knowledge externalization). This task could be done in an oral way but usually it is necessary and important to record it. Recording can be done by different means such a text, a graph, an image, or a concept map. The expression of ideas may be to make a synthesis of a text, paper or article, to record any process such as a learning or research project, to produce texts that express our understanding of a given subject, or even to produce a speech. Regardless of the means to be used all demand a specific cognitive effort. But what is most remarkable is the fact that in all these situations there are important points, which we must highlight. In other words, we want to express the important concepts that were identified and the relations among them.

In such context we visualize the use of the maps to represent knowledge. As knowledge organizers, maps are represented by the concepts and their relationships identified in a subject. We understand that the construction of a map demands less cognitive effort than the construction a linear text does. This happens because when we construct a map we first identify the concepts we consider more important, no matter the order they were studied or they appear in the text. And this is a more natural process than to think of a text that demands a formalism and forces the ideas to be expressed in a sequential manner. After this reflection about the concepts it is enough to materialize the connections we see on these concepts. After that, we must observe the map constantly observing and make the required changes to reflect the constant changes that occur in our cognitive structure as we learn.

The Use of Concept Maps in Education

This section will present some applications of the concept maps in education as follows: the use of concept maps as content indexers, as a tool to support bibliographic review, and as a metacognitive tool in learning projects.

Using Concept Maps as Indexers of Content

By using software for edition of maps, it is possible to associate several resources to the nodes of a map. One of these resources is to associate a collection of documents (text, pages web etc.) to the maps, where each node, which represents a concept, can be associated to one or more documents of this collection. However, this association is free and it is under the responsibility of the user of these tools. Our proposal aims at improving this resource by associating the nodes of a map to a content indexation system, where we can associate a node to a search engine instead of associating it only to specific documents. This searching will be based on concepts and will find all documents of an available collection that are associated to the concept represented by the node. In this way, the concept map can be used as a great indexer of content. In this context, we used the CMap Tool to develop a small application to illustrate the content indexation regarding to just any theme. The chosen theme was "Computer in Education". This site makes several concept maps available. They were done based on the "Salto para o Futuro" Collection, that is a Virtual Library which possesses papers on Computer in Education. This Virtual Library is part of the PROINFO Project (http://www.proinfo.mec.gov.br). Each map of this collection presents the most important concepts approached in the papers and their respective relationships. Besides, each map possesses a link to the paper (in the HTML form) on which it was based and to other resources such as texts, papers, web pages and homepages. This site possesses an initial map on "Computer in Education", presenting the most important concepts of this theme (Figure 4). Starting from this initial map the user can browse other maps that were developed to this application.

Using Concept Maps as a supporting Tool for Bibliographical Review

The bibliographical review supposes some steps, such as: the reading, the analysis and the adequate registration of the most important annotations related to the revised documents. The concept maps, as knowledge organizers, can be used to represent knowledge of people on a certain subject. Based on this possibility and on the existence of tools for construction of maps we can use concept maps as a supporting tool to both teachers and students, this is, they can to represent the important concepts on a certain article, paper or text. In this way, the students can record their most important annotations in the form of maps. On the other hand, the teachers will have in hands another resource to verify the learning of students on the approached subjects. Besides that they can compare the several maps, built by the students, in order to identify the formation of the concepts, misconceptions, their your ideas and identified relationships among the concepts, following up the evolution of the students' knowledge. Using maps like that is still a good instrument to facilitate the discussion centered in the reading of texts. After reading a text, where the student progressively builds a map of his/her knowledge, the students can meet with one another to discuss about the subject, starting from the comparison of the maps and identifying concepts and connections that were noticed or not. They can still discuss about the noticed connections in a different way and, even, in conflicting situations. A brief reflection allows us to notice the advantages of this proposal on discussions based on isolated annotations.

Using concept maps as a support tool for the development of Learning Projects

The main idea of the use of maps in the evaluation of learning processes is to evaluate the student in relation to what he/she already knows, starting from the concept constructions that he/she can create, that is, the way that he/she structures, hierarchy, differentiates, relates, discriminates and integrates the concepts of a miniworld in observation, for instance. Once the maps are explicit representations of the cognitive structure, we can have a very approximate picture of the student's previous knowledge, which is a starting point for the meaningful learning. In the same way, by observing several pictures of different moments of the process (his/her several maps), we can accompany the cognitive growth of the student, so improving the feedback offered to him/her.

A Learning Project can be seen as a process that goes through some steps [SOUZA & MENEZES, 2000], such as: the choice of a theme, the identification of subjects that will be explored inside this theme, an inventory of knowledge of the student built in the beginning of the project (doubts and statements), the choice of the methodology and of work plan (consisting of work items) which will be followed in order to accomplish the proposed goals. Besides, at the end of each work item it is fundamental to do evaluations of the evolution of the student's knowledge. Along the process, the student looks for to clear his/her doubts and to validate his/her statements. During the exploration of the proposed project, it is very important properly to record the way the learning process occurred throughout the construction of the project, instead of just to publish the reached final results. It is suggested the use of concept maps to express the inventory of the knowledge of a workgroup member or of whole workgroup at different moments of the project. We suggest the construction of a map to express knowledge in such stages: in the beginning of a project, at the end of each work item (that demands the construction of a synthesis on its accomplishment) and at the end of all the work items, i.e., at the end of the project. In this way, through the analysis of these maps, we can clearly know all transformations happened in individual and workgroup knowledge, such as cleared doubts, validated statements, statements that became doubts, doubts that become statements, appearance of new doubts and statements etc. The use of appropriate conventions can facilitate the identification of the student's historic, synthesizing the evolution of his/her mental models through the collection of his/her maps. We propose a way to the student express his/her knowledge on the project theme, at different moments of the learning process, though concept maps. This knowledge consists of his/her statements and doubts and of his/her conclusions.

In concept maps, the relationships between two concepts express propositions. In the same way, the speech on any context can be completely expressed through propositions. In general, relationships have been used in Concept Maps to just register affirmative propositions. However, we can also use them to represent doubts. We identified some situations. They are: 1) We know that two concepts are related somehow, but we cannot identify which relationship that is. 2) One of the concepts of a relationship is not known. 3) We know the concepts but we are not sure of the relationship among them. 4) We identified the relationship between two concepts, but we do not have the scientific proof.

We visualized two possibilities to register the process of development of a project:

1) We can start with a map of doubts and statements, built in the beginning of the process. A map can also represent the synthesis of each investigation item. This second map should be accessible thought a link starting from the original questioning. The evaluation of the evolution of the knowledge can be accomplished through the browsing this group of maps.

2) Another alternative is the construction of several different maps, built in the beginning of the project, at the end of each investigation item and at the end of the project. In this case, each map is the evolution of the previous one, where the gaps are filled out. The evaluation of these maps will reflect the evolution of the student's knowledge, where one can observe the explanation of doubts, the validation of statements and the appearance of new doubts and statements.

Other Applications of Concept Maps

The nature of concept maps clearly turns them into a tool for multiple activities. After all, it has been long since human beings first sought for the use of non-linear languages to express their ideas with more flexibility and expressiveness. It is not by chance, therefore, that we can use these concept maps in all and any activity where we needed to organize our ideas. As examples, we can mention the preparation of a lecture, speech, article or paper. The technique suggested herein is to begin gathering the principal elements that we want to identify and gradually to construct important connections for the approached context, thus generating a map. In this way, it is easier to produce a text. In relation to a speech, we can construct a map to be a base for this speech. For instance, the map illustrated in the Figure 2.4 was prepared for a graduation speech to computer engineering students.

Another important activity, in the technological point of view, is the specification of product requirements, which is an intensive one in knowledge construction. Starting from interviews and from gathering data the specialist should produce a rigorous specification of the product. In general, the natural language brings countless problems. So, concept maps can be used with plenty advantage by several professionals such as architects, lawyers, software engineers, knowledge engineer, among others.

Final Considerations

This paper has presented the concept maps as a metacognitive tool that can be very useful in the education, especially for indexation of content, as support to bibliographical review and as support to the development of learning projects. We have been trying out all these activities in our graduate and post graduation courses.

As future perspectives, we have been developing a tool that will be part of the framework presented for knowledge organization and integration, that it will use concept maps as indexers of content for a collection of documents used by a learning community interacting inside a Virtual Learning Environment. Besides that, in July, 2002 we concluded a site that make concept maps available. These maps were built for the "Salto para o futuro" Collection, that is a Virtual Library of the Proinfo Project (http://www.proinfo.mec.gov.br). It is a collection of articles on Computer in Education.

This year we also have tried out the use of concept maps as a pedagogical tool in distance specialization courses, based on the pedagogy of learning projects. The maps are used for the construction of knowledge inventories, which consist of the doubts and statements of a student on his/her themes of project.

We have also intended to use them intensively as a tool for organization of ideas that precede the text production in elementary and high school.

Final Considerations

The purpose of this work is to present a Framework as a logical model for the organization and integration of the knowledge in virtual learning environments. The goal is to propose an ontology of knowledge in such environments. It is also our goal to propose solutions to the problems presented in the section 2, using metacognitive tools such as concept maps. To illustrate this Framework, a prototype will be developed approaching two aspects. The first one will be a tool for instanciation of courses in virtual learning environments, based on the ontology that will be developed. The second one will be a virtual environment that integrates the knowledge content of a virtual learning community.

Um Framework Reutilizável para o Desenvolvimento de Objetos de Aprendizagem – o Projeto WEL (Web Engineering for Learning)

Carlos Fernando de Araujo Jr.[1], Ismar Frango Silveira[2]

Resumo *— O principal objetivo deste trabalho é apresentar um framework para a elaboração e gerenciamento de meterial didático digital que pode ser utilizado em educação a distância e em educação baseada em recursos tecnológicos. Este artigo é baseado no trabalho de pesquisa desenvolvido na Universidade Cruzeiro do Sul em trabalho em conjunto com o Núcleo de Pesquisa em Computação e Tecnologia da Informação e Núcleo de Educação a Distância, denominado Projeto WEL (Web Engineering for Learning). Os objetivos de pesquisa de pesquisa desse projeto pe desenvolver material didático digital e ferramentas genéricas, como simulações e sistema de avaliação direcionadas para o ambiente Web. Os fundamentos deste projeto de pesquisa e de seus resultados advém da Engenharia Web e do conceito de objetos de aprendizagem. Neste trabalho apresentamos um framework reusável que poderá ser utilizado em projetos de e-learning em larga escala para integração de outros recursos e objetos de aprendizagem.*

Palavras Chaves — Informática na Educação, Educação a Distância, Ensino de Computação, Objetos de Aprendizagem.

I. INTRODUÇÃO

O uso e aplicação das tecnologias de informação e comunicação (TIC) na educação tem se intesificado nos últimos anos, principalmente após o advento da Web. Novas formas e aplicações das tecnologias de informação e comunicação estão trazendo para os setores educacionais, nos seus diferentes níveis, uma crescente demanda seja no âmbito do e-learning ou do uso das TICs como uma ferramenta auxiliar à educação "tradicional" [1]-[4].

Na área de Computação e Informática tem-se realizado diversos estudos e pesquisas sobre uso e aplicação das TICs que têm contribuído para o melhor entendimento destas tecnologias e sobre sua efetividade no processo de aprendizagem e o desenvolvimento de novas tecnologias [5]. Dentro deste contexto surge o Projeto *WEL* (*Web Engineering for Learning*), que está sendo conduzido pelo grupo de pesquisa em Tecnologia da Informação da Universidade Cruzeiro do Sul em um trabalho conjunto com o NCTI (Núcleo de Pesquisa em Computação e Tecnologia da Informação) e NEAD (Núcleo de Educação a Distância)[6]. Um dos principais objetivos do Projeto *WEL* é o desenvolvimento um framework para produzir e gerenciar conteúdos digitais para serem utilizados em cursos on-line (e-learning) e material didático digital para disciplinas específicas da área de Computação e Informática. Dentro do escopo das pesquisas deste projeto está também a investigação sobre metodologias e ferramentas que possam ser utilizadas em ambientes virtuais de aprendizagem: avaliação on-line e simulações, por exemplo.

Neste trabalho apresentamos o resultado do desenvolvimento de um framework reutilizável para desenvolvimento de objetos de aprendizagem. O trabalho está dividido como segue: na seção II apresentamos nosso referecial teórico para o desenvolvimento de objetos de aprendizagem. Na seção III apresentamos o framework. Na seção IV apresentamos nossas conclusões e trabalhos futuros.

II. OBJETOS DE APRENDIZAGEM E ENGENHARIA WEB

As recentes pesquisas na áera de Engenharia Web e Objetos de Aprendizagem, têm contribuído na busca de padrões para o desenvolvimento de material instrucional e conteúdos digitais que sejam adaptáveis (reusáveis), genéricos e escaláveis além de ambientes de aprendizagem virtuais que suportem tais objetos de aprendizagem com suas propriedades e características. Dentro deste contexto, tem-se buscado padrões gerais e internacioanais para o desenvolvimento de objetos de aprendizagem e ambientes de aprendizagem para garantir interoperacionalidade.

Contudo, o que seriam e como poderíamos definir o que são objetos de aprendizagem? Em nossa definição consideramos objetos de aprendizagem como qualquer entidade digital que pode ser usada, reusada ou referenciada durante um processo de aprendizagem suportado pela tecnologia [7].

O conceito de objetos de aprendizagem é um conceito fundamental para o desenvolvimento de conteudos e material didático digital para ser usado em experiências e

[1] Carlos Fernando de Araujo Jr., Núcleo de Computação e Tecnologia da Informação - NCTI, Universidade Cruzeiro do Sul - UNICSUL, Av. Dr. Ussiel Cirilo, 225 , 08060-070, São Paulo, SP, Brazil, carlos.araujo@unicsul.br
[2] Ismar Frango Silveira., Núcleo de Computação e Tecnologia da Informação -NCTI, Universidade Cruzeiro do Sul - UNICSUL, Av. Dr. Ussiel Cirilo, 225 08060-070, São Paulo, SP, Brazil, ismar.silveira@unicsul.br

projetos de larga escala (envolvendo grande número de estudantes e disciplinas na educação formal convencional). A garantia da reusabiliade permite que um conteúdo ou parte dele seja usado em diferentes contextos o mesmo ocorrendo com sistemas de avaliação, simulações ou sistemas para desenvolvimento de simulações. Um repositório de objetos de aprendizagem que possua um esquema de metadados sobre esses objetos, bem definido, poderá ser utilizado para personalizar e individualizar o processo de aprendizagem através do uso de agentes baseados em computador. Um resultado desejável em larga escala é a economia e competitividade que poderá ser obtida através do uso deste conceito chave. Na Tabela I apresentamos os principais tipos de objetos de aprendizagem conforme Wiley[7].

TABELA I
TAXONOMIA PARA OBJETOS DE APRENDIZAGEM [7].

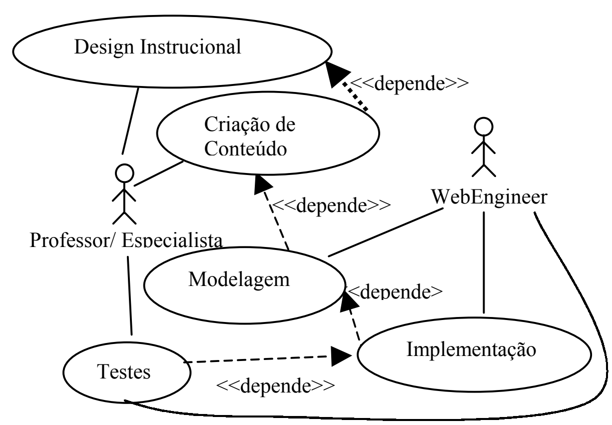
Tipo	Denominação	Descrição
1	Fundamental	Um recurso digital não combinado com qualquer outro.
2	Combinado-fechado	Um conjunto pequeno de recursos digitais combinados mas não acessíveis individualmente para reuso.
3	Combinado-aberto	Um conjunto grande de recursos digitais combinados em tempo de execução quando requisitado. Os objetos constituintes são acessíveis para reuso.
4	Gerador de apresentações	Possui lógica e estrutura para combinar e gerar objetos de aprendizagem de baixo nível (dos tipos 1, 2).
5	Gerador Instrucional	Possui lógica e mecanismos para combinar objetos de aprendizagem (dos tipos 1, 2 e 4), avaliar as interações dos estudantes com os objetos e instanciar estratégias e aprendizagem individuais e personalizadas

A característica principal do ambiente *Web* é sua tecnologia hipermídia, que, em linhas gerais, se caracteriza pela utilização de conteúdos multimídia, organizados sob uma estrutura de hiperdocumentos, estrutura esta difundida a partir dos primeiros sistemas de hipertexto. Baseado neste fato, a modelagem e desenvolvimento de conteúdo deve se utilizar dos recursos tecnológicos diversos quando da elaboração de conteúdo multimídia, uma vez que o uso não adequado torna o conteúdo modelado pobre em qualidade, mesmo que esse tenha sido adequadamente produzido por um especialista. Em se considerando a utilização do ambiente *Web* para fins educacionais é indispensável a utilização de estratégias e abordagens metodológicas (didático-pedagógicas) adequadas para cada conteúdo. Deste modo, o desenvolvimento de conteúdos digitais para educação em ambiente *Web* é uma tarefa complexa que envolve várias dimensões (conteúdo, metodologia , estratégias específicas e tecnologia). Neste *framework* que apresentamos um dos nossos objetivos é contribuir para o melhor entendimento desta complexidade.

Os princípios da Engenharia Web devem ser seguidos na modelagem e desenvolvimento de conteúdos para Web para um adequado acoplamento entre o conteúdo e a tecnologia. A modelagem de conteúdos então se define como sendo a forma de adequar o conteúdo produzido por um especialista ao modelo estabelecido utilizando-se critérios de design. Deste modo, os princípios de elaborados por Olsina [8], por exemplo, no contexto da qualidade de sites, podem servir de guia para essa tarefa: usabilidade, comunicabilidade, funcionalidade, eficiência e manutenibilidade [9]-[12]. O mapeamento do conteúdo desenvolvido para um ambiente virtual de aprendizagem pressupõe características de hardware e software, para cada item do material didático a ser utilizado (unidades, textos, figuras, exemplos, sons, imagens, simulação e avaliação, por exemplo). Esse mapeamento não é unívoco, pode ser realizado de diversas formas. O uso de ambientes comerciais impõem algumas restrições neste mapeamento que devem ser consideradas na etapa de modelagem.

III. O FRAMEWORK PARA DESENVOLVIMENTO DE OBJETOS DE APRENDIZAGEM

O framework, esquematizado nas Figuras 1 e 2 , possibilita um ponto de partida para grandes projetos que considere o uso das tecnologias de informação e comunicação na Educação ou em educação a distância (e-learning) para diversas áreas do conhecimento. O modelo desenvolvido com as premissas da Engenharia *Web* possibilita a



disponibilização de conteúdos em uma forma estruturada, adequada para as utilizações em Educação [13], [14].

FIGURA. 1
DIAGRAMA DE CASOS DE USO REPRESENTANDO UM PADRÃO DE PROJETO PARA DESENVOLVIMENTO DE CONTEÚDO.

A figura 1 mostra um diagrama UML de casos de usos[15] que que apresenta as principais regras realizadas por dois atores – o professor/especialista, responsável, principalmente, pela fase de design instrucional, quando o conteúdo a ser modelado é relacionado com os objetivos de aprendizagem desejados em um processo de aprendizagem

O outro ator, rotulado como *WebEngineer*, realiza boa parte dos papéis comumente atribuídos ao Engenheiro do Conhecimento em Sistemas Especialistas clássicos: implementação, modelagem e testes, sendo os testes executados com o participação do professor/especialista.

A Figura 2 mostra um Diagrama de Componentes UML [15] para duas fases da Figura 1: a Criação de Conteúdo (responsabilidade do Professor/Especialista) e a Modelagem deste conteúdo (responsabilidade do Web Engineer).

Na Figura 2, observa-se, ainda, o componente principal, nomeado "Conteúdo on-line", sendo especializado em dois outros componentes: "Conteúdo Estático" e "Conteúdo Dinâmico / Interativo" e sub-componentes destes.

processo de aplicação e pesquisas em projetos-piloto que estão em andamento atualmente. Sem dúvida um sistema dinâmico de educação a distância que busque métricas de qualidade e desempenho necessita de mecanismos (instrumentos e procedimentos) para análise da qualidade. Nosso objetivo, nesta primeira instância deste *framework*, estava restrita a modelagem para disponibilização de conteúdo Web.

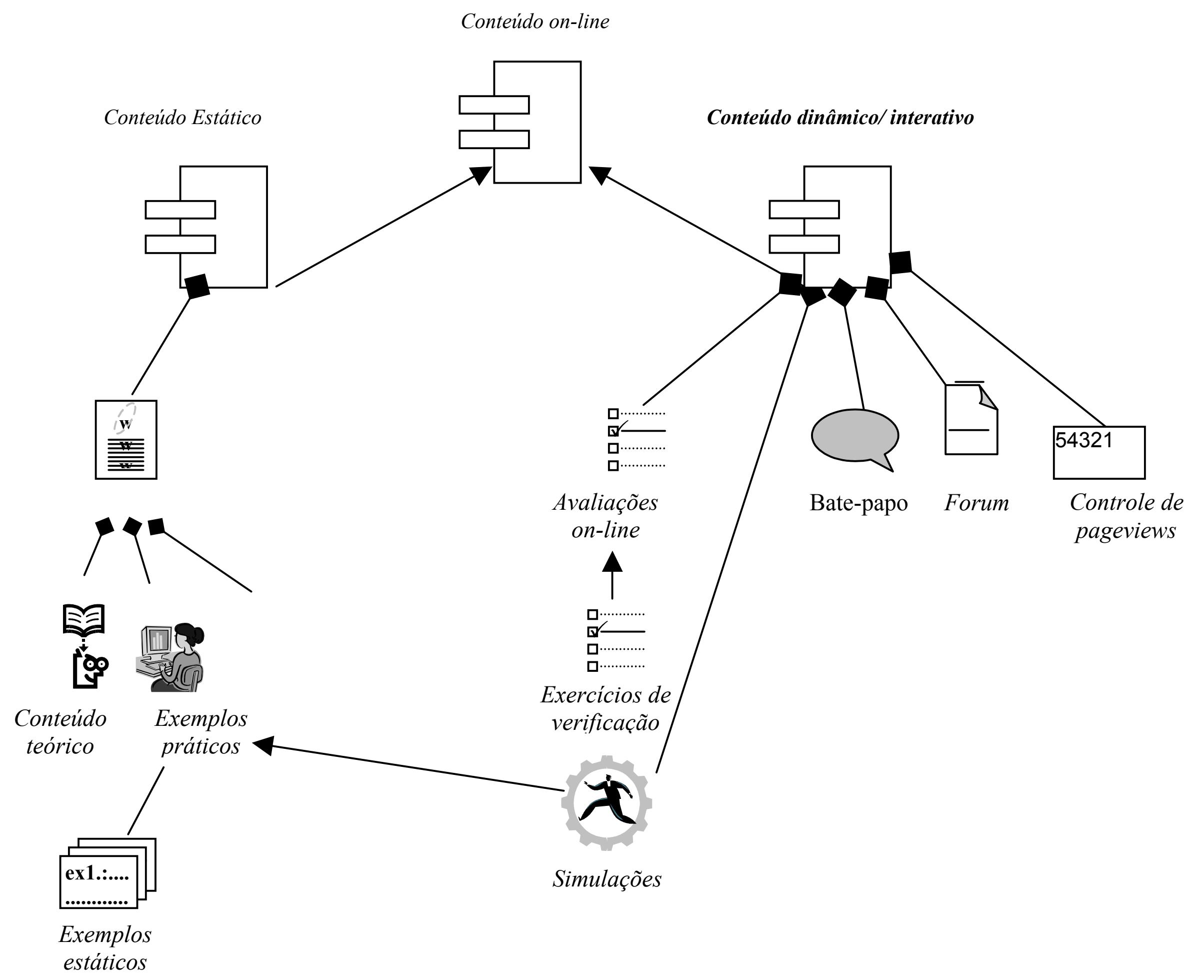


FIGURA. 2
DIAGRAMA DE COMPONENTES UML DO FRAMEWORK DE DESENVOLVIMENTO DE OBJETOS DE APRENDIZAGEM.

.

IV. CONCLUSÕES

O framework proposto já foi neste trabalho já está em utilização em um projeto-piloto desenvolvido pelo NEAD-UNICSUL na oferta de algumas disciplinas dos cursos de Computação e Informática dessa Universidade, por meio do ambiente WebCT. Os resultados obtidos com a sua utilização é um menor tempo de desenvolvimento para conteúdos digitais e material didático de suporte as atividades virtuais e a possibilidade de ampliarmos o número de estudantes atingidos pela iniciativa. Em 2003 esperamos envolver 5000 estudantes em cerca 200 disciplinas das diversas áreas do conhecimento. As disciplinas serão ofertadas na modalidade simipresencial onde 50% das atividades serão realizadas presencialmente e 50% das atividades realizadas utilizando-se do ambiente virtual de aprendizagem.

Nossas pesquisas atuais encontram-se na fase de integração do objeto de aprendizagem de conteúdo desenvolvido através deste framework com outros objetos de aprendizagem a fim de obter processos e mecanismos de personalizar e individualizar o aprendizado via web.

FACIO: An integrated proposal to virtual learning environment interactions

José Marques Pessoa[1], Hylson Vescovi Netto[2] and Crediné Silva de Menezes[3]

Abstract — *This work presents a proposal of an interface to virtual learning environments, no matter the general communication tools. It also presents a prototype called FACIO, which gather the most outstanding functionality from the general tools, present on the main CSCL environments. FACIO provides an integrated vision of the synchronous interactions, aiming to stimulate the participation and facilitate the coordination of activities in the virtual learning environments, without taking the possibilities of the asynchronous discussion away.*

Index Terms — *integration of Interface, Coordination, Interaction, Learning Virtual Environment.*

INTRODUCTION

The learning tasks are usually a collective labor. With the introduction of the computer network in the teaching and learning process, the students' and teachers' localization ceased to be a limitation and gained completely innovative aspects. Now it is already possible to talk about distance learning without renouncing cooperation, collaboration and collective strength to construct knowledge. However, to make these dreams come true, we have to turn them available, in a synchronous as well as asynchronous way.

The experiences indicate that the students learn better and more enthusiastically when they interact to one another and it is critical for the computer systems which support collaborative learning to have environments that make these interactions easy [8], [11].

Virtual learning support environments have been basically using general purpose communication tools, such as: email, discussion forum, chat, bulletin board and instant messages. While the use of these tools have been reported by its positive aspects [16], [10], an inadequate use might be observed: the lack of integration. It means that to interact with any of these tools, the learner must switch over many different applications, one at a time, with their own usage peculiarities. Such procedure makes it difficult for the people to participate, besides making the interaction flow also more difficult, and as a consequence dispersion occurs and the production of the collective knowledge gets shackled.

This work presents the proposal of an interactive interface independent of the general communication tools. The proposal comes true with FACIO, a communication tool which seeks to reunite some performances from the most popular applications, such as: email, discussion forum, chat, bulletin board, and instant message in one single application. The prototype was constructed to experience and validate the ideas discussed herein.

Therefore, the text is organized like this: Section 2 discusses the role of the communication on the learning process; Section 3 presents the most used communication tools in the virtual learning environments; Section 4 presents an integrated proposal of communication, based on the main conceptual elements; Section 5 presents FACIO, a prototype constructed to materialize, experiment and validate the ideas; Section 6 shows the internal architecture of the system and Section 7 makes the conclusions and indicates the perspectives of the future researches.

COMMUNICATION, COOPERAATION AND APPRENTICESHIP

According to Piaget, cooperation is an essential element to learning. The constructivism, proposed by him, highlights the learner interaction with objects of knowledge and with other individuals as the key element to construct knowledge. Still according to Piaget, cooperation is indispensable to reach intellectual abilities of higher level. Thus, cooperate is not goodwill, but before it is an essential attitude to take better advantage of our potentials.

In his many works, Pierre Lévy, a sociologist of the CIT (Communication and Information Technology), points out the fundamental role of the internet in order to produce a learning revolution. Lévy emphasizes that human intelligence depends greatly on the technology we use to register the knowledge and from this, make new inferences. To illustrate his point of view, Lévy, remind us of the advances that humanity has obtained on the intellectual field by the time the *printing-press* was invented. Still according to him, we are ready to a new revolution, able to overcome the previous ones.

The importance of the communication in the learning task has been reported in many works from the CSCL area (*Computer Suported Collaborative Learning*). Just to illustrate, the following opinions are shown below:

In [4] it is possible to read: "Computers provide the opportunity to learn to communicate, as well as they make it possible for communication to improve the learning experience."

[1] José Marques Pessoa, ICLMA – UFMT, Rodovia MT 100 km 4, 78600.390, Pontal do Araguaia, MT, Brazil; PPGEE/UFES, Av. Fernando Ferrari, S/N, 29060-900, Goiabeiras, Vitória, ES, Brazil, jmpessoa@hotmail.com
[2] Hylson Vescovi Netto, PPGEE/UFES, Av. Fernando Ferrari, S/N, 29060-900, Goiabeiras, Vitória, ES, Brazil, hvescovi@bol.com.br
[3] Crediné Silva de Menezes, PPGEE/UFES, Av. Fernando Ferrari, S/N, 29060-900, Goiabeiras, Vitória, ES, Brazil, credine@inf.ufes.br

To [11], the apprenticeship is stimulated by communication and the computers may help in three ways: making human-to-human communication easier, stimulating the production of ideas and helping to organize them.

[5] adds that "the verbalization growth compels the cognitive restructuring", essential to the individual and collective construction of the knowledge.

[3] indicates that "the encouragement of the discussions between pairs in real as well as in virtual situations reinforce the apprenticeship" quoting accounts from many researches.

Therefore, learning is not just an active task, in the sense of doing it alone, but before it is an interactive, in the sense of doing it together [7]. Yet, [15] points out that the social interaction in virtual environment cannot be taken for granted. After all, it is not guaranteed even in the real world! It is up to the learning support computational environments a much more important role. One which goes beyond the grasp of mere facilitators of social interaction. And, for sure, it is necessary to stimulate those interactions.

Next the most used communication tools in the learning support telematic environment are briefly discussed.

USUAL COMMUNICATION TOOLS

Collaboration and communication are the main objectives of the virtual learning environments [11]. To make them feasible a variety of tools, synchronous and asynchronous, of general purpose, are being used for such environment. With this it becomes possible to have the communication, the experience exchange, and the interaction among students and knowledge mediators. Such tools might be divided, according to its return time, into synchronous (when the communication return is immediate, also called "alive communication" or online) and asynchronous (when the communication return can delay for an indefinite time.

Asynchronous Communication Tools

The most used asynchronous communication tools in virtual learning environments are: electronic mail (email), thematic discussion forum, bulletin board (mural) and FAQ.

- **Electronic Mail (e-mail)**

It is a messages and documents transmission service between individuals. An extension of this concept is the discussion group (mailing list/e-group) in which a group of individuals subscribe in order to receive and send messages to the same group.

- **Discussion Forum**

In an discussion forum, the messages about a certain topic/issue keeps organized under hierarchical order, showing the chained-answer tree, making it easier to browse.

- **FAQ (Frequently Asked Questions)**

Frequently asked questions. *Site* with a list of questions and its respective answers, related to the most common doubts about a certain subject.

Synchronous Communication Tools

The most used asynchronous communication tools in virtual learning environments are: *Chat* and *Instant Messages*.

- **Chat (Internet Relay Chat)**

It is a virtual meeting room where people get together in order to talk in real time (*online*). It allows a message to be sent to a person or to all the people in the chat room.

- **Instant Messages**

The instant message services, *ICQ* for instance, make it possible that online meetings occur occasionally, while the users just have to be online at the time of the conversation. The service will take care of notifying each of the participants about each others' presence, allowing sudden meetings on real time.

Conclusions of the Section

The use of this variety of applications for communication reveals that none of them satisfies the needs of virtual learning environments alone, thus justifying the use of them all by the important differentiation that each one has and which sums up to the whole process of social interaction aiming the collective construction of the knowledge. It is important to point out that the set of those applications does not configure one single educational environment. They came up at different times, according to the available technology and imitating existing metaphors. Moreover, if they get summed up to a use, in cyberspaces, they tend to bring about knowledge dispersion and cognitive overload.

The cognitive overload goes through the choosing of the tools to be used, the theme to be discussed and the best pair of students to interact to one another.

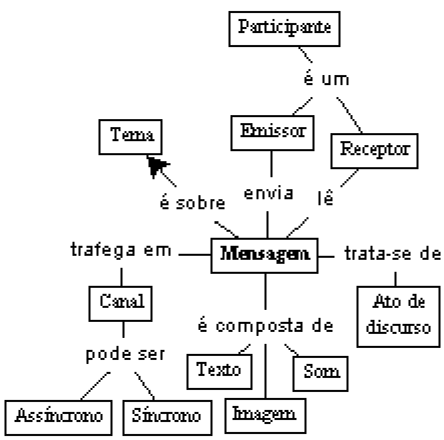
The knowledge dispersion might be characterized as built-in an specific tool, for example, the message exchange among the various pairs (be it in a chat, or in an instant message) often suffers the lost of context [14], because of the lack of connection in-between the subjects and the visibility, due to privacy with which the conversations are held between pairs. But dispersion can also be explicit when the same subject/theme is treated/discussed simultaneously in different spaces and tools.

AN INTEGRATION PROPOSAL FOR COMMUNICATION IN VIRTUAL ENVIRONMENTS

In the virtual learning environments communication is the social interaction way which contributes to knowledge construction. Here knowledge construction is understood as a continuous process which stands on the existence of an environment to encourage people to communicate and take part of it. A communication can be synchronous or asynchronous, taking effect through a means of communication, among a group of people (participants) who are transmitters and/or receivers. It is a public broadcast, when the transmitter addresses to all the receivers. Or a restrict one, when the transmitter restrict to a set of receivers. A communication is based on the context (theme/subject). The subject of a communication might be a text, a sound, a image, or even a combination of those formats. A text message might incorporate an speech act [1], [17].

We propose to gather the outstanding functionalities from some conventional tools, like the theme based discussion, presence notification and exchange of synchronous and asynchronous in a single application. The proposal goes far beyond when it allows an innovative view of the synchronous interactions what, according to accounts from [6] and [2], "multiplies participation and make the coordination of the activities on the virtual learning environment easier", without taking the chances of asynchronous discussions away.

Picture 1 presents a map of the main conceptual elements identified on the communication process.



PICTURE 1
CONCEPTUAL MAP

On the map, we used the following conceptions: theme, channel, participant and messages, with the following meaning:

Theme: Relates to the subject which is being discussed. A theme might be created by any participant. The theme is discussed by a group of participants, synchronously as well as asynchronously. A theme can be inspected so that it is possible to know what happened there at the last hour, day or week. It is also possible to relate a theme to a set of images or sounds or even to a bulletin board (mural).

Participant: Individual who takes part of the discussions of one (or more) themes. The participant is associated to his profile and also to a picture of his. The center of attention might be focused on a participant, in order to get his last hour, day or week interactions better known.

Channel: means of communication to transmit the message between the sender and the receiver. A channel can be synchronized so that it is possible to know its content at that very moment, or it can be inspected in order to know what might have happened there during the last period of time (i.e. on the last hour, last week, etc.).

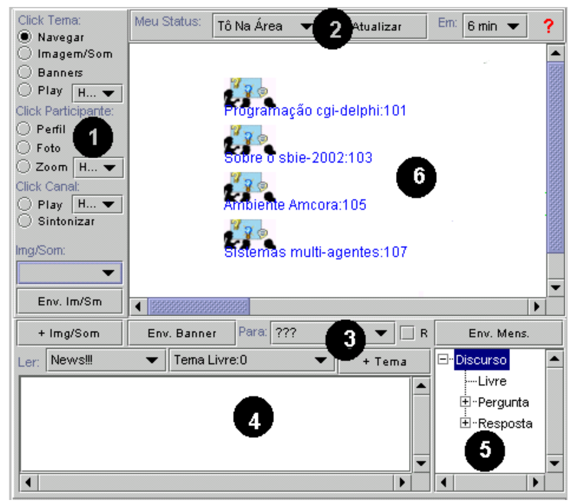
Message: The content of a communication unit. It can be a text, a sound, an image, or even the combination of these formats. A text message might incorporate an speech act (information, opinion, suggestion, etc.).

FACIO – The Prototype

FACIO is an application that runs on web browsers, developed with an *applet* technology (java language).

INTERFACE ELEMENTS WITH THE USER

Picture 2 presents FACIO's interface. The black numbered spots indicate the main interface elements.



PICTURE 2
FACIO

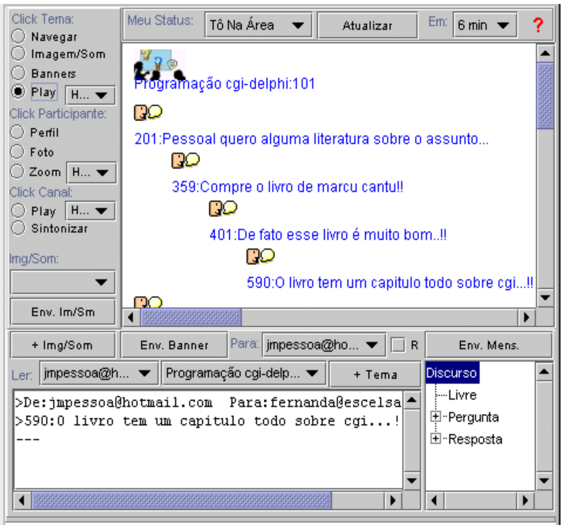
On panel 1 there is an option menu which sets the mouse-click function over the interaction view panel (Panel 6). On panel 2, the first list offers a user's status option (I'm free for chat, I'm away, I'm busy, etc.). Each status has a corresponding icon. The "Refresh" bottom updates the screen information and the following list manually configures the interval of refreshments of the view panel (panel 6). Panel 3 presents the reading and exchange messages controls (From, To, Theme, Send, Reserved). Panel 4 is the editing and reading space of the messages. Panel 5 configures the speech connotation elements (Free, Question, Answer, etc.), clues that may be used by intelligent routines in order to automatically extract the knowledge [17]. Panel 6 allows the access to the content about a theme previously discussed and also to the participants interaction diagram, with a click of the mouse.

Utilization Scenarios

FACIO's basic utilization scenarios follow the conceptual elements: Theme, Participant, and Channel.

Executing a theme (Theme/Play)

The discussion of a theme might be tracked since the last hour, day, or week. Picture3.



PICTURE 3

DISCUSSED CONTENT ON A THEME

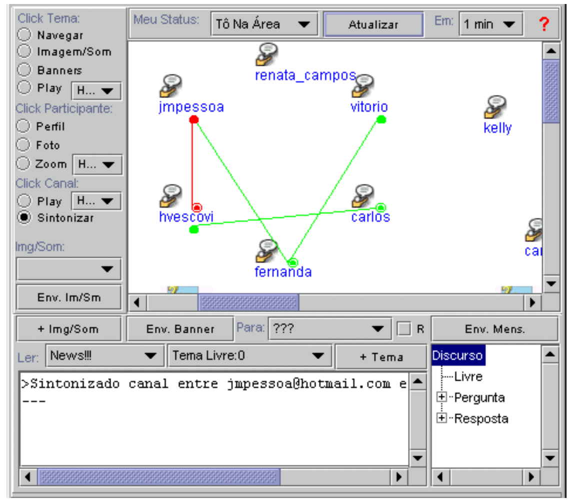
A theme being discussed by a Group (browse)

Configuring the mouse-click to Theme/Browse and by clicking on a certain theme it is possible to see the group of participants who are performing the discussion. Picture 6.

Each icon represents an individual participating on the discussion theme and the lines between the icons indicate the conversation channels. An user may configure his icon to denote his *status* on that very moment, like: "I'm free to chat.", "I'm out.", "I'm busy." Etc. So that the other participants can understand his disposition to participate on any synchronous discussion [9].

Tuning in to a Channel (Channel/Tuning)

A discussion channel between two participants can be tuned in, so that it becomes possible to attend or even participate to the conversation. A reserved message keeps its content secret, but the interaction is always public. Picture 4.



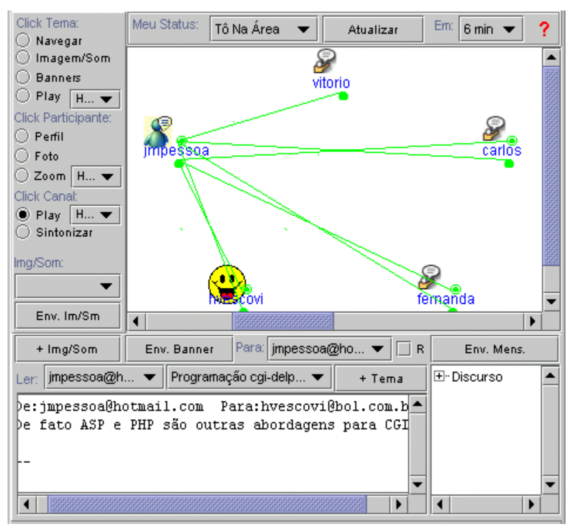
PICTURE 4

TUNING A COMMUNICATION CHANNEL

Still, a channel may be run (Channel/Play) in order to know the content of a conversation which happened there on a certain time intervale (last hour, day, or week.).

Broadening the interactions with a participant (Participant/Zoom)

The participant grasp can be broadened over many subjects and themes. Picture 5 presents a *Zoom* on the participants interaction.



PICTURE 5

THE INTERACTIONS DIAGRAMS OF A PARTICIPANT

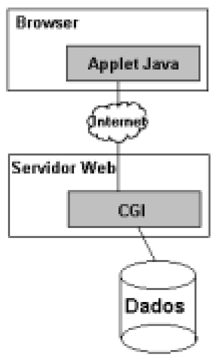
Under any circumstance in which a conversation is going on line (happening), the other participants may tune in to it, in order to attend and/or take part of the discussion.

Sending and receiving messages

FACIO automatically notifies the user about new income messages and to each opened message, it synchronizes the theme and the addresses to the answers. A message might be sent with "reserved" or "public" status and still it may incorporate a speech act.

FACIO'S INTERNAL ARCHITECTURE

FACIO is a www application based on the browser-host web paradigm. The client is a java *applet* who communicates, over the internet with a *CGI application,* data server. Picture 6 illustrates this architecture.



PICTURE 6
FACIO'S INTERNAL ARCHITECTURE

FUTURE PERSPECTIVES AND CONCLUSIONS

This work has presented an integrated communication proposal, made come true by communication tools which aims to put some functionalities of the most popular applications, such as: email, discussion forum, chat, bulletin board, instant message together in one single application. FACIO tries to put the outstanding devices from those tools together, but it goes beyond when it allows an innovating view of the synchronous interactions, aiming to stimulate the participation and making the task coordination on virtual learning environments easier, although without taking the possibilities of asynchronous discussion away.

At the moment our researches are focusing the FACIO's integration with the AmCorA environment [12]. That means we intend to make FACIO a single interface to the various communication spaces used nowadays. This includes the integration of conventional services such as: forum, chat, instant messages, bulletin board (mural) and FAQ, together with the intelligent addressing service *Qsabe* [13]. Thence we expect to correct some dispersion aspects of the knowledge and stimulate the interactions.

FAmCorA: A Framework to Construct Intelligent Learning Environments on the Web

José Marques Pessoa[1], Hylson Vescovi Netto [2] and Crediné Silva de Menezes[3]

Abstract *— The development of new virtual learning environment demands such an amount of resources which makes it very difficult for innovative proposals to arise. As a consequence there is a huge gap between the theoretical conceptions and the actually implemented work.*
The present job presents a framework proposal to develop applications of the CSCL type. Be it by the reuse of the service providers(web services), implemented in the framework, or be it done by the sharing of applications among many systems.

Index Terms — Virtual Environment to Learn, Cscl, Cscw, Framework, amcora, Application Composition.

INTRODUCTION

Telematic environments to support collaborative learning, consist of one of the most prominent innovations due to modern information technology and communication. The computer networks, particularly the internet, have broaden the possibilities to construct cooperative environments, in which researchers, teachers and students relate to each other aiming to exchange and acquire knowledge.

According to Bonk & King, referred in [1] a network can: i)change the way learners and teachers interact; ii) enhance the opportunities to the collaborative learning; iii) facilitate discussions; iv) shift the process of study from an isolated one to a more sociable and dynamic activity.

Even so, in the nowadays state of the art, the development of learning environment of CSCL type on the web, has been proving to be a complex task, either for the theoretical point of view, or to the technical one. And of an extremely high cost to most the institutions/schools intentions, which are interested in the use and exploration of this new technology into the teaching and learning process.

According to [2] from the theoretical point of view "the collaborative learning variables have been extensively studied, however, it is safe to say that we are still on the first step towards the design and development of CSCL- *Computer-Supported Collaborative Learning*". Cook [3] has written: "We still don't have enough detailed knowledge about the relations between theory, empirical work and the implementation of leaning environment".

In practice, it is possible to observe, in [1,2,4,5], that typical telematic environment of web learning backing, support a standard set of functionality: hypertext, specific areas for file sharing (*upload/download*), messages distribution (*email*), synchronous conversation (*chat*), discussion forums, boards (advice boards), news notification service, presence notification to exchange instant messages (*IM*) and a Frequently Asked Questions Service (*FAQ*). No doubt, there are still many other functions belonging to each system.

Despite the clear intercession of the basic set from the tool/ application used in these systems, due to technological issues and to the scope of the problem domain, the construction of a new environment almost always requires the re-implementation of each of those tools. This work proposes a framework to the development of cscw/cscl applications, emphasizing the reuse of *ready to run applications*, and not of source code (beans, activex, etc). The purpose is to make cscl/cscw portals creation on the web an authoring activity within the grasp of educators and teachers in general, instead of being an exclusive expert-programmer job.

The text is organized like this: Section 2 presents a brief introduction to some technologies of reuse; Section 3 treats the motivation of this work; Section 4 talks about the aims of the cscls environments; Section 5 discusses the aspects which must be solved on a reuse-based architecture; Section 6 proposes an architecture based on the composition of applications, the FamCorA; Section 7 consider the implementation of the proposal and last, but not least, Section 8 presents the conclusions and perspectives.

WEB ENVIRONMENT DEVELOPMENT REUSE TECHNOLOGIES

The technologies to develop *groupware* applications on the *web,* emphasizing the reuse, have been indicating three directions: Components (modules pre-compiled), class library and service composition (web services).

[1] José Marques Pessoa, ICLMA – UFMT, Rodovia MT 100 km 4, 78600.390, Pontal do Araguaia, MT, Brasi and PPGEE/UFES, Av. Fernando Ferrari, S/N, 29060-900, Goiabeiras, Vitória, ES, Brazil, jmpessoa@npd.ufes.br
[2] Hylson Vescovi Netto, PPGEE/UFES, Av. Fernando Ferrari, S/N, 29060-900, Goiabeiras, Vitória, ES, Brazil, hvescovi@bol.com.br
[3] Crediné Silva de Menezes, PPGEE/ UFES, Av. Fernando Ferrari, S/N, 29060-900, Goiabeiras, Vitória, ES, Brazil, credine@inf.ufes.br

Component Based Solutions

[6] presents a methodology to develop *groupware* environment based on pre-fabricated components. Such components are understood as self-contained elements, with well defined objectives and with the capacity to be used both isolated as well as in composition with other components. Likewise [7] presents the *COGAM* (C*omponent-based Groupware Architectural Model*) architecture constructed specifically to the Windows plataform and its COM objects (*Common Object Mode l*).

Programming Environment Based Solutions

Some *frameworks* are specific to a certain programming environment, for example, *GroupKit* [8] offers a developing framework to *groupware* environment, based on the *Tcl* programming language. Habanero [9] is a Java language based framework.

Service Based Solutions

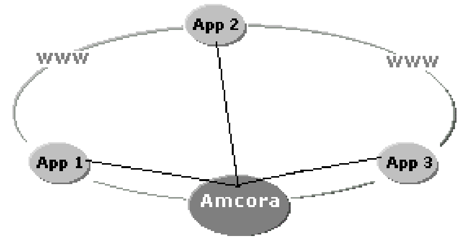
A service oriented architecture (SOA)[10] combines the ability to invoke remote objects and functions (called "services") with tools for dynamic service discovery, placing an emphasis on the interoperability. Examples of service-oriented architectures include HP's E-Speak, Sun's Jini and ONE and Microsoft .NET. Recently such technologies have been converged to a W3C standard called Web Services[11].

What those three approaches have in common is the fact that the proposed reuse occurs in relatively low level, in all of them, because class libraries, pre-fabricated components (*building blocks*), and services are the pieces of software which still require a meaningful implementation struggle to the "gluing" of the various parts which will result into a cscl/cscw application *ready do run*! And in this sense, far from the [12]'s request: "what we need to reuse is the actual stuff of which our products are made: executable software".

REVISITING THE WEB: HYPERLINK APPLICATION COMPOSITION

In this work we advocate a solution which observe the necessary reuse of the available services on the web, but that goes far beyond, when proposing the reuse of entire applications, including their interfaces.

Considering the hypertext paradigm on the web and taking App1, App2 and App3 as typical applications used in virtual learning environments, picture 1 presents a possible composition of those applications, giving birth to a learning support portal.



Picture 1. ***Amcora***'s composition.

At the most *hyperlink* web style, the ***Amcora*** application (a acronym for Cooperative Learning Environment) is a unification spot (Thus the name portal) for the access to the App 1, App 2 and App 3 services.

However, in real situations, the nowadays technologies and paradigms used in the development of general web applications, the complexity, and the domain needs of the support environment to the cooperative work (CSCW), specially of those aiming the teaching and learning process (CSCL), make the construction of new environments, with the simple reuse of hypertext model on the web, impossible.

COMPUTER SUPPORTED COLLABORATIVE LEARNING

To [13], the computer supported collaborative learning environments were greatly benefited by the internet. Such environments have proven to be very expressive, as much on the cognitive as on the social aspects.

According to [14] the CSCL environment type shall give support to:

a) Communication/interaction between participants;
b) Information Sharing and
c) Tasks / Interactions analysis;

Aiming to help the collective knowledge construction.

Nevertheless, as [15] enphasizes "there are few resources which provide insights (both technical and theoretical) to the development of such an environment".

E2HDL: UMA NOVA FERRAMENTA DE SÍNTESE PARA IMPLEMENTAR EQUAÇÕES ALGÉBRICAS EM FPGA

Adriano dos Santos Cardoso[1], Alexandre César Rodrigues da Silva[2] e Aparecido Augusto de Carvalho[3]

Resumo *— O desenvolvimento de ferramentas de síntese automática permite que projetistas gerem uma descrição de Hardware sem a necessidade do conhecimento profundo da tecnologia em que o sistema será implementado. Este artigo apresenta uma ferramenta de síntese para projetos de sistemas digitais denominada E2HDL (Equação para Linguagem de Descrição de Hardware). Com a especificação dos parâmetros da equação, a ferramenta desenvolvida gera um modelo em linguagem de descrição de hardware, podendo ser a AHDL ou a VHDL, que implementa a equação desejada. Esta ferramenta em conjunto de ambientes de síntese comerciais possibilita a configuração, em FPGA, de uma grande quantidade de formas de ondas, utilizando somente recursos digitais. Para avaliar a sua eficiência implementou-se em FPGA uma grande variedade de formas de ondas como, por exemplo, seno, sigmoide, gaussiana e muitas outras. Diferentes especificações puderam ser avaliadas. A ferramenta, apresentou-se como uma poderosa contribuição para a criação automatizada de circuitos digitais.*

Palavras Chave — Ferramenta de Síntese, FES, FPGA, VHDL.

INTRODUÇÃO

Com a evolução dos processos de produção tecnológicos, os sistemas de integração de circuitos se tornaram mais complexos. O mercado demanda por circuitos mais eficientes e pela redução nos prazos de desenvolvimento. Esses fatores, justificam a utilização cada vez mais freqüente da automação dos processos de desenvolvimento dos projetos.

Circuitos com centenas de elementos apresentam uma dificuldade enorme de serem implementados com ferramentas CAD (*Compiter Aid Design*), baseadas em captura de esquemático. Atualmente, os projetos vêm sendo desenvolvidos com ferramentas com níveis mais altos de abstração, usando HDLs (*Hardware Descripton Language*) e métodos de detalhamento e refinamento automático.

Os sistemas e processos digitais podem ser representados em função de um domínio e, em cada domínio por um nível de abstração.

A representação de um modelo que contém os níveis de abstração e os domínos de descrição de um sistema digital foi proposta pela primeira vez por Gajski e Kuhn [1], o chamado Diagrama Y, apresentado na Figura 1.

FIGURA 1.
ELEMENTOS PRIMITIVOS DE CADA NÍVEL DE ABSTRAÇÃO NO DIAGRAMA DE GAJSKI E KUHN (DIAGRAMA Y).

Neste diagrama, os níveis de abstração (Nível de Dispositivo, Nível Lógico, Nível RTL, Nível de Arquitetura) são identificados pelas suas distâncias do centro do diagrama, enquanto os segmentos de reta radiais correspondem a domínios de descrição. Por exemplo, um diagrama de esquemáticos de portas lógicas TTL é uma descrição estrutural lógica, estando, portanto, localizado na intersecção do eixo rotulado Domínio Estrutural com o nível lógico de abstração.

A Figura 2 representa o diagrama de Gajski da ferramenta desenvolvida. A E2HDL leva do nível de abstração de Equações Algébricas para o nível de Equações

Booleanas. O ambiente de projeto MAX + Plus II leva o nível de portas lógicas (Compilador) e, finalmente, para o nível de Planta Baixa (Configurador de FPGA).

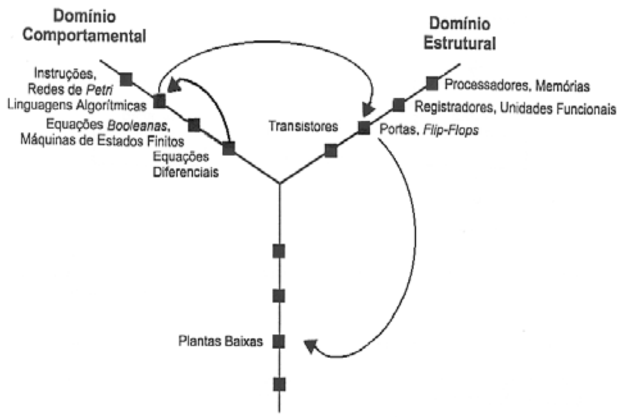

FIGURA 2.
REPRESENTAÇÃO DAS TRANSIÇÕES OCORRIDAS COM A E2HDL.

Uso de Lógica Programável

O uso de Lógica Programável (LP) está ligada intrinsecamente com o uso de tecnologias digitais, ou seja, criar um projeto com tecnologia FPGA (que é a LP escolhida), é criar um projeto digital. Projetos digitais podem-se utilizar de equipamentos variados como microprocessadores, tecnologia discreta e tecnologia de lógica programável, entre outros. A utilização do FPGA é decorrente de algumas vantagens tais como:

- Arquitetura em Hierarquia de Projeto;
- Paralelismo, o que leva a vários processos ou projetos simultâneos;
- Relógio (Clock) Elevado;
- Reutilização de Programas;
- Grande número de E/S (*I/O*);
- Fácil Roteamento;
- Possibilidade de Sistemas-on-Chip;
- Ferramentas de projeto;
- Utilização de funções parametrizáveis;
- Grande número de Células Programáveis.

CRIAÇÃO DE DECOFICADORES DIGITAIS UTILIZANDO FERRAMENTAS DE SÍNTESE AUTOMÁTICA

SISTEMAS DIGITAIS

Um sistema digital é um sistema discreto, isto é, transforma valores discretos de entrada em valores discretos de saída. Ele trabalha aplicando operações ou transformações nos valores de entrada. Os resultados dessas operações são passados a outras operações e, finalmente, para o valores de saída.

A descrição através de uma interpretação funcional do sistema é chamado de Descrição Comportamental. Em linguagem de descrição de hardware, a descrição comportamental é diretamente integrada na linguagem. Assim, pode-se trabalhar em uma descrição com um nível mais alto de abstração.

As ferramentas de síntese, trabalham em torno de modelos funcionais que representam algum conjunto de funções.

Um dos modelos que se pode trabalhar nessas ferramentas são os decodificadores. Estes, representam funções booleanas. Assim, cada um dos pinos de saída é uma função de todas as entradas.

Um decodificador de 7 segmentos representa bem esta ideia, ele possui 4 entradas (A, B, C, D) e 7 saídas (a, b, c, d, e, f, g) e a saída "a", pode ser transcrita como:

$$a = F(A,B,C,D) = \\ = \Sigma(0,2,3,5,6,7,8,10,12,14,15) \qquad (1)$$

Extrapolando para as outras saídas, determina-se as funções b, c, d, e, f, g e aplica-se os processos de minimização (fornecidas pelo ambiente de projeto Max + Plus II da Altera).

IMPLEMENTAÇÃO DE FORMAS DE ONDA ANALÓGICAS

O intervalo de valores possíveis de um contador, depende da quantidade de flip-flops que se está trabalhando, ou de outra forma, do número de bits. Assim, um contador de n = 8 bits, por exemplo, apresenta em função da contagem, valores em sua saída entre 0 e 255, ou seja, $2^n - 1$, onde n é o número de bits. Desta forma, a cada pulso de relógio a contagem aumenta em uma unidade percorrendo todos os valores de forma crescente. Acoplando-se a saída do contador a um decodificador com o mesmo número de bits, a cada valor de contagem, tem-se no barramento de saída do decodificador valores em função da contagem atual do contador. A freqüência de saída do sistema, depende do número de bits e do relógio conforme (2). A Figura 3, representa o sistema que gera uma onda analógica partindo de recursos digitais.

$$fsinal = \frac{fclock}{2^n} \qquad (2)$$

Onde:
n = número de bits do contador;
fclock = freqüência do relógio (entrada);

fsinal = freqüência do sinal (saída).

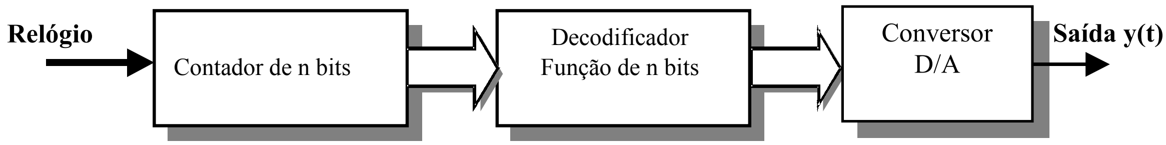

FIGURA 3.

FERRAMENTAS DE PROJETO BASEADAS EM SÍNTESE AUTOMÁTICA

Métodos de síntese automatizada ótima para equações Booleanas datam das décadas de 50 e 60 e não tinham a capacidade de resolver sistemas muito complexos. A necessidade de manipular quantidades crescentes de informações durante o projeto de sistemas digitais exigia a consideração constante de novas ferramentas. Estas deveriam transcender as atividades de facilitar a captura e de exercitar descrições, passando a ser capazes de gerar novas descrições de forma automatizada e corretas por construção, baseadas nos mesmos requisitos manipulados pelos projetistas. O estilo de projeto estabelecido por estas novas ferramentas baseia-se no uso de ferramentas computacionais e guia o processo de projeto. A ferramenta central possui embutido um conjunto de modelos de síntese, e é capaz de gerar uma descrição correta por construção, bem como uma avaliação do desempenho desta descrição. O laço de realimentação é fechado pelo projetista, que julga os resultados da síntese e aceita a descrição, ou a rejeita e escolhe um novo modelo de síntese para ser usado. Essa escolha pode ser feita com o auxílio de outras ferramentas distintas e apropriadas no processo de validação.

As ferramentas de simulação podem, ainda, ser empregadas, visando fornecer mais detalhes sobre a implementação. Freqüentemente, o sintetizador gera uma descrição a partir dos requisitos, e refina esta descrição através de técnicas de otimização. Somente a descrição resultante deste processo é fornecida ao projetista.

ESTIMULAÇÃO ELÉTRICA FUNCIONAL E FORMAS DE ONDA

A estimulação elétrica funcional (FES) vem sendo aplicada para restaurar e manter a atividade muscular de pacientes paralisados que sofreram lesão medular. Várias formas de onda de corrente e tensão vêm sendo aplicadas com sucesso na recuperação destes pacientes. Equipamentos desenvolvidos comercialmente, entretanto, apresentam de forma geral, serias restrições quanto à variação dos parâmetros do sinal aplicado (freqüência, forma de onda, amplitude, número de pulsos em modulação tipo Burst, tempo de repouso, etc.) o que abre a possibilidade do desenvolvimento de equipamentos mais completos e versáteis.

Uma grande variedade de aparelhos está comercialmente disponível para aplicações eletroterapêuticas. A instrumentação na eletroterapia está se proliferando rapidamente com aos avanços da engenharia, dos desenvolvimentos na pesquisa de eletroterapia e do alcance ampliado dos problemas tratados pela eletroterapia.

Muitos aparelhos projetados antes do início dos anos 80 incluíam geradores de forma de onda capazes de produzir somente um tipo de forma de onda a partir de um único aparelho.

Hoje, contudo, muitos estimuladores disponíveis comercialmente são capazes de produzir várias formas de onda distintas, mas, muitos dos parâmetros de controles não estão disponíveis. Esta dificuldade, abre a possibilidade do uso de novas tecnologias e da introdução de equipamentos com mais recursos, possibilitando uma geração de pulsos mais adequada do ponto de vista fisiológico ao paciente e, também, mais confortável.

Este trabalho apresenta o desenvolvimento de uma ferramenta de síntese automática para a geração de circuitos digitais com o uso de tecnologia de lógica programável. Os circuitos gerados, representam formas de onda de diferentes tipos de especificações e utilizam somente componentes digitais. A ferramenta tem como entrada os principais parâmetros de uma equação.

MATERIAIS E MÉTODOS

A ferramenta foi desenvolvida em linguagem C, e trabalha com funções analógicas para serem implementadas em hardware. A ferramenta gera um arquivo de HDL e para gerar um arquivo bastante pequeno, optou-se pela AHDL (*Altera Hardware Description Language*) da empresa Altera.

As formas de onda são parametrizadas com diferentes especificações, a ferramenta possui parâmetros de entrada para definir a quantidade de bits que o sinal digital deverá possuir e, também, a quantidade de pulsos necessários para percorrer-se um ciclo do sinal. Assim, se uma forma de onda tiver 8 bits de entrada e 12 bits de saída, tem-se uma forma de onda que necessita de um conversor D/A de 12 bits e 256 pulsos de relógio para completar um ciclo.

A ferramenta de síntese E2HDL gera o arquivo texto HDL.

O ambiente de programação MAX + Plus II da Altera simula e compila os arquivos HDLs e gera vários arquivos de reportagem e de interface com outros ambientes de programação.

O aplicativo TBL2M, foi desenvolvido para interpretar dados do arquivo .TBL (arquivo de simulação) e convertê-los em um arquivo gráfico do MatLab.

E, de forma geral, podemos descrever os passos para a geração de formas de onda como:

- Descrição da forma de onda (análise espectral);
- Utilização de uma das ferramentas de síntese para gerar o arquivo HDL (AHDL ou VHDL);
- Compilação, Simulação;
- Criação do Arquivo de Simulação TBL;
- Execução do Programa TBL2M;
- Visualização da forma de onda proposta no MatLab;
- Validação do Circuito;

Resultados

A forma de onda escolhida para implementação em FPGA foi a onda denominada farádica. Esta onda tem como característica um pulso de breve duração seguido de um período de decaimento exponencial. A equação farádica, foi modelada de acordo com as especificações da literatura de eletroterapia [7]. A Figura 4, apresenta a onda farádica simulada com 8 bits de entrada e 8 bits de resolução. Na figura, além da forma de onda, são mostrados os valores dos contadores em função do tempo.

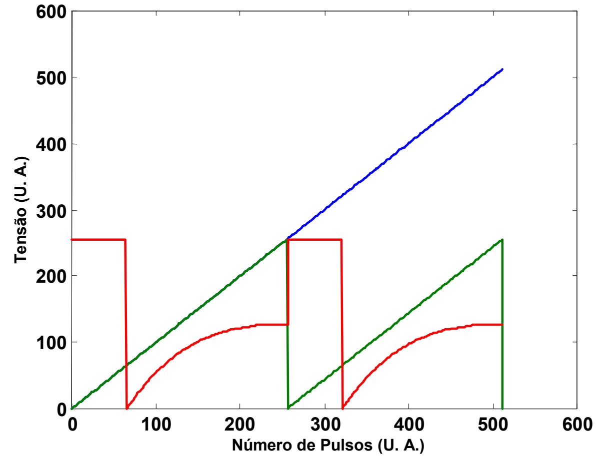

FIGURA 4.
FORMA DE ONDA IMPLEMENTADA EM FPGA

A Figura 5, apresenta a mesma forma de onda plotada com 5 períodos.

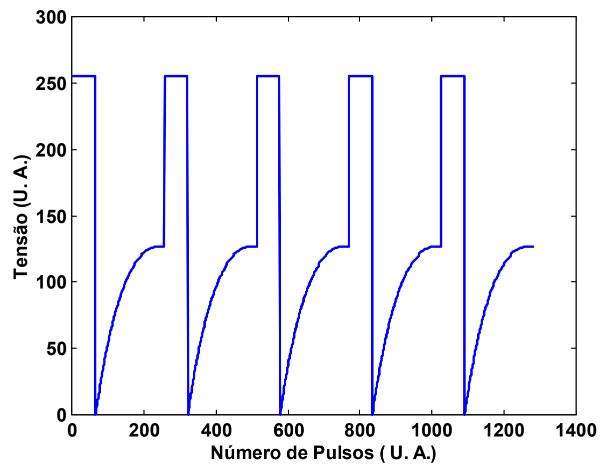

FIGURA 5.
FORMA DE ONDA IMPLEMENTADA EM FPGA

Conclusões

As ferramentas de síntese automática apresentaram-se como poderosas ferramentas para a geração de circuitos digitais.

A estrutura em hierarquia de projeto permite que, uma vez necessária a modificação da forma de onda previamente descrita, a fácil substituição desta por uma outra mais adequada dentro do projeto.

As freqüências de trabalho realizadas nas medições e simulações, permitem a implementação física das formas de onda, já que o objetivo é a aplicação em sistemas de Estimuladores Neuromusculares onde a freqüência de trabalho é quase sempre menor que 10 KHz.

ASPECTS OF CSCL

The web allow us to talk about a FOA/applications oriented framework, going beyond the code based, components, and even service paradigm. However, as in the objects oriented modeling, the complexity in relation to the system/domain partition, remains. In general, a partition aims to establish the responsibilities of each piece of the system in a certain domain of the problem. Nevertheless, it is observed that some properties of the system "cross-cutting" many parts of them. In AOP-Aspect Oriented Programming such proprerties are called *aspects* [16].

To the purposes of this work, a survey of the cscl/cscw aspects to be considered, is presented.

Community Organization Aspects

In the modeling of cooperative/collaborative learning and working support environment, the following aspects must be observed:

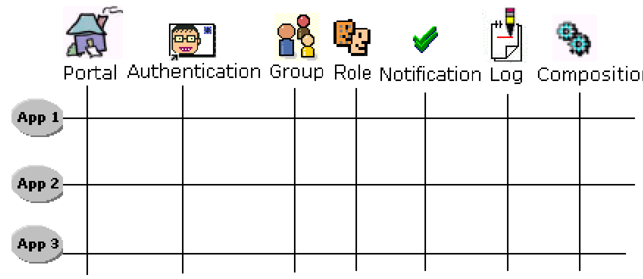
Portal: The term "Portal" is used to designate a comprehensible spot of access to the information (categorizing and seeking), applications (desktop integrated) and people (collaboration) in a virtual community on the web.
Authentication: Most of the cscl environments require that the user identifies himself.
Group: [17] mentioning (Johnson & Johnson) says that "the basic component of the collaborative learning is the group learning".
Role: The capacity of an application to adapt to the role performed by the user in the environment. Which besides being an organizational aspect, opens excellent pedagogical opportunities.

Interoperability Among Applications Aspects

The following interoperability aspects are required in cscl environment:

Notification: Aiming to have the applications and their users updated about facts, preferences, incidents and events which occur in the environment the cscl/cscw systems implement some notification mechanism.
log: [14] argues it is essential that the virtual learning environments store the history (log) of the individual and the group activities, in order to help the analysis and coordination of the job.
Composition: The composition concerns the connection between an application and the framework, and a plug-in-agent and a application. A plug-in-agent, together with the role, open opportunities to the adaptation/specialization of an application to the pedagogical needs.

Picture 2 shows the "orthogonality" among those aspects and the applications in a cscl environment.

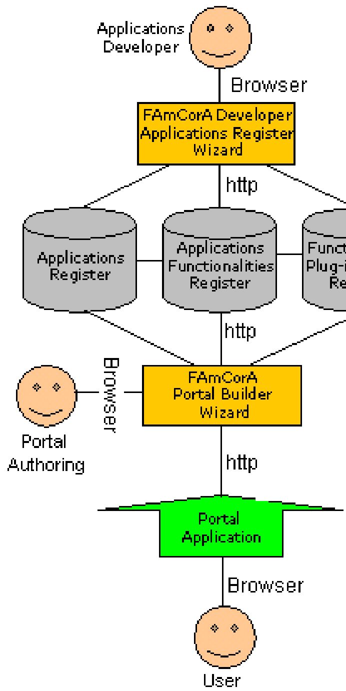


Picture 2. Aspects x Applications in CSCL/CSCW environment

According to [18] there are three basic approaches to addressing the process of separation of concerns : i) On the linguistic approach, relevant concerns are identified at the problem domain and are translated to aspectual constructs and later integrated with the functionality-decomposed program via well-defined interfaces; ii) Within the OO view, two main alternatives for handling aspects are frameworks, where concerns are materialized as aspectual classes either at the framework level or at the user-application level and reflective architectures; iii) the architecture-oriented approach, ***followed in the present work***, proposes an early identification of concerns using architectural organizational models. In this approach concerns are initially mapped to architectural constructs, instead of coding them using framework or language constructs.

FAMCORA ARCHITECTURE

The FAmCorA treats the aspects issues from the architecture point of view. Picture 3 presents a macro vision of the FAmCorA. The architecture concerns three kinds of users: application developer, portals author and end user. The mediation between the framework and its users is done through the web. The application programmer uses an assistant (Applications Register Wizard) to register applications and plug-in-agents. The portals author uses the information basis (Applications Register, Applications Functionalities Register e Functionalities Plug-ins Register) and an assistant (Portal Builder Wizard) to construct teaching and learning support environment on the web (Portal Application) in such a direct way as in those offered by environments called RAD (Rapid Application Developer). The end-user is the uppermost beneficiary of this construction endeavor.



Picture 3. FamCorA Architecture.

In picture 3, the Portal Builder Wizard module is the responsible for the portals catalog (portal aspect). The Portal Application module is responsible for the group catalog (group aspect), users (authentication aspect) e roles (role aspect). The aspects related to the interoperability (notification, log) are solved through communication protocols. A notification is sent through Passport Protocol and the Log of activities through xLidex (Extensible Learning Interactions Data Exchange Protocol). The composition between an application and the framework is given through an application class interface. Yet the composition between an application and a plug-in-agent occurs through the Plug-in-agent Protocol.

A FAMCORA IMPLEMENTATION

An implementation of the ideas discussed here is under development in the GAIA's laboratory (Computer Learning Application Group) from the Federal University of Espírito Santo, Brazil. The main concern of the project is to make the development of cscl environments an easy task, avoiding the need of expert programmers and turning it into an authoring assignment, giving educators and teachers the opportunity to create virtual environments to support the teaching and learning process.

The authoring of an educational portal in the FAmCorA is attended by a wizard, following the RAD paradigm. A mouse-click generates the basic nucleus of the system, instantly installed and ready to work on the web portal.

As the portals author logs on the environment, picture 4, he already has three groups at his disposal to administer: "Community" which is the portal's master group, where all the users are filed. The "Individual_Space" which is a template that concerns the personal space of each future user from the portal. When active, this space is assigned by the icon (Ayrton Senna's helmet – the F1 pilot) and has the same name as the user's email. In our case it refers to the author's cockpit, already equipped with two basic tools: xLidexManager, assigned by the icon (mobile-phone), it is a mechanism which communicates with all the FamCorA application, through the xLidex protocol, searching information about the users activities in the environment. GroupManager, assigned by the icon (wheel), it is the basic tool to drive around the portal, with it the author can: 1) create groups and their roles; 2) choose which tools will be available to the group users , according to the role taken by each one of them; 3) Include new users in a group.

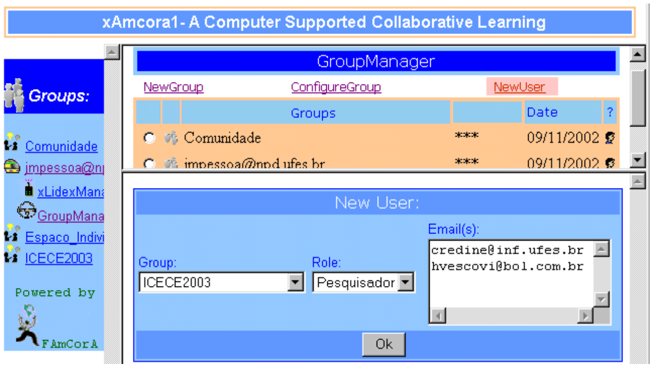
To create a new group, using the GroupManager, the author just have to select a "father group", afterwards he edits the name of the new group, for instance ICECE2003, and the roles of the individuals in this group, in the example "researcher" and "student".

Still on the GroupManager, the author uses a list to select, among the many tools, made available by the FAmCorA developers community, those which will be in the work area (windows desktop) of the new group, when the user is, for example, a "researcher". When the author chooses a tool, for instance "ExpressCalculator", he is offered the opportunity to customize or adapt its use, through a menu which presents the many available functionalities. To each functionality, a plug-in-agent may be selected, or not.

As an example, ExpressCalculator is a conventional application of general purpose, able to evaluate math expressions. However, as any well designed FAmCorA application, its performance might be adapted, depending solely on a plug-in-agent existence. In particular, the functionality "NewExpression" can be configured to generate typical expressions of some knowledge area as Physics, Chemistry, etc.

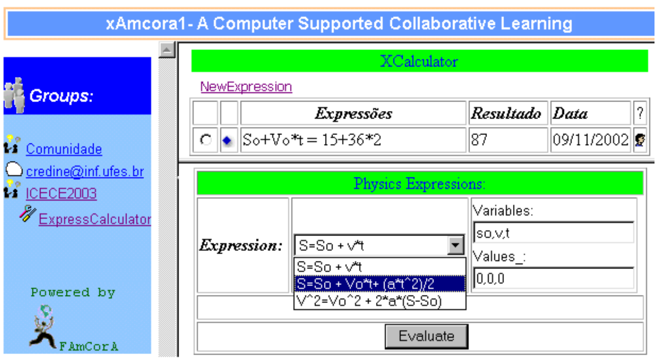
After the application, the functionality, and the adaptation (plug-in-agents) have been set to each role in the group, there is only the task of registering the users to turn the portal useful, picture 4.

Picture 5, presents the login of the user "credine@inf.ufes.br", newly registered with the role as a researcher in the group ICECE2003.



Picture 4. Cockpit and GroupManager

See, in picture 5, how a plug-in-agent choice has changed the specialized calculator ExpressCalculator into Uniformly Varied Movement Formulas (Physics), for the users whose role is to act as researchers in the ICECE2003 group.



Picture 5. An adaptive Calculator.

Perspectives and Conclusions

The Group Construction Support System, the so called e-groups, are not new on the web. Anyway, as being of general purpose, they lack convenient requisites and applications to the cooperative work activities required in cscw/cscl environments. They still miss intelligent and adaptive mechanisms to keep track, help and notify the interactions/tasks developed by the individuals in the various roles.

The FAmCorA architecture focus the resuse and the interoparationability among applications. In our point of view this has an important meaning: An application or a plug-in developed to a portal can be used in others, just by pointing it to a *link*. This strategy is crucial for the arising of new approaches to the educational environment, simply because now we can easily construct them, through means of application composition already existing in different domains, under different pedagogical conceptions.

NaTIEng: New Technologies of Information and Communication in the Teaching of Engineering

Edson Pereira Cardoso[1], Crediné Silva de Menezes[2], Jaime Roy Doxsey[3]

Abstract -- *Education in general and, in particular Higher Education, faces today a great challenge to form a citizen that will live appropriately in a society of knowledge. The pedagogic approaches (learning and evaluation) and the educational technologies have been shown as inadequate, thus motivating research efforts at the international level. In this article we present a project for insertion of new technologies of information and communication (**TIC**) in the modernization of the engineering courses of the Technological Center of the Federal University of the Espírito Santo (**UFES**). The project contemplates all the courses and will have a hybrid vocational capacity to assist not only the students and basic disciplines, as well as the professional disciplines, in respect to the use of modern technologies of information. It will also attempt to facilitate the students' integration in the community, to create the conditions for the practice of learning and of cooperative work and to support the traditional classroom teaching through the use of virtual learning environment*.

Index Terms: distance education, Internet and education, virtual learning environment

INTRODUCTION

Education in general and, in particular Higher Education, faces today a great challenge to form a citizen that will live appropriately in a society of knowledge. The pedagogic approaches (learning and evaluation) and the educational technologies have been shown as inadequate [1], thus motivating research efforts at the international level.

In Brazil, these concerns are constant, which can be verified by the appearance of projects as Program **REENGE** (**CAPES**, **FINEP**, **CNPq**), created in 1996, whose conception can be summarized in the following way:

> ***REENGE*** *has a main objective to restructure higher education, motivating the accomplishment of different teaching experiences such as the implantation of virtual learning modules, the use of computer resources, research activities and experimental development, in the constant requalification of professionals. The main motivation for the reformulation of the Engineering curriculum was the rapid speed of the technological progress and the growing computerization of the means of production.* [2]

In the **REENGE** project, the Technological Center of The UFES had significant participation, through six sub-projects intertwined by the conjugated effort in the appropriation and use of computer systems [3], [7].

More recently, those concerns are present in the higher educational system, as in the case of a recent proclamation of the National Fund of Telecommunications (**FUNTTEL**) where the higher education institutions are invited to form competence nets in the Information and Communication Technologies, in association with companies of the telecommunications section [4].

In the ambit of the Federal University of Espírito Santo (**UFES**), there is a growing concern with the use of these new technologies to amplify the potential of the University as an agent of State development, as exemplified by the creation of its Center for Open and Distance Education, which will make intensive use of the Communication and Information Technologies in a proposal to expand free public higher education throughout all municipalities in the state [5].

Within this context, the Technological Center of the **UFES** decided to participate, institutionally, in the collective effort of discussion and development of methodologies for learning and evaluation. It therefore instituted the NaTIEng project, designed to focus on research and development of pedagogic practices mediated by telematic platforms. The project seeks not only the insertion of these new technologies but also the evaluation of the impacts of the pedagogic results of the implantation of those learning platforms.

The project contemplates all the courses at the Technological Center: Civil, Mechanical, Electrical Engineering, Computation Sciences, and also the Masters Program in Computation Science and the Mechanical Technology Course. It will have a hybrid vocational capacity to assist not only the students and the basic disciplines, as well as the professional disciplines. It also should facilitate the students' integration in the professional community. The project intends to create the conditions for the practice of learning and of cooperative work and to support the traditional classroom teaching through the use of virtual environment of learning.

This article presents the conception of the project and its current stage of development.

THE INFORMATION SOCIETY: PEDAGOGIES AND TECHNOLOGIES

The exercise of the professions, considered in this project, is understood as a group of intellectual activities that can be grouped in the following categories: analysis, modeling, simulation, project and calculations. Underlying all these activities is the manipulation of a valuable that we denominate as information.

For information we can understand the description of facts (the weight to be calculated for concrete structures, for example), scientific laws, processes (the sequence of steps to project a thermal machine), diagnoses (the identification of flaws in a system of energy transmission) and description of engines (the architecture of a computer, the project of a machine, the plan of the first floor of a building, etc.).

According to Dertouzos [6], we are entering an information era based on 5 pillars, of the which the first three are:

- The information can be represented by numbers;
- Any number can be represented by sequences of 0 (zeros) and 1 (one);
- The computers transform the information when treating those numbers arithmetically.

The growing and accelerated increase of the complexity of problems treated by the different areas of engineering, turns undesirable and, who knows in a very close future, until impracticable, engineering practices without the presence of modern tools for the treatment of the information for which the computer is the base.

The remaining pillars are:

- Communication systems transport the information when moving those numbers;
- Computers and communication systems combine to form networks of computers. Those networks constitute the base of the infrastructure of the information of the future.

The appearance of these networkss created what we call the information community. A community of information can be understood as a group of individuals that use the resources of the network to change correspondence, to buy or sell services, to cooperate to diagnose a problem, to project an engine, etc. These communities create the conditions for a new praxis of social production, at the same time cooperative and distributed and, theoretically on planetary scale. It is predictable, therefore, that the treatment of great problems can accomplished more and more in a distributed way. The engineer today needs to be prepared for a reality where the cooperative and distributed work prevails. He/she must be capable of freeing him/herself of temporal and space limitations.

On the other hand, recent discoveries within the sciences of cognition reveal the most varied cognitive profiles of students. Different profiles imply the need for different learning practices that, certainly, are unattainable for the classic pedagogic strategies centered in the class room. We maintain that the teacher's work will be much more effective if it can be facilitated, in different academic practices, through the use of the computer and of the technologies associated to the computer.

The act of learning is a complex process that is developed by means of: the observation of phenomenon, the collection of data, analysis, synthesis, formalization and validation. Each learner builds his knowledge within the rates and strategies of his own reasoning. Therefore, in a group, each student will execute all the above stages differentially over time, that is to say, each learner in his own rhythm. The impossibility of corresponding to that demand by the teacher, contributes to a treatment of students in a standardized and canonical way, which unavoidably leads to the construction of a not very flexible knowledge with relationship to its use in the resolution of problems and the development of a learner with few creative resources, essential for a more autonomous learner.

There are innumerable tools that we can use in education mediated by computer. The tools for analysis, simulation, synthesis and communication deserve proeminence. The three first give support to the learning activities cited above. They can be used individually or in groups. Those of the last type facilitate the practice of the "inquiry pedagogy". They make cooperative learning possible and facilitate the extra-class attention and interaction. Besides giving them a dimension which is not face-to-face and asynchronous, those tools, when endowed with resources of artificial intelligence, allow the reintroduction of work/tasks produced previously.

Today there are countless possibilities for access to knowledge. We lived immerged in a world of information and, therefore, constantly we learn through a processing of what we are presented by different agents. These sources are more attractive and overcome the traditional school in the dispute for our attention.

The school we know today, which limits physically and in time a section of the teaching-learning process, has inherited the practices of a time in which the source of information was centered principally on the figure of the **teacher**.

The education needs to appropriate of the modern instruments of the generation and diffusion of information so that it can also integrate itself into the daily reality. We estimate that only in that way education can appropriately play its part in the preparation of the individual for a critical exercise of his or her activities in an economic society more and more centered in the services sector.

It is in this direction the world net of computers (Internet), becomes as indispensable partner. With the network we can build telematic supports which activate our classroom-based courses and, at the same time, prepares us, teachers and students, for the use of information technology as a mechanism which mediates of distance education. The Internet integrates the different well-known media and adds to them the capacity of processing of information, what activates and stimulates the teacher-student interaction. We know this interaction is fundamental in the teaching-learning process, and does not manifest itself adequately through the isolated use of the other media.

EDUCATION WITHOUT DISTANCES

The insertion of the computer in the pedagogic practices is being pointed out as a powerful instrument capable to reduce many difficulties found in general in education and, in particular, in higher education. Today, countless universities of recognized quality at the national and international level [8] seek the introduction of information and communication technologies to revitalize their courses. The forms of usage, in spite of many diversities, concentrate in two main groups: tools to support the interaction with objects of the knowledge (simulation, conceptual maps etc.) and tools to support the social interaction, indispensable for the construction of the individual and collective knowledge.

Social interaction from the educational point of view are the interactions that an individual accomplishes with partners in a learning community (teachers, classmates, former classmates, monitors, projects colleagues, people from the community). This interaction has as its main objectives – clarification and the exercise of critical observations, fundamental activities for the development of intellectual abilities of the student. The students' need, as soon as possible, to enter the labor market hinders the exchange of experiences among colleagues. In spite of not lacking free time for studies, study activities happen in different times and places for each individual. Those circumstances contribute to an increasing decline in the quality of learning and even in the increase of dropout rates.

The use of a cooperative environment for support of learning, made possible by networks of computers, and globally practiced through the Internet, has been show as effective in the recuperation of the practices of social interactions, reducing barriers imposed by time and geography [9]. Today we can say that the telematic ambient of a group is its encounter point, where those interactions can be practiced in a synchronous and asynchronous form, resulting in what comes being called education without distances.

From a general point of view, we seek the study, planning and insertion of new pedagogic approaches (learning and evaluation) supported in the Information and of Communication Technologies. We therefore understood the necessity for training and awareness of students and faculty in an integrated and critical use of **TIC** in their respective professional life and learning practices.

Within this viewpoint, we are developing the following actions:

- Production and availability of instructional material in digital media, besides the new forms of content presentation such an as hypertext and conceptual maps;
- Production and availability of support tools for simulation and the construction of the knowledge;
- Support for extra-class attendance which facilitates that teacher-student and student-student interaction take place, in a distance and asyncronous mode, mediated by telematic support;
- Support to the student and teacher integration with the greater community (society).

ACTUAL PRACTICES

In one way or another, students and teachers from the Technological Center already use the Internet, including in their school activities. We needed to identify these pedagogic practices, to systematize them, to compare them with those practiced in another institutions and re-elaborate them in a collective way, thus building a modern approach more tuned in with the peculiarities of our institution. With this purpose in mind, we carried out two diagnostic activities. Initially, involving the coordinators of each course and department chairperson, interviews were realized in an attempt to capture the institutional feeling with regard to the main problems encountered in the development of the undergraduate courses. Later we conducted a survey of professors in the use of **TIC** in their classroom and laboratory procedures.

As a result of the interviews with the coordinators and department chairpersons, it was verified that there is an growing concern with the evaluation of the current methodological aspects of the engineering teaching and with the transformation of the students' profile in regard to the use of the information and communication technologies. In addition, it was noticed that great importance is given to the incorporation of **TIC** in the learning process, as element that can result in improvements in the quality of the learning.

From the collected data with professors regarding of use of **TIC** in the engineering teaching, we can verify that there is a moderate use of the e-mail for attending to student needs outside of class and the availability of didactic material through personal web pages. It was verified, however, a low use of virtual environment for the cooperative work or learning. We also could verify that all the respondents use the e-mail for its personal communication and about 90% demonstrated interest in participating of the **NaTIEng** Project. In our understanding these two aspects are fundamental for the success of the proposal.

CT-ONLINE: A VIRTUAL LEARNING ENVIRONMENT

Based upon the information collected regarding the identified practices a initial structure for the CT-online was conceived - a virtual environment for support to the didactic activities of the courses of graduation of the Technological Center.

In this conceived learning environment we give emphasis to the following elements:

a) public communication, by the professor for the students, through a bulletin-board of announcements;
b) public communication, among all the participants, through virtual forums;
c) private communication, through e-mail;
d) digital library, that promotes available didactic materials (texts, computer programs, orientations, etc);
e) webliography, that allows the cataloguing of references of interest for each discipline;
f) posting of the students' production.

We highlight three aspects, which are understood as representing a great differential from other similar proposals. In the CT-Online, the participants can access the complete bibliographical material, independent of the class group in which that are registered and the professors possess a free access to all the ongoing forums and discussions. In addition, the materials stay in the system, as long as they demonstrate importance, giving therefore a sense of continuity to the academic life, instead of reducing it to each new scholastic period.

The learning platform was materialized through a tool produced by **MEC (Brazilian Educational Ministry)**, denominated ***eproinfo*** [10], which has been used in courses for teachers qualification, in the distance modality. In the Figure 1 we can observe a list of course offered by UFES using the eproinfo environment.

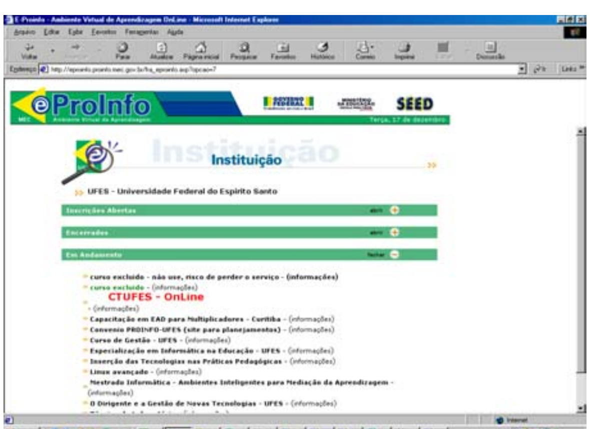

Figure 1: A list of courses offereded by UFES

In the Figure 2 we can observe the list of lesson groups established in the CT-Online environment. The students can access their groups just clicking in the group name.

Figure 2 : List of lessons groups at CT-Online

In the figure 3 is showed a forum page for a specific group. The forum is organized by theme and sub-themes. To each topic of interest the teacher starts a new theme.

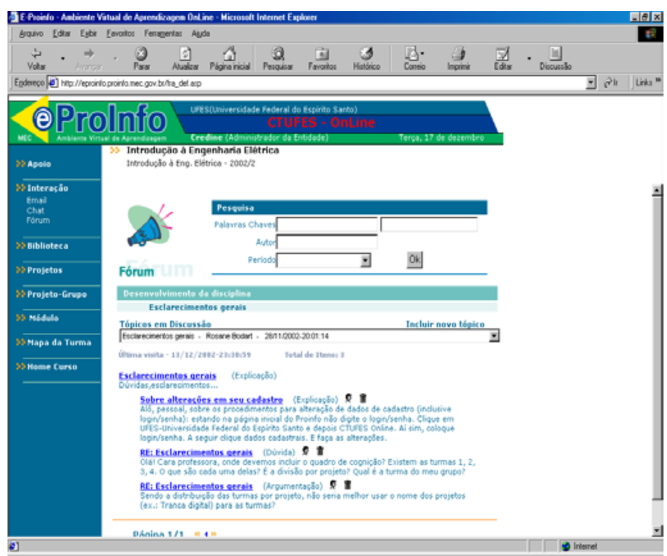

Figure 3: The forum for a specific lesson group

The students can publish their productions using a a file system with an special interface. The teacher can access the student assignment just clicking in their names, at the list of student ilustred in Figure 4.

Figure 4: A list of students name for an specific lesson group

FINAL CONSIDERATIONS

The system is in operation since the second semester of 2002 and the strategy that we adopted is to begin with a promotion of the professor's awareness. The results of the survey of the pedagogic use of telematic practices are being introduced to the teachers through specific meetings, when we also present the CT-online. The insertion of a new discipline in the learning platform is made by the teacher's adhesion, accomplished by a request to the coordination of the project.

During this first semester of system use, we are collecting data to carry out a quantitative and qualitative evaluation of the use of the platform. Platform improvements will be made through this evaluation.

It is desirable also that the activities of the courses in the virtual environment come to involve, besides professors and students, former-students of the discipline, other teachers and the professionals in most the diverse companies which apply the knowledge organized in the discipline. Conviviality in the virtual environment, therefore, will constitute a new learning practice where students of the most varied levels and styles cooperate for improve their knowledge and understanding. This, certainly, will plant the seeds of a culture of permanent and integrated education in the **CT-UFES**, through virtual learning communities. We already have experiences with teacher qualification courses where students from several places, at different levels of knowledge, cooperate using eproinfo environment. In Figure 5 we presents a page of a work group which develops a learning project.

The use of virtual learning platforms and the knowledge built through them can contribute to improve the opportunities in the on-campus, face-to-face courses. On the other hand, the use of the CT-online can hopefully contribute to the creation of a culture of distance education that will allow to evaluate, plan and adopt this education modality, at the undergraduate and masters level, when there are evidences of the advantages that distance education and the new technologies can proportion.

INTRODUÇÃO

A informática aplicada à educação surge em um momento de muitos questionamentos a respeito dos métodos tradicionais aplicados à educação que geraram a exclusão de alunos com insucesso escolar, dentre eles as Pessoas com Necessidades Educacionais Especiais (PNEs), desrespeitando os diferentes ritmos de aprendizagem.

Neste contexto, a informática oferece uma metodologia inovadora e atrativa aos educandos estimulando os profissionais/professores a se reciclarem e buscarem novas alternativas visando o pleno desenvolvimento de seus alunos.

É preciso ressaltar que não se trata de ignorar ou substituir os métodos tradicionais de ensino/aprendizagem da leitura e escrita, mas sim de fazer uso da tecnologia digital para enriquecer a prática pedagógica.

O ambiente informatizado de aprendizagem privilegia a interação entre sujeitos em um clima colaborativo e extremamente desafiador, os quais constroem seus conhecimentos a partir das suas vivências e de acordo com seus diferentes ritmos de aprendizagem, mediados pelo professor.

Teoricamente não há limites para a aprendizagem humana e todas as pessoas, independente de suas condições, possuem potencialidades, desde que lhes sejam dadas oportunidades e espaço para que se desenvolvam, ou como propõe Vygotsky, que haja uma atuação do educador na Zona de Desenvolvimento Proximal (ZDP).

O grande desafio resume-se em criar ambientes que oportunizem a todos o acesso a educação e que contemplem o desenvolvimento integral do ser humano sem excluir ou discriminar.

O atual momento histórico caracteriza-se pelo fracasso das diversas modalidades de organização social, gerados por sua incapacidade de organizar a sociedade em torno de objetivos que visem a liberdade, a igualdade e a solidariedade. Fracasso este, gerado, ainda, por diferentes regimes políticos, que secundarizam as políticas de bem-estar social evidenciadas nos indicadores de desemprego, marginalização e deterioração dos serviços públicos de saúde e de educação.

Este cenário é resultado de práticas históricas que reproduzem os valores existentes em uma sociedade onde não há lugar para todos, principalmente quando se refere ao progresso tecnológico que marginaliza uma parcela significativa da população.

Em decorrência da democratização do ensino e conseqüente garantia em oferecer a todos igualdade de oportunidade para aprender, torna-se necessário pensar uma prática educativa inserida no contexto das relações sociais globais, que considere a realidade viva do educando e a realidade viva da sociedade.

O novo paradigma tecnológico tem provocado profundas transformações na realidade social que impõe, por sua vez, novas exigências para o processo educacional e, em particular, para a educação escolarizada.

Na evolução dos estudos realizados com Pessoas Portadoras de Necessidades Especiais (PPNE) freqüentemente são evidenciadas as dificuldades relacionadas à aquisição da escrita e da leitura, por se tratar de habilidades cuja abstração é fator preponderante em seu desenvolvimento cognitivo

Nesse sentido, este trabalho enseja proporcionar a essas pessoas oportunidades para superar suas deficiências neste campo e tornar possível o afloramento das suas capacidades, utilizando como recurso metodológico as Tecnologias Digitais, com destaque para os ambientes baseados em Realidade Virtual (RV).

2 Departamento de Eletrônica e Computação – Universidade Federal de Santa Maria (UFSM)
CEP 97019 900 – Santa Maria – RS – Brasil – rosecleamedina@aol.com

Como uma experiência inovadora em nossos trabalhos no Núcleo de Desenvolvimento Infantil (NDI), do Centro de Educação da Universidade Federal de Santa Maria (UFSM), criamos um laboratório o qual denominamos “AIA” - Ambiente Informatizado de Aprendizagem - para o atendimento de Pessoas Portadoras de Necessidades Especiais (PPNE) objetivando o desenvolvimento de suas capacidades e potencialidades em leitura e escrita, através das tecnologias digitais.

Em parceria com o Departamento de Eletrônica e Computação do Centro de Tecnologia da UFSM, este projeto vem sendo desenvolvido por uma equipe de seis profissionais, constituída por dois professores orientadores, uma recreacionista e quatro acadêmicos dos Cursos de Educação Especial, Pedagogia e Informática.

Atualmente atendemos a um grupo de seis alunos com diferentes deficiências (Síndrome de Down, Síndrome do X - Frágil e outras deficiências mentais), em idades que variam de 15 a 28 anos. Por se tratar de um projeto de pesquisa, a extensão desse atendimento foi delimitada a poucos participantes, dada a natureza dos sujeitos envolvidos (PPNE), que exigem, por parte da equipe de profissionais, um atendimento individualizado, considerando os diferentes tipos de deficiências destes alunos.

O uso da Telemática e de ambientes de RV como recurso educativo, insere-se em um contexto pedagógico *mediatizado*, através da concepção de metodologias e estratégias de ensino centradas no aluno e mediadas por instrumentos tecnológicos, que potencializam ao máximo uma aprendizagem individual e coletiva; interativa e cooperativa.

Essa nova forma de aprender utilizando a tecnologia como instrumento mediatizador baseia-se nos fundamentos teóricos de Vygotsky apud Oliveira [8], que define a mediação como “(...) o processo de intervenção de um elemento intermediário numa relação; a relação deixa, então, de ser **direta** e passa a ser **mediada** por esse elemento”.

A definição apontada para *mediatizar*, neste trabalho, é muito bem caracterizada por Belloni [2]. Para essa autora,

> (...) mediatizar significa conceber metodologias de ensino e estratégias de utilização de materiais de ensino/aprendizagem que potencializem ao máximo as possibilidades de aprendizagem autônoma. Isto inclui desde a seleção e elaboração dos conteúdos, a criação de metodologias de ensino e estudo, centradas no aprendente, voltadas para a produção de materiais, até a criação e implementação de estratégias de utilização destes materiais e de acompanhamento do estudante de modo a assegurar a interação do estudante com o sistema de ensino.

Assim, neste novo contexto de aprendizagem, novas bases epistemológicas, novas metodologias e novos ambientes interativos de aprendizagem são requeridos, a fim de que possam ser desvelados no sujeito aprendente sua multidimensionalidade e integrá-lo na sociedade que o exclui.

Na perspectiva de se desenvolver uma metodologia mediatizada por recursos informáticos, que sejam interdisciplinares e integradores das aprendizagens já constituídas ou por se constituírem, entre as ações desenvolvidas no projeto **AIA,** procuramos proporcionar às PPNE um ambiente que seja diferenciado das classes tradicionais, que estimule o pensamento simbólico e operacional concreto destes educandos, proporcionando-lhes a construção do conhecimento e o desenvolvimento de conceitos abstratos, a partir de situações virtuais concretas, praticadas em ambientes baseados em Realidade Virtual, como campo exploratório de simulação interativa.

Para que esses educandos superem suas “dEficiências” e evidenciem suas “Eficiências”, este projeto ao utilizar recursos tecnológicos que propiciem a aquisição da leitura e escrita, tem por objetivos:

a) Proporcionar aos portadores de necessidades especiais (PNE) a interação em ambientes baseados em Realidade Virtual que ofereçam situações nas quais possam desenvolver suas capacidades de representar e compreender idéias abstratas e conceitos lingüísticos.

b) Desenvolver atividades de comunicação oral e escrita de forma colaborativa e interativa, utilizando as ferramentas de comunicação tais como: *e-mail, MSChat, ICQ, Netmeeting, EquiText,* entre outros, que promovam a apropriação e produção de conhecimentos, através de um aprendizado autônomo, crítico e criativo;

c) Oportunizar o intercâmbio de mensagens e trabalhos cooperativos entre os alunos participantes do “AIA” e outros educandos, tanto portadores de Necessidades Educativas Especiais de outras instituições, quanto pessoas interessadas em manter interação com os mesmos, através de *chats* programados a partir de temas previamente definidos.

d) Explorar os recursos da Internet através de suas possibilidades de navegação no ciberespaço, buscando estratégias de interação e motivando os alunos para o desenvolvimento de atividades relacionadas à leitura e à escrita;

e) Construir com os alunos suas *Home-Pages* como repositórios dos trabalhos produzidos.

PARADIGMAS TEÓRICO/METODOLÓGICOS

A questão teórico/metodológica deste projeto insere-se em uma base construtivista que tem como ponto central a análise dos saberes e necessidades do educando e do contexto sócio-educativo ao qual ele pertence, caracterizando-se pelo estabelecimento de um programa integrador das aprendizagens já realizadas ou por se realizarem.

A esse propósito, esta metodologia tem como preocupação tanto a reprodução como a produção de conhecimentos, em um processo dialético onde a reprodução deve ser sempre superada, por incorporação, no processo de produção. A reprodução e a superação do saber existente efetivam-se a partir da produção dos novos conhecimentos em uma apropriação racional e crítica do saber já elaborado.

Esta postura construtivista co-existe com uma postura democrática na qual procura-se desenvolver no aluno sua autonomia, propiciando-lhe condições de reflexão sobre suas idéias e interação com seus parceiros e o objeto de sua aprendizagem.

Na concepção Vygotskiana a relação homem/mundo é uma relação mediada. O homem se constrói através das relações que estabelece com o meio, sendo um ser em constante transformação.

O sujeito se constitui como tal através da sua relação com o mundo e das vivências com seu grupo cultural, que lhe fornece um ambiente estruturado e uma interação mediada para essa constituição, sendo, dessa forma, responsável pelo seu desenvolvimento.

Partindo dessas premissas, buscamos desenvolver um trabalho utilizando a telemática como uma metodologia diferenciada daquela desenvolvida na escola regular. Uma metodologia que propicie o desenvolvimento integral dos PNE como indivíduos, considerando seu universo sóciocultural e que possa inseri-los no mundo virtual através da aprendizagem digital.

O ambiente de aprendizagem computacional oportuniza, para esses alunos, espaços para a construção do conhecimento e oferece diferentes ferramentas e recursos de comunicação, que os desafiam e motivam para a aprendizagem da leitura e da escrita, em uma construção conjunta com outras pessoas, tornando-os ativos no processo e abrindo novos caminhos para a construção do conhecimento, de outra forma que não seja a sala de aula convencional.

A utilização das TICs em ambientes informatizados de aprendizagem, como espaço de comunicação, favorece a inclusão social dos PNEs, pois esse novo ambiente instaura um clima de segurança, enfatiza a ação conjunta/cooperativa e colaborativa, que resulta em uma maior autonomia e independência dos educandos, incentivando-os a desinibição e iniciativa face à realização das atividades. Os educandos, nesta nova maneira de aprender, sentem-se motivados a buscar novos conhecimentos, tornam-se mais persistentes e fortalecidos em sua auto-estima através da interação com os outros.

Neste clima de cooperação, os alunos mais experientes desempenham o papel de mediadores, auxiliando os colegas na realização das atividades. Essa tarefa proporciona grande satisfação, pois os educandos passam a ter consciência das suas potencialidades. O uso de ferramentas informáticas lhes dá a chance de ampliar seus conhecimentos e superar suas dificuldades, favorecendo a participação de todos em um trabalho conjunto, no qual podem observar **o como** e **o porquê** escrevem.

Estas questões nos remetem a um dos instrumentos mais eficientes para o professor assumir com autonomia as suas ações que é o planejamento. O homem é o único ser capaz de sonhar, projetar, optar, enfim, ser o autor da sua própria história. Através do planejamento ele redimensiona o que faz, avalia e, se necessário for, modifica todo o processo. Para o êxito deste planejamento optamos por um método que determina a metodologia, as prioridades e a interação entre os sujeitos

As atividades têm, portanto, uma intenção definida e contemplam as necessidades, potencialidades e interesses dos alunos PNEs, principalmente no que se refere ao uso dos recursos/ferramentas existentes em rede.

As ações planejadas têm a preocupação de disponibilizar situações que mobilizem a comunicação/cooperação entre esses usuários, com vistas ao seu aprendizado, bem como, oferecer uma gama de informações que proporcionem a democratização desses instrumentos digitais, para a sua inserção no mundo virtual, tendo como instrumento de mediação ambientes de realidade virtual.

Para tanto, nosso esquema de trabalho propõe aos educandos uma freqüência ao "AIA" de duas vezes por semana, duas horas por dia, por um período determinado pelo seu desempenho e avaliação satisfatória, uma vez que não há prazo para que deixem o projeto.

A cada encontro são feitos registros das observações efetivadas durante o processo e a avaliação tem como dinâmica considerar o **"antes"** e o **"depois"** de cada aluno, isto é, o que já conseguem fazer sozinhos (nível de desenvolvimento real) e o que podem realizar com a ajuda de alguém (nível de desenvolvimento potencial), atuando na ZDP de cada um, considerando, ainda, sua história, sua cultura e sua linguagem, a partir dos fundamentos teóricos que dão suporte à prática pedagógica desenvolvida neste ambiente de aprendizagem.

Neste conjunto de propósitos o presente trabalho destaca, dentre os recursos telemáticos utilizados, os **Ambientes Baseados em Realidade Virtual,** nos quais os educandos têm as possibilidades de desenvolver sua fantasia, sua imaginação, sua capacidade de criação e de reelaboração dos conhecimentos.

Nesse sentido, é preciso, ainda, investigar as várias propriedades de cada ambiente na promoção da aprendizagem conceitual, como as atividades "*sense making",* ou seja, não apenas treinar e praticar experiências, é necessário, também, compreender os elementos dos sistemas de RV, que levam os estudantes a não apenas realizar tarefas de "execução tranqüila", mas se envolver em atividades que requeiram explanação e extrapolação.

A PRODUÇÃO DE TEXTOS POR PPNE A PARTIR DAS EXPERIÊNCIAS REALIZADAS EM AMBIENTES BASEADOS EM REALIDADE VIRTUAL

Um ambiente imersivo de aprendizagem, para ter sucesso, deve fornecer sistemas de ensino de domínios diversos, representando as experiências requeridas no mundo real, fornecidas pela RV, podendo resultar na otimização de uma ferramenta direcionada ao ensino. De acordo com os pesquisadores Burdea [3] e Jacobson [4], pode-se dizer que a RV é uma técnica avançada de interface, onde o usuário pode realizar imersão, navegação e interação em um ambiente sintético tridimensional, gerado por computador, utilizando canais multi-sensoriais.

A RV também pode ser considerada, de acordo com Pinho [9], como a junção de três idéias básicas: imersão, interação e envolvimento. Isoladamente, essas idéias não são exclusivas de realidade virtual, mas aqui elas coexistem.

A qualidade que faz superior o ambiente de aprendizagem utilizando RV é a possibilidade do uso da tecnologia para superar as estratégias tradicionais do ensino, favorecendo a construção do conhecimento pelo aprendiz, atendendo, ainda, as características individuais dos sujeitos na aprendizagem,conforme conceitua Camacho [5]:

> (...) uma das grandes virtualidades dos sistemas de Realidade Virtual é a sua capacidade em apresentar e representar, através de sons e imagens, idéias abstratas e conceitos de difícil representação. A Realidade Virtual torna-se, então, uma espécie de transdutor sensorial, que traduz idéias e conceitos para sensações visuais, auditivas e tácteis que, depois de percebidas e processadas se transformam na informação que permitirá a compreensão dessas idéias e conceitos, de outra forma, inacessíveis.

No contexto deste referencial, um ambiente baseado em Realidade Virtual visa, assim, permitir que usuários possam expressar suas idéias e sentimentos, aperfeiçoar progressivamente suas potencialidades cognitivas e alcançar maior compreensão da realidade social, ou seja, conquistar sua liberdade formativa, intelectual e política.

Situações simuladas em RV propiciam a produção cooperativa de textos em que o retrato sócio-cultural dos usuários é promovido em situações sociais e de ação - ação que não ocorre fora das situações sociais - pois, ao mesmo tempo em que o indivíduo vivencia uma determinada situação, relaciona-a com a realidade, também a emprega na análise da situação social, objeto de sua aprendizagem, utilizando a língua e a linguagem de forma concreta.

É importante considerar ainda, que a RV aplicada à educação tem mostrado, segundo Medina et al [6]:

> (...) que o *fazer-agir, o inter-agir, o aprender, o conhecer sentir* assumem novos contornos: é como se, neste mundo, o que é da ordem do pensamento – *portanto imaterial-singular-subjetivo, inacessível ao outro que não o próprio pensador* – pudesse deslizar para um exterior-objetivo, para ser manuseado, transformado, compartilhado; mas que tendo deslizado, ainda assim permanece interior, imaterial; e toda interação se desse, neste mundo, no âmbito da imaterialidade, do incorpóreo; um mundo desabitado de corpos, em que tudo existe sem existir, em que tudo é puro efeito de realidade.

Com base nessa perspectiva, produzir textos a partir de experiências em ambientes baseados em RV tem o sentido de não se limitar apenas à prática lingüística, como um fim em si mesma, como afirma Alonso et al [1], mas:

> (...) sua tarefa é a de ir mais além, é a de propiciar condições para a formação de conceitos com os quais os usuários possam pensar e desenvolver a capacidade de analisar, generalizar e assimilar formas mais complexas de reflexão sobre os fenômenos da realidade; de organizar de uma nova maneira a sua percepção; de adquirir a capacidade de tirar conclusões das suas próprias observações; de conquistar todas as potencialidades do pensamento, superando, assim, suas limitações.

No cenário epistemológico atual, que não se contenta mais com verdades pré-estabelecidas, vale pensar, também, sobre a idéia da aprendizagem ativa a respeito do "aprender fazendo". Este aprender normalmente se concretiza através da produção textos escritos, que não são simples transcrições, mas, produtos de uma reflexão, reorganização e reformulação de conceitos, num complexo processo de descobertas.

A produção de textos por alunos PNEs, inserida em um contexto significativo, funcional, desafiador e com objetivos que atendam aos seus interesses e expectativas tem mostrado mudanças positivas no que diz respeito às suas atitudes em relação à própria escrita e, conseqüentemente, na aquisição de conhecimentos e ampliação de seu universo cultural e social.

As experiências realizadas por PNE com RV nos têm surpreendido no que se refere ao potencial destes educandos, que estão compreendendo seu mecanismo e interagindo no ambiente com expectativas e motivações. A RV tem auxiliado nossos alunos a compreender melhor a realidade, o outro e a si próprio como parte do sistema ao qual está inserido, tornando-os abertos ao pluralismo e à relatividade do observador, confirmando as palavras de MEDINA et al [7] quando diz que:

> (...) se o nosso modo de *conhecer-sentir-aprender* é um, ou não, entre outros; e se, assim como outrora tivemos que construir um mundo de objetos e sujeitos para nos construirmos enquanto sujeito de cultura, auto-consciente, podemos, agora, construir e coordenar **múltiplos modos de produzir sentido, múltiplos modos de conhecer-sentir-aprender-interagir,** inaugurando formas de entendimento calcadas num processo de estranhamento do *Real-Social,* conquistado pela mediação virtual.

O objetivo a que a RV se propõe neste projeto é oferecer situações onde os PNE possam desenvolver suas capacidades cognitivas de abstração, através de sua interação com o outro, com o meio físico, social e simbólico-cultural-tecnológico, que propiciam a construção de suas estruturas mentais, possibilitando que o conhecimento *subjetivo* se torne *objetivo* pela capacidade dedutiva que se instaura no processo das múltiplas possibilidades impostas pela RV.

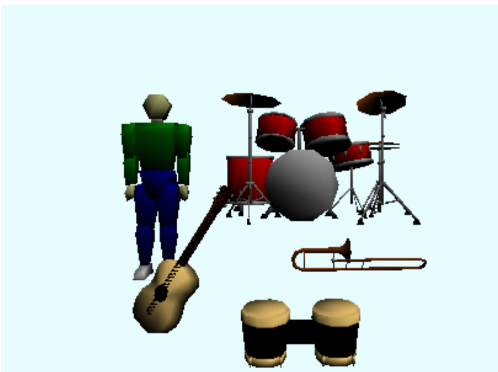
As questões acima colocadas podem ser observadas nos textos produzidos coletivamente pelos alunos participantes do projeto, a partir dos cenários de RV experienciados, dos quais mostramos alguns exemplos abaixo junto às respectivas cenas:

Figura 1 – Cena de lojas

Estamo paseado na rua vendo as loja. E colorido. Gostei atavesar parede não me maxuquei. Entrei na lojas. O guri esta camihnando na cauçada perdido. Qeum escreveu e o Tiago e a Katia vai crever agora.

Quero lanchar no restaurante que é bom. a comida é gostosa. estou voando emcima das lojas. Como é bom voar. vou trazer minha irma para voar. Euuu sou a adrianaaa e vou pegaar o gguriii que esta voado. Fim.

Figura 2 – Interior da loja de instrumentos



Fui em sam Paulo com meus amigos.

Eu sou Ronaldo. Toqeui bateria fes muito baruhlo. Vamos faze uma banda. E agora qeum vaescrever eo vitor.

Eusoo Vctor e vo com compra uma giutara. Daniel toca bateria e gosta Dniel atista qe canta CD.

Agorae Daniel .eu Daniel gosta do cator Daniel e vou coprar uCD

Vamosembora. Tcahu. FIM

Figura 3 - Cena 3

Minha namorada vai comprar ingreso para ver o chouda Xuxa. Ela e minha namorada. Eu quero casa co ela. E te muitos filhos. Estamos namorado no café brihlante e comendo bolo.

Quando o Ronaldo comprar bolo eu tambem quero comer bolo e refri. Eu sou a Kátia. fim

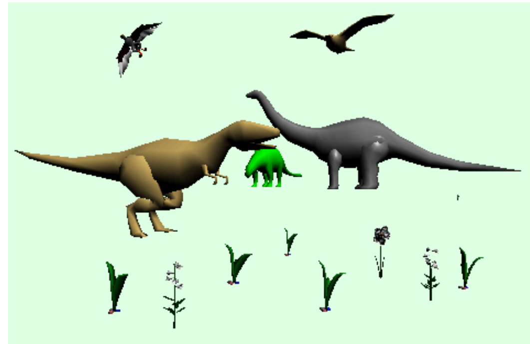


Figura 4 – Parque dos dinossauros

Etamos paseando em Porto Alegure ena rua da paia.

La bhlietria parconprar engreso pver paque dinsauru. Eu gosto denosaro Rex que e carnivo

Hoje vou ver denosauro. Como estou felis. Voutamos para casa de alto com Adriana e Kátia o Vitor tambem vai. Ele vai com a bandera dogremio.

Passsei com osdinossss. Pasei deeetro do dino. Ele não mordeuuu.

CONCLUSÃO

Apesar de os alunos PNE participantes do Projeto AIA já terem experiências no manuseio de ferramentas informáticas, em suas primeiras inserções nos mundos de RV tiveram um impacto, principalmente quando perceberam que poderiam visualizar os diferentes ângulos das cenas, atravessar os objetos, movimentá-los, produzir sons, etc., o que não os intimidou a continuar explorando o mundo virtual e a escrever sobre suas experiências apaixonadamente.

Suas produções revelam criatividade e um pouco da personalidade individual, possibilitando observar suas capacidades de atenção, memória, imaginação e organização de idéias.

Ressaltamos que é preciso levar em consideração o processo de construção do conhecimento de cada aluno, seus esforços, a superação de algumas dificuldades, enfim, toda a evolução da aprendizagem. Consideramos todo e qualquer progresso dos alunos, por menor que possa parecer e comemoramos como grandes conquistas. É preciso, ainda. considerar as limitações de cada um deles e o seu grau de comprometimento, assim como a vontade de progredir e superar os próprios limites.

Os textos evidenciam a originalidade de conteúdo, conduzindo-nos a refletir sobre a importância de assumirmos a postura de mediadores, estimulando a construção do conhecimento e, principalmente, proporcionando atividades de escrita com objetivos definidos pelos autores, no sentido de encontrar prazer em escrever e não apenas o fazer por obrigação, como uma tarefa a ser cumprida ou como rotina de uma aula de alfabetização.

Dessa forma, percebemos os alunos PNE como seres singulares e dotados de capacidades, que possuem valores e uma história de vida que deve ser considerada. Cabe a nós, educadores, impulsioná-los para que alcancem seus objetivos, através de outros mundos possíveis, via artefatos tecnológicos para que superem seus limites de aprendizagem.

Hiper-Animações - Teoria Hipermídia Aplicada em Animações

Roges Horacio Grandi[1] e Paulo Fernando Blauth Menezes[2]

Resumo *— As animações são seqüências de imagens individualmente concebidas, acompanhadas ou não de sons, que objetivam simular um movimento. A teoria hipermídia é baseada na liberdade oferecida ao usuário de um determinado sistema computacional de escolher a ordem da apresentação de conteúdos diversos. Tradicionalmente, animações são construídas através de uma seqüência de quadros estáticos ou, então, de uma seqüência de transformações gráficas. Se oferecermos ao usuário a possibilidade de seguir, interativamente, não somente uma seqüência predeterminada de quadros ou transformações, oferecendo seqüências alternativas, estaremos criando hiper-animações, cujas potencialidades tecnológicas na informática, educação e engenharia estão para serem exploradas. Este artigo propõe a utilização de autômatos finitos com saída para uma forma de criar e controlar hiper-animações e demonstra sua aplicabilidade em educação à distância através de um exemplo de um simulador animado de um autômato que expressa uma determinada gramática de uma linguagem formal como exercício de teoria da computação.*

Palavras-chave — animações, hipermídia, teoria dos autômatos, educação à distância, padrões de projeto, UML.

INTRODUÇÃO

Antes do advento da eletrônica, o conhecimento da humanidade era registrado, basicamente, em livros. Uma sinfonia de Mozart, uma novela de Dostoievski, um fato histórico, um princípio filosófico, uma conclusão científica, que melhor maneira de armazenar e passar para gerações seguintes um conhecimento além de um bom livro?

A eletrônica, porém, permitiu expressivas diminuições dos custos e do espaço necessário para o armazenamento do conhecimento, conforme previra Vannevar Bush na década de 1940. Além disso, surgiram novos meios de comunicação que tornaram a troca de informações muito mais rápida e eficaz.

A busca seqüencial e indexada, características dos livros tradicionais tornaram-se insuficientes para a busca e associação de informações correlatas, exigindo a criação de alternativas mais diretas de acesso e relacionamento. O próprio Vannevar Bush, ao discutir essa questão, já propôs um mecanismo de associação e busca direta de informações que denominou Memex, um aparelho que funcionaria tal e qual uma extensão da memória humana. Esse aparato tornou-se a base de inspiração para a hipertecnologia, uma área de pesquisa da informática que se preocupa em propor formas alternativas de associação e busca entre informações além da seqüencial e da indexada [1].

Hoje, devido ao *boom* de informações gerado, a hipertecnologia é uma necessidade crescente e está se tornando uma característica funcional padrão dos sistemas de informação.

As primeiras implementações da hipertecnologia visaram permitir leitura não seqüencial de textos e foram denominadas hipertexto por Theodor Nelson em 1965. Outras formas de mídia (imagens, sons, animações, etc.) podem ser igualmente desejados em uma leitura não seqüencial. Por não se tratarem tais mídias de um texto puro Nelson também cunhou o termo hipermídia para definir a hipertecnologia multimídia [2].

ANIMAÇÕES GRÁFICAS E SISTEMAS HIPERMÍDIA BASEADOS EM AFS

Sendo, essencialmente, a hipertecnologia uma rede de informações, buscou na teoria dos grafos e em outros fundamentos matemáticos formas e propriedades para apresentar suas características, modelagens e implementações. Os autômatos finitos com saída (AFS) baseiam sua forma nos grafos. O Laboratório de Fundamentos da Computação (LFC) da Universidade Federal do Rio Grande do Sul (UFRGS), do qual os autores participam, tem realizado pesquisas propondo os AFS como base matemática e de modelagem de sistemas hipertexto, que tem gerado implementações bem sucedidas e de qualidade e podem ser vistas no sítio (site) do laboratório [3]. Uma dessas pesquisas, denominada Animação Gráfica baseada em Autômatos Finitos (AGA), propõe a montagem e gerenciamento de animações bidimensionais de tempo real modelando-as como AFS especializados, contendo alfabetos de entrada e de saída, fitas, estados e funções, onde os atores – objetos que participam da animação - são definidos através dos autômatos e as fitas definem seus comportamentos.

"Independente da dimensão, os sistemas de animação por computador também podem ser classificados, segundo o critério de modo de produção, em sistemas de tempo real ou quadro a quadro [4,5].

Os sistemas de animação em tempo real geram a imagem final para visualização no momento de sua

[1] Roges Horacio Grandi, Universidade Federal do Rio Grande do Sul (UFRGS), Instituto de Informática. Av. Bento Gonçalves, 9500 Campus do Vale - Bloco IV, 91501-970, Porto Alegre, RS, Brazil, roges@inf.ufrgs.br

apresentação. Esta abordagem favorece principalmente as animações interativas, onde a imagem visualizada deve corresponder às ações instantâneas tomadas pelo usuário [4 apud 6]". Sendo uma das características básicas da hipertecnologia - a interatividade - e sendo que a abordagem de tempo real a favorece, mais uma vez podemos perceber um elevado potencial de integração entre as duas tecnologias.

Uma vez que a base matemática dos AFS, utilizados no AGA, é a teoria dos grafos, a mesma que baseia a hipertecnologia, percebemos uma interseção natural de propriedades permitindo-nos supor que a inserção de características hipermídia no AGA, do ponto de vista matemático, é um tanto facilitada e natural. O LFC já implementou alguns sistemas hipermídia baseados em AFS: o Hyper-Automaton, para apresentar cursos na Web [7] e as Provas Adaptativas, um modelo hipermídia de construção de avaliações eletrônicas [8]. Dessa maneira, já estão definidos sistemas hipermídia e, também, um modelo de animação todos baseados em AFS.

INSERINDO HIPERTECNOLOGIA EM ANIMAÇÕES

Podemos classificar os diversos tipos de mídia de forma independente em textos, sons, imagens, filmes e multimídia, sendo o último uma composição dos anteriores [9]. Outra classificação possível é, inicialmente, dividir diversas mídias em sons, que estimulam o senti

do da audição, e em imagens, que estimulam o sentido da visão. As imagens, por sua vez, podem ser especializadas em gráficos e textos, conforme a presença ou não de elementos gramaticais. Filmes e animações são composições seqüenciais de mídias visuais sendo as suas formas de aquisição, respectivamente, por fotografias ou concepção individual. Podem incluir, opcionalmente, seqüências de elementos sonoros. Um exemplo de animação contendo seqüências de imagens e textos combinados são as animações legendadas. A sincronização ou não de sons com imagens permite-nos mais uma vez classificar filmes/animações em "falados" ou "mudos". Animações podem, também, ser inseridas em filmes, à exemplo das produções cinematográficas que contém efeitos especiais produzidos por animações [10]. Classificando-se desta maneira, filmes e animações podem ser considerados como produtos multimídia, uma vez que possuem a capacidade de absorver mais de um tipo de mídia. Se formos mais específicos, podemos aindaé subdividir as imagens em bi e tridimensionais. O escopo deste trabalho são as imagens bidimensionais, sendo que o LFC pretende dar continuidade a esta pesquisa contemplando a tridimensionalidade.

Por fim, mídias podem contemplar hipertecnologia, se desejado. Qualquer mídia, seja auditiva ou sonora, podem servir de âncora hipermídia. Com a tecnologia atual, entretanto, somente imagens podem servir como elementos clicáveis servindo como opção interativa para determinar seqüências de execução através de hiperligações. Textos podem ter, por exemplo, características funcionais semelhantes à uma referência hipertexto em HTML[3]. Da mesma forma, tendo como base a WWW/Internet, sistema hipertexto mais popular atualmente, uma imagem pode ser definida como um mapa clicável.

Um diagrama de classes escrito em UML[4], produto desta forma de classificar, pode ser visto na Fig. 1. Observa-se no diagrama a aplicação do padrão de projeto orientado a objetos Composite [11].

Animações em tempo real podem permitir que várias mídias sejam transformadas simultânea e concorrentemente, disponibilizando textos, sons e imagens em uma mesma composição. Se tais características multimídia tiverem, adicionalmente, características hipermídia, cremos que a semântica operacional poderá ser fortemente enriquecida. É nesse intuito que se propõe o estudo de animações em tempo real com características hipermídia, formando hiper-animações.

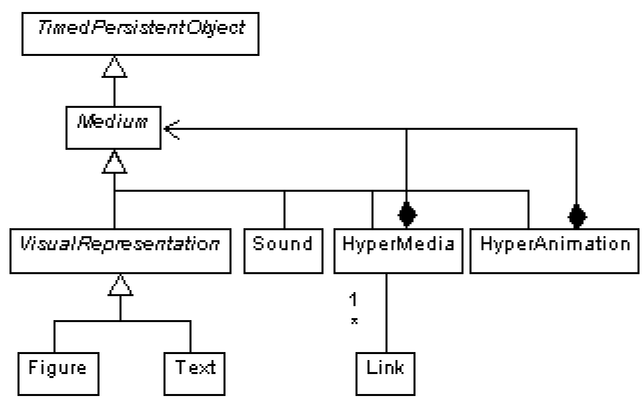

FIGURA 1
Diagrama de classes em UML especificando uma taxionomia de mídias contemplando hipertecnologia.

HIPER-ANIMAÇÕES BASEADAS EM AFS

Um padrão de projetos comportamental bastante útil para se modelar interações homem-máquina, principalmente quando a mudança de estados na máquina é bem controlada, é o *State*, uma vez que elimina a necessidade de formação de grandes estruturas condicionais, explicita as transições e os estados e permite que os objetos referenciados sejam reaproveitados interna e externamente, através da interação com outros sistemas [11].

Tal abordagem, conforme já comentado, é adotada pelo LFC através da implementação de AFS em vários projetos e apresenta-se igualmente útil para modelar hiper-animações. A fim de integrar a modelagem das hiper-

[4] Unified Modeling Language. Linguagem de especificação padrão de fato em sistemas computacionais orientados a objetos.

animações (Fig. 1) com a modelagem de um AFS, podemos montar uma máquina de Mealy[5] [12] especializada. A estrutura básica de uma máquina de Mealy, para este caso, inclui os conceitos de estado, transição, alfabetos de entrada e de saída e função parcial programa. Dentre algumas especializações, as palavras de saída são mídias hiper-animadas que, para tecnologia Internet, podem ser referenciadas por URL[6].

. Por objetivar a construção de uma aplicação persistente, pode-se aplicar também o padrão de projeto *PersistentObject* [13], a partir do qual todos os objetos persistidos possuem um identificador e, por conveniência de publicações, podem ter também um nome e um autor. O resultado é o diagrama de classes UML da Fig. 2.

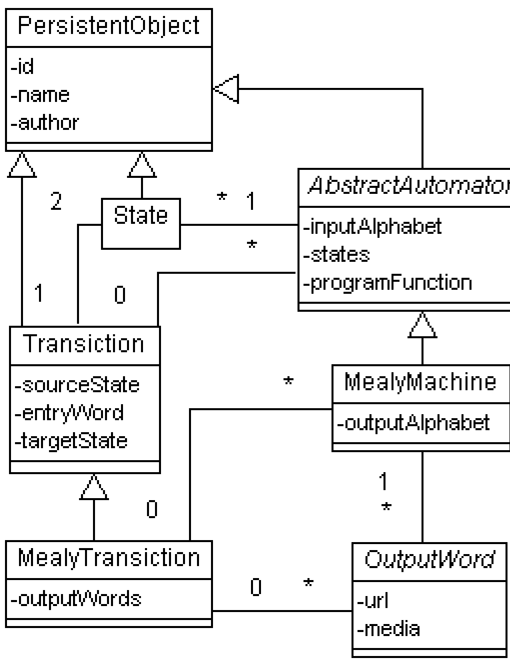

FIGURA 2
Diagrama de classes em UML especificando uma taxionomia de mídias contemplando hipertecnologia.

Um autômato abstrato reúne os conceitos básicos de coleção de estados, alfabeto de entrada e função parcial programa. Concretizando-se o autômato abstrato em uma máquina de Mealy, sua função programa é especializada passando a gerar palavras de saída a casa transição, no nosso caso palavras vazias, mídias simples ou compostas.

SIMULADOR ANIMADO

Hiper-animações podem ser aplicadas em diversas áreas, dentre elas a da educação à distância (EAD). Um simulador animado de um autômato que expressa uma determinada gramática de uma linguagem formal é um exemplo de sua aplicação em cursos eletrônicos sobre teoria da computação, disponibilizados via Internet. A Fig. 3 mostra uma instância desse tipo de autômato equivalente à expressão regular `(a|b)*(aa|bb)(a|b)*`.

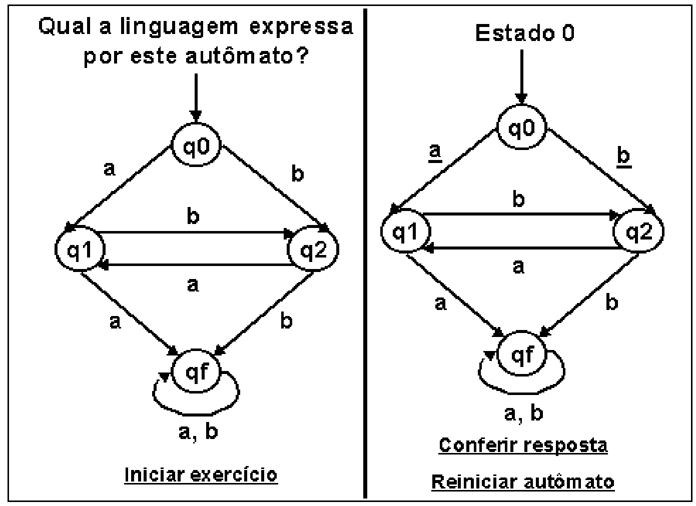

FIGURA 2
Exemplo de hiper-animação aplicada em ensino de teoria da computação

Neste exemplo, o aluno pode optar como controlar a simulação. Após ser introduzido ao problema proposto, quadros seguintes da animação, acionadas pela hiperligação "Iniciar exercício" permitem que o aluno, a partir do estado zero (representado por `q0`) interaja com o autômato experimentando-o com as hiperligações `a` e `b`, ou, opcionalmente, com as hiperligações "Conferir resposta" ou "Reiniciar autômato". Note-se que a animação não segue, necessariamente, uma seqüência específica de quadros. Esta é determinada pela vontade do aprendiz que pode experimentar vários quadros seguintes (estados 1, 2 e f), conferir diretamente a resposta, caso já a tenha abstraído, ou reiniciar o autômato (reiniciar a animação). Esta liberdade de escolha de seqüência de apresentação de mídias é desejada pela hipertecnologia e sua programação, bem como sua documentação, são facilitadas pela presença das hiperligações e, também, por sua modelagem utilizando-se os padrões de projeto supra citados.

CONCLUSÕES

Conforme demonstrado no exemplo aplicado em educação à distância, as hiper-animações possuem um forte potencial de simplificação de programação, aprimoramento de documentação e, também, de reaproveitamento tanto de análise como dos produtos gerados, se utilizados padrões de projeto corretos.

[5] Autômato finito que gera uma palavra de saída para cada transição.

Implementação de um sistema de desenvolvimento para microcontroladores 8051

João Pereira de Brito Filho[1], Remy Eskinazi Sant'Anna[2]

Resumo *— Este trabalho apresenta a implementação de um sistema de desenvolvimento para hardware e software, baseado no microcontrolador 8051, desenvolvido para ser utilizado cursos técnicos de nível médio, graduação e pós-graduação de Eletrônica.. Paralelamente, é apresentada uma metodologia de implementação de projetos, utilizando-se técnicas de particionamento para hardware e softwar. Através de um sistema operacional, o sistema de desenvolvimento em microcontrolador, apresenta facilidades de acesso aos recursos de um microcontrolador 8051 standard, bem como de interfaceamento com memória e dispositivos de E/S externos, além de armazenamento e execução de programa externo, em uma operação de download de programa. Para permitir estas operações de descarga de programa em memória externa do protótipo, de forma que este permanecesse executável, foi implementado também um programa de interface em ambiente gráfico, de modo a permitir a edição de diversos programas em Assembler do microcontrolador, chamadas para compilação e verificação de erros além da operação de download do programa compilado.O protótipo construído apresentou-se perfeitamente operacional, atendendo as especificações iniciais de projeto.*

Palavras chave — Microcontroladores 8051, Metodologias de projeto, Particionamento Hardware/Software, Protótipo.

Introdução

Atualmente, podem ser observados diversas aplicações, equipamentos e sistemas de controle baseados em microcontroladores. Notadamente os dispositivos da família 8051 são bastante populares , apesar de utilizarem barramentos de 8 bits, o que na verdade torna-se vantajoso para aplicações de pequeno e médio porte, que são a maioria das aplicações encontradas [5].

Apesar deste grau de utilização e popularidade, este dispositivo ainda não é estudado com profundidade e atenção merecidas, pelos cursos da área de Engenharia Eletrônica e de nível médio (UPE – Escola Politécnica e CEFET-PE), mais ainda, existem poucos ou nenhum recursos práticos para ensino que possam dar acesso à potencialidade deste dispositivo, proporcionando um maior e melhor nível de concernimento à utilização pratica, projetos e desenvolvimento de *hardware* e *software* [7].

Outro aspecto que merece atenção é o fato de que praticamente não existam sistemas de treinamento semelhantes a disposição com nível de informações de *hardware* e *software* abertos ou seja, que seja possível e permitido o melhoramento de suas características e potencialidades funcionais pois na maioria das vezes estes sistemas estão protegidos de alguma forma por *copyrights*. Alem disso, com freqüência, os sistemas importados tornam os custos de expansão e até mesmo de aquisição, proibitivos ao passo que o desenvolvimento de um sistema deste tipo no âmbito da UPE teria como vantagens imediatas uma maior flexibilidade de sistema , maior índice de informações de *hardware* e *software*, além de ser facilmente duplicável através da aquisição de componentes no mercado local [8].

O presente trabalho de pesquisa tem como objetivo o desenvolvimento de um sistema de treinamento e ensino em microcontroladores da família 8051 que possa ser utilizado posteriormente nos cursos de graduação e pós graduação de eletrônica, de forma que este permita, por possuir uma arquitetura aberta, deixar a disposição todas as facilidades de expansão de hardware e de software, e melhoramento de sua operacionalidade e recursos implementados.

Outro ponto observado no projeto é como sistemas deste tipo podem ser implementados. Freqüentemente, durante a execução de um projeto baseado em microcontrolador, ocorrem diversos erros de implementação por *hardware* ou *software*. As etapas de correção de erros, freqüentemente chamadas pelos projetistas como fase de *debug*, consomem bastante tempo de projeto. Estas etapas de *debug* podem ser minimizadas caso seja adotada uma metodologia de particionamento do projeto a ser implementado. Isto quer dizer que operando-se em módulos bem especificados e pequenos e, posteriormente promovendo-se a interação entre estes módulos, sejam estes em *hardware* ou *software*, se tem maior probabilidade de acerto na montagem final do projeto. O presente trabalho de pesquisa enfoca paralelamente, a utilização desta metodologia para implementação do sistema de desenvolvimento, bem como para projetos baseados em microcontroladores.

Sendo assim, os temas abordados no presente artigo são os seguintes:

- Implementação de um sistema de desenvolvimento em microcontroladores, aberto, de baixo custo, que

[1]João Pereira de Brito Filho, UFPE - DES, R. Acadêmico Hélio Ramos, s/n, 50740-530 Recife-PE, Brasil jbrito@ufpe.br

possa ser utilizado no âmbito dos cursos Eletrônica de nível médio, graduação, pós-graduação e atividades de pesquisa;

- Estudo de uma metodologia de implementação prática, através de particionamento de *hardware* e *software* de modo a facilitar o desenvolvimento de circuitos microcontrolados;

- Aprimoramento das técnicas de implementação de projetos baseados em controle por microcontroladores.

Metodologia de implementação de projeto baseado em microcontrolador

Apesar de se enfatizar aplicações da metodologia para microntroladores 8051, ela poderá ser aplicada, em grande parte, para qualquer sistema baseado em determinado dispositivo controlador, ou seja, aprenta-se uma metodologia de desenvolvimento de *hardware* e *software* que pode ser aplicada como técnica de projeto de sistemas microcontrolados. Neste ponto, pode-se estabelecer o que será denominado de etapas de desenvolvimento de um sistema baseado em microcontrolador. Estas etapas unificadas podem gerar na verdade um processo cíclico, ou seja, quando na etapa final de testes não forem alcançados os objetivos traçados na etapa inicial, o processo poderá ser revisto ou retornado em algum ponto.

Pode-se estabelecer pelo menos os seguintes pontos como etapas de desenvolvimento de sistemas [1]:

- Requerimentos funcionais do sistema;
- Especificações de projeto do sistema;
- Particionamento;
- Modularização de *hardware* e *software;*
- Integração de *hardware* e *software;*
- Elaboração da documentação de projeto;
- Verificação funcional e avaliação do sistema.

Estas etapas serão adaptadas às características do sistema a ser desenvolvido. Tem-se a seguir, uma descrição generalizada de cada etapa de desenvolvimento.

Requerimentos funcionais do sistema

Nesta etapa é confeccionada a documentação que descreve exatamente as capacidades, características e modo funcional do sistema quando terminado. Esta documentação deve conter, por exemplo, uma relação de todas as tarefas que o sistema deve realizar para o usuário final. Nesta etapa, deve existir um intercâmbio entre projetistas e usuários finais do sistema de forma a gerar os requerimentos funcionais de maneira a mais definitiva possível (que será o alicerce para todas as outras etapas de desenvolvimento) de forma consistente e viável.

Especificações de projeto de sistema

Uma vez que estejam definidos os requerimentos funcionais do sistema, devem ser feitas as especificações do projeto do mesmo. Isto quer dizer que, nesta etapa, deve-se decidir como o sistema deverá interagir com o usuário bem como especificar as entradas e saídas dos dispositivos envolvidos. Talvez seja fundamental, a confecção de uma relação das funções que o sistema deve realizar de forma a implementar as tarefas definidas pelo usuário.

Desta forma pode-se estabelecer que enquanto os requerimentos funcionais do sistema devem mostrar o *que* o dispositivo final deve fazer, as especificações de projeto do sistema devem detalhar *como* o sistema deve operar de forma a realizar as tarefas especificadas na etapa anterior.

Particionamento

Uma vez estabelecidas as especificações de projeto, poderá ser feito o particionamento entre *hardware* e *software,* ou seja, quais as funções do sistema que serão realizadas por *hardware* e *software*. Para cada projeto sempre ocorrerá situações em que uma função do sistema deve ser implementada apenas em *hardware* (ou *software*). Caso exista a possibilidade de a função ser implementada de outra maneira, devem ser levados em consideração outros aspectos, tais como, custo ou tempo requerido de implementação da nova solução. Existe nesta etapa, dependendo da complexidade do projeto, a possibilidade de ser preciso realizar um estudo de *hardware*/*software* codesign.

Modularização de *hardware e software*

Após a definição das funções que serão implementadas por *hardware* e por *software* no sistema, o projeto pode tomar dois caminhos distintos, geralmente dependentes da sua complexidade:

- Desenvolvimento de *hardware* e *software* por apenas um projetista;
- Desenvolvimento de *hardware* e *software* paralelo por projetistas ou equipe de projetos distintos

A primeira situação ocorre com freqüência em projetos de baixa complexidade que envolvem ciclos de implementação curtos e custo reduzido. Sistemas mais complexos como projetos de instrumentação ou controle de sistemas distribuídos, exigem um particionamento (até mesmo integração) de projeto em *hardware* e *software*. Em ambos os casos existe então a modularização do projeto de *hardware* e *software* ou seja, o projeto de *hardware* é dividido em módulos, cada qual implementando uma ou mais funções de *hardware*. O *software* também é particionado em uma hierarquia de módulos, cada um dos quais implementa uma ou mais tarefas. Estes módulos podem posteriormente ser divididos em *procedures* que seriam rotinas para realizar funções específicas. O módulo final de *software* consistiria de grupos de *procedures* que estariam ligadas umas as outras.

Integração de *hardware* e *software*

A integração entre *hardware* e *software* pode ser vista como a etapa de compatibilidade entre os dois projetos especialmente se estes forem implementados de maneira paralela. Isto é possível de ser implementado normalmente pela instalação de uma memória não volátil com o sistema de *software* desenvolvido, adicionado ao *hardware* e fazendo posteriormente um teste de desempenho do sistema. Neste caso, deverá também ser implementada uma interface entre o *hardware* e o *software* ou seja, algum programa que permita a operação do *software* sobre o *hardware* projetado. Como exemplo desta interface, pode-se ter um módulo anterior ao *software* a ser integrado que identifique quais as funções ou recursos de *hardware* que estão implementados e que deverá interagir com o *software*. Outra possibilidade seria a utilização de um emulador do microcontrolador utilizado para verificação de funcionalidade do *software*.

Elaboração da documentação de projeto

Uma etapa não menos importante seria a geração de relatórios e anotações das tarefas realizadas e resultados obtidos durante o ciclo de desenvolvimento do projeto. Posteriormente, a unificação destes relatórios de forma lógica e ordenada formaria a documentação do sistema. A importância deste ponto pode ser percebida em um caso particular de desenvolvimento de um projeto de grande complexidade. Se as anotações estão incompletas ou escritas de forma não clara, surgirá a dificuldade de manutenção de *software* o que muitas vezes podem alcançar grandes percentuais de custos de desenvolvimento de *software*. Em resumo, técnicas bem direcionadas de projeto associadas a documentação de desenvolvimento e a objetivos bem definidos de projeto, conduzem a facilidades de implementação e menor custo de manutenção do sistema em desenvolvimento.

seja, a detecção de erros em qualquer ponto significa o retorno para o ponto anterior do ciclo. A Fig. 1 mostra um fluxograma do processo de execução de projeto:

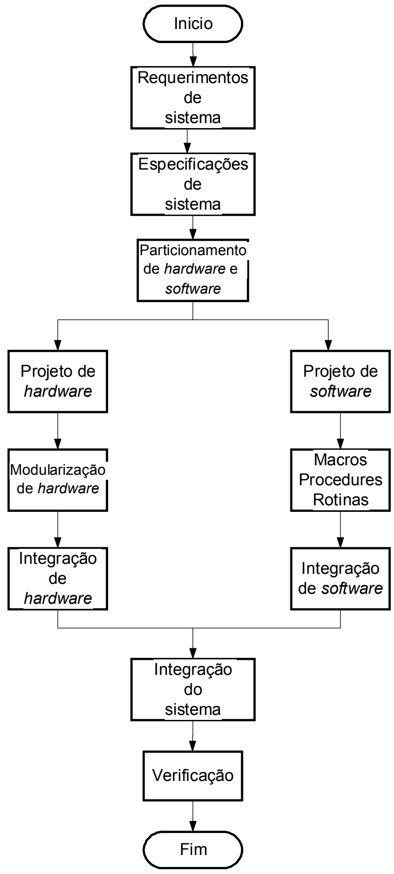

FIGURA 1 – METODOLOGIA DE IMPLEMENTAÇÃO DE PROJETO

As etapas para desenvolvimento do *hardware* [3] podem ser colocadas em um fluxograma como o ilustrado na Fig. 2, como considerações a serem observadas no desenvolvimento do *hardware* que atenda as especificações do sistema alvo.

Verificação e avaliação do sistema

Finalmente, a ultima etapa seria a avaliação completa do sistema para a verificação dos requerimentos funcionais idealizados na primeira etapa. Pode-se perceber que todo processo de execução do projeto é interativo, ou

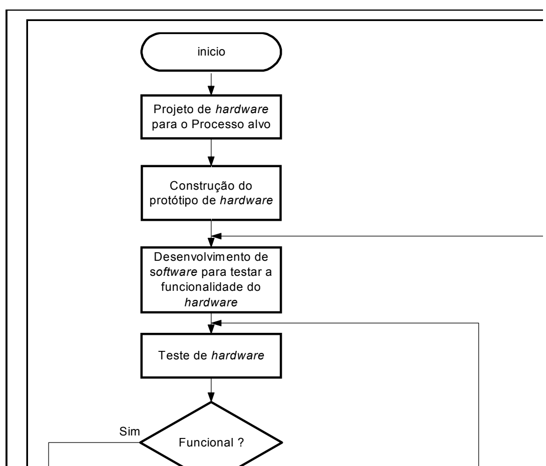

FIGURA 2 – METODOLOGIA DE IMPLEMENTAÇÃO DE *HARDWARE*

Para o desenvolvimento do sistema opracional foi utilizada uma metodologia Top-Down de particionamento de software. Neste tipo de implementação, as funções do sistema são especificadas e o projeto é dividido em subfunções onde, inclusive, podem ocorrer outros níveis mais abaixo destas subfunções. Como cada subfunção está especificada, isto limita e define as suas propriedades. Desta maneira, as propriedades das funções em níveis mais baixos tem uma maior probabilidade de integração nas etapas onde o *hardware* e *software* vão ser integradas. Percebe-se que o projeto procede das considerações dos maiores para os menores níveis ou do mais generalizado para os mais específicos. As funções de níveis mais subalternos deverão ser especificadas posteriormente às de maior nível, quando ficar claro de que maneira será a interação com estes módulos de níveis mais elevados, sendo que a implementação das funções de menor nível não poderá ocorrer , até que o processo de particionamento esteja completo.

Pode-se então fazer algumas considerações de como se apresenta em linhas gerais, um programa estruturado na metodologia "*top-down*". Na realidade existe normalmente um arranjo hierárquico de todas as rotinas do *software* desenvolvido. No nível de topo, existe uma rotina principal, freqüentemente chamada de rotina ou programa principal. A função desta rotina principal é gerenciar o fluxo de todo o programa sendo que as tarefas que devem ser executadas são implementadas como uma série de subrotinas ou *procedures*. O programa principal inicializa o sistema e então ele realiza entradas, *poolings* e *loops* de programa que examinam as entradas e controles do sistema, muitas vezes por subrotinas específicas para tal. Estas condições são testadas e se necessário, o programa principal chama as rotinas adequadas para realizar a tarefa necessária. Em sistemas mais complexos, o programa principal pode chamar uma das diversas subrotinas e muitas das procedures que estão operando, podem ter suas próprias subrotinas em níveis mais baixos. Em qualquer caso, o fluxo do programa ocorre a partir do programa principal para as subrotinas ou subdivisões destas e sempre retorna para o programa principal. A Fig. 3 mostra uma metodologia de implementação "*top-down*" [2].

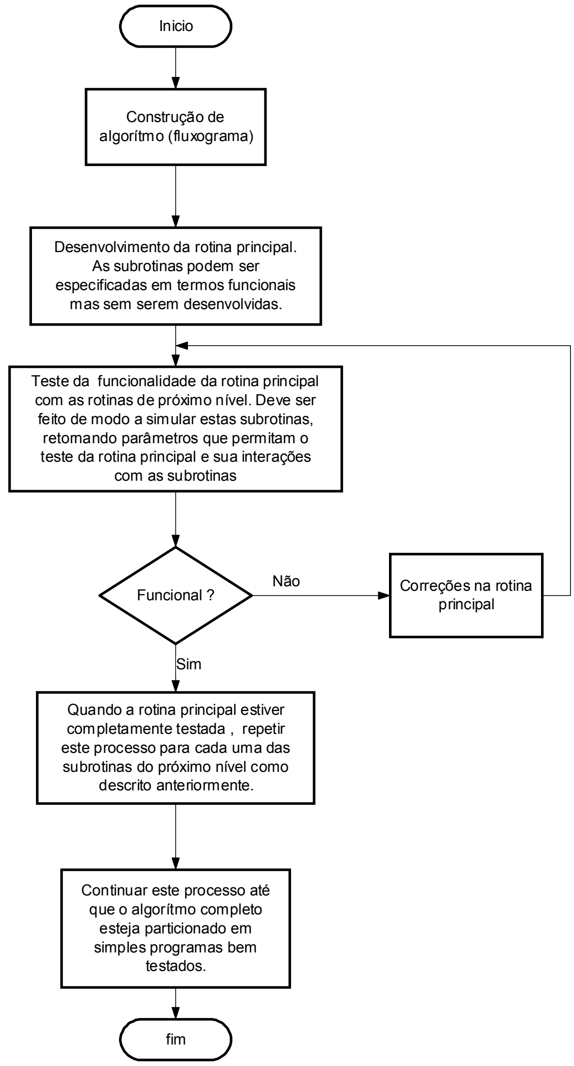

FIGURA 3 – METODOLOGIA DE IMPLEMENTAÇÃO DE *SOFTWARE TOP -DOWN*

Implementação do sistema de desenvolvimento

A partir dos requerimentos para um sistema de desenvolvimento para microcontrolador 8051, foram feitas as especificações e o diagrama em blocos, mostrado na Fig.4:

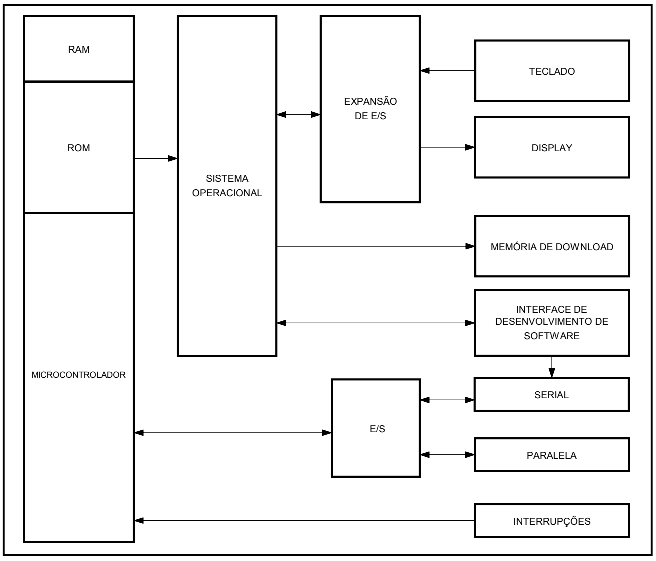

FIGURA 4 – DIAGRAMA EM BLOCOS DO HARDWARE DO SISTEMA

Implementação do sistema operacional

O sistema operacional foi implementado de acordo com os requerimentos do sistema, para atender a 8 funções básicas como pode ser visto na Fig. 6.

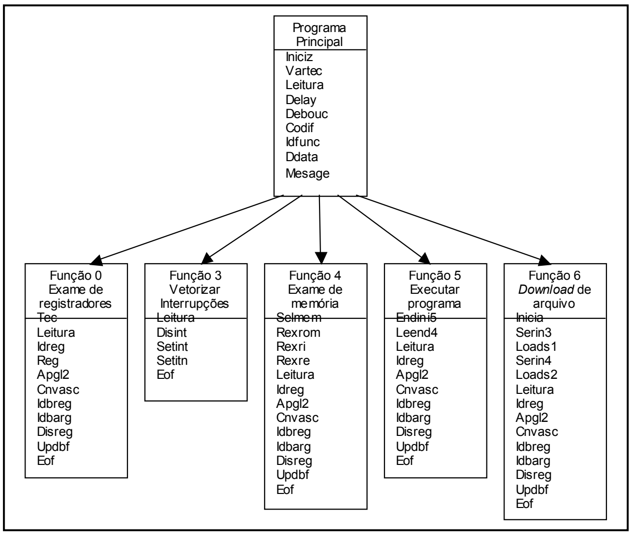

FIGURA 5 – PARTICIONAMENTO DO SISTEMA OPERACIONAL

As funções 1 e 2 estão reservadas a expansão pelo usuário. A função 7 está reservada para finalizar as outras funções e remeter o S.O. ao estado de reset. A figura mostra o particionamento do S.O com as principais subrotinas utilizadas de acordo com a metodologia Top-Down.

Implementação da Interface de Desenvolvimento

Este programa foi desenvolvido em Delphi, de forma a disponibilizar ao usuário a edição, chamada para compilação e download de arquivos binários para o sistema de desenvolvimento em ambiênte gráfico. A Fig. 7 mostra a tela do programa com 2 arquivos sendo editados.

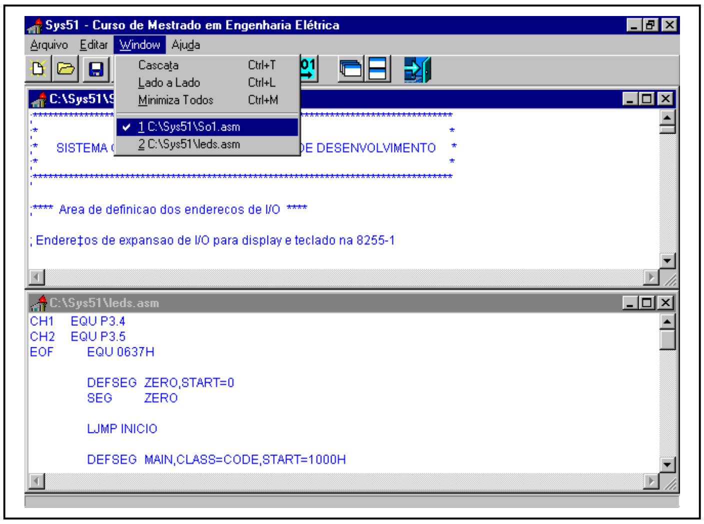

FIGURA 6 – TELA DA INTERFACE DE DESENVOLVIMENTO

Atualmente está sendo implementado uma interface de simulação do microcontrolador 8051, que ainda não se encontra disponível, dentro da filosofia deste sistema ser aberto a melhoramentos e modificações dentro do ambiente acadêmico. Desta forma, os programas poderão ser simulados antes de serem executados na plataforma de desenvolvimento.

Conclusões

A implementação deste sistema de desenvolvimento para microcontroladores 8051, sendo um sistema aberto, trouxe vantagens imediatas no processo de ensino-aprendizagem nas disciplinas correlacionadas a projetos com microcontroladores. Mesmo não apresentando uma arquitetura tão moderna, este microcontrolador (ou algum dos seus variantes) ainda é encontrado fartamente em aplicações de controle.

Com as informações de projeto disponibilizadas, o sistema tende a se desenvolver com diversos melhoramentos que podem ser implementados. A metodologia de projeto ora apresentada, sendo bastante simples e generalista, pode ser empregada em qualquer projeto que envolva o uso de microcontrolador, mesmo aquelas de arquitetura distinta (RISC por exemplo) [4].

Fluxo de Carga versus Fluxo de Carga Continuado Parte III: Fluxo de Carga Desacoplado Rápido

Dilson A. Alves[1] *e Rogério R. Matarucco* [1]

Resumo — *Os métodos de fluxo de carga de Newton e Desacoplado Rápido convencionais são considerados inadequados para a obtenção do ponto de máximo carregamento* (*PMC*) *de sistemas de potência, devido à problemas de mal-condicionamento das matrizes usadas pelos métodos, neste ponto crítico e na sua vizinhança. Neste ponto a matriz Jacobiana do método de Newton torna-se singular e considera-se que não são mais válidas as hipóteses de desacoplamento P-V e Q-θ utilizadas para a formulação do método fluxo de carga Desacoplado Rápido. Os métodos da continuação são ferramentas eficientes para se obter o PMC. Nestes, técnicas de parametrização são utilizadas para evitar a singularidade da matriz Jacobiana e assim eliminar o mal-condicionamento das matrizes utilizadas nos métodos desacoplados. Neste trabalho são apresentados e avaliados os métodos de Fluxo de Carga Desacoplado Rápido convencional e propostos, considerando as variações de cargas numa única barra.*

Palavras - Chave — Fluxo de carga desacoplado rápido, métodos da continuação, ponto de máximo carregamento.

INTRODUÇÃO

A ampla utilização do método desacoplado rápido tradicional, no que diz respeito ao cálculo de FC, se deve às suas características de velocidade de convergência e pequeno espaço de memória necessário. Em função destas vantagens, há um interesse por parte das empresas na sua utilização nos algoritmos de continuação visando, com isso, a redução do tempo de CPU necessário para o traçado das curvas PV. A não utilização dos métodos desacoplados se deve ao fato de se acreditar que o desacoplamento não possa ser usado próximo ao PMC, e que somente as soluções de alta tensão podem ser obtidas. Os objetivos deste trabalho são os de introduzir os conceitos básicos dos métodos Desacoplados Rápidos propostos para a solução de fluxo de carga (FC) e demonstrar que, uma vez adequadamente equacionados, qualquer um deles pode ser usado para a obtenção do PMC de um sistema de potência. Os métodos estão subdivididos de acordo com as curvas a serem traçadas: PV, QV, e SV. Ao final de cada grupo demonstra-se que os métodos utilizados no traçado das curvas PV e QV podem ser considerados como casos particulares do usado para o traçado da curva SV. As expressões analíticas apresentadas na parte I [1] são usadas para convalidar os resultados obtidos pelos métodos desacoplados rápidos, existente e propostos, considerando as variações de cargas numa única barra. Conforme concluiu-se na parte II [2], todos os métodos aqui apresentados são casos particulares do método da continuação com preditor secante de ordem zero [3].

OBTENÇÃO DAS CURVAS QV, PV E SV PELO FLUXO DE CARGA DESACOPLADO RÁPIDO

A seguir apresentam-se os métodos Desacoplados Rápidos utilizados para o traçado das curvas QV, PV, e SV, para o caso de variação de potência em apenas uma única barra.

Fluxo de Carga Desacoplado Rápido Convencional

As simplificações introduzidas por Stott e Alsaç [4] na matriz Jacobiana do fluxo de carga pelo método de Newton deram origem ao método de FC Desacoplado Rápido (FCDR), descrito por:

$$\begin{aligned} B'\Delta\theta &= \Delta P/V \\ B''\Delta V &= \Delta Q/V \end{aligned} \qquad (1)$$

A versão proposta em [4] é atualmente conhecida como versão XB. Outras versões foram implementadas e testadas por Van Amerongen [5], sendo uma delas a versão BX. A diferença básica entre as versões está nos elementos das matrizes *B'* e *B"*. As matrizes são constantes e de dimensões diferentes em virtude da exclusão das barras do tipo *PV* da matriz *B"*. Monticelli *et al.* [6] apresentaram uma justificativa analítica e unificada, que possibilitou uma melhor compreensão do bom desempenho dos métodos desacoplados rápidos (BX e XB), a qual era até então desconhecida. Em [6] mostra-se que os algoritmos das versões BX e XB podem ser deduzidos a partir da equação do método de Newton (equação (34), parte I [1]), considerando-se V = 1 p.u. e θ = 0 grau, e assumindo que o sistema seja constituído por ramos com a mesma razão r/x ou seja radial. Mesmo quando o sistema não apresenta uma destas características, os algoritmos BX e XB continuam a ser uma boa aproximação para fins práticos. No geral, a versão BX apresenta melhor desempenho que a XB, em virtude das aproximações extras (desconsideração dos efeitos das barras *PVs* e dos elementos *shunts* na matriz de sensibilidade P-θ) necessárias para a obtenção da última.

O FCDR foi utilizado para o traçado da mesma curva PV da Figura 1 parte II [2], utilizando o mesmo sistema da Figura 1 parte I [1], e o mesmo procedimento usado no caso do método de Newton [2]. Os resultados mostram que, embora seja possível obter os mesmos pontos, o número de

---

[1] Dilson Amancio Alves e Rogério R. Matarucco, UNESP–Universidade Estadual Paulista, Departamento de Engenharia Elétrica, Campus de Ilha Solteira, C.P. 31, 15385-000, Ilha Solteira SP, Brasil, +55 18 3743 1163, dalves@dee.feis.unesp.br

meias iterações necessárias é muito alto, em torno de 100, enquanto que para o método de Newton tem-se 10 iterações [2]. Interrompendo o processo de cálculo com um número menor de iterações a potência máxima alcançada será proporcionalmente menor. Por exemplo, para 15 meia iterações o valor máximo de Pg_2 foi de 94,15 MW pelo FCDR usando a versão XB, enquanto que pelo método de Newton Pg_2 foi de 95,15 MW para 3 iterações [2].

Fluxo de Carga Desacoplado Rápido Modificado

Os métodos FCDR modificados (FCDRM) foram obtidos a partir dos respectivos métodos de Newton modificados usando o mesmo procedimento mostrado em [6]. O sistema considerado para a obtenção dos FCDRM pode ser visto na Figura 1 a seguir.

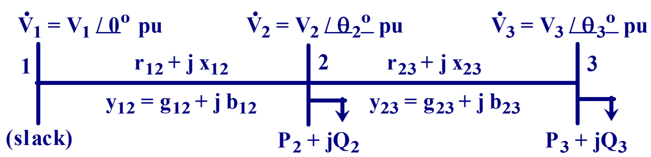

FIGURA 1
SISTEMA DE TRÊS BARRAS

Os valores numéricos adotados para os componentes deste sistema foram os seguintes: $\dot{V}_1 = 1{,}19\angle 0^{o}$ p.u., z_{12} = (1/3)×(0,3 + j 1,0) p.u., z_{23} = (2/3)×(0,3 + j 1,0) p.u., e $P_2 + jQ_2$ = 0 + j 0. Estes valores, bem como a tolerância de 10^{-5} p.u. adotada para a convergência dos *mismatches* e o esquema de iteração padrão, são usados em todos os exemplos que se seguem para os métodos desacoplados, excetuando os casos para os quais for especificado de forma diferente. Entende-se por esquema de iteração padrão aquele que, após a convergência de um dos subproblemas, iterações sucessivas podem ser realizadas no outro subproblema, até que ambos atinjam a convergência ou, o que pode ocorrer, o subproblema convergido divirja [4].

Curvas QV e PV

Para se obter as curvas QV e PV segue-se o mesmo procedimento apresentado em [2]. No caso da curva QV, com a especificação da tensão V_k eliminam-se a linha e a coluna k da matriz *B"*, procedimento similar ao utilizado para as barras *PV*. Para cada tensão especificada V_k executa-se um programa de FCDRM e obtém-se a potência reativa Q_k necessária para se manter o nível preestabelecido de tensão. Da mesma forma, para se obter a curva PV pode-se especificar o ângulo da tensão da barra k. A barra é redefinida como sendo do tipo $Q\theta$. Com isso, θ_k deixa de ser uma variável dependente e, consequentemente, pode-se eliminar as respectivas linha e coluna k da matriz *B'*. Para cada valor especificado de θ_k obtém-se a respectiva potência ativa P_k. Nestes dois casos, excetuando a eliminação da linha ou da coluna k em função do parâmetro (V_k ou θ_k) do método considerado, não há alterações nas leis de formação das matrizes *B'* e *B"*, e ambas as versões BX e XB podem ser utilizadas em suas formas convencionais.

Entretanto, a obtenção das curvas QV e PV por meio da especificação de θ_k e V_k, respectivamente, conduzem a leis de formação para as matrizes *B'* e *B"* um pouco diferentes das da convencional. A seguir é apresentado o desenvolvimento da versão XB para a obtenção da curva QV com θ como parâmetro, e BX para a obtenção da curva PV com V como parâmetro. A equação correspondente de Newton para o sistema da Figura 1, considerando $V_2 = V_3$ = 1 p.u. e $\theta_2 = \theta_3 = 0$, torna-se:

$$\begin{bmatrix}\Delta P_2\\ \Delta P_3\\ \Delta Q_2\\ \Delta Q_3\end{bmatrix}=\left[\begin{array}{cc|cc}-(b_{12}+b_{23}) & b_{23} & (g_{12}+g_{23}) & -g_{23}\\ b_{23} & -b_{23} & -g_{23} & g_{23}\\ \hline -(g_{12}+g_{23}) & g_{23} & -(b_{12}+b_{23}) & b_{23}\\ g_{23} & -g_{23} & b_{23} & -b_{23}\end{array}\right]\begin{bmatrix}\Delta\theta_2\\ \Delta\theta_3\\ \Delta V_2\\ \Delta V_3\end{bmatrix} \quad (2)$$

Versão XB para a Obtenção da Curva QV

Para a obtenção das matrizes *B'* e *B"* da versão XB, para o caso da curva QV, utilizando θ_3 como variável independente, o sistema (2) deverá ser posto na seguinte forma:

$$\begin{bmatrix}\Delta P_2\\ \Delta Q_3\\ \Delta Q_2\\ \Delta P_3\end{bmatrix}=\left[\begin{array}{c|c|cc}-(b_{12}+b_{23}) & b_{23} & (g_{12}+g_{23}) & -g_{23}\\ \hline g_{23} & -g_{23} & b_{23} & -b_{23}\\ \hline -(g_{12}+g_{23}) & g_{23} & -(b_{12}+b_{23}) & b_{23}\\ b_{23} & -b_{23} & -g_{23} & g_{23}\end{array}\right]\begin{bmatrix}\Delta\theta_2\\ \Delta\theta_3\\ \Delta V_2\\ \Delta V_3\end{bmatrix} \quad (3)$$

o qual após a eliminação da linha e coluna correspondente à θ_3 conduz a:

$$\begin{bmatrix}\Delta P_2\\ \Delta Q_2\\ \Delta P_3\end{bmatrix}=\left[\begin{array}{c|cc}-(b_{12}+b_{23}) & (g_{12}+g_{23}) & -g_{23}\\ \hline -(g_{12}+g_{23}) & -(b_{12}+b_{23}) & b_{23}\\ b_{23} & -g_{23} & g_{23}\end{array}\right]\begin{bmatrix}\Delta\theta_2\\ \Delta V_2\\ \Delta V_3\end{bmatrix},$$

$$=\left[\begin{array}{c|c}H_\theta & N_\theta\\ \hline M_\theta & L_\theta\end{array}\right]\begin{bmatrix}\Delta\theta_2\\ \Delta V_2\\ \Delta V_3\end{bmatrix} \quad (4)$$

e que corresponde ao sistema da equação (3.35) para $V_2 = V_3$ = 1 p.u. e $\theta_2 = \theta_3 = 0$. Usando o mesmo procedimento de [6], obtém-se a matriz *Heq*:

$$Heq_\theta = H_\theta - N_\theta \times L_\theta^{-1} \times M_\theta, \quad (5)$$

a qual após a substituição e devidas manipulações conduz a:

$$Heq_\theta = \left[\frac{1}{x_{12}} + \frac{1}{x_{23}} + g_{23}\left(\frac{g_{23}}{b_{23}} - \frac{g_{12}}{b_{12}}\right) + b_{23}\left(\frac{g_{12}}{b_{12}}\frac{b_{23}}{g_{23}} - 1\right)\right]. \quad (6)$$

Para sistemas com topologia radial e relação *r/x* idênticas tem-se:

$$Heq_\theta = \left[1/x_{12} + 1/x_{23}\right]. \quad (7)$$

Observa-se que a matriz Heq_θ = *B'* da versão XB do método convencional, e, consequentemente, a mesma lei de formação. Observa-se que neste caso, a matriz *B'* não apresentará a linha e a coluna da variável (θ_3) que foi escolhida como parâmetro. Já a matriz *B"* terá a lei de formação diferente da correspondente do método convencional apenas na linha correspondente a V_3, cujos elementos não diagonais correspondentes a b_{3i} devem ser substituídos pelos respectivos $-g_{3i}$, enquanto que o elemento da diagonal $B_{33} = \Sigma(-b_{3i})$ deverá ser substituído por $G_{33} = \Sigma(g_{3i})$. Uma outra observação importante é que agora, no cálculo de V_3, é usado o *mismatch* de P_3 e não o de Q_3.

Versão BX para a Obtenção da Curva PV

Para obter as matrizes *B'* e *B"* da versão BX, usada no traçado da curva PV, considerando V_3 como variável independente, parte-se da mesma matriz do sistema (3). Entretanto, a linha e coluna eliminadas são as correspondentes a V_3, ou seja, a última linha e a última coluna. O sistema matricial resultante será:

$$\begin{bmatrix}\Delta P_2\\ \Delta Q_3\\ \hline \Delta Q_2\end{bmatrix}=\left[\begin{array}{cc|c}-(b_{12}+b_{23}) & b_{23} & (g_{12}+g_{23})\\ g_{23} & -g_{23} & b_{23}\\ \hline -(g_{12}+g_{23}) & g_{23} & -(b_{12}+b_{23})\end{array}\right]\begin{bmatrix}\Delta\theta_2\\ \Delta\theta_3\\ \hline \Delta V_2\end{bmatrix},$$

$$=\left[\begin{array}{c|c}H_V & N_V\\ \hline M_V & L_V\end{array}\right]\begin{bmatrix}\Delta\theta_2\\ \Delta\theta_3\\ \hline \Delta V_2\end{bmatrix} \quad (8)$$

e que corresponde ao sistema (2) da parte II [2] para $V_2 = V_3 = 1$ p.u. e $\theta_2 = \theta_3 = 0$. Conforme [6], a matriz Leq_V é dada por:

$$Leq_V = L_V - M_V \times H_V^{-1} \times N_V\ , \quad (9)$$

e que após as substituições e manipulações algébricas produzem exatamente a mesma expressão da obtida para a matriz Heq_θ em (6). Com as mesmas considerações feitas para a (6), pode-se obter:

$$Leq_V = \left[1/x_{12} + 1/x_{23}\right], \quad (10)$$

ou seja, para se obter a matriz $Leq_V = B"$ da versão BX do método convencional, a qual, consequentemente, apresenta a mesma lei de formação, diferindo apenas na sua dimensão devido à eliminação da linha e coluna da variável (V_3) escolhida como parâmetro. A matriz *B'*, por outro lado, terá a lei de formação diferente da correspondente do método convencional apenas na linha correspondente a θ_3 cujos elementos não diagonais correspondentes a b_{3i} são substituídos pelos respectivos g_{3i}, enquanto que o elemento da diagonal $B_{33} = \Sigma(-b_{3i})$ é substituído por $G_{33} = \Sigma(-g_{3i})$. Aqui também deve se observar que é usado o *mismatch* de Q_3, e não o de P_3, no cálculo de θ_3.

Versões XB e BX para a Obtenção das Curvas PV e QV

Uma forma mais geral de se obter a lei de formação das matrizes *B'* e *B"* para todas as possíveis versões (XB e BX), seria considerar a matriz completa representada por (2), obter as matrizes *Heq* e *Leq*, e, em seguida, obter as versões a serem usadas na obtenção dos valores máximos de *P* e *Q*. Procedendo dessa forma para o sistema da Figura 1, no caso da versão XB obtém-se:

$$Heq = \begin{bmatrix}(1/x_{12} + 1/x_{23}) & -1/x_{23}\\ 1/r_{23} & -1/r_{23}\end{bmatrix}, \quad (11)$$

e para a versão BX:

$$Leq = \begin{bmatrix}(1/x_{12} + 1/x_{23}) & -1/x_{23}\\ -1/r_{23} & 1/r_{23}\end{bmatrix}. \quad (12)$$

No caso mais geral de uma barra *k* qualquer, considerando o uso de θ_k para a obtenção da curva QV, pode-se obter as matrizes das respectivas versões XB e BX como segue:

- Versão XB: para se obter *B'*, elimina-se a respectiva linha e coluna correspondente a θ_k na matriz *Heq*, como p. ex., no caso de (11), da qual se obtém a (7) após a eliminação da linha e da coluna 3. Portanto, a sua lei de formação será a mesma da matriz *B'* da versão XB do método convencional, exceto, conforme já mencionado, pela eliminação da linha e coluna correspondente a θ_k. Por outro lado, a lei de formação da matriz *B"* é diferente da correspondente do método convencional apenas na linha correspondente a V_k, cujos elementos não diagonais correspondentes a b_{ki} são substituídos pelos respectivos $-g_{ki}$, enquanto que o elemento da diagonal $B_{kk} = \Sigma(-b_{ki})$ é substituído por $G_{kk} = \Sigma(g_{ki})$. Outra observação importante é que agora é usado o *mismatch* de P_k, e não o de Q_k, no cálculo de V_k.
- Versão BX: a matriz *B'* tem a mesma lei de formação da matriz *B'* (que é a mesma da matriz H) da versão BX do método convencional, exceto pela eliminação da respectiva linha e coluna correspondente a θ_k. A lei de formação da matriz *B"* é igual à da matriz *Leq*, similar à (12), ou seja, a mesma lei de formação da matriz *B"* da versão BX do método convencional, excetuando a linha correspondente a V_k, cujos elementos não diagonais correspondentes a $-1/x_{ki}$ são substituídos pelos respectivos $-1/r_{ki}$, enquanto que o elemento da diagonal $B_{kk} = \Sigma(1/x_{ki})$ é substituído por $\Sigma(1/r_{ki})$. Também, neste caso, é usado o *mismatch* de P_k, e não o de Q_k, no cálculo de V_k.

Já no caso de se considerar o uso de V_k para a obtenção da curva PV, pode-se obter as matrizes das respectivas versões XB e BX como segue:

- Versão XB: para se obter *B"*, elimina-se a respectiva linha e coluna correspondente a V_k na matriz *L*, obtendo-se com isso, a mesma lei de formação da matriz *B"* da versão XB do método convencional, exceto pela eliminação da linha e coluna referida anteriormente. A lei de formação da matriz *B'* é igual à da matriz *Heq* (similar à (11)), ou seja, apresenta a mesma lei de formação da matriz *B'* da versão XB do método convencional, excetuando a linha correspondente a θ_k, cujos elementos não diagonais correspondentes a $-1/x_{ki}$ serão substituídos pelos respectivos $1/r_{ki}$, enquanto que o elemento da diagonal que é igual a $\Sigma(1/x_{ki})$ é substituído por $\Sigma(-1/r_{ki})$. Outra observação importante é que agora é usado o *mismatch* de Q_k, e não o de P_k, no cálculo de θ_k.

- Versão BX: para se obter *B"*, elimina-se a respectiva linha e coluna correspondente a V_k na matriz *Leq*, similar ao procedimento que se faz para obter a (10) a partir de (12). Portanto, a sua lei de formação é a mesma da matriz *B"* da versão BX do método convencional, a menos das referidas linha e coluna eliminadas. A matriz *B'* tem a lei de formação diferente da correspondente do método convencional apenas na linha correspondente a θ_k cujos elementos não diagonais correspondentes a b_{ki} são substituídos pelos respectivos g_{ki}, enquanto que o elemento da diagonal $B_{kk} = \Sigma(-b_{ki})$ é substituído por $G_{kk} = \Sigma(-g_{ki})$. Aqui também observa-se que agora é usado o *mismatch* de Q_k, e não o de P_k, no cálculo de θ_k.

FCDRM para a Obtenção das Curvas SV

Da mesma forma que foi feito para o método de Newton [2], pode-se obter um algoritmo mais geral para o FCDR, sendo que os anteriores passam a ser uma particularidade. Assim sendo, para o sistema de três barras da Figura 1 p. ex., no caso de usar-se a tensão da barra *3* (V_3) como parâmetro a equação ficaria:

$$\begin{bmatrix}\Delta P_2\\ \Delta P_3\\ \hline \Delta Q_2\\ \Delta Q_3\end{bmatrix}=\left[\begin{array}{cc|cc} -(b_{12}+b_{23}) & b_{23} & (g_{12}+g_{23}) & 0\\ b_{23} & -b_{23} & -g_{23} & -K_pS_3\cos\varphi\\ \hline -(g_{12}+g_{23}) & g_{23} & -(b_{12}+b_{23}) & 0\\ g_{23} & -g_{23} & b_{23} & -K_qS_3\,sen\,\varphi\end{array}\right]\begin{bmatrix}\Delta\theta_2\\ \Delta\theta_3\\ \hline \Delta V_2\\ \Delta\lambda\end{bmatrix}. \quad (13)$$

Procedendo como nos casos anteriores pode-se obter a matriz *Leq*, a qual terá a seguinte forma:

$$Leq=\begin{bmatrix}(1/x_{12}+1/x_{23}) & -K_pS_3\cos\varphi(g_{12}/b_{12}-g_{23}/b_{23})\\ -\dfrac{1}{x_{23}} & -K_qS_3\,sen\,\varphi+(g_{23}/b_{23})K_pS_3\cos\varphi\end{bmatrix}, \quad (14)$$

a qual, nos casos em que a rede do sistema apresentar a relação *r/x* idêntica para todos as linhas, se reduz a:

$$Leq=\begin{bmatrix}(1/x_{12}+1/x_{23}) & 0\\ -1/x_{23} & -K_qS_3\,sen\,\varphi+(G_{33}/B_{33})K_pS_3\cos\varphi\end{bmatrix}, \quad (15)$$

onde os termos G_{33} e B_{33} correspondem aos elementos diagonais da matriz *H* e *N* calculadas na condição $V_2 = V_3 = 1$ p.u. e $\theta_2 = \theta_3 = 0$, vide a matriz de (2). Portanto, as aproximações consideradas são as mesmas feitas para um sistema não radial conforme em [6]. O algoritmo da versão BX é o mesmo do apresentado em [6], exceto que a na formação da matriz *B"* as diferenciais correspondentes à variável V_3, e que agora é um uma variável independente (especificada), são substituídas pelas diferenciais com relação à nova variável λ, ou seja, todos os elementos da coluna 3 são nulos a menos do elemento diagonal L_{22} que é igual a $[-K_q S_3 sen\varphi + (G_{33}/B_{33}) K_p S_3 \cos\varphi]$.

No caso de usar o ângulo da tensão da barra *3* (θ_3) como parâmetro a equação resulta:

$$\begin{bmatrix}\Delta P_2\\ \Delta P_3\\ \hline \Delta Q_2\\ \Delta Q_3\end{bmatrix}=\left[\begin{array}{cc|cc} -(b_{12}+b_{23}) & 0 & (g_{12}+g_{23}) & -g_{23}\\ b_{23} & -K_pS_3\cos\varphi & -g_{23} & g_{23}\\ \hline -(g_{12}+g_{23}) & 0 & -(b_{12}+b_{23}) & b_{23}\\ g_{23} & -K_qS_3\,sen\,\varphi & b_{23} & -b_{23}\end{array}\right]\begin{bmatrix}\Delta\theta_2\\ \Delta\lambda\\ \hline \Delta V_2\\ \Delta V_3\end{bmatrix}. \quad (16)$$

Analogamente, como no caso anterior pode-se obter a matriz *Heq*:

$$Heq=\begin{bmatrix}(1/x_{12}+1/x_{23}) & -K_qS_3\,sen\,\varphi((g_{12}/b_{12})-(g_{23}/b_{23}))\\ -1/x_{23} & -K_pS_3\cos\varphi-(g_{23}/b_{23})K_qS_3\,sen\,\varphi\end{bmatrix}, \quad (17)$$

a qual, nos casos em que a rede do sistema apresentar a relação *r/x* idêntica para todos as linhas, se reduz a:

$$Heq=\begin{bmatrix}(1/x_{12}+1/x_{23}) & 0\\ -1/x_{23} & -K_pS_3\cos\varphi-(G_{33}/B_{33})K_qS_3\,sen\,\varphi\end{bmatrix}, \quad (18)$$

onde os termos G_{33} e B_{33} correspondem aos elementos diagonais da matriz *H* e *N* calculadas na condição $V_2 = V_3 = 1$ p.u. e $\theta_2 = \theta_3 = 0$, vide a matriz da equação (2). O algoritmo da versão XB é o mesmo do apresentado em [6], exceto que a formação da matriz *B'* deve levar em conta a nova variável λ, ao invés de θ_3, e com isso, a correspondente coluna tem todos os seus elementos iguais a zero excetuando o elemento diagonal H_{22} que é igual a $[-K_p S_3 \cos\varphi - (G_{33}/B_{33}) K_q S_3 sen\varphi]$. Observe que da mesma forma que no caso do método de Newton [2], as curvas PV (*fp* = 1, isto é, $K_p = 1$ e $K_q = 0$, Figura 2(a) [2]) e QV (*fp* = 0, isto é, $K_p = 0$ e $K_q = 1$, Figura 2(b) [2]) passam a ser casos particulares da metodologia empregada para traçar a curva SV.

As Figuras 2 e 3 a seguir apresenta as curvas SV obtidas pelos métodos FCDR propostos considerando variações de potência aparente na barra *3*, para vários *fp*, isto é, várias relações entre K_p e K_q. Também são apresentados os números de iterações gatos para cada um dos casos. As curvas foram obtidas através de incrementos sucessivos de potência aparente na barra *3*. Também, encontram-se ilustrados nas figuras os casos particulares das Figuras 2(a) e 2(b) apresentadas em [2] .

A análise das expressões analíticas permitem o perfeito entendimento das dificuldades de convergência apresentadas pelos métodos numéricos. A extrapolação dos métodos de Newton e desacoplado rápido, para variações de carga por todo o sistema, é feita a partir da parametrização por λ, usado na obtenção das curvas SV. Considera-se que a carga varia não em apenas uma única barra, mas por todo o sistema, e que a variação de potência ativa das cargas é assumida não somente pela barra *slack*, mas por todas as barras de geração disponíveis. O conjunto das equações do FC, em sua forma mais geral, apresentará a seguinte forma:

$$G(V,\theta,\lambda)=0, \quad (19)$$

a qual pode ser rescrita como:

$$\begin{aligned}&\lambda P^{esp}-P(V,\theta)=0 \quad \text{para barras } PQ \text{ e } PV\\ &\lambda Q^{esp}-Q(V,\theta)=0 \quad \text{para barras } PQ,\end{aligned} \quad (20)$$

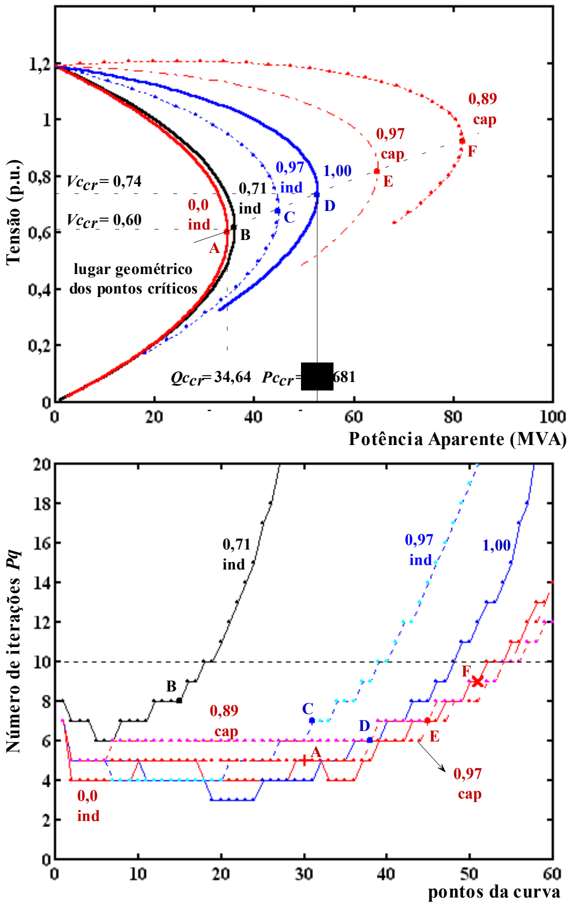

FIGURA 2
CURVAS SV PARA O SISTEMA DE TRÊS BARRAS DA FIGURA 1, UTILIZANDO V_3 COMO PARÂMETRO.

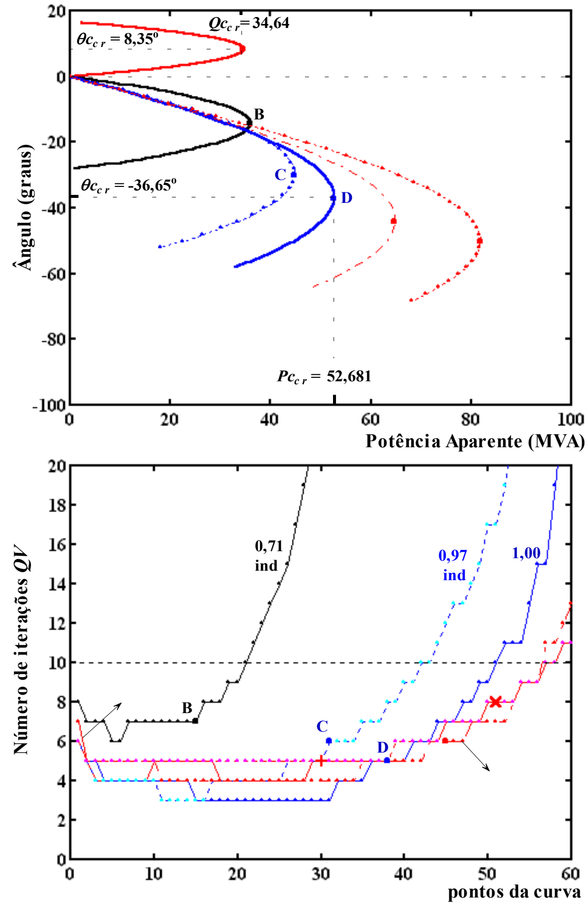

FIGURA 3
CURVAS SV PARA O SISTEMA DE TRÊS BARRAS DA FIGURA 1, UTILIZANDO θ_3 COMO PARÂMETRO.

onde $P^{esp} = P_g^{esp} - P_c^{esp}$ é a diferença entre as potências ativas gerada e consumida nas barras de carga (*PQ*) e de geração (*PV*), $Q^{esp} = Q_g^{esp} - Q_c^{esp}$ para as barras *PQ*, e λ = 1 corresponde ao carregamento do caso base. Na resolução de (20) usa-se ou o método de Newton ou o desacoplado rápido, de forma similar ao usado para as curvas SV.

CONCLUSÕES

Neste trabalho são apresentados e avaliados os métodos de Fluxo de Carga Desacoplado Rápido convencional e propostos, considerando as variações de cargas numa única barra. Estes métodos permitem o traçado completo das curvas PV através de simples modificações dos métodos convencionais de Newton [2] e FCDR [4]. Além disso, mantêm suas vantagens características. Dos resultados pode-se concluir que ambas as versões, BX e XB, do FCDR modificado são adequadas para o traçado completo da curva PV. Além disso, essas versões modificadas do FCDR também permitem obter soluções na parte inferior da curva PV, contradizendo a noção de que as versões desacopladas sempre fornecem as soluções da parte superior da curva PV.

Como conclusão geral comprova-se que todas as metodologias propostas para a solução de um sistema simples de 2 barras, conduzem à mesma curva de solução.

O LOGO COMO FERRAMENTA AUXILIAR NO DESENVOLVIMENTO DO RACIOCÍNIO LÓGICO – UM ESTUDO DE CASO

Scheila Wesley Martins[1] *and Luiz Henrique de Andrade Correia*[2]

Abstract - *This article describes an experiment carried out with the students of the first year of a computer science course using the LOGO Language as a support methodology for the development of a logical reasoning for computers programming. This is a interdisplinar proposal of integration of Mathematics and Algorithms.*

Index Terms - LOGO, logical reasoning, programming.

Resumo - Este artigo apresenta um experimento realizado com os alunos do primeiro ano do curso de Ciência da Computação empregando a Linguagem LOGO como metodologia de apoio ao desenvolvimento do raciocínio lógico para programação em uma proposta de integração de conteúdos das disciplinas de Matemática e Algoritmos na forma de um projeto de contexto interdisciplinar.

Palavras-Chave: LOGO, raciocínio lógico, programação.

1. Introdução

O problema da compreensão e aplicação da lógica é muito comum nas disciplinas de programação e bem conhecido nas graduações dos cursos de informática e computação [02][06]. Não raro essa grande dificuldade apresentada pelos alunos é uma das maiores causas das reprovações e desistências no decorrer do curso, seja em instituições de ensino públicas ou privadas. É uma dificuldade que se apresenta já nas primeiras atividades das disciplinas de Matemática, Álgebra e, principalmente, Algoritmos.

Quando não solucionada a tempo traz prejuízos imensos aos discentes e docentes da instituição no cumprimento dos programas disciplinares do curso, tornando morosa a formação acadêmica do aluno e muitas vezes incompatível com o nível de atividades práticas e intelectuais que lhe serão exigidas ao longo da graduação.

Essa deficiência tem sido verificada pelos professores nas cinco turmas que ingressaram no curso de graduação em Ciência da Computação das Faculdades Integradas de Rondonópolis – FAIR. Assim a instituição optou por oferecer aos ingressos do último concurso vestibular de 2002 um curso de extensão de Matemática Básica [13]. Baseado em projetos que auxiliem a minimizar deficiências de formação [04][07] a exemplo do curso de extensão, a linguagem de programação LOGO foi oferecida, na forma de um experimento com atividades em laboratório sob acompanhamento dos professores de Matemática e Algoritmos, como mais uma alternativa para buscar solucionar os problemas e as deficiências no desenvolvimento e na aplicação da lógica para programação.

A intenção do trabalho foi realizar um experimento no laboratório de informática, observando a reação dos alunos do primeiro ano do curso utilizando a linguagem de programação LOGO, que possui características pedagógicas reconhecidas, como ferramenta no desenvolvimento da lógica matemática e da sistematização do raciocínio na abstração e resolução de problemas de pequena complexidade. O trabalho teve ainda como objetivo demonstrar a possibilidade de empreender um projeto interdisciplinar a partir do uso da linguagem LOGO. Foi utilizado o ambiente de programação SuperLOGO 3.0 por ser uma distribuição livre da linguagem e pelos recursos do ambiente que favorecem sua utilização em projetos de outras disciplinas como Estruturas de Dados e Inteligência Artificial.

Como os alunos em questão já estavam fazendo uma recuperação do programa de matemática do ensino médio, foram utilizados alguns conteúdos de geometria e uma revisão em paralelo dos conteúdos já abordados pela disciplina regular de Algoritmos da graduação.

A análise dos resultados obtidos com esse experimento em conjunto com os professores das referidas disciplinas, estes foram considerados satisfatórios, possibilitando a implementação do SuperLOGO 3.0 como metodologia auxiliar para promover atividades de interdisciplinariedade, a priori, entre os conteúdos das disciplinas de Algoritmos e

[1] Scheila Wesley Martins, Faculdades Integradas Cândido Rondon – UNIRONDON, Av. Beira Rio, 3001, 78.065-780, Cuiabá, MT, Brasil, swrs@terra.com.br, aluna do curso de Especialização em Informática em Educação - FAEPE/UFLA.

[2] Luiz Henrique de Andrade Correia, Universidade Federal de Lavras – UFLA, Campus Universitário Cx. Postal 37, 37200-000, Lavras, MG, Brasil, lcorreia@ufla.br, orientador e professor da disciplina Computador Tutelado do curso de Especialização em Informática em Educação – FAEPE/UFLATEC.

Matemática na graduação do curso de Ciência da Computação.

Entre os aspectos da avaliação da ferramenta SuperLOGO3.0, que a metodologia proposta esperava observar, podemos destacar as seguintes:

- Verificação de evidências na melhora do desenvolvimento e do aprimoramento do raciocínio lógico e matemático dos alunos;
- Possibilitar uma dinamização do contexto da recuperação dos conteúdos de Matemática do ensino médio e, de Algoritmos, como revisão e fixação de conceitos introdutórios;
- Verificação de evidências na melhora do desenvolvimento da capacidade de abstração de problemas e na sistematização do raciocínio das soluções desses problemas;
- Possibilitar uma introdução menos traumática do aluno iniciante e inexperiente a um ambiente de programação;
- Verificação de uma melhora na recuperação e nivelamento dos alunos com deficiências nas disciplinas de Algoritmos e Matemáticas na graduação em Ciência da Computação;

Durante as seções que seguem serão descritas com maiores detalhes o modelo aplicado no experimento, as características que levaram a escolha da linguagem LOGO para composição da metodologia, bem como os resultados observados e as considerações finais sobre o experimento realizado.

2. Metodologia

Durante os meses de abril e maio de 2002, foram feitas reuniões para delinear as formas de aplicar a ferramenta SuperLOGO 3.0 a partir da avaliação de estudos similares como os descritos em [02] adequando a metodologia e o modelo do projeto executado à realidade da instituição, de maneira a maximizar os resultados da recuperação dos alunos nos conteúdos do curso de extensão de Matemática Básica, dinamizando e otimizando essa recuperação pela revisão em paralelo dos conteúdos introdutórios de Algoritmos e de Matemática e promover uma atividade de caráter interdisciplinar entre os conteúdos abordados.

Foi tomado o cuidado de esclarecer que, embora todos os docentes estivessem empolgados com as perspectivas positivas do experimento, era preciso reduzir um pouco essas expectativas devido a diferenças eminentes nos projetos, levando em consideração a qualidade do público alvo, os objetivos propostos e a forma de desenvolvimento das atividades.

Durante esse período foram envidadas atividades individuais de análise da Linguagem LOGO e de experimentação da ferramenta SuperLOGO3.0 pelos docentes [01][03] e realizada a confecção de listas de exercícios, bem como a preparação das instalações do laboratório de informática e a formalização de um convite aos alunos para que participassem do experimento.

As listas de exercícios preparadas não continham apenas os exercícios, também traziam especificados os objetivos e os conhecimentos a serem gerados, numa forma de indicar ao aluno que o que estava sendo realizado, embora a primeira vista pudesse parecer trivial, não era uma brincadeira sem sentido. Haviam vários conhecimentos implícitos como elaboração de fórmulas, uso de variáveis e contastes e uso de estruturas de controle a cada atividade apresentada.

Dessa forma foram elaboradas três listas de exercícios a serem aplicadas, cujos os conteúdos abordavam respectivamente: reforço da capacidade de abstração para a confecção de algoritmos, movimentação pelo plano cartesiano, rotinas para construção e manipulação de polígonos básicos e noções de geometria; uso de estruturas de controle e escrita de procedimentos.

Uma das exigências da instituição para viabilizar a execução do experimento era justamente que não houvesse a necessidade de aquisição de nenhum equipamento ou programa que implicasse em custo adicional, procurando fazer uso de material já disponível. Assim sendo, a ferramenta utilizada e que implementaria a linguagem LOGO em um ambiente de programação bastante acessível do ponto de vista didático-pedagógico, uma vez que integra sabiamente módulos de desenvolvimento dos canais visual, auditivo e textual foi o SuperLOGO3.0, ambiente traduzido e disponibilizado pelo Núcleo de Informática Aplicada a Educação – NIED/UNICAMP, que tem como característica ser um software de distribuição livre.

Em uma primeira análise foi possível lançar mão de uma ferramenta como a linguagem de programação LOGO para diminuir as dificuldades encontradas por professores e, principalmente, por alunos em relação a lógica, tal como foi realizado em [02], porque ela trás muitas vantagens. Para os docentes permite uma maior dinamização no contexto dos conteúdos a serem abordados, facilitando o processo de nivelamento e recuperação dos alunos com deficiência nas áreas de matemática, lógica e algoritmos em função da simplicidade com a qual exercícios podem ser implementados nessa ferramenta e, por viabilizar a aplicação de um modelo interdisciplinar e/ou multidisciplinar da construção do conhecimento. O docente teria uma forma de estruturar com maior eficiência medidas adicionais ou corretivas de reger o processo de recuperação do aluno [10].

Por outro lado, o LOGO proporcionaria ao discente uma metodologia que acrescentaria a este medidas alternativas de aprendizagem. Pelas características próprias de trabalho da linguagem, o aluno poderia evoluir mais efetivamente no processo de construção do seu conhecimento, em seu próprio ritmo, desenvolvendo e aperfeiçoando sua capacidade de abstração pela verificação do erro sob uma outra perspectiva [11].

É nesse sentido que o aluno com dificuldades no aprendizado das disciplinas pode sair ganhando em tomar contato primeiramente com uma linguagem como o LOGO que notoriamente favorece a construção e o exercício do raciocínio lógico. Suas características permitem ainda que o aluno vá além e se exercite na elaboração de rotinas de programação que trazem também um contato prévio com um ambiente de programação. Porém nesse ambiente a ocorrência do erro é menos traumática e mais saudável por possibilitar a promoção de conhecimentos gradualmente. O aluno passa a ser um agente mais ativo na recuperação de suas deficiências e falhas.

Na próxima seção serão apresentados detalhes sobre do experimento.

3. O Experimento

O ambiente SuperLOGO 3.0 foi apresentado aos alunos paulatinamente, ao longo de 08 horas de atividades, divididas em 05 aulas de aproximadamente 01h 30min de duração. As atividades no laboratório se realizaram duas vezes por semana em horário anterior ao início das aulas regulares, a partir das 17h 30 min indo até as 18h 50min.

As listas de exercícios abrangendo considerações sobre comandos do ambiente e os conteúdos de geometria associados aos conceitos básicos da construção de algoritmos foram resolvidas pelos discentes a cada aula e, ao final do curso, um pequeno projeto individual foi implementado e entregue para avaliação.

A resolução das listas de exercícios foi efetuada sob acompanhamento dos professores das duas disciplinas que observaram a reação dos alunos durante essas atividades e durante as atividades em sala de aula das disciplinas de Matemática e Algoritmos. Foram elementos muito observados pelos professores: comportamento dos alunos com relação a fixação dos conteúdos apresentados no experimento e os apresentados em sala de aula, as dificuldades apresentadas no ambiente SuperLOGO 3.0 e nos exercícios das listas, bem como o desempenho por eles demonstrado nas disciplinas da graduação.

Ao final de cada atividade no laboratório era realizada uma verificação informal junto aos alunos questionando-os sobre as atividades desenvolvidas no dia e uma identificação das perspectivas destes em relação ao curso como um todo.

Todos esses elementos eram alvos de análise e discussão entre os professores ao final de cada atividade no laboratório e ao final do experimento, a razão de verificar a eficácia da ferramenta nos objetivos específicos propostos.

Em função de não se tratar de um curso de extensão nos moldes definidos pela instituição e, dada a capacidade das instalações utilizadas não suportarem o total de alunos do primeiro ano, pois comportavam apenas vinte máquinas, e estes foram convidados pelos professores a freqüentar o curso. A intenção era ter um aluno por máquina para melhor observar suas reações. Todos os participantes estavam cientes de que a presença não era obrigatória e que a participação no experimento não implicava na distribuição de pontos de bonificação para qualquer das disciplinas de Algoritmos ou Matemática.

A seguir são apresentados os resultados obtidos com a realização do experimento.

4. Resultados

As atividades começaram a ser realizadas com um número de participantes bastante razoável nas primeiras aulas. Na segunda aula, por exemplo, o número de participantes foi bastante elevado, sendo necessário a acomodação de dois alunos por máquina, o que foi constatado como em [02] não muito produtivo, uma vez que a operação da máquina ficava delegada, quase sempre, a apenas um dos alunos da dupla. Ocasionalmente, alunos em dupla se envolviam em tal nível com a atividade que dois comportamentos eram notados: ou eles se integravam na busca pela solução do exercício, ou acabavam discordando a tal ponto que torna-se necessário a separação da dupla e a realocação dos alunos em nova composição de parceria.

A partir da terceira aula, um problema de ordem médica obrigou um dos professores ao afastamento por aproximadamente uma semana, provocando a suspensão das atividades por esse período. Ao retorno, na semana seguinte, notou-se uma redução expressiva no número de participantes.

Observou-se também que o horário escolhido para a realização das atividades, antes do início das aulas, acabou por tornar-se inconveniente. Foi constatada uma sobrecarga de atividades nos alunos devido ao término das aulas do curso de extensão de Matemática Básica e, também, devido a proximidade da semana de provas bimestrais.

Ficou constatado que poucos alunos do total esperado estavam participando e, destes, apenas uma parcela reduzidíssima dos que iniciaram as atividades chegaram efetivamente ao final do experimento. Além do percentual de participação dos alunos ter sido bastante reduzido, também pudemos observar que os alunos não exploraram todo o seu potencial criativo durante as atividades, limitando-se a resolução dos exercícios e prendendo-se aos temas já apresentados.

Apesar da presença não ser obrigatória, de qualquer forma, todas as aulas tiveram listas de freqüência para acompanhamento dos níveis de participação e evasão como especificados na tabela abaixo:

TABELA I
Índice de Participação dos Alunos.

	N º DE PRESENTES	(%)*
Aula 1	15	23
Aula 2	21	37
Aula 3	08	12,7
Aula 4	08	12,7
Aula 5	05	7,7

O fato das atividades não oferecerem algum tipo de bonificação e, devido ao reduzido número de alunos que

* Calculado em relação ao total de alunos matriculados no primeiro ano.

entregaram de fato os trabalhos, a avaliação destes foi realizada de maneira conceitual, levando em consideração a criatividade e a perícia do aluno em solucionar o problema a partir do tema proposto para o projeto, pois não se tratava de um curso formal do currículo, e isso pode ter também contribuído para a falta de participação dos alunos e para que a evasão ocorresse.

Em termos de programação LOGO, os resultados corresponderam razoavelmente ao nível que se esperava na metodologia. O desenvolvimento das atividades demonstraram uma reação positiva quanto a metodologia e a ferramenta SuperLOGO3.0, porém existe uma necessidade maior de tempo e um número maior de atividades para que os alunos cheguem a um nível onde os recursos do ambiente tais como a técnicas de recursão e o trabalho com vetores, listas e arquivos possam ser explorados com maior abrangência. Contudo foi possível perceber entre os alunos que realizaram o experimento até o final, mudanças comportamentais interessantes.

Em primeiro lugar, uma das mudanças mais evidentes foi a apresentação de uma reação mais pró-ativa dos alunos em relação as atividades sugeridas pelas disciplinas regulares do curso. De um modo geral, foi notada uma postura menos reativa às exigências decorrentes dos problemas aplicados em sala de aula, pois estes passaram de problemas "impossíveis de resolver" para problemas "difíceis de resolver" na perspectiva desses alunos. No âmbito específico da disciplina de Algoritmos, percebeu-se uma melhora na atitude desses alunos que passaram a ser mais dedicados e menos propensos a desistência, mesmo que o resultado em termos de nota não tenha correspondido ao esperado pelo aluno.

Em segundo lugar, observou-se que esses alunos começam a encarar o trabalho com o computador de maneira diferente. Estavam mais conscientes de que a atividade de programar necessita da compreensão da natureza e especificações dos problemas, para poderem então solucioná-los, e da habilidade de raciocinar e aplicar a lógica, isto é, a solução computacional começa no programador e não na máquina.

Embora persista a atitude, muito comum nos alunos, de associar à máquina qualidades humanas, onde ela deveria apresentar uma postura mais "colaborativa" no sentido de efetuar as correções necessárias para que os programas e comandos se executem de maneira correta, percebeu-se que esse atitude vem sendo substituída por uma maior racionalidade do aluno com relação as suas atribuições enquanto programador.

Por fim, notou-se que as dificuldades desses alunos com relação a compreensão e emprego dos conceitos básicos da construção de algoritmos tais como a utilização de variáveis, constantes, estruturas de repetição, o trabalho com ângulos, implementação e desenvolvimento de funções matemáticas e a visão espacial foram bastante minimizadas.

Ao final dos trabalhos, devido aos imprevistos decorrentes por nos encontrarmos dentro do período de provas bimestrais, foi realizada uma avaliação verbal com questionamentos sobre as expectativas e impressões dos alunos e pudemos observar uma empatia tanto com relação a ferramenta SuperLOGO 3.0 quanto com a metodologia aplicada.

5. Conclusão

As razões que levam a presença dessa dificuldade na aplicação da lógica na programação nos cursos de graduação de informática podem remeter a alguns fatores críticos pelos quais passam o ensino nacional. Um desses fatores está fundamentado nas deficiências de formação observadas no ensino médio e fundamental, trazida a tona a partir da necessidade dos governos de instaurar e participar de exames de avaliação das qualidades de ensino de âmbito nacional e internacional. Dois exemplos claros dessa prática é a realização do ENEM e do PISA.

O ENEM (Exame Nacional do Ensino Médio) [13], instituído pelo Ministério da Educação e realizado anualmente a partir de 1998, com adesão facultativa dos alunos que estão concluindo ou já concluíram o ensino médio no país, com o objetivo de verificar o desempenho do aluno ao término da escolaridade básica (ensino fundamental e médio), visando aferir o desenvolvimento das competências e habilidades necessárias ao exercício pleno da cidadania.

O PISA (Programa Internacional de Avaliação de Alunos)[12], desenvolvido e coordenado internacionalmente pela Organização para Cooperação e Desenvolvimento Econômico (OCDE), que é realizado de três em três anos a partir de 2000 com a adesão do Brasil e de outros 35 países é um programa de avaliação comparada e tem por finalidade avaliar o desempenho de alunos a partir de 15 anos de idade, produzindo indicadores sobre a efetividade dos sistemas educacionais dos países participantes.

A análise dos últimos resultados observados nessas provas de qualificação bem como os resultados dos próprios vestibulares de várias universidades do país sugerem que o ensino de segundo grau, não só mas principalmente no Brasil, não vem atingindo com efeito o seu objetivo na formação intelectual do jovem, demonstrando um número cada vez maior de estudantes ingressando, ou tentando ingressar, no ensino universitário despreparados, sem os conhecimentos básicos necessários e bem fundamentados, além de competências fundamentais pouco ou pobremente desenvolvidas. E não estamos falando apenas das deficiências de conhecimento de conteúdos e da aplicação do raciocínio lógico, incluímos também nessa lista aquelas deficiências que decorrem da dificuldade na concatenação de idéias e da construção do pensamento crítico.

Outro fator que temos observado contribuir para o número de desistentes dos primeiros anos de graduação tem haver com o desconhecimento, por parte dos vestibulandos, das características e do perfil de aluno que os cursos da área de computação e informática exigem. Muitas vezes o estudante não tem a mínima idéia do que vai encontrar na graduação e, não é de admirar que ao se deparar com as perspectivas do curso opte por deixá-lo, especialmente se sua expectativa quanto ao currículo não condiz com o seu perfil.

Também não podemos deixar de indicar como fator importante, que deva ser considerado, o formato dos processos de seleção executados bem como a qualidade da clientela atendida pelas instituições que oferecem cursos de graduação em informática e computação.

Todos esses fatores tem particularidades que, em conjunto, contribuem para o cenário de deficiências apresentado pelas graduações em informática e, em separado, são passíveis de produzirem discussões mais abrangentes sobre suas causas e efeitos.

Contudo, o problema do raciocínio lógico, pelo que se tem observado, não é um problema isolado desse ou daquele tipo de instituição e, esforços tem sido despendidos em estratégias de nivelamento e recuperação na grande maioria dos cursos de computação do país, talvez devido a não ser comum nas graduações a inclusão, em seus currículos, de disciplinas introdutórias que focalizem formas de melhor explorar os métodos de solução de problemas. Essa é uma habilidade extremamente necessária a formação e ao bom desempenho do discente durante o curso.

Estudos recentes indicam que os índices de reprovação e desistências nos primeiros anos dos cursos de graduação em informática e computação têm sido muito elevados, motivando uma série de preocupações e discussões entre professores e coordenadores [06]. A conclusão a que se tem chegado para justificar esses índices é simples: as características de um aluno de graduação em informática passam, indubitavelmente, pela capacidade deste de abstrair, organizar e aplicar a lógica.

Programar, aprender a programar e, principalmente, ensinar a programar não são atividades fáceis de realizar. Para uma parcela pequena da população de discentes dos cursos de computação e informática programar, ou melhor, solucionar problemas utilizando linguagens de programação com consciência científica e metodológica do que é programar[08], seja talvez uma habilidade natural mas para a grande maioria essa consciência da natureza dessa atividade e da habilidade de abstração no uso de uma ferramenta de programação não está clara. É preciso esforço e paciência, do docente e do discente, envolvidos no processo da análise e compreensão da natureza dos problemas, no levantamento de seus requisitos, na elaboração e refinamento das idéias que possibilitarão chegar a solução e, principalmente, é preciso obedecer o ritmo de cada um no desenvolvimento dessas competências. Quando todo esse processo não faz parte da natureza ou não está totalmente claro para o indivíduo é preciso construir essa perspectiva dentro dele. Talvez esse seja o maior problema relacionado ao ensino de programação.

Embora, erroneamente, o LOGO seja associado por alunos e professores ao ensino infantil e fundamental, alguns trabalhos [02][09] provam sua viabilidade e aplicabilidade no ensino superior. Por ser uma ferramenta de características reconhecidas no desenvolvimento de múltiplas habilidades de conhecimento, suas várias versões cobrem do ensino de crianças até o de adultos, e tem sido empregado com sucesso em projetos que vão da alfabetização até o aprendizado de noções de física e matemática, sendo uma ótima alternativa ao propósito da lógica de programação.

É sabido que muitas vezes o aluno que apresenta deficiência de conteúdo se sente inferiorizado em não se adequando ao ritmo e evolução dos conteúdos em sala de aula ministrados, utilizando o modelo tradicional de ensino de programação a partir do paradigma imperativo. Como na graduação em computação, toda a evolução do aluno dentro do curso vai ser baseada na qualidade com que seus conhecimentos na disciplina de Algoritmos sejam bem absorvidos e, como esta disciplina requisita em quase sua totalidade conhecimentos matemáticos fortemente esclarecidos e ampliados, não é difícil observar porque os rendimentos nas duas disciplinas, Algoritmos e Matemática, é muitas vezes sofrível. E, não raro, no caso de Algoritmos venham a ser desastrosos, pois leva ao aluno a um desânimo contundente, o que resulta em um número muito elevado de reprovações e, consequentemente, em desistências.

Desde a muito tempo vêm sendo apresentados a comunidade acadêmica pesquisas direcionadas a amenizar a problemática do emprego da lógica no ensino da programação. Muitas pesquisas, com especial atenção a atividade de programar, especificam novas metodologias de ensino atentando para o fato de que o ensino de programação envolve muito mais que o domínio de uma ferramenta ou linguagem.

O domínio da ferramenta de programação só poderia ser devidamente iniciado quando a capacidade de abstração e o exercício do raciocínio estiverem devidamente fundamentados no aluno. O aluno já deveria ingressar no curso com total domínio para exercer essa capacidade de abstração e exercício da lógica, como herança desenvolvida no ensino fundamental, porém os resultados das provas qualitativas, como o ENEM, e dos vestibulares comprovam que em muitos casos essa competência ou não foi desenvolvida ou o foi muito precariamente.

O surgimento de novas metodologias no ensino de programação que levam em consideração as deficiências de formação estão se popularizando e sendo reconhecidas como medidas do mais alto nível na construção do conhecimento, pela adoção de abordagens que levam em consideração estratégias e formas de promover e capacitar o aluno a solucionar problemas adequadamente. Solucionar problemas adequadamente é raciocinar adequadamente.

Muitos autores [02][05][06][08] propõe o emprego de novas metodologias e ferramentas de auxílio ao ensino da programação, incluindo em seus estudos algumas sugestões interessantes, como a aplicação do paradigma de programação declarativo pelo emprego de ferramentas da Programação Funcional, inclusive o LOGO. O modelo tradicional de ensino de programação pelo paradigma imperativo é mantido, mas em virtude de atender a necessidade de melhorar ou desenvolver no aluno a capacidade de solucionar problemas, a programação funcional é introduzida primeiro, com o objetivo de promover um nivelamento tornando o paradigma imperativo menos traumatizante e o aluno menos propenso a desistência.

Analisando as perspectivas iniciais do experimento e comparando os resultados obtidos podemos concluir que o experimento obteve um resultado positivo em relação aos objetivos propostos pela metodologia, apesar dos problemas decorridos durante as atividades, entre os quais podemos destacar a evasão dos alunos.

Ao que parece essa evasão pode ter sido ocasionada em função do período de aplicação do experimento não ter sido o mais propício, pois os alunos se encontravam sobrecarregados pelo curso de extensão e a proximidade da semana de provas bimestrais; e, também favorecida pelo afastamento ocorrido durante o inicio dos trabalhos, que acabaram por quebrar o ritmo das atividades e obrigaram a alterações e adequações constantes na metodologia empregada.

Verificou-se que muitos alunos não estavam totalmente conscientes dos vários conceitos computacionais explorados durante a realização dos exercícios, deixando a desejar no que tange ao aprimoramento e recuperação de suas deficiências. Uma das grandes características da linguagem LOGO é possibilitar ao aluno estar mais ativo no processo ensino-aprendizagem imprimindo nesse processo o seu ritmo de absorção de conteúdo e transformação deste em conhecimento.

No entanto, uma grande maioria se aproximou do experimento movido mais pela curiosidade, como pode-se observar na tabela de freqüência de aulas, sendo que alguns chegaram a entrar no laboratório pela primeira vez na última aula para "ver", e não encararam a ferramenta com a devida seriedade, confirmando o pré-conceito de que ela estaria única e exclusivamente relacionada ao ensino infantil, deixando alguns, por esse motivo, de freqüentar as atividades.

Para os professores envolvidos no projeto, apesar da evasão ocorrida durante o experimento, uma certa melhora no nível e atitude dos alunos foi realmente percebida, por um posicionamento mais ativo e mais consciente do quão importantes são as atividades de recuperação no aprimoramento e desenvolvimento de sua formação, e, espera-se que o experimento tenha contribuído para facilitar aos alunos a introdução de um ambiente de programação imperativo como a Linguagem Pascal.

Entretanto foi consenso entre eles de que para uma melhor análise quanto a eficácia da metodologia seria melhor que esta fosse readequada e ampliada em alguns aspectos, de modo que ela pudesse ser reaplicada em um período menos conturbado no terceiro ou quarto bimestre senão no próximo ano. Entre as alterações discutidas foram especificadas:

- Ampliar o conteúdo das listas de exercícios para abranger além de geometria e conceitos básicos de algoritmos, explorar mais conteúdos de Matemática, de Algoritmos e recursos da ferramenta SuperLOGO 3.0;
- Ampliar da carga horária de 08 para 40 horas, configurando ao experimento características de um projeto educacional na modalidade de curso de extensão tal como o de Matemática Básica;
- Incluir nas atividades exercícios que possibilitem a correlação entre o ambiente de programação LOGO e sua implementação na linguagem Pascal;
- Especificar um índice de bonificação das atividades efetuadas durante o curso para incentivar e aumentar o índice de participação dos alunos;

Para os alunos que participaram do experimento até o final, as impressões foram bastante positivas e ultrapassaram as expectativas, pela intenção declarada destes em participarem novamente do experimento se este fosse realizado no segundo semestre.

A boa impressão indicada por alunos e professores sobre a ferramenta SuperLOGO 3.0 reforça a certeza de que o experimento chegou a resultados positivos quanto a aplicabilidade do LOGO como ferramenta para promoção de projetos de interdisciplinaridade, não apenas aplicada ao caso da lógica de programação como também na possibilidade de aplicação em conhecimentos mais avançados tratados por outras disciplinas como Linguagem de Programação e Inteligência Artificial.

De um modo geral a proposta de desenvolver atividades com caráter interdisciplinar dos conteúdos das disciplinas de Algoritmos e Matemática aplicando a ferramenta SuperLOGO 3.0 foi alcançada e, o presente trabalho trouxe resultados que contribuirão para que esse projeto seja efetivado na instituição.

ESTANDES - A COMUNICAÇÃO VISUAL GERADORA DE NEGÓCIOS EM EXPOSIÇÕESINDUSTRIAIS

(Mercado Business to Business)

Prof. Luiz Carlos Ferreira Martins Corrêa

Resumo

A comunicação visual como ferramenta geradora de negócios insere-se numa discussão muito atual sobre a revolução estética em nossa sociedade. Diversos são os aspectos que sua denominação abrange. E neste estudo, que aborda um mercado essencialmente técnico, algumas destas denominações serão mostradas. Acreditamos que neste mercado técnico e de relacionamentos fechados, as exposições industriais abriram um grande espaço para transformar seus maquinários em peças atrativas e modernas. Estes contrastes são apresentados em espaços denominados estandes, que são elaborados para expor uma imagem que, na verdade, é o reflexo da própria empresa.

Neste estudo, avalia-se a eficácia da comunicação visual dos estandes em exposições industriais (mercado business to business), como fator de influência na geração de negócios.

Palavras-chave

1. Estandes 2. Exposição Industrial 3. Comunicação Visual

Por que a imagem estabelecida pelas empresas em eventos industriais, através de seus estandes, podem gerar negócios? Até que ponto a linguagem visual encanta o target de exposições industriais?

Este trabalho visa avaliar a comunicação visual praticada por empresas no mercado *business to business*, através de estandes em exposição industrial, como a real fonte geradora de negócios. Apresentando o significativo relacionamento visual das empresas, em um segmento – industrial – onde o relacionamento é extremamente técnico.

A comunicação visual dos estandes influencia consumidores industriais na geração de negócios no período posterior a exposição, fixando esta imagem até o próximo evento, que ocorre anualmente. Isto é, o comprador ao visitar a exposição depara com uma realidade visual muito agressiva, ou seja, tem um impacto visual imediato muito forte devido às diversas formas e apelos visuais e à medida que percorre a feira sente-se mais atraído por alguns destes apelos visuais. Sendo assim, as nuances estéticas que diferenciam os projetos de estandes influenciam o comprador a estabelecer um contato com a empresa naquele instante da feira, no momento de opção para fornecimento e também na decisão do negócio, que ocorre em sua maioria no período posterior à exposição.

Mercado e Marketing - conceituações

Para definirmos *marketing* é fundamental explicarmos que sua prática é datada de milhares de anos, contudo só se concretizou na segunda metade do século XX. Sua incompreensão no significado ainda é grande, pois sua prática interfere diretamente em todos os segmentos do mercado, não havendo espaço para fundamentações teóricas a respeito.

O que é mercado *business to business*?

Denominado no Brasil de mercado empresarial, industrial ou organizacional, é a prática de empresas de vender bens ou serviços a outras empresas e é formado por uma variedade de diferentes compradores comerciais e institucionais. Desenvolveu-se extraordinariamente, a partir da década de 50 quando as empresas de bens de consumo adotaram uma orientação para marketing. O marketing começou a dominar as operações de

eficiência da produção, para melhor atender às exigências do consumidor. Nas indústrias de base tecnológica, o desenvolvimento de novos produtos tornou-se uma atividade importante. O direcionamento do foco sobre os mercados e os produtos dominou a preocupação com o potencial dos lucros futuros. Alguns aspectos, com o decorrer do tempo (principalmente nos anos 70 e 80) foram observados neste mercado, como a passagem gradativa da produção de bens para a economia de serviços, a distinção da classe de profissionais e de técnicos, a gestão do desenvolvimento técnico e o controle normativo da tecnologia, o foco na tecnologia intelectual. Aspectos que definem a passagem da sociedade industrial para a pós-industrial.
O mercado industrial, em face da emergência de mercados mundiais, alargou o seu enfoque sobre os tradicionais mercados industriais para os mercados mais amplos de negócios a negócios.

A orientação para o marketing ou conceito de marketing é uma filosofia de negócios segundo a qual vendas lucrativas e retornos satisfatórios serão alcançados quando da adequação de produtos ou serviços às necessidades e desejos dos consumidores, por parte da empresa. A prática, e até mesmo o reconhecimento desta filosofia, ainda está distante de ser aquilo de que a sociedade necessita. Grande parte das empresas ainda se orienta no posicionamento de seus produtos e serviços, deixando de lado a evolutiva orientação para o marketing societal.

Na sociedade pós-industrial, onde tecnologia intelectual é fator de diferenciação, as empresas passam a atuar com ferramentas milenares, como a estética, para através de fundamentações técnicas, aliadas a aspectos sociais e psicológicos, estarem alcançando a tão cobiçada necessidade dos consumidores.

Nos dias atuais, nomenclaturas como "Dreamketing" ou marketing dos sonhos, postulam que para se diferenciar, as empresas devem interpretar e materializar os sonhos mais profundos dos clientes. Em um mercado onde empresa vende para empresa, é possível aplicar este conceito que já esta em uso no mercado de varejo.

Na verdade, não é uma tarefa fácil, porém deve-se interpretar que neste mercado produtos e serviços são um meio de estimular os desejos dos clientes. Uma nova aplicação para a máquina, um projeto diferenciado para a nova linha de produtos e assim por diante. E tudo isso deve ser vendido para o cliente, e de que forma? Como um sonho. Neste instante a estética, não só dos produtos, mas de suas embalagens e empresas, passam a ser um fator de diferenciação, pois fazem parte do sonho do cliente. Este processo estético pode ser avaliado em uma exposição industrial, onde formas e estruturas, texturas, cores, iluminação, paisagismo e produtos dão existência a uma empresa que é construída buscando atender aos sonhos de seus clientes. Tudo isso só pode ser compreendido se avaliarmos como a comunicação ocorre neste processo.

O processo de comunicação no mercado business to business

Indiscutivelmente, o desenvolvimento tecnológico de um produto, sua composição de custo competitivo e disponibilidade no mercado são aspectos relevantes, entretanto, se não possuirmos um plano de comunicação eficiente e eficaz com o mercado tendemos ao declínio. Na área de *marketing*, é costume citar que comunicação é o ponto final do processo estratégico. Na verdade, um modelo utilizado pelos profissionais da área de marketing estabelece que o processo de comunicação é a transmissão de uma mensagem de um emissor para um receptor, de modo que ambos entendam da mesma maneira

Neste estudo estabelecemos um novo parâmetro de avaliação do que denominamos "instalações", aqui representadas pelos estandes. Partimos do princípio que estes espaços, através de uma minuciosa preparação, criam um elo direto de identificação com o mercado consumidor, fazendo com que haja relações comerciais e sociais adequadas às partes.

Este circuito faz crer que estamos trabalhando com um modelo de diálogo, um fluxo de informação em duas direções. No livro Comunicação e Pesquisa, Lúcia Santaella, ressalta um modelo de comunicação circular, enfatizando que na sociedade pós-industrial com difusão da teoria de sistemas, que tem por objetivo pensar *"a globalidade, as interações dos elementos, mais do que a causalidade, apredendo a complexidade dos sistemas como conjuntos dinâmicos de relações múltiplas e cambiantes"* (A. e M. MATTELART, ibid.:62), associado ao crescimento acelerado dos mecanismos de comunicação, que trouxeram o conceito de retroalimentação de informações (feed-back), estabelecem parâmetros coerentes com o estudo que esta sendo desenvolvido. Todo este processo de comunicação circular, de uma empresa precisa ser planejado, o que auxilia a continuidade no processo de vendas.

As etapas para este desenvolvimento da comunicação são: a identificação do público-alvo, a determinação dos objetivos da comunicação, elaboração da mensagem, seleção dos canais de comunicação, estabelecimento do orçamento, o mix de comunicação, a mensuração dos resultados e gerenciamento do processo de comunicação integrada de marketing. Conforme a definição da American Association of Advertising Agencies, comunicação integrada de marketing é: *um conceito de planejamento de comunicação de marketing que reconhece o valor agregado de um plano abrangente que avalie os papéis estratégicos de uma série de disciplinas da comunicação – por exemplo, propaganda geral, reposta direta, promoção de vendas e relações públicas – e combine-as para oferecer clareza, coerência e impacto máximo nas comunicações por meio de mensagens discretas integradas de maneira coesa.*

No mercado industrial não é diferente, o plano de comunicação, através das estratégias e táticas de comunicação, é o momento de explicar como sua empresa será vista no mercado. Primeiro descobrindo a linguagem a ser adotada e depois os meios para que a mensagem atinja os clientes. Neste instante deve-se montar um conjunto de decisões relativas à comunicação, o qual se denomina de composto de promoção. Cujos os objetivos são:

- Informação – que aspectos da empresa / produtos devem ser levados ao conhecimento do cliente. Normalmente estes itens são extraídos dos planejamentos estratégicos das empresas, os quais são de responsabilidade da alta administração.

- Persuasão – direcionamento da mensagem e da imagem propostas pela empresa, para atingir o público-alvo.
- Lembrança – efeito desejado na persuasão.

No mercado industrial a "venda pessoal" é o principal instrumento, a "promoção e "publicidade" vêm em seguida e a propaganda auxilia o trabalho do vendedor.
Os profissionais de *marketing* desejam que os receptores de mensagens respondam comprando os produtos, serviços ou marcas oferecidas e, para obter este resultado, é necessário que a comunicação influencie os clientes de diversas maneiras.

Por estarmos trabalhando exposições industriais, a correlação estabelecida entre os objetivos da promoção industrial, o processo da adoção dos produtos e as tarefas do modelo AIDA (**A**tenção / **I**nteresse / **D**esejo / **A**ção) de McCarthy (Marketing-Rio: Campus, 1982), torna-se muito relevante pois a promoção é um fator chave para o cliente visualizar e decidir sobre o produto, que aliados as tarefas descritas geram o resultado desejado.

Atenção e **interesse**, são os primeiros pontos trabalhados pelos expositores em uma feira. Estabelecem a forma, definem as cores e tons, cercam-se de acessórios pertinentes ao evento e buscam o interesse do visitante. Com o cliente no estande demonstram sua experiência, através do atendimento técnico e social, da demonstração do produto, na busca de uma avaliação positiva.

Despertam o **desejo** do cliente que dentro deste processo já esta passível de decisões. Cabe à empresa direcionar este desejo para a ação, estabelecer os primeiros “acordes” de um processo de negociação, que em grande parte ocorre no período pós-feira, onde é confirmado o pedido. A **ação** é concretizada desde o momento primeiro do estande e confirmada pela lembrança, um dos objetivos promocionais. É o impacto da imagem causado durante o evento que tornará a empresa viva na mente do comprador e é exatamente o feed-back que este cliente dará a empresa que garantirá o sucesso deste processo, completando o ciclo deste modelo circular de comunicação.

É significativo neste processo, o posicionamento do cliente. Durante a exposição ele recebe uma carga muito grande de informações e códigos visuais. Para alguns, a reação é imediata, demonstrando preferência por estar em um espaço (empresa) específico. Porém, a maior fatia destes clientes, vivência o momento do evento, recebendo os estímulos visuais e somente ao retornar para seu ambiente de trabalho, passam a fazer ponderações sobre o que viram. E na maioria das vezes, não conseguem definir exatamente a codificação destes estímulos, porém sabem que foram impactados. A partir daí, é possível selecionar o fornecedor a ser procurado no momento da cotação. Isto ocorre, exatamente entre uma exposição e outra. Por outro lado, a empresa expositora parte neste mesmo período, para a manutenção da imagem formada junto ao cliente. Fazendo visitas ou simplesmente mantendo um contato, sempre utilizando o referencial “estande”. Sendo assim, neste modelo circular o feed-back é a ferramenta chave na comprovação do efeito causado no cliente e avaliado pelas empresas.

Todas as atividades estratégicas da empresa são planejadas pelo marketing, afim de que a mesma ingresse em uma exposição industrial adequadamente. Em razão disto, nasce uma comunicação visual que, através da união de aspectos estéticos, estabelece um vínculo com o mercado, capaz de fixar esta imagem na mente do consumidor e ser influenciadora de negócios.

Planejamento – A base

Após a Segunda Guerra Mundial houve uma grande expansão econômica e as mudanças ocorridas foram o foco de diversos estudos. Na essência nascia uma sociedade industrial mais rica e num processo contínuo de evolução, uma forma mais avançada da sociedade industrial. Alguns fatores marcaram este novo período: o dinamismo tecnológico; o emprego maciço de capital; a combinação de conhecimento, competência e especialização; e organização eficiente (empresa planejada). A especificidade das ações e a instabilidade dos mercados estabelecem uma das principais atividades estratégicas do novo sistema industrial, o **planejamento**, que é a determinação dos objetivos ou metas de um empreendimento, como também da coordenação de meios e recursos para atingi-los.

O sucesso das empresas depende em grande parte da eficiência dessa atividade, pois, aliado à ascensão da capacitação e competência dos profissionais, se tornou a prerrogativa de quem detém ou controla o fator estratégico da produção. O planejamento delimita e norteia a atividade de marketing, que deve ser compreendida através das diferentes “gerações” passadas por este processo.

A busca e manutenção da imagem são as grandes metas das empresas, no mercado atual. E trabalham com planejamento para alcançá-la. Este planejamento define estratégias de *marketing* que atinjam seus objetivos, satisfazendo as necessidades dos clientes.

Exposições industriais

Ao afirma-se que a imagem da empresa é estabelecida por um plano de marketing e dele origina-se toda a estratégia de comunicação, podemos destacar que o trabalho de promoção por meio de exposições é uma das principais ferramentas no mercado industrial.

Para validarmos esta afirmação devemos ressaltamos que a prática de comércio em feiras é datada dos primórdios da humanidade, quando exerciam atividades de trocas, ainda sem o uso da moeda. O aprimoramento levou ao surgimento de lojas e em seguida de grandes conglomerados comerciais, aonde era possível adquirir os mais diversos produtos, como ocorria nos mercados do Império Romano. Com a decadência do mesmo, as lojas desapareceram e deixaram o comércio ser exercido somente nas feiras. Neste momento surge a utilização de símbolos para identificação do comércio e conseqüentemente a fácil assimilação pelo cliente. Estas feiras eram realizadas em diferentes localizações, gerando os primeiros conceitos de posicionamento, para melhor sobressair-se para o cliente. Com o passar dos tempos, houve o retorno natural das lojas e bem depois, dos grandes conglomerados. Para chegar cada vez mais perto do consumidor, a lojas passaram usar a decoração como ferramenta de promoção dos seus produtos. Na verdade, esta exposição coloca o consumidor em contato direto com a empresa e também estabelece a oportunidade de comparações com a concorrência.

Até agora, todo o processo avaliado diz respeito à comercialização dos produtos de varejo, ou seja, produtos direcionados ao consumidor final. No mercado industrial, este tipo de promoção difere do executado no mercado de varejo, em sua essência. O processo de compra é diferenciado devido à relação ser entre duas empresas e não com o consumidor final; desse modo, o campo de observação do consumidor industrial é além do produto, a imagem que a empresa apresenta.

A preparação de um evento para o mercado industrial movimenta hoje um elevado número de profissionais em todo Brasil, com maior concentração em São Paulo e Rio de Janeiro. Muitas são as empresas prestadoras de serviço nesta área e até mesmo algumas associações específicas também exercem esta função. Preparar um evento significa antes de qualquer coisa, conhecer bem as necessidades do mercado alvo, sendo assim, os idealizadores devem estar vivenciando o mercado em questão, para recolher o máximo de informações.

As exposições industriais ocorrem em cada setor de atuação com intervalos de um ano ou dois. No Brasil é muito usual acontecer o evento anualmente. Exposições como Fispal (Indústria Alimentícia), ABTCP (Associação Brasileira Técnica de Celulose e Papel), FIEPAG (Indústrias de Embalagem, Papel e Gráficas) são exemplos de eventos anuais, assim como, temos a Feira da Mecânica a cada dois anos. Mesmo diante de um grande investimento para participação em eventos deste tipo, as empresas deparam com uma realidade tipicamente brasileira, isto é, o fato de não existir a cultura de negociação durante as exposições industriais, principalmente as de bens de capital (equipamentos feitos sob encomenda). Sendo assim, o que realmente atrai a alta administração de uma empresa manter e investir cada vez mais em exposições? Em estandes que elevem a imagem da empresa? Talvez o fato de reconhecer que a imagem (institucional) de sua empresa esta sendo cada vez mais fixada no mercado consumidor. Vale lembrar que uma imagem institucional engloba a empresa como um todo, inclusive com toda a sua linha de produtos. Isto posto, se temos uma imagem institucional por intermédio dos estandes e sabemos que as organizadoras divulgam potenciais de vendas durante os eventos, que números são estes? Qual a origem?

Os números são projeções que as empresas preparam para o próximo ano, e a origem dos dados esta no próprio mercado. Estes valores são repassados às organizadoras que divulgam como uma projeção de negócios durante o evento.

Se o pedido não esta sendo fechado, o cliente não esta levando sua "mercadoria" durante o evento, o que o faz procurar a empresa após o evento para realizar a compra desejada? Exatamente, a imagem construída pela equipe de *marketing* através do estande. O cenário onde este cliente pode perceber seus desejos e necessidades serem atingidos. Por este motivo, o estande pode ser considerado como uma comunicação visual geradora de negócios em eventos industriais.

Comunicação visual geradora de negócios

A visualização de como a empresa se apresentará durante um evento, exposição ou feira é de responsabilidade da área de *marketing* , que procura associar toda a estratégia estabelecida pela alta administração, pela sua identificação visual como, logotipia, papéis, cores escolhidas etc., às tendências atuais de mercado. Estando inclusas nestas tendências, as necessidades do mercado comprador e também os aspectos mais relevantes de comunicação visual, *design*. Estabelecer uma imagem para a empresa não é um simples "toque" de decoração. O estande é o espaço destinado à criação da imagem da empresa, onde os produtos e/ou serviços são mostrados, expostos e comunicados visualmente para atrair os possíveis compradores, ou seja, o público-alvo. A comunicação visual do estande define-se pela conceituação de Design, que significa projetar, compor visualmente ou colocar em prática um plano intencional. Plano que produz, no estande, efeitos desejados pelos consumidores e que dependem de diversos fatores, como: materiais estruturais adequados, iluminação, definição do espaço de circulação, entre outros.

O estande é um cenário construído pela empresa expositora, onde o artista principal é o comprador. Neste espaço é permitido ao atuante encenar seus desejos e buscar o atendimento de suas necessidades. Cabe, então, a empresa estabelecer uma relação cenográfica adequada à imagem que quer estabelecer no mercado em que atua. Por este enfoque, concorda-se com Sylvia Demetresco, que, ao estudar as vitrines, afirma que *as cenarizações são complexas encenações articuladas para atuar sobre as ordens sensoriais do consumidor a partir de um trabalho estético que estrutura o discurso, seja a proposta de venda ou somente a atração do observador".* As formas de arte expressam um pensamento, uma visão do mundo que de alguma maneira provocam inquietude em quem vivência, buscando uma sensação diferenciada, uma contemplação, admiração ou comunicação. Estes aspectos fazem parte de uma experiência estética. Por isso, podemos dizer que o consumidor industrial estabelece uma relação com a empresa expositora através de sua experiência estética. Isto ocorre porque o projeto de um estande procura acompanhar as tendências estéticas do mercado nacional e internacional. Estas tendências na verdade seguem um processo histórico da arte que na modernidade apresentou-se através de movimentos como cubismo, futurismo, construtivismo, dadaísmo, suprematismo, neoplasticismo e o minimalismo, que procuravam romper com as tradições.

Por trás de todo este cenário institucional, está o produto, o grande potencial da empresa. Sendo assim, a construção de um estande busca a identificação do produto junto à imagem da empresa. Quando se monta um estande a principal razão é despertar desejos, criar expectativas e uma sensação de prazer nos consumidores, tudo isso através da comunicação visual estabelecida por formas, linhas, cores, texturas, entre outros aspectos. Neste espaço, é permitido à fantasia da empresa em relação ao seu dia-a-dia.

Um outro trecho do livro da Sylvia Demetresco, A Vitrina, retrata bem este posicionamento: *é o cenário que contém uma mensagem englobadora de vários elementos, significados e efeitos de sentido, tudo isso para mistificar um produto, objeto-valor, no qual valores são investidos a partir da edificação da encenação com todos os seus itens construídos, para definir identificar e marcar a relação sujeito-objeto.*

Um cenário construído para um período máximo de até 05 dias, onde seu design e estética são os geradores de transformações a ponto de fixar esta imagem na mente dos compradores, na verdade, uma sequência de imagens a cerca dos visitantes atuando como espelhos, observando seus íntimos, trazendo a tona seus segredos.

Estamos falando da função do marketing como planejador e determinador da imagem da empresa, e sua relação direta com design e estética, na composição de um estande para exposições industriais. Cabe ressaltar que esta relação ocorre porque sempre deve ser avaliada a composição da imagem que será passada durante uma exposição, na intenção de que a mesma seja um espelho aonde o visitante visualize a satisfação de suas necessidades e a partir daí entregue-se ao composto de artifícios que englobam o espaço denominado estande.

Todas as atividades de marketing visam estabelecer um forte relacionamento entre a empresa vendedora e a compradora, afim de que a negociação seja proveitosa, para ambas às partes. É sabido que a empresa compradora precisa e muitas vezes depende fazer bons negócios que ajudem a alcançar as metas globais da empresa. Por este motivo, os profissionais destas organizações freqüentam eventos, como as exposições industriais, visando ampliar relacionamentos e constatar novas tecnologias e oportunidades na participação da empresa vendedora.

A imagem e o símbolo continuam sendo os principais meios de comunicação e, dentre eles, só o visual pode ser mantido em qualquer circunstância prática. Isso é tão verdadeiro hoje quanto tem sido ao longo da história. Mas as implicações da natureza universal da informação visual não se esgotam em seu uso como substitutivo da informação verbal. Não há nenhum conflito entre os dois tipos de informação. Cada uma tem suas especificidades, mas o modo visual ainda não foi utilizado em sua plenitude. Esta abertura para o mercado movimenta um grande número de profissionais que transformam as exposições industriais em um canal de comunicação direcionado, em função da temática do evento.

As empresas expositoras estabelecem sua imagem a partir da uma forma determinada para elaborar seu estande. Na linguagem visual, a forma é estabelecida por linhas que são pontos (unidades simples e mínimas de comunicação visual) em movimento. As formas podem ser geométricas, já conhecidas pela geometria ou orgânicas que são encontradas nos objetos ou em manifestações naturais. O estudo das formas conduz a formas que resultam da acumulação de duas ou mais formas iguais. A forma determinada pela empresa é uma expressão da cultura empresarial da mesma, associada a valores estéticos e padrões de construção vigentes no mercado. O profissional que visita a exposição é impactado por diversos fatores, e com certeza a forma do estande é uma delas. Os estandes refletem a criatividade dos designers que operam as cores em sintonia com a ciência e a indústria. Para eles as cores corretas são as próprias dos materiais com que são produzidos os objetos, pois elas têm uma função simbólica muito importante e transmitem idéias ou conceitos. A diferenciação entre empresas com o mesmo perfil de cores, está no grau de luminosidade produzido pelos diversos tons empregados na estrutura, assim como, a textura dada às paredes, que é um elemento visual que com freqüência serve de substituto para as qualidades de outro sentido, o tato. A combinação de texturas diferentes produz efeitos interessantes e surpreendentes. É indiscutível a associação entre a estrutura e a cor empregada nos estandes, e é esta mescla que faz o visitante parar, observar, entrar e se encantar.

O grande desempenho na estruturação de um estande esta na dimensão ou espaço, um aspecto visível, e na movimentação, um aspecto implícito que a empresa demonstrará ao seu cliente. Estabelecida à área, cabe a montadora apresentar o projeto com uma circulação adequada, prevendo o número de visitantes que poderão por ali passar. A associação é responsável pela divulgação do evento na mídia especializada e também nas empresas do setor.

A classificação construtiva não difere nos mercados de varejo e industrial, ou seja, os estandes podem ser: padrão, básico, misto e construído.

A linguagem visual aqui, tem sido um constante aprimoramento dos itens abordados, provocando o efeito proposto pela comunicação, que é atingir diretamente o público-alvo daquele evento que a empresa esta participando. Para isso é fundamental que se destaque que todos expressam e recebem mensagens visuais em três níveis, o primeiro é aquilo que vemos e identificamos com base no meio ambiente e na experiência, isto é de forma representado. O segundo é o nível abstrato, ou seja, a qualidade sinestésica de um fato visual reduzido a seus componentes visuais básicos e elementares, enfatizando os meios mais diretos, emocionais e mesmo primitivos da criação de mensagens. E finalmente, o vasto universo de sistemas de símbolos codificados que o homem criou arbitrariamente e ao qual atribuiu significados (linguagem verbal). Todos esses níveis de resgate de informações são interligados e se sobrepõem; no entanto, é possível estabelecer distinções suficientes entre eles, de tal modo que possam ser analisados tanto em termos de seu valor como tática potencial para a criação de mensagens, quanto em termos de sua qualidade no processo da visão. É importante destacar que a geração desta comunicação é estreitamente ligada ao plano estratégico da empresa. A cada evento nota-se que existe uma constante preocupação das empresas na forma de se apresentarem ao mercado, inovando na construção de seus estandes, nas cores e materiais promocionais. Este crescimento na forma de comunicação com o mercado é que esta sendo avaliado neste estudo.

O estudo está baseado no enfoque dos "Expositores", por serem os responsáveis pelo planejamento e determinação da imagem que será lapidada para a criação do estande, sua empresa, durante a exposição industrial. Foi escolhida uma das exposições industriais mais importantes no setor de celulose e papel e dela extraídos alguns expositores que auxiliaram na pesquisa. Para melhor analise dos resultados foram destacados três blocos, o primeiro enfatizando o perfil do público e modelo dos estandes; o segundo como é tratada a comunicação visual nos estandes e a terceira a expectativa de geração de negócios a partir da imagem construída.

Foi concluído que os fatores estéticos aliados às estratégias de marketing na elaboração de projetos para estandes em exposições industriais, estabelecem uma comunicação circular capaz de despertar os desejos dos clientes, fazendo com que os mesmos busquem a concretização de negócios em andamento ou novos, no período posterior ao evento.

UM CLASSIFICADOR DE SINAIS PROJETADO COM PRINCÍPIOS DAS REDES NEURAIS ARTIFICIAIS PARACONSISTENTES

Maurício Conceição Mário[1] e *João Inácio da Silva Filho*[2]

Resumo *- Neste artigo, com base nos conceitos teóricos da Lógica Paraconsistente Anotada, apresentamos um Sistema capaz de classificar sinais. A lógica paraconsistente Anotada LPA, conforme apresentada em [1] é uma classe de Lógica Não Clássica que permite manipular sinais contraditórios sem trivialização. Em [5] foram apresentadas Células Neurais Artificiais Paraconsistentes construídas com Algoritmos baseados na LPA onde ficou demonstrado sua capacidade de aprender e desaprender determinados sinais em forma de funções aplicados em suas entradas. A partir dos algoritmos das Células foram feitas conexões e agrupamentos entre os algoritmos para se criar um Sistema Paraconsistente Classificador de Sinais – SPCS. O SPCS é capaz de aprender quatro tipos de sinais diferentes. Depois do aprendizado dos quatros sinais o SPCS pode reconhecer se o sinal apresentado na entrada pertence ou não ao grupo de sinais aprendido anteriormente. Os resultados obtidos com o SPCS demonstram que os algoritmos das Células Neurais Artificiais Paraconsistentes interligados desta forma se transformam em um Sistema Paraconsistentes Classificador de Sinais robusto indicado para utilização em vários campos da área de Inteligência Artificial como os Sistemas Especialistas e de Reconhecimento de palavras e imagens.*

Palavras chaves: lógica paraconsistente, lógica paraconsistente anotada, redes neurais, redes neurais paraconsistentes, neurocomputação.

1 – INTRODUCÃO

Do ponto de vista de engenharia, sinais são funções ou seqüências que transportam informações de uma fonte de mensagens a um destinatário. As características específicas dos sinais dependem do canal de comunicações utilizado para o transporte do sinal. Um canal de comunicações é definido pelo tipo de distorção que introduz nos sinais, podendo esta ser do tipo: a) determinística linear (limitação da banda de freqüência dos sinais); b) determinística não linear (existência de saturações); c) aleatória (presença de ruídos) [9].

Em sistemas eletrônicos de comunicação a fonte geradora de informação, o canal de comunicação, o canal de comunicação e o destinatário são elementos pré-definidos, geralmente com características bem especificadas.

Em outras situações, como nos processos de medição em investigação científica, a fonte de mensagens e o canal de comunicações poderão estar apenas parcialmente caracterizados. Sinais bioelétricos como o eletrocardiograma (EKG), o eletroencefalograma (EEG), o eletromiograma (EMG) ou o eletroneugrama (ENG) são estudados há décadas com a finalidade de se extrair informação sobre estados patológicos de órgãos, sem que se tenha muitas vezes a certeza de que tal informação é de fato transportada por estes sinais.

Os sinais que constituem a voz humana codificam uma variedade de informações: sobre a semânticado que está sendo dito, sobre a identidade do locutor, etc [9].

1.1. CLASSIFICAÇÃO DE SINAIS

Dado o sinal representado pela equação:

$$\mathbf{y(t)=f(t,A)+n(t)}$$

Supondo que o sinal y(t) possa pertencer a categorias $\{Cj\}^{M,\quad j=1}$, conforme o valor do parâmetro **A** e particularizando para o caso, por exemplo, da tentativa de se diagnosticar condições cardíacas patológicas a partir de traçados de EKG, então para cada categoria diagnóstica *j* é escolhida uma coleção de traçados representativos:

$$\{y_{i,j}(t)\}^{Nj,\ i=1}\ \ j=1,2...M$$

Conforme exposto em [9] uma tentativa de classificação de sinais pode ser feita fazendo-se uma abordagem direta com técnicas de Redes Neurais. Neste caso é feito o treinamento em uma rede neural multicamada **N**(W) que terá como entradas todos os **N** pontos das séries temporais associadas a cada um dos sinais, e como saídas as **M** categorias em que se pretende classificá-los, como mostrado na figura 1:

Um problema para este tipo de abordagem é que cada série temporal é representada por cerca de 500 pontos amostrais para cada ciclo de EKG, o que impõe uma dimensão grande à rede, mesmo havendo poucas categorias de classificação.

Uma abordagem mais econômica é procurar reduzir a dimensão dos sinais a uma coleção menor de parâmetros que representem adequadamente os sinais originais e, implementar uma classificação neural para estes parâmetros.

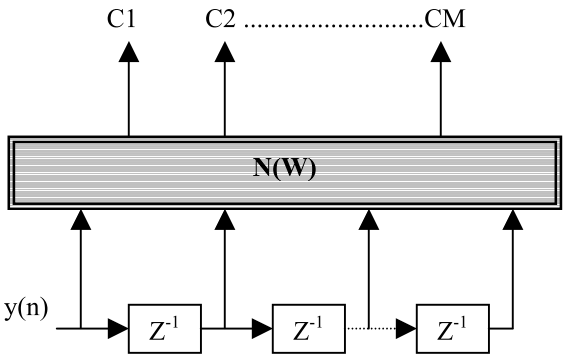

Fig.1 Rede Neural Artificial Multicamada na Classificação de Sinais.

A literatura apresenta vários métodos de classificação de sinais como em [9] onde se faz a parametrização e efetua as medições de amplitudes de pontos fiduciais (ondas P, Q, R, S, T, U) no traçado, áreas associadas, durações e separações. Um método muito estudado é o proposto por Halliday [7], onde a coleção de todos os sinais é modelada por um processo aleatório Y(t) do qual cada traçado individual é uma particular função amostra. Neste processo é feita uma classificação de modo aleatório e em seguida é representado por uma expansão ortonormal como o de Kahrunen-Loeve. Por esta expansão, determinam-se a seguir funções ortonormais $\{\Phi_i(t)\}$ chamadas de autofunções da função de covariança associada ao processo, tais que:

$$\int^T_0 \Phi_i(t)\ \Phi_k(t)dt = \partial(i,k)$$

$$y_k(t) = \lim_{n\to\infty} \Sigma^n_{i=1} a_{ki}\Phi_i(t)$$

e os coeficientes associados a cada um dos sinais são calculados por: $a_{ki}=\int^T_0 y_k(t)\ \Phi_i(t)\ dt$

Ordenando as médias destes coeficientes calculadas sobre toda a população de sinais em ordem decrescente dos seus valores absolutos, pode-se aproximar cada sinal individual apenas pelas L autofunções mais significativas:

$$\ddot{y}_k(t)= \Sigma^L_{i=1} a_{ki}\Phi_i(t)$$

Deste modo, espera-se que o vetor de coeficientes $\mathbf{a_k}$ de dimensão L<<N represente adequadamente cada sinal com um erro de reconstrução suficientemente pequeno.

Com este modelo matemático que foi utilizado em [7] para a classificação de traçados VCG's (vector cardiogramas), pode-se implementar uma rede neural multicamada de dimensão mais viável, que, utilizando apenas estes coeficientes a_k, classifique adequadamente os sinais nas J categorias.

Neste trabalho apresentamos uma nova metodologia onde um Sistema Paraconsistente Classificador de Sinais construído com base na Lógica Paraconsistente Anotada [5] utiliza Células Neurais Artificiais Paraconsistente devidamente configuradas para aprender e classificar sinais usando Algoritmos muitos simples e capazes de ser controlado para efetuar classificação de categorias de sinais.

2 – A LÓGICA PARACONSISTENTE ANOTADA COM ANOTAÇÕES DE DOIS VALORES - LPA2v

As contradições ou inconsistências são comuns quando descrevemos partes do mundo real. Os sistemas de análises e tratamento de sinais utilizados em Inteligência Artificial funcionam em geral com base na lógica convencional, onde a descrição do mundo é considerada por dois estados: Falso ou Verdadeiro. Estes sistemas binários não conseguem tratar adequadamente as situações contraditórias. As Lógicas Paraconsistentes nasceram da necessidade de se encontrar meios de dar tratamento não trivial às situações contraditórias. Os estudos e propostas das Lógicas Paraconsistentes apresentaram resultados que possibilitam considerar as inconsistências em sua estrutura de um modo não trivial [4] e [1], e por isso, se mostram mais propícias no enquadramento de problemas ocasionados por situações de contradições que aparecem quando lidamos com o mundo real.

A Lógica Paraconsistente Anotada LPA é uma classe de lógica Paraconsistente Evidencial que faz tratamento de sinais representados por anotações permitindo uma descrição e equacionamento por meio de Algoritmos.

Na Lógica Paraconsistente Anotada LPA as fórmulas proposicionais vêm acompanhadas de anotações. Cada anotação, pertencente a um reticulado finito τ , atribui valores à sua correspondente fórmula proposicional. Uma Lógica Paraconsistente Anotada LPA pode ter como reticulado finito, o de "quatro estados", conforme a figura 2.

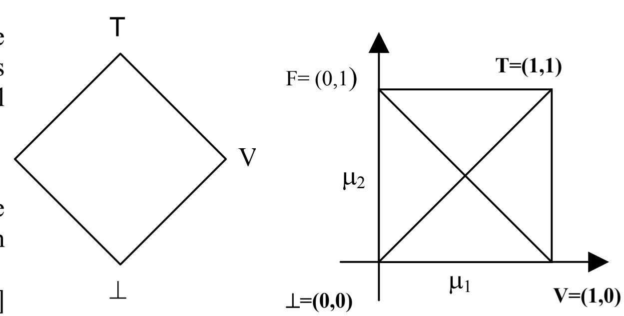

Fig.2 Reticulado finito e Quadrado no Plano Cartesiano.

A Lógica Paraconsistente Anotada com anotação de dois valores - LPA2v é uma extensão da LPA e pode ser representada através de um reticulado de quatro vértices [2] onde podemos estabelecer algumas terminologias e convenções, do seguinte modo:

Seja $\tau = < |\tau|, \leq >$ um reticulado finito fixo, onde:

1. $|\tau| = [0, 1] \times [0, 1]$
2. $\leq = \{((\mu_1, \rho_1), (\mu_2, \rho_2)) \in ([0, 1] \times [0, 1])^2 \mid \mu_1 \leq \mu_2$ e $\rho_1 \leq \rho_2\}$ (onde $\leq$ indica a ordem usual dos números reais). Tal reticulado denomina-se *reticulado de valores-verdade*.

3 – AS CÉLULAS NEURAIS ARTIFICIAIS PARACONSISTENTES

Na análise paraconsistente o objetivo principal é saber com que medida ou grau de certeza podemos afirmar que uma proposição é Falsa ou Verdadeira. Portanto, é considerado como resultado da análise apenas o valor do grau de certeza G_c. O valor do grau de contradição G_{ct} é um indicativo que informa a medida da inconsistência. Se houver um baixo valor de certeza ou muita inconsistência o resultado é uma indefinição. Estes valores podem retornar em dois eixos sobrepostos representando a reticulado finito, agora com valores, conforme a figura 4 abaixo:

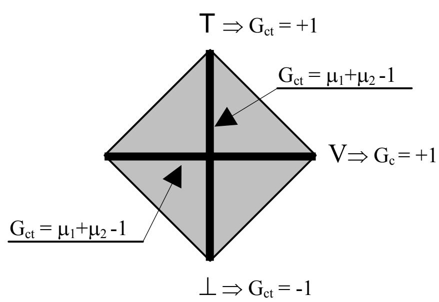

Fig.3 Reticulado finito da LPA2v com valores.

Os valores de controle ajustados externamente são limites que vão servir como referência na análise.
Podemos descrever a análise paraconsistente utilizando apenas as equações originadas no Quadrado Unitário do Plano Cartesiano.
Uma descrição do reticulado utilizando os valores obtidos pelas equações resulta no Algoritmo denominado "Para-Analisador" [5]. Este algoritmo é elaborado com base na descrição do reticulado e pode ser escrito na sua forma reduzida expressando assim uma Célula Neural Artificial Paraconsistente básica CNAPb conforme é descrito a seguir:

/Definições do valores ajustáveis/
V_{scc}=C_1 ***/Valor superior de controle de certeza*/***
V_{icc}=C_2 ***/ Valor inferior de controle de certeza*/***
V_{scct}=C_3 ***/Valor superior de controle contradição*/***
V_{icct}=C_4 ***/Valor inferior de controle contradição*/***
/Variáveis de entrada/
μ_1, μ_2
/Variáveis de saída
Saída Digital = S_1
Saída analógica = S_{2a}
Saída analógica = S_{2b}
*/Expressões matemáticas */
sendo : $G_{ct} = \mu_1 + \mu_2 - 1$
e $G_c = \mu_1 - \mu_2$
*/determinação dos *estados lógicos extremos* */
Se $G_c \geq C_1$ então S_1 = V
Se $G_c \leq C_2$ então S_1 = F

$G_{ct} = S_{2a}$
$G_c = S_{2b}$

*/ *FIM*/

Denomina-se *Célula Artificial Paraconsistente básica* (CAPb) o elemento capaz de, composto de quando um par de graus de crença e descrença *(u_{1a}, u_{2a})* for apresentado na sua entrada fornecer um resultado na sua saída na forma de uma tripla dada por: G_{ct} = *grau de contradição* resultante, G_c = *grau de crença* resultante e X = constante de anotação resultante Indefinido. A figura 4 mostra a representação de uma CNAPb.

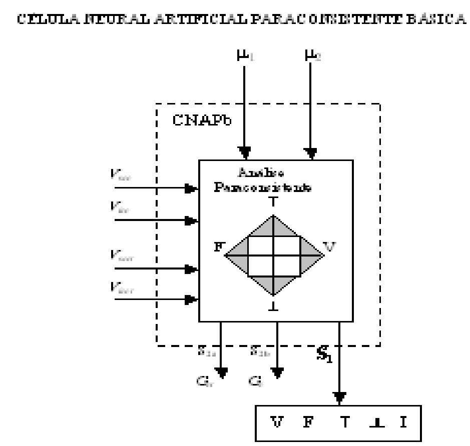

Fig.4 A Célula Neural Artificial Paraconsistente Básica CNAPb.

Na Célula Neural Artificial Paraconsistente básica CNAPb representada pelo algoritmo "Para-Analisador", foram considerados todos os valores envolvidos nas equações, sendo assim, se os valores dos graus de certeza e de contradição estiverem fora dos valores impostos pelos limites ajustáveis, a saída é um estado denominado de *não-extremo*, sendo a este atribuído um valor indefinido *I*.
A partir da *Célula Artificial Paraconsistente básica* (CAPb) foram criadas outras Células as quais denominamos de *Células Neurais Artificiais Paraconsistentes* (CNAP's).

Os estudos das CNAP deram origem a uma família de Células Neurais Artificiais Paraconsistentes que constituem os elementos básicos das *Redes Neurais Artificiais Paraconsistentes* (RNAP's). Neste trabalho para elaboração do Classificador de Sinais foram necessários apenas três tipos [5] de Células denominadas: Célula Neural Artificial Paraconsistente de Aprendizagem CNAPap que consegue aprender e memorizar um padrão aplicado em sua entrada, uma Célula Neural Artificial Paraconsistente de Conexão Lógica Simples de Maximização - CNAPLs que determina a sua saída pelo maior valor aplicado na entrada e uma Célula Neural Artificial Paraconsistente de Decisão - CNAPd que determina a saída final resultante da análise Paraconsistente.

5. O CLASSIFICADOR PARACONSISTENTE DE SINAIS

Neste trabalho o Classificador Paraconsistente de Sinais é composto por módulos básicos denominados de Unidade Neural Artificial Paraconsistente de Comparação de Padrões – UNAPCP que armazenarão sinais para serem comparados com aqueles que serão aplicados na entrada. Cada Unidade – UNAPCP é composta, por sua vez, de três Células Neurais Artificiais Paraconsistentes; uma Célula Neural Artificial Paraconsistente de aprendizagem CNAPCa, uma Célula Neural Artificial Paraconsistente de Conexão Lógica Simples de Maximização - CNAPLs e uma Célula Neural Artificial Paraconsistente de Decisão - CNAPd. O diagrama em blocos da figura 5 mostra como se compõem o Classificador Paraconsistente de Sinais.

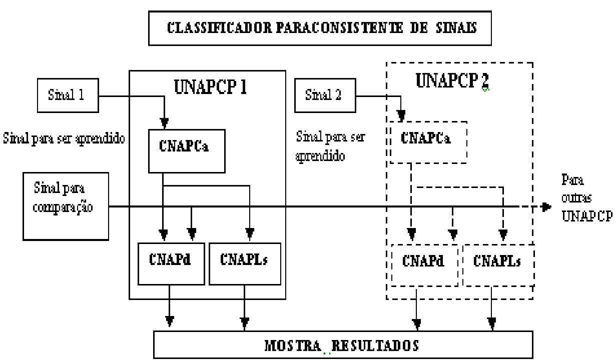

Fig.5. Diagrama mostrando interconexões dos módulos do Classificador paraconsistente de Sinais.

Neste trabalho optamos por construir um Classificador que permite comparação com quatro tipos de sinais, portanto com quatro módulos de Unidade Neural Artificial Paraconsistente de Comparação de Padrões – UNAPCP, no entanto mais módulos podem ser agregados para expandir a capacidade do Classificador. A quantidade de módulos vai depender da natureza da aplicação do projeto.

3.CÉLULA NEURAL ARTIFICIAL PARACONSISTENTE DE APRENDIZAGEM-CNAP-Ap

A Célula Neural Artificial Paraconsistente de aprendizagem CNAPap é uma Célula Neural Artificial Paraconsistente Básica com uma saída μ_{1r} interligada à entrada do grau de descrença complementado μ_{2c}. Conforme pode ser visto no Algoritmo sucessivos valores aplicados à entrada do grau de crença μ_1 resulta no aumento gradativo no grau de crença resultante da saída μ_{1r}. Esta Célula pode funcionar de dois modos, para aprendizado do *padrão de verdade*, onde são aplicados valores μ_1=1 sucessivamente até o grau de crença resultante na saída chegar à μ_{1r}=1, e para o aprendizado do *padrão de falsidade* onde são aplicados valores μ_1=0 até o grau de crença resultante chegar à μ_{1r}=1, neste caso a entrada do grau de crença é complementada μ_{1c} conforme mostra a figura 6

6. RESULTADOS PRÁTICOS

Com base na teoria exposta foi elaborado um software Classificador Paraconsistente de Sinais capaz de aprender sinais e compara-los com padrões inseridos na entrada. A figura 7 mostra a tela principal do Classificador Paraconsistente de Sinais proposto neste trabalho com as legendas explicativas.

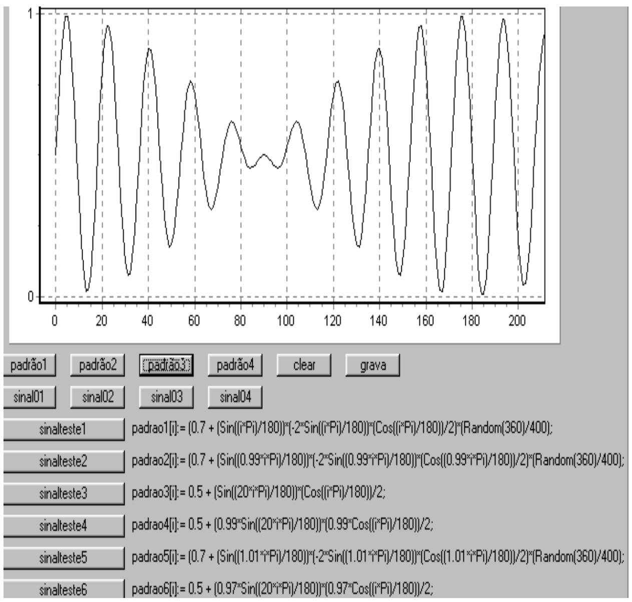

Fig 7- Tela principal do Classificador de Sinais

Os botões na janela do Software permite que o classificador aprenda 4 tipos de sinais com as equações correspondentes. Na análise o software reconhece apenas o sinal apreendido anteriormente, conforme mostra a figura 8.

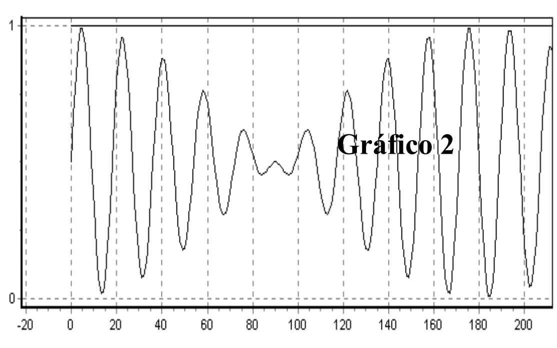

Fig 8- Forma de Onda reconhecida pelo Classificador de Sinais

O exemplo exposto na figura mostra apenas o sinal padrão 3 sendo desnecessário a apresentação dos outros sinais aprendidos.

USO DE SIMULAÇÕES MATEMÁTICAS DE PROCESSOS NO ENSINO DE ENGENHARIA DE MATERIAIS

Antonio Augusto Gorni[1] *e Regina Zayat Gorni*[2]

Abstract — *O atual ensino de engenharia deve, tanto quanto possível, promover a familiarização dos alunos com os processos industriais que eles encontrarão ao desempenhar sua profissão. Uma das maneiras mais eficazes de lhes ensinar as correlações entre os parâmetros desses processos e seus resultados finais está na execução orientada de programas computacionais que simulem fidedignamente tais processos. Este artigo mostra dois exemplos práticos desse tipo de abordagem na engenharia de materiais, mais especificamente na laminação a quente de aços. Um deles consiste no cálculo do balanço térmico de um forno para reaquecimento de placas destinadas à laminação a quente de chapas. O segundo trata da determinação da evolução microestrutural de aços processados num laminador de tiras a quente. Para que tal abordagem seja bem sucedida o professor deve garantir a representatividade e consistência tanto dos modelos matemáticos como dos dados empregados nas simulações matemáticas.*

Palavras-Chave — *Engenharia de Materiais, Laminação a Quente, Modelo Matemático, Simulação*

INTRODUÇÃO

As vertiginosas e contínuas mudanças tecnológicas, econômicas e políticas do mundo moderno também devem se refletir no ensino de engenharia de forma que seus alunos tenham plenas condições de enfrentar um mercado extremamente competitivo e que apresenta condições de trabalho altamente mutáveis. As sugestões para se atingir esse objetivo são das mais variadas, incluindo-se aí a famosa abordagem sobre "ensinar como se deve aprender", já que o aprendizado contínuo é uma realidade que parece ter vindo para ficar.

Entre esses vários avanços que vêm se verificando no ensino de Engenharia pode-se incluir o uso de simulações computacionais de processos industriais e sua aplicação na sala de aula. A aplicação de interfaces gráficas amigáveis e interativas permite que tais simulações sejam executadas sem entediar o aluno. Dessa forma podem ser feitos exercícios extensivos que têm como objetivo demonstrar o efeito de variações nos parâmetros de processo sobre seu resultado final. O objetivo aqui é familiarizar o aluno com a realidade que encontrará no chão de fábrica enquanto ele ainda se encontra na escola. Isso contribuirá para que seu período de integração técnica na empresa seja encurtado, fazendo com que o recém-formado rapidamente se torne útil à empresa.

Obviamente este é um campo muito vasto, dadas as várias modalidades de engenharia existentes e a miríade de processos industriais associados em cada uma delas. Este artigo mostrará como exemplo de simulação industrial dois casos ligados à engenharia de materiais, mais especificamente sobre laminação a quente de aços: o balanço térmico de fornos e a evolução microestrutural observada ao longo da laminação de tiras a quente.

BALANÇO TÉRMICO DE FORNOS

O balanço térmico é uma das ferramentas mais eficazes para se diagnosticar o nível de desempenho energético para qualquer tipo de forno. Como se sabe, ele nada mais é do que a identificação de todas as fontes de entrada e saída de calor de um determinado forno, juntamente com os respectivos cálculos de sua magnitude. Sua aplicação na área siderúrgica é mais comum em altos-fornos e conversores LD, onde é parte obrigatória do próprio processo metalúrgico. Em outras aplicações, como no caso dos fornos de reaquecimento usados em laminações, ele é relegado a segundo plano, pois já não é vital ao processo. Além disso, a quantidade de energia envolvida é menor, particularmente quando se trata de fornos de tratamento térmico e recozimento. Contudo, a não-execução do balanço térmico faz com que se perca uma excelente oportunidade para se fazer uma auditoria contínua no forno do ponto de vista energético, identificando seus pontos fracos e até quantificando os ganhos decorrentes de sua eliminação. E, obviamente, ganhos energéticos se refletem na lucratividade da empresa, como também ajudam a poupar recursos não-renováveis e reduzem o nível de agressão ao meio ambiente.

Como se pode observar, todas essas vantagens decorrentes do cálculo do balanço térmico de um forno tornam sua simulação dentro de um curso de engenharia de materiais bastante interessante. Neste trabalho será apresentado um exemplo desse cálculo para fornos de reaquecimento de placas a serem processadas por laminação a quente numa usina siderúrgica integrada.

Como se sabe, a laminação a quente de produtos planos inicia-se com o reaquecimento de placas até uma temperatura da ordem de 1200°C. Cada placa de aço - na verdade uma chapa extremamente grossa, com espessura

[1] Antonio Augusto Gorni, UniFEI – Centro Universitário da FEI, Av. Humberto Alencar Castelo Branco, 3972, 09850-901, São Bernardo do Campo SP, Brasil, agorni@iron.com.br
[2] Regina Zayat Gorni, Unilus – Centro Universitário Lusíada, Rua Batista Pereira 265, 11015-100, Santos SP, Brazil, rzayat@iron.com.br

entre 180 e 250 mm - pesa tipicamente entre 8 e 12 toneladas. Cada forno de reaquecimento possui capacidade de reaquecer até 100 toneladas de placas por hora, o que dá uma idéia da enorme quantidade de energia envolvida no processo.

Nos fornos de reaquecimento de placas as fontes de calor disponíveis para o processo são basicamente a queima de combustível, o ar pré-aquecido da combustão e o calor decorrente da formação de carepa na placa. Já as saídas de calor ocorrem através das próprias placas reaquecidas, pelos fumos aquecidos que saem pela chaminé, a água de refrigeração dos skids, o calor irradiado pelas paredes do forno e outras perdas menores. As equações necessárias foram codificadas numa planilha Excel usando-se a linguagem de macro Visual Basic. Maiores detalhes sobre o desenvolvimento do algoritmo de cálculo desse balanço térmico podem ser encontrados em [1].

Os resultados de um balanço térmico típico de um forno de reaquecimento de placas, calculados a partir de dados industriais reais, podem ser vistos nas tabelas I e II.

TABELA I

ENTRADAS DE CALOR DE UM BALANÇO TÉRMICO EFETUADO NUM FORNO DE REAQUECIMENTO DE PLACAS.

Entradas de Calor	Mcal/t aço	%
Calor de Combustão do Gás	612,3	74,2
Calor Sensível do Ar	194,0	23,5
Calor de Formação da Carepa	18,7	2,3
Calor Sensível das Placas	0,0	0,0
TOTAL	824,9	100

TABELA II

SAÍDAS DE CALOR DE UM BALANÇO TÉRMICO EFETUADO NUM FORNO DE REAQUECIMENTO DE PLACAS.

Saídas de Calor	Mcal/t aço	%
Calor Absorvido pelas Placas	192,2	23,2
Calor Sensível dos Fumos	449,1	54,4
Calor de Refrigeração do Forno	138,2	16,8
Calor Perdido pelas Paredes	33,7	4,1
Outros	11,6	1,4
TOTAL	824,9	100

Já nesta primeira demonstração há várias informações técnicas muito úteis e interessantes para os alunos. Como seria de se esperar, a maior contribuição ao aquecimento veio da combustão, com 612 Mcal/t de aço reaquecido, o que corresponde a 74% do aporte térmico total. O calor sensível do ar de combustão veio em segundo lugar, com 194 Mcal/t ou 24% do total. A contribuição da reação exotérmica de oxidação do ferro foi mínima, 19 Mcal/t ou aproximadamente 2% do total. Portanto, o aporte térmico específico foi de 825 Mcal/t de aço.

A análise sobre as saídas de calor revelou um resultado intrigante: a maior parte do calor - 449 Mcal/t de aço ou 54% do calor total fornecido - saíram na forma de fumos aquecidos! Somente 192 Mcal/t de aço (apenas 23% do calor total) realmente foram aproveitados de forma útil, ou seja, no reaquecimento das placas de aço até 1200°C. Além disso, 138 Mcal/t (17%) são levados pelo sistema de refrigeração do forno e 34 Mcal/t (4%) são irradiados pelas paredes do forno para o ambiente externo. Como se pode observar, ainda se faz necessário um grande trabalho de engenharia para se melhorar o rendimento energético desses fornos. O maior desafio aqui consiste na identificação de aperfeiçoamentos economicamente compatíveis com a atual realidade industrial e econômica.

Os efeitos dos diversos parâmetros técnicos e operacionais sobre o desempenho térmico do forno de reaquecimento de placas foram determinados a partir de múltiplas execuções do software de balanço térmico aqui descrito. Cabe aqui ao professor orientar os alunos sobre quais parâmetros devem ser alterados e como a modificação deve ser executada, como num verdadeiro trabalho de diagnose técnica. A tabela III mostra resumidamente as oportunidades para economia de energia que foram identificadas e hierarquizadas dessa forma.

TABELA III

OPORTUNIDADES PARA ECONOMIA DE ENERGIA IDENTIFICADAS E HIERARQUIZADAS PELAS SIMULAÇÕES EFETUADAS USANDO-SE A PLANILHA DO BALANÇO TÉRMICO.

Alteração	1° Caso [Mcal/t]	2° Caso [Mcal/t]	Redução [Mcal/t (%)]
Taxa ar-gás 7:1	612	477	135 (22)
Placa a 250°C	612	514	98 (16)
Placa a 400°C	612	447	159 (27)

Já foi identificada neste estudo específico a perda significativa de calor através dos fumos que saem pela chaminé. Os dados coletados para o cálculo deste balanço térmico revelaram o uso de uma relação média ar-gás combustível igual a 12,8:1 durante a operação do forno. Trata-se de um valor exageradamente alto, pois sabe-se que uma boa combustão do gás de coqueria normalmente usado como combustível nas siderúrgicas integradas requer que a relação ar-combustível se situe entre 6,5:1 e 7:1. Ao se recalcular um balanço térmico hipotético, assumindo-se uma relação ar-combustível de 7:1 e todas as demais condições constantes ocorre, em primeiro lugar, um considerável aumento da eficiência do equipamento: o calor derivado da queima de combustível cai de 612 para 477 Mcal/t - ou seja, uma apreciável redução de 22% no consumo energético! De fato, as quantidades de calor que saem contidas nas placas reaquecidas e nos gases de combustão passam a ficar praticamente iguais, evitando o sério desbalanceamento verificado anteriormente: 192 Mcal/t (33%) e 207 Mcal/t (36%), respectivamente.

Uma conseqüência colateral é a ligeira queda na participação do calor sensível do ar de combustão préaquecido no aporte térmico ao forno, que passou para 83

Mcal/t (14%), pois agora é necessária menor quantidade de ar para a combustão. Aqui há um benefício secundário, mas não desprezível: menores vazões de ar de combustão significam menor consumo de energia elétrica nos sopradores de ar, além de menor esforço (e correspondente desgaste) nesse equipamento. Por outro lado, a combustão teria de ser monitorada com mais cuidado, uma vez que passaria a haver uma menor disponibilidade de oxigênio. Uma eventual elevação no poder calorífico inferior da mistura gasosa combustível poderia produzir combustão incompleta, com liberação de fumaça preta pelas chaminés. Esta ocorrência leva a risco de multa pelas entidades que fiscalizam a emissão de poluentes.

O enfornamento a quente de placas – ou seja, sua introdução no forno de reaquecimento imediatamente após sua produção na máquina de lingotamento contínuo - também é outra contramedida que pode garantir boa economia de energia, apesar do grande problema que representa em termos de planejamento de produção e logística. Por exemplo, o enfornamento de placas a 250°C, um objetivo relativamente modesto, reduziria o calor necessário para o aquecimento das placas de aço de 192 Mcal/t para 164 Mcal/t; em termos globais, o consumo energético do forno cairia de 612 Mcal/t para 514 Mcal/t, ou seja, uma queda de 16%. A economia de energia seria ainda maior se o enfornamento fosse realizado a 400°C: o consumo energético cairia para 447 Mcal/t.

Ainda há várias outras possibilidades para se reduzir o consumo energético como, por exemplo, aumentando-se a temperatura do ar fornecido para a combustão. Outra possibilidade a ser considerada seria a redução da quantidade de calor extraída do forno pelo seu sistema de refrigeração, que é função do jogo entre a vazão e as temperaturas inicial e final da água que circula em seu interior. Ambas as sugestões requerem grandes alterações em termos de equipamento; portanto, a solução desse exercício requereria também um estudo sobre os custos ligados à implementação das modificações que se fariam necessárias.

EVOLUÇÃO MICROESTRUTURAL NA LAMINAÇÃO DE TIRAS A QUENTE

As propriedades mecânicas de chapas laminadas a quente dependem primordialmente de sua microestrutura ou, mais precisamente, de seu tamanho de grão. Esta, por sua vez, é função da composição química do material e também é grandemente influenciada pelos parâmetros usados no seu processo de laminação a quente. Por esse motivo já foram elaborados diversos modelos matemáticos para se correlacionar os parâmetros aplicados na laminação a quente com as características obtidas no produto final [2,3].

Um desses modelos matemáticos, próprio para o processo de laminação de tiras a quente [2], foi tomado como base para o desenvolvimento de uma planilha Excel acoplada a uma macro escrita em Visual Basic. Este algoritmo de cálculo determina a evolução do tamanho de grão austenítico durante a laminação a quente de um esboço plano de aço ao carbono-manganês num trem acabador constituído de seis cadeiras de laminação, bem como o correspondente tamanho de grão ferrítico conseguido no material ao final do processo.

Esse modelo matemático permite que se determine, de forma quantitativa, o efeito de diversos parâmetros de processo na evolução microestrutural do material. Entre esses parâmetros se encontram:

- Temperatura de início de laminação;
- Tamanho de grão inicial do esboço;
- Esquema de passes;
- Velocidade de laminação;
- Grau de deformação total placa/tira;
- Evolução da temperatura durante a laminação a quente;
- Temperatura final de laminação;
- Taxa de resfriamento imposta ao laminado ao final da laminação a quente.

Observa-se a partir daqui que há um grande campo de exploração para os estudantes da área de metalurgia de materiais, já que os parâmetros podem ser modificados de forma isolada ou em combinações, permitindo a determinação de seus efeitos sobre a microestrutura do material. Em função das limitações de espaço, serão aqui discutidas apenas algumas das possibilidades que este programa oferece para desenvolver esse tipo de exercício.

O primeiro exemplo a ser visto mostra o efeito da deformação total sobre a evolução do tamanho de grão austenítico da tira a quente. A figura 1 mostra essa evolução para dois laminados, cada um com espessura diferente (2,3 mm e 9,8 mm), laminadas a partir de esboços com a mesma espessura inicial (30 mm).

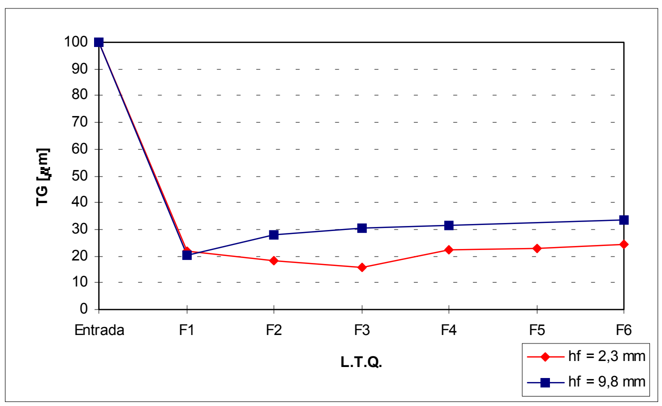

FIGURA 1
EVOLUÇÃO DO TAMANHO DE GRÃO AO LONGO DA LAMINAÇÃO DE TIRAS A QUENTE PARA DOIS ESBOÇOS, CADA UM COM ESPESSURA DIFERENTE (2,3 MM E 9,8 MM).

Pode-se observar que ambos os laminados apresentaram tamanho de grão similar na primeira cadeira de laminação (F1), da ordem de 20 a 22 µm. Esse valor é bem menor que o tamanho de grão inicial (100 µm). Este significativo refino de grão pode ser atribuído ao fenômeno da recristalização dinâmica: o encruamento na microestrutura provocado pela deformação a quente é eliminado no próprio momento em que ela é aplicada. Esse fenômeno é favorecido pelas condições típicas de conformação a quente aplicadas nessa cadeira, ou seja, baixa velocidade de deformação e temperatura relativamente elevada do material.

A partir daí as evoluções de tamanho de grão observadas variam para os dois esboços. O material mais fino, com espessura de 2,3 mm, sofre deformações mais pesadas nas demais cadeiras; por esse motivo, passa novamente por recristalização dinâmica na segunda e terceira cadeiras (F2 e F3, respectivamente) o que contribuiu para refinar adicionalmente seu tamanho de grão. Nas demais cadeiras ocorre apenas recristalização estática parcial, o que levou a um ligeiro aumento no tamanho de grão. Já o laminado mais espesso, com espessura de 9,8 mm, apresenta leve crescimento de tamanho de grão já na cadeira seguinte (F2) e nas demais, devido ao menor grau de deformação nelas aplicado, o qual não foi suficiente para provocar a recristalização dinâmica. Dessa forma, neste caso só se verificou a ocorrência de recristalização estática entre uma cadeira de laminação e outra. Além disso, não foi aplicada deformação na quinta cadeira (F5).

Por esse motivo, houve ligeira diferença no tamanho de grão austenítico final dos dois materiais: 24 µm para a tira com 2,3 mm de espessura e 34 µm para o material com 9,8 mm - uma diferença de 42%. Após a transformação da austenita em ferrita, que ocorre durante o resfriamento do material após sua laminação e resfriamento forçado, houve grande diminuição nessa diferença: o tamanho de grão ferrítico desses materiais foi de 8 e 10 µm respectivamente, passando a diferença a 25%.

O efeito do tamanho de grão inicial sobre a evolução microestrutural do esboço que está sendo processado no Trem Acabador é um parâmetro de grande interesse metalúrgico. Se houver recristalização dinâmica na primeira cadeira, como foi o caso anterior, ele não influi na evolução do tamanho de grão do laminado durante sua conformação, uma vez que o tamanho de grão obtido na primeira cadeira de laminação (F1) independerá do seu valor anterior. Contudo, ao se laminar chapas com espessura relativamente alta usando-se todas as cadeiras do Trem Acabador a redução por cadeira diminui, reduzindo-se as chances de ocorrência de recristalização dinâmica na primeira cadeira do trem. Neste caso o refino do tamanho de grão ocorre somente através de recristalização estática, que apresenta efeito bem menor nesse sentido.

Esta é a situação que será abordada no próximo exemplo, mostrado na figura 2. Trata-se de esboços com a mesma espessura inicial e final (30 e 4,9 mm, respectivamente) mas, que por algum motivo, apresentaram diferentes tamanhos de grão iniciais: 200 e 100 µm.

Ao contrário do que havia sido observado no caso anterior (ver figura 1), o refino de grão na primeira cadeira de laminação não foi tão radical, uma vez que aqui não houve a ocorrência de recristalização dinâmica durante o processamento dos dois laminados. Por outro lado, no laminado com tamanho de grão inicial igual a 100 µm, as sucessivas recristalizações estáticas entre passes ao longo das várias cadeiras foram eficazes o suficiente para promover um grande refino de grão já na terceira cadeira (F3), tendo sido atingido um valor de tamanho de grão da ordem de 25 µm. No caso do laminado com tamanho de grão inicial de 200 µm o resultado obtido foi surpreendente: a recristalização estática observada após a laminação na primeira cadeira do trem acabador (F1) não foi completa. Em conseqüência desse fato o material foi conformado na segunda cadeira (F2) contendo ainda alguma deformação residual a qual, acumulada com essa nova deformação, permitiu a deflagração de recristalização dinâmica. Isso proporcionou intenso refino microestrutural a esse laminado, o que resultou na obtenção de um tamanho de grão menor do que o valor calculado para o outro material, invertendo a situação que estava sendo observada desde o início da laminação.

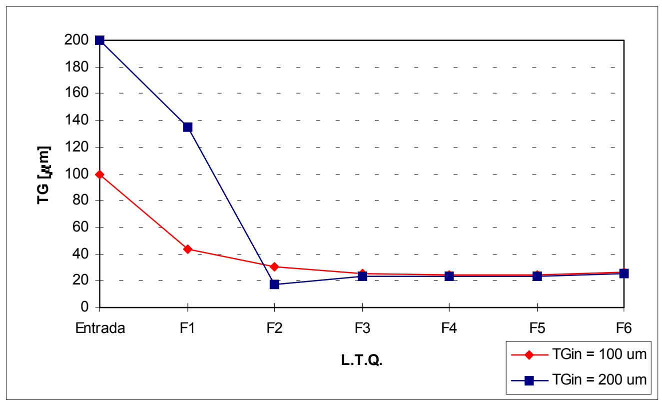

FIGURA 2

EVOLUÇÃO DO TAMANHO DE GRÃO AO LONGO DA LAMINAÇÃO DE TIRAS A QUENTE PARA DOIS ESBOÇOS COM 4,9 MM DE ESPESSURA, MAS COM DIFERENTES TAMANHOS DE GRÃO INICIAIS (100 E 200 µM).

Essa nova tendência se manteve até o final da laminação, quando foram atingidos valores de tamanho de grão iguais a 26 e 25 µm para os laminados com tamanho de grão inicial igual a 100 e 200 µm respectivamente. Essa ligeira diferença desapareceu com a transformação da austenita para ferrita, quando o valor de tamanho de grão ferrítico de ambos os materiais situou-se por volta de 8 µm.

Como se pode observar, o uso de um modelo matemático integrado para a determinação da evolução microestrutural dos esboços processados no Trem Acabador do Laminador de Tiras a Quente é extremamente oportuno, uma vez que a complexidade dos fenômenos envolvidos pode gerar resultados contrários ao que se poderia supor em termos meramente conceituais. Neste caso é interessante que os alunos expliquem detalhadamente as causas que estão por trás da obtenção de resultados contraditórios ou aparentemente inconsistentes, analisando detalhadamente o algoritmo de cálculo e os fundamentos físicos por trás dele.

CONCLUSÕES

Este trabalho mostrou alguns exemplos do uso de modelos para a simulação de processos metalúrgicos no ensino de engenharia de materiais. Eles permitem o desenvolvimento de exercícios com o objetivo de fazer com que o aluno entenda melhor a correlação entre os parâmetros de processo aplicados e os resultados finais obtidos. Por outro lado, para que essa prática efetivamente alcance os objetivos propostos, cabe ao professor oferecer modelos e dados que sejam efetivamente representativos da prática industrial moderna, bem como orientar os alunos sobre como usá-los de forma racional e sistemática. Caso contrário os resultados obtidos estarão fora da realidade e contribuirão mais para confundir ao invés de orientar os alunos.

Resumo *— O conteúdo da disciplina de Algoritmos e Programação é de suma importância para a formação de alunos na área de Ciência da Computação. Daí surge a necessidade de se repensar em formas de ensino desta disciplina a fim de facilitar o processo de ensino-aprendizagem. Neste trabalho é apresentada uma experiência baseada no uso do software Mathcad no ensino de algoritmos e também são discutidos caminhos e questões com o objetivo de minimizar alguns problemas detectados nesta prática docente.*

Palavras-chave — algoritmos, ensino de programação

INTRODUÇÃO

Muitos dos alunos ingressantes no primeiro semestre do curso de Bacharelado em Ciência da Computação encontram dificuldades em disciplinas da área de Matemática e na área de Construção de Algoritmos. Algumas destas são comuns a estes dois campos de conhecimento e estão relacionadas principalmente à compreensão de abordagens abstratas e ao desenvolvimento do raciocínio lógico-dedutivo.

Durante o processo de ensino e aprendizagem da disciplina de Algoritmos e Programação, são detectados alguns problemas didático-pedagógicos, um dos principais relaciona-se ao ambiente computacional. O uso de ferramentas de programação sofisticadas logo no início desta primeira disciplina de programação leva os alunos a se concentrarem em aspectos específicos de implementação e desviarem a atenção de questões fundamentais relacionadas ao aprendizado de algoritmos.

O objetivo principal deste trabalho é encontrar métodos de ensino de algoritmos que minimizem estes e outros problemas detectados. Como primeira tentativa foi adotado o software Mathcad nas aulas da disciplina de Algoritmos e Programação já que ele oferece um ambiente interativo e interpretado para a construção de algoritmos. Além disso, este software apresenta alta conformidade com a notação matemática formal. Através desta experiência, pretende-se analisar o seu uso no ensino de algoritmos e as conseqüências desta aplicação no processo ensino-aprendizagem.

Desta forma, um ponto chave deste trabalho é o uso de uma ferramenta de programação de alto nível num primeiro momento na disciplina de algoritmos. A justificativa para o uso de uma ferramenta de programação com tal particularidade reside na tentativa de adiar alguns detalhes específicos de programação, que não são relevantes na implementação de algoritmos ministrados neste curso introdutório.

Este trabalho teve como base a experiência didático-pedagógica desenvolvida na disciplina de Algoritmos e Programação ministradas no período matutino no primeiro e segundo semestres de 2002 na Faculdade SENAC de Ciências Exatas e Tecnologia.

O documento aqui apresentado é organizado da seguinte forma: primeiramente é relatado um breve histórico do uso do software Mathcad na instituição, depois é descrita a experiência da aplicação desta ferramenta na disciplina de Algoritmos e Programação seguida por uma análise dos resultados de pesquisas realizadas junto aos alunos; na última seção são apresentadas as conclusões e levantadas algumas questões.

HISTÓRICO DO USO DO MATHCAD

Com base na prática docente são observadas dificuldades, por parte dos alunos, em assimilar o conteúdo da disciplina de Algoritmos e Programação. Estas questões tornaram-se preocupantes quando foi observado que não somente os alunos em curso (isto é, que estão cursando a disciplina), mas também alunos que já foram aprovados na mesma, não conseguiam aplicar seus conhecimentos em outras disciplinas como, por exemplo, em Cálculo Numérico e Cálculo Diferencial e Integral.

Para tentar diminuir a dificuldade demonstrada por estes alunos, algumas disciplinas adotaram o software Mathcad como instrumento de desenvolvimento de atividades e projetos. As atividades se iniciaram nas disciplinas de Álgebra Linear (oferecida no segundo período do curso) e Cálculo Numérico (oferecida no quinto período do curso). Na primeira o trabalho se deu muito bem, devido à proximidade da linguagem utilizada pelo software com a usual. Já na segunda, apesar dos problemas diminuírem, o resultado ainda não foi o esperado, houve muita resistência

por parte dos alunos já "viciados" em algumas dificuldades desnecessárias, como declaração de variáveis e, se envolvendo nestes detalhes, não percebiam que a questão fundamental relacionava-se à elaboração de algoritmos e não em traduzi-los para a linguagem de programação do Mathcad.

No segundo semestre de 2001, foi desenvolvido um projeto interdisciplinar com os alunos das disciplinas de Cálculo Integral e Diferencial I e Geometria Analítica que envolvia alguns aspectos de algoritmos. Em função de um bom resultado nesta experiência, foi decidido usar este software na disciplina de Algoritmo e Programação no primeiro semestre de 2002 com os seguintes objetivos:

- Auxiliar o aluno na tarefa de construção de algoritmos;
- Mostrar caminhos para a implementação de uma abordagem multidisciplinar no ensino de algoritmos num primeiro momento e de uma abordagem interdisciplinar num segundo momento;
- Avaliar o uso do software Mathcad no ensino de algoritmos;
- Avaliar o aprendizado de uma linguagem de programação estruturada com base numa experiência anterior em Mathcad.

No segundo semestre de 2002 estas atividades se repetiram com algumas alterações descritas na seção a seguir. Além da disciplina Algoritmos e Programação, o software continua sendo adotado por várias outras disciplinas do curso.

RELATO DA EXPERIÊNCIA

Algoritmos e Programação é uma disciplina oferecida no primeiro período do curso de Ciência da Computação cujo objetivo é ensinar os alunos a construir algoritmos e a colocá-los em prática na forma de programas de computadores.

Nesta disciplina, usualmente é ensinada uma linguagem para descrição de algoritmos como: Pseudocódigo, Português Estruturado, Fluxograma ou diagrama N-S. Numa segunda fase é utilizada uma linguagem de programação estruturada como C, C++ ou Pascal para a codificação do algoritmo. Em alguns casos, estas duas fases ocorrem simultaneamente.

Nesta experiência é utilizado o Mathcad para o ensino de aspectos básicos de programação: construção de funções, uso de estruturas de condição e repetição. Este software é voltado para soluções matemáticas e, por outro lado, apresenta uma própria linguagem de programação. Além disso, ele oferece um ambiente de programação de alto nível e fácil uso. Outro ponto interessante é que ele faz uso da linguagem matemática, que foi usada pelos alunos desde o ensino fundamental e assim espera-se quebrar uma barreira inicial na aprendizagem de algoritmos que é uso de uma linguagem extremamente técnica e longe da realidade dos alunos. Espera-se que ao usar uma ferramenta de programação de alto nível, o foco da atividade seja o problema e a construção de algoritmos, desviando a atenção dos detalhes de programação.

Num segundo momento passa-se a usar uma linguagem de programação, no caso específico a linguagem C++. Nesta fase é mostrado como converter uma função em Mathcad numa função em C++. Ao se ensinar C++ o docente estabelece uma outra ordem na exposição dos conteúdos onde o primeiro tópico a ser apresentado é a construção de funções (conceito avançado no curso tradicional de Algoritmos e Programação). Seguindo este roteiro o primeiro curso de programação já enfoca a construção de software modular.

Em resumo, esta experiência consiste em desenvolver atividades em um ambiente de programação mais próximo do aluno, livre de detalhes específicos de programação e adequado a um primeiro contato com funções, seqüência de comandos, estruturas de condição e de repetição. De tal forma que os alunos sejam motivados a descobrirem por si próprios estas estruturas desconhecidas por eles até então. Após este primeiro contato, passamos a utilizar uma linguagem estruturada, no caso, a linguagem C++.

Este método foi aplicado nos dois semestres de 2002. Ao final do primeiro semestre de 2002 na disciplina destacam-se alguns aspectos positivos e outros negativos que são listados a seguir:

Pontos Positivos do uso do Mathcad no ensino de programação:

- Rapidez na implementação e teste do algoritmo;
- Interface homem-máquina mais amigável;
- Detalhes específicos de aspectos de programação são adiados num primeiro momento;
- Similaridade com a linguagem matemática;
- Abordagem multidisciplinar: Algoritmos e Matemática.

Dificuldades encontradas inicialmente no uso de Mathcad no ensino de programação:

- Dificuldades no uso do software por parte dos alunos num primeiro momento;
- Falta de experiência dos professores com manejo do software;
- Excessiva facilidade talvez dificulte no aprendizado de uma linguagem de programação "real" por parte dos alunos;
- Instabilidade do software, que costuma apresentar problemas com uma certa freqüência.
- Assim, para o segundo semestre de 2002 foram tomadas algumas medidas, como:
- Conhecimento aprimorado do uso do software por parte dos professores;

- Aula introdutória ao software onde são desenvolvidas atividades que ainda não estão diretamente relacionadas a aspectos de programação;
- Troca da versão do Mathcad por uma mais estável.

A linha mestre deste trabalho baseia-se na seguinte diretriz: os conteúdos abordados nas aulas práticas são superiores aos ministrados na aula teórica, assim pretende-se estimular o aluno a buscar soluções, conhecimento e desenvolver a sua própria autonomia.

ANÁLISE DA PESQUISA REALIZADA JUNTO AOS ALUNOS

Foi feita uma pesquisa junto aos alunos da disciplina de Algoritmo e Programação do primeiro e segundo semestre de 2002 no período matutino.

Com base nesta pesquisa, alguns resultados já começam a se evidenciar, levantando alguns pontos que serão discutidos a seguir. Alunos que já tiveram contato com programação anteriormente (seja porque reprovou a disciplina ou porque fez colegial técnico em informática) têm mais dificuldades em trabalhar com o Mathcad do que com uma linguagem estruturada. A maioria destes alunos não se adapta ao software e acham que o problema está no programa e não percebem suas falhas na disciplina. Muitas vezes, eles acreditam que saibam programar, enquanto os professores afirmam o contrário. Por outro lado, alunos que nunca tiveram contato com programação anteriormente assimilam com mais facilidade e rapidez do que aqueles que aprenderam a programar com o método tradicional.

Ao se comparar os dados da pesquisa respondida pelos alunos do primeiro e segundo semestre observou-se uma maior aceitação na segunda edição da disciplina. Isto deve-se ao fato dos docentes estarem mais familiarizados com o software e de já possuírem uma experiência acumulada na primeira edição da disciplina. Outra questão relevante é que na segunda edição o software encontrava-se mais estável, causando uma melhor impressão por parte dos alunos. Mesmo assim, observa-se ainda algumas falhas que devem ser retificadas numa próxima edição do curso:

- Necessidade de material didático adequado;
- Necessidade de contextualizar as atividades com Mathcad à realidade dos alunos.

Em conversas informais com os alunos de turmas de disciplinas que não envolvem programação (como Cálculo, Álgebra Linear, entre outras) a reação dos alunos tem sido excelente, mas ainda não foi feito um levantamento formal destes dados.

Com relação à aceitação do uso do software em disciplinas mais avançadas que utilizam algoritmos, há uma expectativa do resultado, já que os alunos que passaram por esta experiência inicial ainda não as alcançaram. Por exemplo, Cálculo Numérico é uma das disciplinas onde o professor relata muita dificuldade por parte dos alunos e aonde houve rejeição ao software. Mas isto se deu em turmas que nunca haviam tido contato anterior com ele e, como também não haviam atingido maturidade matemática e "computacional" esperada, é compreensível tal atitude. A expectativa agora é o resultado da disciplina quando esta for cursada por estudantes que já trabalharam com o Mathcad na disciplina de Algoritmos e Programação.

CONCLUSÃO

O professor preocupado com a aprendizagem de seus alunos deve estar sempre empenhado em utilizar procedimentos que se mostrem eficientes nesse propósito. Tais procedimentos vão além das classificações teóricas, importando apenas que se mostrem facilitadoras da integração entre o conteúdo em estudo e as experiências e conhecimentos prévios dos alunos.

Adotando uma atitude dialética o professor poderá ser muito dinâmico e transformador por intermédio de suas aulas expositivas. A questão não está em se rotular essa técnica como tradicional e rejeitá-la como meio de ensino. Ocorre que professores mediadores mostram-se capazes de levar seus alunos a reelaborar ou produzir conhecimentos por meio de suas aulas práticas.

Numa perspectiva crítica, a aula prática com o Mathcad pode se transformar numa técnica que estimula a atividade e a iniciativa dos alunos sem prescindir da iniciativa do professor; favorece o diálogo entre professor e aluno, e dos alunos entre si, sem cair numa prática permissiva; e considera os interesses e experiências dos alunos sem desviar-se da sistematização lógica dos conteúdos previstos no programa de ensino.

Com esta nova abordagem houve a necessidade de se repensar o curso de Algoritmos e Programação, não somente com relação à ordem de exposição de conteúdo, como também à metodologia usada nas aulas teóricas e nas aulas práticas. Como o ambiente de programação Mathcad aborda conteúdos que extrapolam a ementa tradicional de um curso de Algoritmos e Programação, houve a necessidade de se aprofundar no binômio teoria-prática, na tentativa de modificar a conduta pedagógica tradicional da teoria para prática e invertê-la para da prática para teoria.

Esta experiência ainda está em andamento e pretende-se futuramente responder às seguintes questões:

Como o Mathcad pode ser usado em disciplinas de modo a facilitar um ensino significativo de matemática e programação?

Como o professor, com o auxilio do Mathcad, pode ajudar o aluno a construir com significado seu conhecimento?

APLICAÇÃO DE ALGORITMOS GENÉTICOS NA ADAPTAÇÃO DE UM AMBIENTE MULTIAGENTE INTERATIVO DE APRENDIZAGEM NA INTERNET

Sidnei Renato Silveira[1], Dante Augusto Couto Barone[2]

***Resumo -** Este artigo apresenta o trabalho que está sendo desenvolvido como proposta de tese de Doutorado em Ciência da Computação no PPGC-UFRGS. A idéia inicial enquadra-se na definição de uma arquitetura de agentes que será integrada a um ambiente multiagente adaptativo de aprendizagem. Estes agentes serão modelados com algoritmos genéticos. O objetivo principal consiste no estabelecimento de uma arquitetura multiagente, buscando definir comportamentos e estratégias de ação destes agentes. A arquitetura de agentes será integrada ao ambiente utilizado no Projeto AMIA-CNPq.*

***Palavras-Chave -** Algoritmos Genéticos, Sistemas Multiagentes, Ambientes Inteligentes de Aprendizagem.*

1. INTRODUÇÃO

O trabalho em desenvolvimento tem por objetivo principal, definir uma arquitetura de agentes para um ambiente multiagente interativo de aprendizagem, utilizando a modelagem dos agentes através de algoritmos genéticos, no contexto do Projeto AMIA.

O Projeto AMIA – Ambiente Multiagente Interativo de Aprendizagem, financiado pelo CNPq[3], é formado por um consórcio entre a Universidade Luterana do Brasil – ULBRA (Faculdade de Informática e Curso de Especialização em Informática na Educação), pela Universidade Federal do Rio Grande do Sul – UFRGS (PGIE – Pós-Graduação em Informática na Educação e PPGC – Programa de Pós-Graduação em Computação) e pela PROCERGS – Companhia de Processamento de Dados do Rio Grande do Sul.

Entre os objetivos propostos pelo projeto está a constituição, a partir de uma plataforma de *software* livre, de um ambiente adaptativo multiagente para a formação continuada a distância de professores na área de Informática na Educação. Um dos sub-projetos que compõem o projeto AMIA envolve a utilização de agentes em ambientes adaptativos de ensino e aprendizagem, tendo como principais objetivos a definição de uma arquitetura de agentes, que modifiquem o ambiente de acordo com as características extraídas do modelo de aluno. Estes agentes utilizarão técnicas de hipermídia adaptativa para implementar as adaptações do ambiente ao perfil do aluno. A hipermídia adaptativa trata do estudo e desenvolvimento de sistemas com técnicas capazes de modelar a adaptação de hiperdocumentos ao perfil, metas, necessidades, expectativas, preferências e nível de conhecimento de seus usuários.

Neste sentido, pretende-se estudar e implantar uma arquitetura multiagente em um ambiente interativo de aprendizagem. A modelagem do comportamento e das estratégias dos agentes deste ambiente serão realizadas através de algoritmos genéticos.

A principal motivação para a realização deste trabalho é o estudo de uma modelagem de agentes utilizando algoritmos genéticos convencionais (com cromossomos binários e/ou com números reais) e algoritmos genéticos não-convencionais, cuja representação deve possibilitar o armazenamento de informações tais como estratégias de ensino, soluções para um determinado problema, dados do aluno, entre outras informações. Estes dados serão utilizados para acompanhar a aprendizagem do aluno.

O presente artigo está estruturado da seguinte forma: na seção 2 são abordados alguns aspectos sobre os Sistemas Multiagentes; na seção 3 apresentam-se algumas considerações sobre os Algoritmos Genéticos, na seção 4 apresenta-se a proposta de trabalho a ser implementada. Finalizando o artigo, apresentam-se as considerações finais e as referências bibliográficas.

2. SISTEMAS MULTIAGENTES

Os Sistemas Multiagentes preocupam-se com a atividade de um agente autônomo em um ambiente multiagente. Um agente autônomo é uma entidade inteligente, cuja existência não depende da existência de nenhum outro agente [5]-[6]-[8]. Os agentes "inteligentes" são entidades de *software* capazes de demonstrar um comportamento autônomo orientado a um objetivo, dentro de um ambiente computacional heterogêneo. Segundo Bond & Gasser [2], uma das razões para se utilizar a abordagem de agentes é que em alguns domínios o conhecimento é inerentemente distribuído e um problema pode ser

[1] Mestre em Ciência da Computação pelo PPGC-UFRGS. Doutorando em Ciência da Computação pelo PPGC-UFRGS. Professor Adjunto da Faculdade de Informática da ULBRA. Professor Assistente do Curso de Sistemas de Informação das Faculdades Integradas Ritter dos Reis. Coordenador do Curso de Sistemas de Informação da FACENSA - Faculdade Cenecista Nossa Senhora dos Anjos.
[2] Professor do Programa de Pós-Graduação em Computação (PPGC) e do Pós-Graduação em Informática na Educação - PGIE/UFRGS.
[3] Projeto financiado pelo CNPq sob coordenação geral da Prof[a]. Dr[a]. Liane M. R. Tarouco - PGIE/UFRGS.

decomposto, na maioria das vezes, em pequenas partes, para facilitar a sua resolução. Além disso, esta abordagem pode facilitar o desenvolvimento e gerenciamento de sistemas, permitindo adaptabilidade, especialização, aumento da eficiência ou velocidade, autonomia e alocação otimizada de recursos. Bond & Gasser [2] também colocam que as atividades humanas envolvem mais do que uma única pessoa, que podem ser simuladas/realizadas por uma coleção de agentes inteligentes. Segundo Castelfranchi [3], os agentes baseados em modelos de organização social humana são denominados agentes sociais. Estes agentes possuem conhecimento de outros agentes e podem seguir uma hierarquia ou dividirem-se em grupos.

Segundo Stone & Lester [12], a utilização de agentes em ambientes de ensino e aprendizagem oferece um potencial significativo para modificar o processo de ensino e aprendizagem, principalmente pelo fato de que os estudantes recebem um *feedback* constante do ambiente utilizado, aumentando efetivamente a aprendizagem. Akhras & Self [1] colocam que o ambiente necessita adaptar a instrução às características individuais do estudante, durante o processo de ensino e aprendizagem.

3. ALGORITMOS GENÉTICOS

Os algoritmos genéticos são uma técnica de busca baseada na teoria da evolução de Darwin. Esta técnica baseia-se nos mecanismos de seleção de indivíduos utilizados na natureza, onde apenas os indivíduos mais aptos de uma população sobrevivem, adaptando-se mais facilmente às mudanças que se produzem no meio ambiente [4]-[9]-[11].

Foram inicialmente propostos pelo Prof. John Holland, em 1975, na Universidade de Michigan. A idéia de Holland foi tentar imitar algumas etapas do processo de evolução natural das espécies incorporando-as a um algoritmo computacional. O ponto de referência foi gerar, a partir de uma população de cromossomos, novos cromossomos com propriedades genéticas superiores às de seus antecedentes, onde os cromossomos são as possíveis soluções de um problema. Os AG's têm se mostrado como uma técnica eficaz de resolução de problemas de otimização. São muito eficientes na busca de soluções "ótimas". Os AG's são utilizados em diversas áreas, tais como: mercado de ações (definir que ações devem ser compradas ou vendidas), indução e otimização de bases de regras, simulação de modelos biológicos, evolução interativa de imagens, composição musical e análise de trajetória, entre outros.

As principais características de um AG, segundo Davis [4] e Mitchell [9], são:

- manter uma população de soluções para um determinado problema;
- possuir um processo de seleção de indivíduos, baseado no grau de adaptação de cada um;
- possuir operadores genéticos para gerar novos indivíduos para a população.

Estas características são implementadas em três módulos distintos, formando a estrutura básica de um AG [4]-[9]-[11]:

- Módulo de avaliação: determina o grau de adaptação (*fitness*) de cada indivíduo ao problema em questão;
- Módulo de população: responsável pela escolha da população inicial;
- Módulo de reprodução: responsável pela aplicação dos operadores genéticos aos indivíduos.

4. TRABALHO PROPOSTO

No trabalho proposto, pretende-se definir os aspectos que envolvem a modelagem dos agentes com algoritmos genéticos, incluindo a forma de representação das informações (conhecimento, estratégias de ensino, entre outras), a função de avaliação e os operadores genéticos, que possibilitem a evolução de estratégias dos agentes inseridos no ambiente em desenvolvimento.

O ambiente proposto para o Projeto AMIA é o *TelEduc* [13], desenvolvido pelo NIED-Unicamp. Este ambiente está sendo estudado e utiliza uma plataforma de *software* livre, um dos pré-requisitos do Projeto AMIA. Constitui-se em um ambiente colaborativo/cooperativo para Educação a Distância. Integrada ao ambiente *TelEduc*, propõe-se a construção de um ambiente multiagente interativo de aprendizagem, através da inserção de uma arquitetura de agentes que acompanharão o processo de ensino e aprendizagem dos alunos, via *web*.

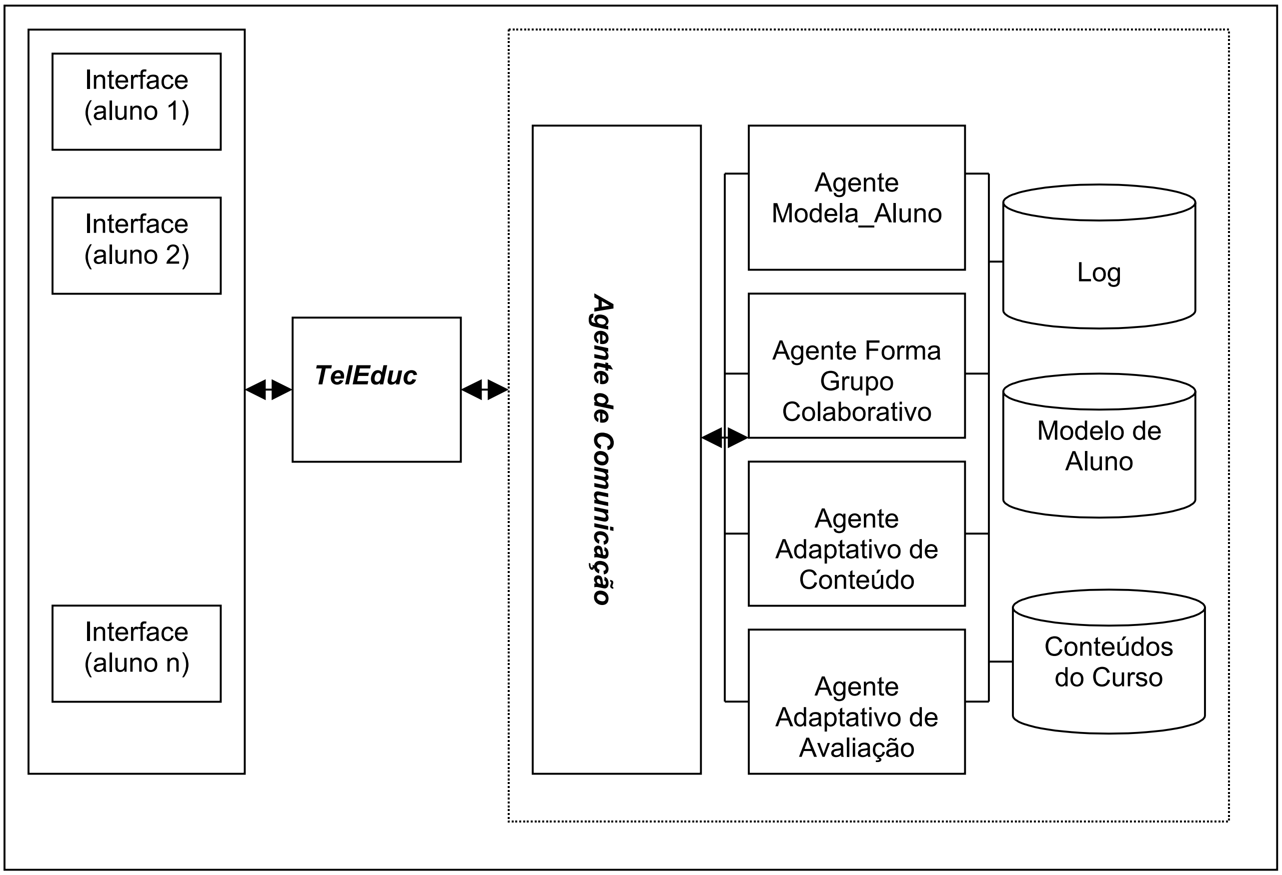
A partir da definição do modelo de aluno proposto para o ambiente, os agentes adaptarão o conteúdo a ser fornecido ao aluno, de acordo com um algoritmo genético. Segundo Giangrandi & Tasso [7], o modelo do aluno descreve o conhecimento do estudante num domínio específico e é utilizado para que o ambiente adapte-se às características individuais do usuário. Em um modelo de aluno podem ser armazenadas diversas informações, entre elas: nível de conhecimento, objetivos, planos, capacidades, atitudes e conhecimento ou crenças [10]. As adaptações serão realizadas através de técnicas de hipermídia adaptativa. O modelo de aluno encontra-se em fase de desenvolvimento, através da aplicação e tabulação de um questionário interativo (via *web*) que identificará o perfil do aluno. Através deste perfil os demais agentes adaptarão o ambiente para facilitar a aprendizagem dos alunos. Na figura 1 demonstra-se a arquitetura proposta para o ambiente, onde um dos agentes será responsável pelas tarefas inerentes ao modelo de aluno.

Na arquitetura inicialmente proposta, tem-se cinco agentes, cujas funções são:

- *agente modela aluno*: responsável por gerenciar as informações que dizem respeito ao modelo de aluno e disponibilizá-las aos demais agentes de forma dinâmica;
- *agente adaptativo de conteúdo:* responsável por adaptar o conteúdo de acordo com o perfil do aluno (informado pelo agente *modela aluno*). Este agente será modelado com algoritmos genéticos;
- *agente adaptativo de avaliação:* este agente será encarregado de adaptar o processo de avaliação de acordo com o perfil do aluno, disponibilizando as ferramentas mais adequadas dentro do ambiente;
- *agente forma grupo colaborativo:* responsável pela formação de grupos de estudo através de critérios definidos pelo professor, de acordo com o perfil dos alunos, estabelecido no modelo de aluno;
- *agente de comunicação:* será o responsável por gerenciar o processo de comunicação entre os agentes integrantes da arquitetura.

4.1 Protótipo em Desenvolvimento

Inicialmente, estão sendo implementados os agentes de comunicação, modelo de aluno e o agente adaptativo de conteúdo. Este último, através do modelo do aluno, disponibilizará o conteúdo de diversas formas (texto, demonstração, gráficos, locução, vídeos, imagens). As formas de apresentação estão ligadas ao perfil do aluno e a técnicas de hipermídia adaptativa. A partir do perfil do aluno, serão definidas as técnicas de hipermídia adaptativa mais adequadas.



Os algoritmos genéticos serão aplicados de duas formas: 1) geração de técnicas de hipermídia adaptativa; 2) criação de grupos colaborativos.

1) geração de técnicas de hipermídia adaptativa: a definição das técnicas de adaptação a serem utilizadas serão realizadas da seguinte forma:

- os alunos serão divididos em grupos, de acordo com o perfil definido pelo modelo de aluno;
- para cada grupo de alunos, o agente adaptativo de conteúdo gerará um conjunto de técnicas de adaptação mais adequadas ao perfil deste grupo.

2) criação de grupos colaborativos: A criação dos grupos colaborativos será realizada da seguinte forma:

- o professor define as características desejáveis para a criação de um grupo colaborativo (estas características são identificadas através do modelo de aluno);
- o agente *forma grupo colaborativo*, formará o "melhor grupo" de alunos, seguindo as características previamente estabelecidas.

A utilização dos algoritmos genéticos justifica-se pela grande quantidade de alunos que poderão participar dos cursos dentro do contexto do Projeto AMIA. O público alvo dos cursos são os professores das Escolas Estaduais do Estado do Rio Grande do Sul. Segundo informações da Secretaria Estadual da Educação (SEC-RS), existem 85.849 professores estaduais. Seria praticamente inviável que o ambiente fosse adaptado individualmente para cada um destes alunos. Sendo assim, o ambiente será adaptado de acordo com o grupo no qual se encaixa o aluno. A definição deste grupo estará a cargo do modelo de aluno e o algoritmo genético, através das características estabelecidas para cada grupo de alunos, combinará as técnicas de hipermídia adaptativa, visando encontrar o conjunto mais adequado ao perfil proposto.

5. Considerações Finais

Atualmente, estão sendo desenvolvidos os agentes de comunicação, modelo de aluno e o agente adaptativo de conteúdo, visando validar a arquitetura proposta através de testes, utilizando como base um Curso de Microinformática Básica e Utilização da Internet, proposto como um dos trabalhos que estão integrados ao Projeto AMIA. Os agentes estão sendo implementados segundo as diretrizes do ambiente *TelEduc* e da plataforma estabelecida no projeto AMIA, utilizando-se a linguagem PHP e o banco de dados *MySql*.

SEMIÓTICA SUBLIMINAR:TECNOLOGIAS DE INSERÇÃO DE SIGNAGENS SUBLIMINARES NOS COMPUTADORES E REDES TELEMÁTICAS

Flávio Mário de Alcântara Calazans[1]

Resumo *— Pesquisa sobre tecnologia subliminar nos computadores e redes telemáticas, presença dos sinais subliminares. Em 1990, no "Laboratório de Telemática da Unisantos", foi desenvolvido e implantado um experimento de pesquisa empregando o "Know-How" (Savoir Faire) adaptando ao "logiciel" (programa de computador) da rede Videotexto (antecessora francesa da Internet) algumas destas tecnologias com o objetivo pragmático de aumentar a interatividade da rede. Em 2002 há tecnologia de inserção de sinais subliminares com o comando DELAY e Layers em softwares como Flash 4.0, Fire-Works, Giff Animator, 3-D Studio Max, Director e linguagens como HTML ou Javascript, para websites da Internet e CDROMS. .*

Palavras Chave — Computação, Internet, Subliminar.

INTRODUÇÃO

Objetiva-se efetuar um panorama do Estado da Técnica das tecnologias audiovisuais midiáticas presentes em programas de computadores que poderiam ter por objetivo a transmissão de mensagens contendo estimulação subliminar cuja signagem (devido ao tempo de exposição, ritmo, sobreposição ou distribuição cromática-espacial-de escala) encontre-se dissimulada ou aparente pretender impossibilitar uma leitura consciente por parte do receptor.

A metodologia empregada será Hipotética-Dedutiva, em conformidade epistemológica com o "Modus Tolens" de Popper, buscando falsear a hipótese de tipologia intuitiva proposta da "inexistência de toda e qualquer propaganda subliminar no decorrer do Século XX", falseada por meio da coleta, identificação e análise de espécimes midiáticos oriundos da Videosfera (Mídia Eletrônica), recorrendo-se a subsídios do referencial teórico dos paradigmas: Midiologia, Semiótica, Hermenêutica, Cibernética, Gestalt etc., em ESTUDO de CASOS, acrescidos da metodologia Antropológica da Observação Participante no decorrer de quinze anos de pesquisa acadêmica isolando a variável do objeto "Propaganda Subliminar" nas comunicações e artes segundo um enfoque multimídia aplicado à metodologia científica do estudo de casos.

PROPAGANDA SUBLIMINAR MULTIMÍDIA

Definição de Propaganda Subliminar.

"...considera-se subliminar qualquer estímulo que não é percebido de maneira consciente, pelo motivo que seja: porque foi mascarado ou camuflado pelo emissor, porque é captado desde uma atitude de grande excitação emotiva por parte do receptor, (...) porque se produz uma saturação de informações ou porque as comunicações são indiretas e aceitas de uma maneira inadvertida" [Ferrés. "Televisão subliminar" p.14].

Por definição, subliminares são as mensagens que são enviadas dissimuladamente, ocultas, abaixo dos limites da nossa percepção consciente (medidos pela Ergonomia) [12] e que hipoteticamente pretenderiam influenciar nossas escolhas, atitudes, motivar a tomada de decisões posteriores[1-30]; fazem-se necessárias algumas digressões e recapitulações no intuito de esclarecer melhor alguns aspectos do corpo teórico que baseia a Tecnologia Subliminar [8].

Histórico das Teorias sobre Subliminares

A Semiótica Subliminar [4] tem seus precursores no filósofo grego Demócrito (400 A.C.) que primeiro afirmou que nem tudo o que é perceptível pode ser claramente percebido, tema continuado por Platão no "Timeu" e detalhado por Aristóteles na obra "Perva Naturalia" com a teoria dos "Umbrais da Consciência", continuado até por Montaigne em 1580 e Leibniz em 1698 com as "Percepções inadvertidas que tornam-se óbvias por meio de suas conseqüências" , sendo que os estímulos subliminares começam a ser mensurados quantitativamente pelo contemporâneo de Freud, Doutor Otto Poetzle , que em 1919 estabelece a relação estatística de causa-efeito entre estímulo subliminar e reação fisiológica; seguidos de Teóricos da Comunicação de Massas como os canadenses Marshall MacLuhan e Wilson Brian Key, e europeus como o italiano Umberto Eco ; até mesmo no Brasil, pesquisadores do porte e reputação do físico Mário Shemberg e do Filósofo das Novas Tecnologias Vilém Flusser abordam as tecnologias subliminares em suas obras [3]

Entretanto, apenas em junho de 1934 a tese de doutorado de Collier em Psicologia Experimental detalhou publicamente os esquemas de construção de um projetor de diapositivos de alta velocidade , o Taquicoscópio (Táquion em grego significa veloz e escópio é visor-projetor) cujas imagens chegam a 1/3000 de segundo, causando reações fisiológicas ao sinal subliminar [1-24], hoje a tecnologia de editoração de imagens por ilhas de edição computadorizadas

[1] Flávio Mário de Alcântara Calazans, UNESP -São Paulo State University / Cásper Líbero University, R. Clay Presgrave do Amaral, 100, 11.070-140, Santos, SP, Brazil, calazans@bignet.com.br, http://www.calazans.ppg.br

e outros recursos da informática permite inserções sem a necessidade de hardware próprio (apesar de processadores sillicon graphics transmitirem imagens televisivas reconstruindo digitalmente a imagem quase ao vivo-em tempo real, com delay de meras frações de segundo) .

Por outro lado, a Midiologia Subliminar [6] teve o primeiro registro histórico entre os Meios de Comunicação de Massa na Videosfera com a mídia eletrônica urbana Cinema, em 1956, quando a firma de Jim Vicary , "Subliminal Projection Company" fez uso do taquicoscópio projetando a cada 5 segundos sobre o fime "Picnic" a frase "Beba Coca", na velocidade de 1/3000 de segundo cada vez, aumentando em 57,7% as vendas no intervalo, um experimento que já assumiu as proporções de "Lenda Urbana" internacional entre professores e pesquisadores da Comunicação mal-informados ou preconceituosos [9].

Somente em 1974 houve o registro de adaptação da tecnologia subliminar à Televisão com objetivos comerciais, quando a frase "Compre-o" foi inserida sobreposta a um "frame" (1/30 de segundo) por 4 vezes durante o comercial de 30 segundos do jogo para crianças "Kusker Du" nos Estados Unidos da América [1].

Entretanto, nos anos 1980-1990 grandes empresas colocaram vírus nos computadores que fazem piscar na tela (efeito flicker em ritmo taquicoscópico) frases como "trabalhe mais rápido" para aumentar a produtividade dos empregados. Também supermercados instalam som ambiente com as frases "sou honesto" e "roubar é errado" alegando obter bons resultados mensuráveis estatisticamente (O processador MARK VI alega Ter reduzido em 30% o índice de furtos em uma rede com 81 supermercados em 4 estados dos USA); e bancos agiriam de forma semelhante para estimular aplicações financeiras [1-53].

Um depoimento pessoal sobre a eficácia das Tecnologias Subliminares

Aqui cabe inserir um depoimento pessoal meu a respeito da eficácia midiológica dos sinais subliminares, pois ainda em 1990, no "Laboratório de Telemática da Unisantos", desenvolvi e implantei com a equipe (Prof. Silvio Ênio Bergamini Filho e a jornalista Paula Prata Vandenbrande) uma experiência de pesquisa empregando o "Know-How" (Savoir Faire) desenvolvido durante 10 anos de pesquisa sobre tecnologias subliminares (incluindo minha dissertação de mestrado e tese de doutorado em Ciências da Comunicação na ECA-USP).

Adaptamos ao "logiciel" (programa de computador) da rede Videotexto (antecessora francesa da Internet) algumas destas tecnologias com o objetivo pragmático de aumentar a interatividade da rede, cujo potencial dialógico era sub-utilizado, sendo lida monologalmente como as mídias de massa da época .

Desta maneira, com a inserção das signagens subliminares (Sintaxe de Pisca-Pisca de frases e cores, sobreposição rápida de três telas batizada TRITELA e que hoje sabemos ter sido precursora da tecnologia de LAYERS) obtivemos um aumento mensurado de acessos na ordem de 550% em relação aos meses anteriores, subindo de 200 acessos/mês em fevereiro de 1991 para 1.100 acessos/mês em abril , mantidos em maio, comprovando assim os efeitos mensuráveis da Midiologia Subliminar [5 CF. Relatórios Estatísticos Telesp do Videotexto do Brasil, março a maio de 1991 e o website http://www.calazans.ppg.br).

Casos atuais envolvendo Tecnologias Subliminares no final do Século XX

A revista GEEK número 9, ISSN 1516-9650, Digerati editorial, São Paulo, Fevereiro de 2001, dedicou matéria ao tema das signagens subliminares em softwares, entrevistando um Professor Doutor da Unesp e publicando três boxes com textos de autoria dele. No segundo box, página 50 o pesquisador Calazans explica:

“Na INTERNET, há um software produzido pela Macromídia, o mais popular programa de animação entre os Webmasters no ano 2000, o "Flash 4.0", um programa vetorial que executa cálculos velozes.No "Ambiente Flash" há comandos que permitem a possibilidade de inserir quadros coloridos cuja leitura-varredura na tela dos computadores chegue aos 30 quadros por segundo, inserindo um quadro com a mensagem subliminar entre os outros 29 do GIFF animado no "Flash 4.0" .Há outras ferramentas para inserir subliminares: Fire-Works, Giff Animator, 3-D Studio Max, Director e muitos outros softwares, e digitando direto em HTML ou Javascript é possível medir o comando "Delay" (tempo de leitura-permanência da tela em velocidades vertiginosamente taquicoscópicas).Tanto Websites, Home-Pages ou CD-Roms que empreguem tais ferramentas podem inserir signagens subliminares, e em uma animação de 300 ou 400 quadros, além de imperceptível, ficaria muito trabalhoso rastrear cada imagem e em cada quadrante dela para vistoriar subliminares, tornando os "webdesigners" seguros para cometer subliminares anti-éticos ou mesmo que enquadrem-se tipificados como crime (incitando a preconceito racial ou religioso, à práticas sexuais pedófilas, violência, etc..)".

Em setembro de 2000, no decorrer da campanha presidencial norte-americana, o candidato republicano à eleição, George Bush, em um filme de televisão veiculou críticas ao programa do candidato democrata Al Gore.Ao criticar o sistema de reembolso de remédios, a equipe de publicitários de Bush (chefiada por Alex Castellano, que anteriormente já tinha empregado subliminares para o candidato Bob Dole em outra eleição presidencial) inseriu, em um "frame" (uma divisão de tempo de varredura da tela equivalente a uma parte entre trinta divisões de um segundo, 1/30 de segundo em ilha de edição computadorizada) a palavra "RATS" (ratos) sobreposta à frase "bureaucrats decide".

Alex Castellano declarou ao jornal NEW YORK TIMES que a insersão em um frame foi "acidental".O filme foi veiculado 4.400 vezes em cobertura nacional antes de ser denunciado e cancelado, e teve um custo aproximado de US$2,5 milhões.

Tal expediente de Signagem Subliminar teria sido empregado objetivando recuperar a queda de Bush nas pesquisas, à época, empatado com Gore.

Segundo Osmar Freitas, correspondente em Nova York, na revista "ISTO É", n.1616 de 20 de setembro de 2000, página 118: "Caracterizava-se, assim, um dos mais clamorosos exemplos de propaganda subliminar jamais descobertos".

Este fato foi amplamente noticiado e documentado em rádio e televisão brasileira, incluindo matérias em jornais conceituados como "O ESTADO DE SÃO PAULO" ("Bush é acusado de usar propaganda subliminar" 13 de setembro de 2000, A15) e "FOLHA DE SÃO PAULO" ("Bush é acusado de propaganda subliminar" 13/9/200), ambas matérias distribuídas pela renomada e fidedigna agência de notícias Reuters.

Outro caso com muito destaque na mídia foi a inserção de dois fotogramas com fotos de uma mulher com os seios nus no desenho animado da Disney "Bernardo e Bianca", conforme a Folha de São Paulo de 15 de janeiro de 1999, "Pela primeira vez na história da companhia, a Disney admitiu ter encontrado imagens subliminares num de seus filmes de animação".

A cena acontece aos 28 minutos do filme e é imperceptível sem que se pare no quadro a quadro.Dois sites da internet iniciaram a polêmica, um deles foi http://www.entertainium.com/francais/video/rescuers2.html , graças a eles, a Disney foi obrigada a recolher 3,4 milhões de fitas em locadoras de vídeo nos USA.

Segundo o jornal A FOLHA DE SÃO PAULO de domingo, 8 de setembro de 2002, p. C-1 e c-3 :"Treze dias antes de a publicidade de cigarro ter sido banida das TVs no Brasil, o que ocorreu em 1º de janeiro de 2001, a Souza Cruz aceitou retirar do ar uma campanha do cigarro Free que o Ministério Público de Brasília considerou ilegal porque estimularia crianças e adolescentes a fumar. Ao decompor o anúncio quadro a quadro, os psicólogos encontraram o que consideram ser "propaganda subliminar". Na definição deles, propaganda sublimar é "qualquer estímulo realizado abaixo do limiar da consciência, que produz efeitos na atividade psíquica e mental do indivíduo". As mensagens subliminares são "remetidas automaticamente ao nosso cérebro, em nível involuntário, inconsciente". Por três décimos de segundo, ou seja, numa fração de tempo imperceptível para os olhos humanos, aparece uma mulher fumando. Logo em seguida, também por três décimos de segundo, aparece outra pessoa fumando.

Se os eventuais efeitos da chamada propaganda sublimar são cada vez mais questionados, a dúvida de Fernandes Neto não é desprezível: "Por que a Souza Cruz incluiu no comercial imagens que não dá para ver? Certamente, há alguma razão para isso".

A Souza Cruz alega que a responsabilidade sobre o comercial é das diretoras do filme, Daniela Thomas e Carolina Jabor. Daniela, porém, afirma não se lembrar dessa imagem e diz que, se ela existir, teria a função de dar ritmo às imagens.

A ADESF (Associação em Defesa da Saúde do Fumante) acha que o Ministério Público pegou um peixe grande.".

Assim, o parecer judicial dos psicólogos, como perícia técnica, define oficialmente na jurisprudência brasileira esta edição de imagens de três décimos de segundo como SUBLIMINAR, ora, na edição de televisão há 30 imagens (Frames) por segundo, e com a internet pode-se editar em velocidades de mais de 60 frames por segundo, como o já antigo SHOWSCAN, uma mídia subliminar [CF. 1-61].

Estes, entre tantos casos, comprovam a existência de Signagens Áudio-Visuais denominadas ora como Signos Subliminares, ora como Mensagens Subliminares, ora como Propaganda Subliminar e demonstram que há um emprego destas tecnologias de manipulação do inconsciente na Mídia Internacional eletrônica digitalizada.

CONSIDERAÇÕES FINAIS

Com estes exemplos acima, (espécimes recolhidos na Midiosfera brasileira no decorrer do Século XX e início do XXI, submetidos à metodologia de estudo de caso, elencados e analisados detalhadamente), fica FALSEADA a hipótese da inexistência de Signagens Subliminares nas Mídias Áudio-Visuais no decorrer do Século XX, comprovando-se que, contrariando a hipótese, há existência de signos denominados como propaganda subliminar veiculados fartamente documentada; desde o desenho animado da Disney (Disney que admite haver signagem subliminar e recolhe as fitas) até em Campanha Eleitoral Presidencial dos USA denunciada em diversos periódicos, e em parecer de psicólogos peritos em processo judicial contra propaganda tabagista.

"POLARIZATION MODE DISPERSION – PMD" UM ESTUDO SOBRE OS EFEITOS DO FENÔMENO EM LABORATÓRIO, ATRAVÉS DE SISTEMAS DE SIMULAÇÃO

Sandra Maria Dotto Stump [1], Maria Lucia M.Carvalho Vasconcelos [2] and Paulo Sérgio Milano Bernal [3]

Abstract *— Este trabalho permitiu explorar as possibilidades didático-pedagógicas dos modelos de simulação para a resolução de problemas complexos, envolvendo fenômenos de propagação em fibras ópticas, mais especificamente a "Dispersão Modal por Polarização" (PMD), cujo estudo dos efeitos e medição, em condições reais, tornaram-se extremamente difíceis na prática, devido à falta de acesso a longos enlaces de fibras ópticas (acima de dezenas de quilômetros), bem como à indisponibilidade de instrumentos de medição. Portanto, como forma de contorno para o problema mencionado, passamos a utilizar métodos de simulação em Laboratório. Estes por sua vez, uniram professores-orientadores e seus alunos em busca da aprendizagem efetiva, porque real. Se tecnicamente a experiência aqui relatada se apresenta como positiva, do ponto de vista da utilização de novos métodos de ensino, encontramo-nos diante de um novo paradigma, que já se apresenta indispensável ao ensino de Engenharia.*

Index Terms *— Inovações em Laboratório, Instrução Integrada com Uso de Laboratório, Differential Group Delay, Polarization Mode Dispersion.*

Este trabalho explora as possibilidades didático-pedagógicas dos modelos de simulação para a resolução de problemas complexos, envolvendo fenômenos de propagação em fibras ópticas, cujo projeto e medição, em condições reais, tornam-se extremamente difíceis na prática, devido à falta de acesso a longos enlaces de fibras ópticas (acima de dezenas de quilômetros), bem como à falta de disponibilidade de instrumentos de medição.

Tais métodos de simulação em Laboratório torna viável, tanto o desenvolvimento de solução para os problemas teóricos, quanto a medição simulada em condições próximas à real, contribuindo, assim, para o desenvolvimento e a formação dos alunos usuários deste Laboratório, que podem efetivar uma experiência transformadora dos procedimentos didáticos na área.

O uso educacional da tecnologia da simulação permite ao educando, diante de uma situação-problema, testar alternativas de ação, buscando a mais adequada sem, no entanto, causar danos ou prejuízos, que em uma situação real poderiam ocorrer.

Os processos de simulação de medições apresentados aqui foram desenvolvidos no Laboratório de Telecomunicações e Computação do Programa de Pós-Graduação em Engenharia Elétrica, da Universidade Presbiteriana Mackenzie, através do software de simulação de enlaces de fibras ópticas denominado VPI (Virtual Photonics Inc), em experiências que uniram professores-orientadores e seus alunos em busca da aprendizagem efetiva, porque real.

Se tecnicamente a experiência aqui relatada se apresenta como positiva, do ponto de vista da utilização de novos métodos de ensino, encontramo-nos diante de um novo paradigma, que já se apresenta indispensável ao ensino de Engenharia.

Do ponto de vista da utilização da tecnologia com fins educacionais, que apresenta, com clareza, a derrubada de padrões anteriormente utilizados, porque agora considerados obsoletos, deve-se ressaltar que a necessidade de mudança nas formas didático-pedagógicas de se trabalhar em sala de aula e/ou laboratório, devem voltar-se não só ao apelo tecnológico, que é instrumental, voltado para a competência do manejo dos meios, assim como para o desenvolvimento da capacidade individual do aluno raciocinar, organizando suas ações, de maneira crítica e analítica. [1]

Apesar de todos os avanços nas últimas duas décadas, visando eliminar, ou pelo menos atenuar significativamente, os efeitos de dispersão nos sinais ópticos propagados em enlaces de fibras ópticas, o crescimento do tráfego de comunicações forçou o aumento das taxas de sinalização de pulsos ópticos, aplicados nos cabos de fibras até então instalados. Conseqüentemente, alguns efeitos, até então não significativos, tornaram-se importantes, pois passaram a afetar a capacidade de transmissão de bits. Estes novos efeitos de dispersão, que se constituíam como objeto de pesquisas, foram sendo devidamente compensados através de novos processos de fabricação de fibras ópticas e pelo uso de novos tipos de LASER emissores de sinais. Como última

medida, foram desenvolvidos compensadores externos, que começaram a serem implantados nos enlaces de cabos de fibras instalados.

Dentre os efeitos que causam sérias limitações nos projetos de enlaces de fibras ópticas, a Dispersão Modal por Polarização (PMD) tornou-se uma das mais importantes limitações da capacidade de transmissão de informações, pois os efeitos decorrentes da PMD impõem limitações na recuperação das informações moduladas ou codificadas, tanto nos sistemas de comunicação óticos analógicos (CATV), como nos sistemas digitais de longa distância, cujas taxas de bits encontram-se acima de 10Gbps.

Nos anos oitenta, com a popularização das fibras monomodo, a principal preocupação quanto à dispersão em enlaces de fibras ópticas para telecomunicações passou a ser a Dispersão Cromática. Porém, com a criação das fibras "*Dispersion-Shifted"* e das fontes de sinal baseadas em Laser "*Single-frequency*", o problema da Dispersão Cromática foi contornado, o que levou diversos pesquisadores a concentrarem esforços para o entendimento, caracterização e compensação dos efeitos da PMD.

O efeito da PMD é particularmente importante nos sistemas multigigabits de longa distância, pois causa a perda de polarização e o espalhamento dos pulsos ópticos transmitidos, o que dificulta a detecção das informações nos receptores, ocasionando o aumento significativo da taxa de erros (BER) [2][3].

Com a introdução comercial dos sistemas de portadoras óticas, baseados em taxas de 10Gbps e 40Gbps, a PMD, tornou-se a maior fonte de preocupação, pois a grande maioria das fibras até então instaladas, não foram construídas para compensar o efeito degenerativo da PMD e, portanto, este efeito limitaria a capacidade de expansão da velocidade de propagação dos pulsos em longas distâncias. Devido ao fato da PMD não ter sido discutida até o início dos anos noventa, aproximadamente 30% das fibras monomodo fabricadas e instaladas até 1995 teriam características construtivas que as tornariam problemáticas em taxas de transmissão acima de 10Gbps, e evidenciariam um forte efeito decorrente da PMD. Como conseqüência, seria inviável tecnicamente a expansão destes sistemas de transmissão para as taxas atualmente suportadas, a menos que fossem introduzidos equipamentos de compensação dinâmica da PMD, ou que as fibras fossem substituídas.

PMD – CONCEITUAÇÃO TEÓRICA

A PMD causa a dispersão dos pulsos ópticos enviados pela fibra, de forma crescente e aleatória com a distância. Portanto, a dispersão dos sinais óticos causa o incremento a níveis inaceitáveis da taxa de bits errados transmitidos e recebidos pelo enlace óptico, limitando a largura de banda de transmissão, com conseqüente limitação da taxa máxima de pulsos óticos conduzidos, comprometendo o comportamento linear do pulso propagado no meio fibra ótica.

Podemos definir a dispersão de sinais ópticos conduzidos em fibras óticas como o efeito de espalhamento do sinal no tempo, ocasionando a sobreposição dos pulsos adjacentes, nos casos de grandes taxas de pulsos e largo espectro de freqüências, quando a PMD de segunda ordem torna-se mais aparente. Em decorrência da dispersão dos pulsos e da sobreposição, os pulsos perdendo o seu formato característico, torna-se difícil detectar o código da informação binária pelos receptores na extremidade final da fibra.

O efeito da PMD nos pulsos ópticos transmitidos nas fibras é normalmente definido e medido através do Atraso de Grupo Diferencial – DGD (Differential Group Delay), que descreve a diferença no tempo de chegada das duas componentes ortogonais que formam o pulso. Desta forma, o sinal composto conduzido nos duas componentes com planos polarizados de forma ortogonal se "separarão" pelo efeito das diferentes velocidades de Grupo em cada plano de polarização. O sinal sofrerá então um espalhamento pela defasagem em tempo que cada componente de polarização terá em relação ao outro, formando o DGD. Como as fibras ópticas são anisotrópicas, possuindo diferentes valores para as constantes de propagação em cada direção, as duas componentes ortogonais da onda que sofreu birrefringência terão diferentes índice de refração entre si e, passarão a ter diferentes velocidades de propagação em cada direção. Como conseqüência, ocorre a dispersão por polarização, que é agravada pelo acoplamento do modo de polarização resultante de pequenas variações randômicas na birrefringência ao longo da extensão da fibra [4]. Desta forma, para extensões superiores a 100 metros de fibra, torna-se difícil prever o comportamento da polarização resultante. Portanto, o modelo de propagação linearmente polarizada com duas ondas ortogonais aplica-se para pequenos comprimentos de fibra. Para contornar esta dificuldade, usa-se o modelo no qual diversos pequenos pedaços de fibras birrefringentes são concatenados, formando uma longa fibra, cujos efeitos individuais de cada pedaço são sobrepostos, representando o efeito total. A aplicação desse modelo mostrou-se inviável experimentalmente para enlaces de fibras maiores do que 1 Km. [2]

O modelo no qual foi baseado esse trabalho, supõe a consideração de duas componentes inicialmente ortogonais (os principais estados de polarização – PSP), propagando-se com a mesma velocidade; mas, devido à birrefringência randômica ao longo da fibra, as componentes ortogonais do sinal passam a ter diferentes velocidades de propagação nas diferentes direções em que podem seguir, causando a separação no tempo (Δt) das duas componentes ortogonais, após algumas dezenas de quilômetros, o que é caracterizado como o "Atraso Diferencial". Na Figura 1 são ilustradas as duas componentes simuladas do sinal óptico numa fibra birrefringente.

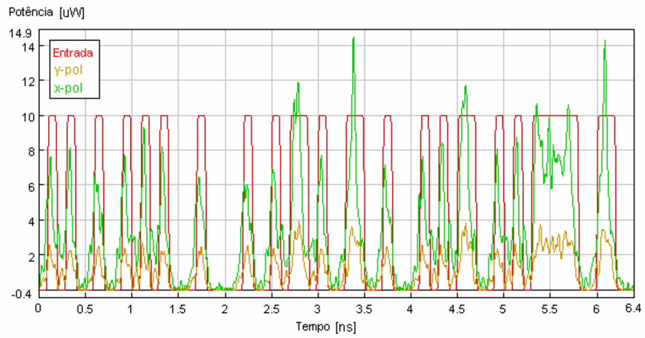

FIGURE. 1
SIMULAÇÃO DAS COMPONENTES DO SINAL ÓPTICO NUMA FIBRA BIRREFRINGENTE, USANDO O SOFTWARE VPI DA PHOTONICS.

No limite do modo de acoplamento extensível, os principais estados de polarização e o tempo de atraso diferencial na fibra não são fortemente correlacionados com as propriedades locais da fibra, desde que eles dependam dos efeitos resultantes de todos os efeitos locais ou pontuais, do modo de acoplamento randômico, por todo o caminho de propagação. Então, espera-se que os PSP e o tempo de atraso diferencial irão variar aleatoriamente de fibra para fibra, com o Atraso Diferencial de Grupo exibindo um comportamento que pode ser aproximado por uma distribuição de probabilidades de Maxwell [5].

Desta forma, o Atraso Diferencial entre as componentes ortogonais, passa a ser tratado como um valor médio para uma família de fibras ópticas com as mesmas características estatísticas. Para a realização de medições práticas, assume o valor do DGD médio em pico segundo (ps). Sabendo-se que este cresce com o quadrado da distância percorrida na fibra entre a entrada e a saída do sinal [4], pode ser calculado o valor do parâmetro PMD para a família de fibras ópticas em questão pelo uso da equação (1):

$$PMD = \frac{\langle \Delta\tau \rangle}{\sqrt{L}} \quad (1)$$

A solução proposta na referência [6] é do uso de um modelo de simulação de Monte Carlo para atingir a solução calculada e comprovar que o a função densidade de probabilidade (PDF) se aproxima a uma distribuição de probabilidade de Maxwell.

Uma vez conhecido o comportamento estatístico aproximado de um fenômeno, sua descrição prática pode ser feita, de modo aproximado, mas satisfatório, segundo a função distribuição de probabilidades.

Então, podemos caracterizar a PMD de uma família de fibras ópticas, estatisticamente equivalentes, pelo conhecimento do valor médio e dispersão em torno deste valor.

MÉTODO DE DESENVOLVIMENTO

Diversos processos são atualmente utilizados para a medição do DGD e da PMD em laboratório, ou em campo. Para a realização deste trabalho utilizamos o software de simulação VPI da Photonics Inc. Este software é disponível no Laboratório de Telecomunicações e Computação do Programa de Pós Graduação em Engenharia Elétrica da Universidade Presbiteriana Mackenzie. O mesmo permite a simulação de sinais ópticos, se propagando em enlaces de fibras ópticas, bem como a simulação de sistemas de comunicação e a medição simulada dos efeitos da PMD.

Utilizando as simulações disponíveis no software VPI, podem ser realizadas medições simuladas do DGD médio de uma família de fibras simuladas, estatisticamente equivalentes, de modo a comparar os resultados experimentais, com os resultados de cálculos teóricos solucionados com simulação por Monte Carlo.

O desenvolvimento teórico para a simulação de Monte Carlo toma como base o desenvolvimento expresso a partir da equação que descreve a birrefringência intrínseca ao meio, fibra óptica e pela variação vetorial do sinal acoplado com esse meio em polarização [6].

É significativo o resultado positivo, no campo de ensino de Engenharia, resultante deste procedimento. Não só a compreensão dos processos fica facilitada, como são ampliadas, em muito, as possibilidades de pesquisa na área. Nesse contexto, a utilização das tecnologias de informática com finalidade educacional, oferece suporte pedagógico às atividades do processo de ensino-aprendizagem, objetivando a qualidade, a flexibilidade e a real experimentação na educação. [8]

METODOLOGIA

Inicialmente estudamos a Dispersão Modal por Polarização (PMD) de primeira ordem em fibras ópticas monomodo, enfocando o modelo dos Principais Estados de Polarização (PSP), introduzido por Poole e Wagner na referência [2], acompanhando, em seguida, a evolução do modelo proposto, nos demais trabalhos das referências [3], [4], [5] e [6]. A revisão bibliográfica foi complementada pelo cálculo de sistemas matemáticos complexos e pelas medições simuladas em computador de enlaces de fibras com manifestação da PMD.

A seguir, estabelecem-se processos para solucionar sistemas de equações probabilísticas dinâmicas, por simulação do tipo Monte Carlo, comparando então os resultados com medições simuladas dos efeitos do PMD de uma família de fibras monomodo estatisticamente compatíveis, através do software de simulação Photonics-VPI. Este procedimento permitiu obter resultados equivalentes às medições realizadas em campo, em enlaces de fibras ópticas de muitas dezenas de quilômetros e com instrumentos de medição sofisticados.

Os resultados obtidos com estas medições simuladas e com os processos de resolução de sistemas de equações por método de simulação, permitiram a incorporação do conhecimento adquirido ao conjunto de técnicas ministradas aos alunos do Programa de Pós-Graduação em Engenharia Elétrica da Universidade Presbiteriana Mackenzie, na forma de aulas de laboratório que dão suporte às disciplinas teóricas do Programa.

Aos alunos são oferecidas possibilidades de realizar diversas medições e previsões teóricas de sistemas práticos, através de processos simulados, permitindo projetar enlaces e analisar problemas de situações reais encontradas em campo.

Do ponto de vista das teorias da aprendizagem, a compreensão, por parte do aluno, daquilo que lhe é apresentado, é condição essencial para sua aprendizagem. Num curso de Pós-Graduação em Engenharia Elétrica, a possibilidade de trabalhar com simuladores, além das evidentes vantagens científicas, as questões motivacionais, contributivas para a efetivação do processo de ensino-aprendizagem, não podem ser menosprezadas.

OBTENÇÃO DE IMPLICANTES PRIMOS PARA FUNÇÕES BOOLEANAS ATRAVÉS DA OPERAÇÃO DE CONSENSO

Alexandre César Rodrigues da Silva[1]*, Ivanil Sebastião Bonatti*[2] *e Cláudio Kitano*[3]

Resumo *— No desenvolvimento de projetos de sistemas digitais envolvendo FPGA, necessita-se de eficientes algoritmos computacionais para a minimização das funções booleanas contendo um grande número de variáveis. Neste trabalho apresenta-se o algoritmo GeraPlex, que obtém todos os implicantes primos de uma função booleana através de sucessivas aplicações da operação de consenso aos ramos de uma árvore de decisão binária, onde cada caminho (nó até folha) representa um mintermo ou irrelevante da função. Da aplicação do consenso são definidas as operações de fusão, deslocamento e expansão, que diminui, mantém e aumenta, respectivamente, os caminhos da árvore. No final do processo os caminhos que permanecem na árvore representam os implicantes primos da função. Dezenas de funções foram minimizadas e os resultados obtidos comparados com o tradicional método tabular para a geração de implicantes primos. Em todos os casos o GeraPlex obteve os mesmos implicantes primos e apresentou desempenho superior em tempo e memória.*

Palavras Chave — Consenso iterativo, Minimização de funções Booleanas, Otimização, Síntese lógica .

INTRODUÇÃO

Na simplificação de funções booleanas de médio porte (tipicamente de 10 a 30 variáveis) o número de implicantes primos gerados pode crescer exponencialmente. Portanto a obtenção de todos os implicantes primos requer grande quantidade de memória e tempo de execução. Alguns autores trataram o problema de forma algébrica [1], [2], enquanto outros utilizaram-se de tabelas e árvores de decisão binária [3], [4], [5] e [6].

Quine [6] e Tison [7] utilizaram-se do consenso iterativo para obter todos os implicantes primos de uma dada função booleana. Neste trabalho, apresenta-se o algoritmo denominado GeraPlex, que obtém todos os implicantes primos de uma função booleana através de sucessivas aplicações da operação de consenso aos ramos de uma árvore de decisão binária que representa a tabela verdade da função a ser minimizada. Nesta árvore cada caminho, que vai da raiz à folha, representa um mintermo ou irrelevante da função.

No algoritmo proposto da aplicação do consenso aos ramos da árvore são definidas três operações: fusão, expansão e deslocamento que diminui, aumenta e mantém o número de caminhos da árvore, respectivamente.

Resultados experimentais indicam que o método proposto é uma eficiente alternativa para a resolução do problema considerado, pois é de fácil implementação e muito adequado para representar circuitos lógicos combinacionais.

O CONSENSO DE UMA FUNÇÃO

O Consenso de $f(x_1, x_2, \ldots, x_i, \ldots, x_n)$ com relação à variável x_i é definida como $C_{xi}(f) = f_{xi} \cdot f_{xi'}$ [9]. Dessa forma, pode-se afirmar que o consenso de uma função booleana com relação a uma variável representa o componente que é independente dessa variável. O consenso pode ser estendido para conjuntos de variáveis como uma aplicação iterativa da operação de consenso sobre as variáveis do conjunto. Por exemplo, o consenso entre os termos produtos A´.B´.D.E e A.B´.C.D é o termo produto B´.C.D.E. Não existe o consenso entre os termos produtos A´.B´ e A.B.C, pois deve haver uma única variável que ocorre negada em um dos termos e não negada no outro.

Método do Consenso para Obter Implicantes Primos

O método do consenso iterativo [10] para a obtenção dos implicantes primos de uma função booleana consiste na aplicação das operações de eliminação e consenso, até que estas operações não sejam mais aplicáveis. Na operação de eliminação elimina-se quaisquer termos produto que cobre algum outro termo produto e na operação de consenso acrescenta-se como termos produto o consenso de dois termos produtos, se este não for coberto por nenhum outro termo produto contido na soma de produto.

Como exemplo da aplicação do método do consenso considere a função $F_1(A,B,C,D) = \sum m(5,7,8,9,13)$. Esta função F_1(A.,B,C,D) pode ser representada através da soma de produto como A´.B.C´.D + A´.B.C.D + A.B´.C´.D´ + A.B´.C´.D + A.B.C´.D. O consenso entre A.B´.C´.D´ e A.B´.C´.D resulta no termo A.B´C´ que não é coberto por nenhum dos termos produtos, devendo então ser incluído na soma. Com a inclusão do termo consenso tem-se uma nova expressão soma de produto, ou seja, F_1(A.,B,C,D) = A´.B.C´.D + A´.B.C.D + A.B´.C´.D´ + A.B´.C´.D + A.B.C´.D + A.B´C´. Pode-se notar que o termo A.B´C´

cobre os termos produtos A.B´.C´.D´ e A.B´.C´.D, podendo ambos serem eliminados. A nova expressão torna-se A´.B.C´.D + A´.B.C.D + A.B.C´.D + A.B´C´. As operações de consenso e eliminação são empregadas tanto quanto possível. Com a aplicação sistemática tem-se F_1(A.,B,C,D) = A.B´.C´ + A.C´.D + A´.B.D + B.C´.D, que representam os implicantes primos da função considerada. A Figura 1 apresenta no Mapa de Karnaugh os implicantes primos gerados.

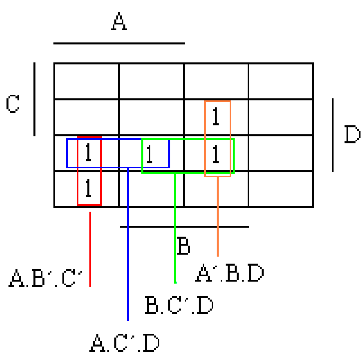

FIGURA. 1
MAPA DE KARNAUGH APRESENTANDO OS IMPLICANTES PRIMOS OBTIDOS PELA APLICAÇÃO DO CONSENSO INTERATIVO NA FUNÇÃO F_1(A,B,C,D).

ALGORITMO PROPOSTO PARA A GERAÇÃO DOS IMPLICANTES PRIMOS

O algoritmo proposto denominado GeraPlex obtém todos os implicantes primos, de uma dada função booleana, utilizando-se da operação de consenso aplicada aos ramos de uma árvore de decisão binária que representa a função a ser minimizada.

Uma árvore de decisão binária é uma forma equivalente à Tabela Verdade utilizada para representar funções booleanas. Nesta estrutura os mintermos são representados pelos ramos da árvore. A Figura 2 apresenta a árvore de decisão para a função F_2(A,B,C,D) = $\sum m(0,1,3,5,9,13,15)$.

Note que na Figura 2 a raiz da árvore (variável A) representa o bit mais significativo e que as folhas (variável D) representa o bit menos significativo. Um mintermo (linha da Tabela Verdade cuja função assume valor lógico 1) é representado por um caminho da árvore, que vai da raiz à folha. Dessa forma, o caminho 1001 representa o mintermo 9.

Esta forma para representar funções booleanas é bastante conveniente para implementações computacionais, pois um mesmo ramo da árvore pode ser utilizado por mais de um mintermo, o que significa menos utilização de memória.

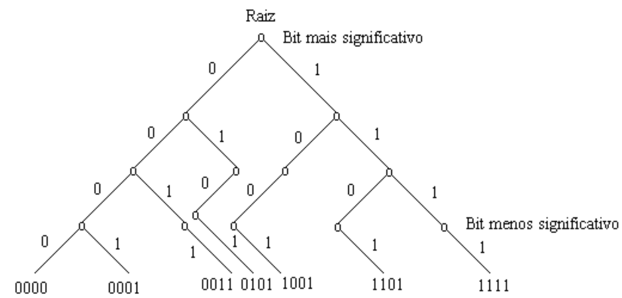

FIGURA. 2
ÁRVORE DE DECISÃO BINÁRIA PARA A FUNÇÃO F_2(A,B,C,D).

No algoritmo GeraPlex, a geração dos implicantes primos tem início analisando-se a possibilidade de se aplicar o consenso aos ramos da árvore pertencentes aos nós do nível mais distante da raiz. Após aplicar o consenso aos ramos dos nós de um nível, avança-se para o próximo nível, no sentido da raiz. Desse modo, quando analisa-se um nó, todas as sub - árvores abaixo desse nó já devem ter sido analisadas. Da aplicação do consenso aos ramos da árvore são definidas três operações:

- **Fusão:** A operação de fusão ocorre quando dois ramos de um nó geram um terceiro ramo. O ramo gerado cobre os outros dois ramos do nó. Neste caso os ramos cobertos são eliminados. Esta operação diminui a quantidade de caminhos da árvore;
- **Deslocamento:** A operação de deslocamento ocorre quando dois ramos de um nó geram um terceiro ramo, porém o ramo gerado cobre apenas um dos dois outros ramos. Neste caso, o ramo coberto é eliminado. Esta operação mantém a quantidade de caminhos da árvore;
- **Expansão:** A operação de expansão ocorre quando dois ramos de um nó geram um terceiro ramo, porém o ramo gerado não cobre nenhum dos outros dois ramos.

Descrição Resumida do Algoritmo GeraPlex

O algoritmo GeraPlex obtém os implicantes primos de uma função booleana, e além disso, determina os implicantes primos essenciais, com vistas à formulação do problema de cobertura como um problema de programação matemática. Os seguintes passos compõe o algoritmo:

- **Montagem das árvores**: Monta-se duas árvores com a mesma estrutura; uma contendo somente os mintermos da função (árvore dos mintermos) e a outra contendo os mintermos e os irrelevantes (árvore dos implicantes). A árvore dos mintermos é utilizada no final do algoritmo para se determinar quais dos implicantes primos gerados são essenciais. Na árvore de implicantes são gerados os implicantes primos da função através das operações de fusão, deslocamento e expansão. Na lista ligada, em estrutura de árvore, cada registro tem três apontadores rotulados por "zero", "um" e "dc";

- **Geração dos implicantes primos**: Os implicantes primos da função são gerados na árvore de implicantes através de sucessivas aplicações do Método do Consenso aos ramos da árvore. Para evitar a geração de implicantes não primos deve-se inicialmente aplicar, para cada nó no mesmo nível da árvore, o consenso a ramos que produzem a fusão para depois aplicar o consenso a ramos que produzem o deslocamento ou a expansão. Para cada nível analisado deve-se eliminar os implicantes não primos. Após analisar o nó da raiz, a árvore de implicantes só contém caminhos que representam os implicantes primos da função;
- **Determinação dos implicantes primos essenciais**: Esse passo consiste em determinar os caminhos que representam os implicantes primos essenciais da função que devem ser eliminados da formulação do problema de cobertura objetivando a sua simplificação. No final desse procedimento a árvore de implicantes contém somente implicantes primos que não são essenciais. Isto corresponde, no Mapa de Karnaugh, a um caso cíclico, podendo ser formulado como um problema de programação linear inteira 0 e 1.
  - Seleciona-se um mintermo (caminho) da árvore de mintermos;
  - Verifica-se na árvore de implicantes quantos implicantes cobrem o mintermo selecionado;
  - Se existir apenas um implicante que cobre o mintermo selecionado, este é considerado essencial sendo removido da árvore de implicantes. Elimina-se também, da árvore de mintermos, todos os mintermos cobertos pelo implicante eliminado da árvore de implicantes;
  - Retorna-se ao início desse passo até que todos os mintermos tenham sido analisados.

Como exemplo de aplicação do algoritmo GeraPlex considere a função $F_3(A,B,C) = \sum m(0,1,5) + d(2,7)$, cujo Mapa de Karnaugh está apresentado na Figura 3.

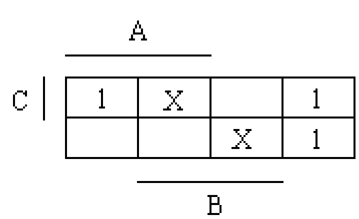

FIGURA. 3
MAPA DE KARNAUGH DA FUNÇÃO F_3(A,B,C).

A árvore inicial dos implicantes primos é mostrada na Figura 4. A geração dos implicantes primos inicia-se pela aplicação do consenso aos ramos dos nós do nível 0, ou seja, os mais distantes da raiz. A árvore apresentada na Figura 5 é o resultado da aplicação do consenso aos caminhos 000 e 001 que resulta no caminho 00X. Note que essa operação corresponde à fusão, pois o caminho gerado cobre os outros dois.

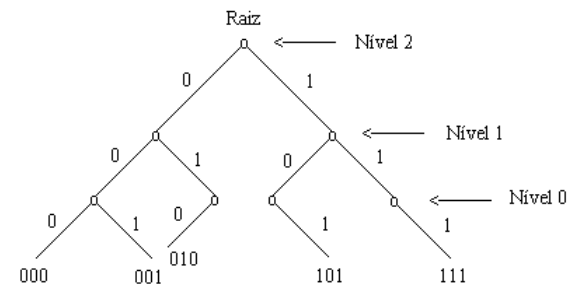

FIGURA. 4
ÁRVORE DE IMPLICANTES PRIMOS PARA A FUNÇÃO F_3(A,B,C).

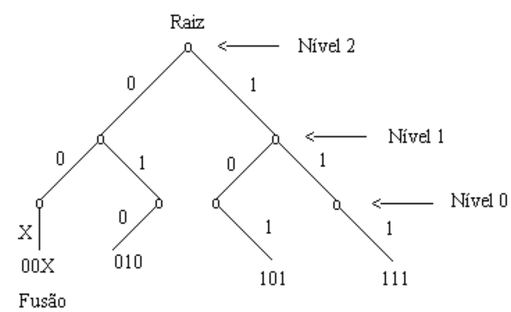

FIGURA. 5
ÁRVORE DE IMPLICANTES PRIMOS APÓS A APLICAÇÃO DO CONSENSO AOS NÓS DO NÍVEL 0.

Após a aplicar o consenso aos ramos de um nível da árvore, avança-se para os nós do próximo nível no sentido da raiz. A árvore apresentada na Figura 6 é o resultado da aplicação do consenso aos ramos dos nós de nível 1. O consenso entre os caminhos 101 e 111 gera o caminho 1X1, que cobre ou outros dois caminhos. Observe que o consenso entre os caminhos 00X e 010 gera o caminho 0X0, que cobre somente o caminho 010. Esta operação é definida como deslocamento.

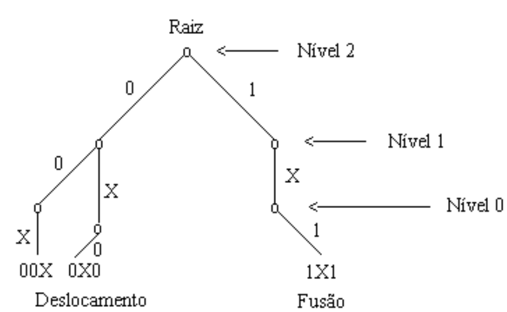

FIGURA. 6
ÁRVORE DE IMPLICANTES PRIMOS APÓS A APLICAÇÃO DO CONSENSO AOS NÓS DO NÍVEL 1.

Para o nó de nível 2 (raiz), da árvore apresentada na Figura 6, o consenso aplicado aos caminhos 00X e 1X1 gera o caminho X01. O caminho gerado não cobre nenhum dos outros dois caminhos. Essa operação é chamada de expansão, pois aumenta o quantidade de caminhos na árvore, como pode ser observado na Figura 7.

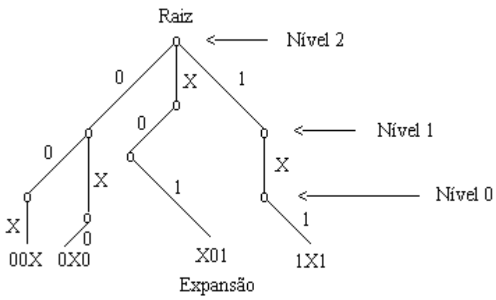

FIGURA. 7
ÁRVORE DE IMPLICANTES PRIMOS APÓS A APLICAÇÃO DO CONSENSO AO NÓ DO NÍVEL 2.

Observe que na árvore apresentada na Figura 7 não se pode mais aplicar o consenso. Todos os caminhos da árvore representam implicantes primos da função como mostra o Mapa de Karnaugh apresentado na Figura 8.

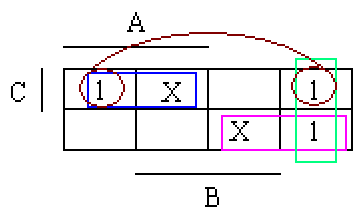

FIGURA. 8
MAPA DE KARNAUGH COM OS IMPLICANTES PRIMOS GERADOS PELO PROGRAMA GERAPLEX PARA A FUNÇÃO F3.

Com os implicantes primos obtidos, o problema de cobertura de funções booleanas pode ser formulado como um problema de programação linear inteira 0 e 1. Para a função F_3 tem-se a seguinte formulação do problema de cobertura:

$$\text{Min } F_3 = 3.1X1 + 3.0X0 + 3.00X + 3.X01$$
s.a.
$$0X0 + 00X \geq 1$$
$$00X + X01 \geq 1$$
$$1X1 + X01 \geq 1$$
$$1X1,\ 0X0,\ 00X \text{ e } X01 \in \{0, 1\}$$

Pode-se notar que o problema de cobertura passou a ser tratado como um problema de programação matemática, podendo-se, dessa forma, utilizar-se de todos os avanços dessa área de pesquisa.

Para as dezenas de casos estudados, o programa GeraPlex obteve os mesmos implicantes primos obtidos pelo método tabular de Quine-McCluskey. Foram também estudadas funções denominadas Tudo Um, isto é, funções contendo todos os mintermos possíveis. Trata-se de uma função sem uso prático, entretanto, consiste em um bom teste para avaliar o desempenho de algoritmos, pois exige grande quantidade de memória e consome muito tempo de computação.

No início do desenvolvimento desta pesquisa, pretendia-se comparar a eficiência do algoritmo desenvolvido com outros algoritmos implementados em pesquisas anteriores. Estas comparações foram realizadas, entretanto, foram logo desconsideradas, pois entendeu-se serem comparações desleais. Dois foram os motivos. Primeiro, as estruturas de dados utilizadas no programa GeraPlex são muito diferentes das estruturas empregadas no Quine-McCluskey e nos outros algoritmos, e com toda certeza essa foi a principal vantagem do GeraPlex sobre os outros algoritmos avaliados. Segundo, as linguagens de programação utilizadas foram diferentes, o que torna sem sentido qualquer tipo de comparação em termos de tempo de execução e uso de memória dos algoritmos.

O programa GeraPlex estará sendo comparado com um outro programa para a geração de implicantes primos que implementa o Método de Expansão de Shannon. Este outro programa, denominado Expander também utiliza-se de estrutura em diagrama de decisão binária e está programado na linguagem de programação C, da mesma forma que o GeraPlex.

Este é o motivo pelo qual não apresentou-se os dados comparativos entre o algoritmo implementado e alguns outros método clássicos. Entretanto, pode-se afirmar com muita segurança que a abordagem dada neste trabalho consiste em uma forma bastante eficiente para a geração de implicantes primos e formulação do problema de cobertura de funções booleanas como um problema de programação matemática.

CONCLUSÃO

Este trabalho apresentou uma alternativa eficiente para a geração de todos os implicantes primos de uma função booleana, a partir dos quais o problema de cobertura pode ser formulado como um problema de programação linear inteira 0 e 1.

Os implicantes primos da função foram gerados aplicando-se a operação de consenso aos ramos de uma árvore de decisão binária cujos caminhos (raiz até folha) representam os mintermos e irrelevantes da função. Da aplicação do consenso aos ramos da árvore são definidas as operações de fusão, deslocamento e expansão, que diminui, mantém e aumenta, respectivamente, os caminhos da árvore. No final do processo os caminhos que permanecem na árvore representam os implicantes primos da função, que no

Método de Quine-McCluskey (tradicional método tabular) corresponde a um Mapa Cíclico.

Dezenas de funções booleanas foram minimizadas e os resultados comparados com tradicionais métodos de geração de implicantes primos. Em todos os casos o GeraPlex obteve os mesmos implicantes primos e apresentou desempenho superior em tempo e memória.

AGRADECIMENTOS

Os autores agradecem o apoio recebido do PPGEE da Faculdade de Engenharia Elétrica de Ilha Solteira – UNESP e da CAPES.

PROGRAMAÇÃO MATEMÁTICA APLICADA NO PROBLEMA DE COBERTURA DE FUNÇÕES BOOLEANAS COM MÚLTIPLAS SAÍDAS

Alexandre César Rodrigues da Silva[1], *Ivanil Sebastião Bonatti*[2] *e Cláudio Kitano*[3]

Resumo — *A complexidade dos sistemas digitais exige circuitos contendo várias saídas, ao invés de apenas uma. Essas funções de saídas podem ser implementadas independentemente, porém uma considerável economia ocorrerá se forem implementadas como um todo. Essa economia decorre do uso de um mesmo termo produto por duas ou mais funções, que é implementado uma única vez e compartilhado pelas funções. Apresenta-se neste trabalho o algoritmo MultPlex, que minimiza funções booleanas com múltiplas saída. Para a fase de geração de implicantes primos, utilizou-se um tradicional método tabular, que foi estendido para considerar as múltiplas funções. As Coberturas das funções são resultado de dois problemas de programação matemática, aqui denominados de problema de cobertura múltipla e problema de cobertura singular. Os testes realizados mostram que este tipo de enfoque resolve o problema de minimização de funções com múltiplas saídas de maneira eficiente e representa um avanço considerável para esta classe de problema.*

Palavras chave — Minimização de funções Booleanas, Otimização, Programação matemática, Síntese lógica .

INTRODUÇÃO

O problema de simplificar funções booleanas que representam circuitos digitais com um grande número de variáveis e com múltiplas saídas, onde as saídas dependem das mesmas variáveis de entrada, ainda continua sem uma solução satisfatória. Seguramente as funções para as múltiplas saídas podem ser minimizadas separadamente, contudo esse procedimento não leva a uma solução de menor custo.

Tanto o Mapa de Karnaugh quanto o Método de Quine-McCluskey [1] podem ser estendidos para simplificar várias funções simultaneamente, através do compartilhamento dos termos comuns. Tal procedimento torna-se impraticável se o número de variáveis ou o número de funções forem grandes.

Uma grande quantidade de algoritmos como, por exemplo, os descritos em [2] - [3] - [4] - [5] - [6] e [7] foram desenvolvidos na tentativa de solucionar esse problema. Um algoritmo denominado McBoole [8] obtém uma cobertura mínima para funções booleanas com múltiplas saídas expressa como uma lista de cubos. Baseando-se na manipulação eficiente de grafos e em técnicas de partição, o McBoole encontra, quase sempre, uma cobertura mínima global. Trata-se de um algoritmo atrativo para funções com até 20 variáveis de entrada e até 20 funções de saída.

Neste trabalho formulou-se o problema de minimização de funções booleanas com múltiplas saídas como um problema de programação linear inteira 0 e 1 e apresenta-se um algoritmo denominado MultPlex, que obtém a cobertura mínima, resolvendo os problemas matemáticos formulados. O critério de custo adotado é o número de portas ANDs na realização das funções.

Para a geração dos implicantes primos, utilizou-se um método tabular, adaptado para considerar funções com múltiplas saídas.

As coberturas das funções de saídas são soluções de dois problemas de programação matemática. No primeiro problema, denominado de cobertura múltipla, formulou-se o problema de cobertura como um problema de programação matemática cujas variáveis são os implicantes primos singulares (pertencentes a uma única função) e os implicantes primos múltiplos (pertencentes a uma ou mais funções) das funções de saída. No problema matemático gera-se uma restrição de cobertura para cada mintermo de todas as funções de saídas.

No segundo problema, denominado de cobertura singular, tem-se como variáveis os termos solução do problema de cobertura múltipla. Desse modo, tem-se tantos problemas singulares quanto forem o número de saídas da função sob estudo.

Na função objetivo de cada problema considera-se somente os implicantes primos solução da cobertura múltipla que cobre a função em questão. Nas restrições de cobertura, considera-se somente os mintermos da função.

GERAÇÃO DE IMPLICANTES PRIMOS PARA FUNÇÕES COM MÚLTIPLAS SAÍDAS

Para a cobertura de funções booleanas com múltiplas saídas considera-se, além dos implicantes primos singulares (que cobrem mintermos pertencentes a apenas uma das funções), os implicantes primos múltiplos (que cobrem mintermos originados do produto lógico de duas ou mais funções de saída).

Na geração dos implicantes primos utilizou-se o tradicional Método Tabular de Quine-McCluskey [1] que foi

estendido para considerar funções com múltiplas saídas. Para esse tipo de funções os mintermos e os irrelevantes devem conter, além do identificador (representação binária de um mintermo ou irrelevante), uma outra seqüência de bits, denominada de rótulo, que assinala quais funções de saída incluem o termo produto (mintermo ou irrelevante). Desse modo, a notação 0100 11 significa que o mintermo 4 que é representado por $(0100)_2$ pertence as funções F_a e F_b representadas pela notação 11. Da mesma forma, a notação 11X0 01 significa que o implicante 11X0 cobre somente o mintermo pertencente à função F_b, pois tem-se 0 no identificador da função F_a.

Para a geração dos implicantes primos singulares e implicantes primos múltiplos, os mintermos e os irrelevantes são combinados da mesma forma que no tradicional Método de Quine-McCluskey, contudo algumas observações tornam-se necessárias:

- Só podem ser combinados mintermos ou irrelevantes comuns (assinalados para as mesmas funções de saída);
- Quando dois mintermos ou irrelevantes combinarem-se, os bits do rótulo do implicante resultante terá o dígito 1, somente nas posições onde ambos os rótulos dos mintermos ou irrelevantes combinados têm 1, ou seja, aplica-se a operação AND entre os bits dos rótulos. Por exemplo, a combinação do mintermo 0110 10 com o mintermo 1110 11 gera o implicante X110 10, que pertence somente à função f_a.
- Marcar um implicante como tendo sido combinado, somente se seu rótulo está contido no rótulo do implicante resultante da combinação.

Para exemplificar o emprego do método tabular para a geração de implicantes primos para múltiplas funções considere as funções $F_1(A,B,C) = \Sigma m(0,1,3,5)$, $F_2(A,B,C) = \Sigma m(2,3,5,6)$ e $F_3(A,B,C) = \Sigma m(0,1,6)$. A Figura 1 apresenta a tabela para a geração dos implicantes primos.

	A B C	f_1 f_2 f_3	
0	0 0 0	1 0 1	*
1	0 0 1	1 0 1	*
2	0 1 0	0 1 0	*
3	0 1 1	1 1 0	
5	1 0 1	1 1 0	
6	1 1 0	0 1 1	
0-1	0 0 X	1 0 1	
1-3	0 X 1	1 0 0	
1-5	X 0 1	1 0 0	
2-3	0 1 X	0 1 0	
2-6	X 1 0	0 1 0	

↑ Identificador ↑ Rótulo

FIGURA. 1
TABELA DE GERAÇÃO DE IMPLICANTES PRIMOS PARA AS FUNÇÕES F_1, F_2 , F_3.

O procedimento para a seleção dos implicantes primos, que corresponde à uma cobertura mínima para as funções em análise, pode ser o mesmo utilizado para a cobertura de uma única função. Entretanto, este método, que já é bastante complexo para tratar de uma única função, torna-se extremamente penoso e ineficiente para trabalhar com múltiplas funções.

Abordagem dada neste trabalho foi a formulação do problema de cobertura múltiplas funções de saída como um problema de programação linear inteira 0 e 1.

COBERTURA DE FUNÇÕES BOOLEANAS COM MÚLTIPLAS SAÍDAS SOB A ÓPTICA DA PROGRAMAÇÃO MATEMÁTICA

O problema de cobertura de funções booleanas com múltiplas saídas pode ser formulado como um problema de programação matemática.

Adotou-se como critério de custo a quantidade de portas ANDs necessárias para a implementação das múltiplas funções. Dessa forma, o problema de cobertura das múltiplas funções de saída torna-se bastante similar ao problema de cobertura para uma única função de saída. A diferença é que, no caso de funções com múltiplas saídas, a cobertura é efetuada em duas etapas.

Na primeira etapa, denominada de cobertura múltipla, as variáveis do problema matemático, são os implicantes primos singulares e os implicantes primos múltiplos, obtidos pelo método de geração de implicantes primos. As restrições de cobertura são tantas quanto forem os mintermos de todas as funções de saída. Se um mintermo está incluído em duas funções, tem-se duas restrições para esse mintermo. Apresenta-se a seguir a formulação do problema de cobertura múltipla para as funções F_1, F_2 e F_3.

$$\text{Min } F = 3.(00X+0X1+X01+01X+X10) + 4.(011+101+110)$$

s.a

$$00X \geq 1$$
$$00X + 0X1 + X01 \geq 1$$
$$011 + 0X1 \geq 1$$
$$101 + X01 \geq 1$$
$$01X + X10 \geq 1$$
$$011 + 01X \geq 1$$
$$101 \geq 1$$
$$110 + X10 \geq 1$$
$$00X \geq 1$$
$$00X \geq 1$$
$$110 \geq 1$$
$$00X, 0X1, X01, 01X, X10, 011, 101, 110 \in \{0, 1\}$$

Pode-se notar que o critério de custo é dado pela soma ponderada dos implicantes primos múltiplos e dos implicantes primos singulares e que há uma restrição para cada mintermo de todas as funções de saída. Desse modo, as quatro primeiras restrições referem-se, respectivamente, à cobertura dos mintermos 0, 1, 3 e 5 de F_1. As próximas quatro restrições se referem aos mintermos 2, 3, 5 e 6 de F_2 e as três últimas restrições referem-se aos mintermos 0, 1 e 6 de F_3. As restrições redundantes podem ser eliminadas.

A solução da cobertura múltipla é obtida utilizando-se algum método matemático de resolução de programação matemática como, por exemplo, o Método Simplex e o Plano de Corte de Gomory [9]. A solução para o problema em questão, apresentado como exemplo, é dada pelos implicantes 101 110, 110 011, 00X 101, 0X1 100 e 01X 010.

Obtida a solução da cobertura múltipla, inicia-se a segunda etapa da cobertura. Na segunda etapa, denominada de cobertura singular, tem-se um problema de programação matemática para cada uma das funções de saída, sendo que as variáveis do problema são os implicantes primos, solução da primeira etapa, que cobrem as funções em questão. As coberturas singulares para as funções F_1, F_2 e F_3 são de solução trivial. A função F_1 é coberta pelos implicantes 101, 00X e 01X, cujo custo dos ANDs é igual a 7. A função F_2 é coberta pelos implicantes primos 101, 110 e 01X, cujo custo é igual a 8, e a função F_3 é coberta pelos implicantes primos 110 e 00X, cujo custo é igual a 5.

O custo total dos ANDs, para realizar as funções F_1, F_2 e F_3, como uma função de múltiplas saídas é igual a 12, pois os mintermos 101 e 110 e o implicante primo 00X aparecem duas vezes na função. O custo do circuito, ANDs e OR, é igual a 12 + 3 + 3 + 2 = 20. As três funções quando implementadas independentemente têm um custo total igual a 26. Nota-se, portanto, uma economia de 6 unidades de custo, quando funções booleanas são tratadas como funções de múltiplas saídas.

O Algoritmo MultPlex

O algoritmo MultPlex, que obtém uma cobertura de custo mínimo para uma função booleana de múltiplas saídas, consiste nos seguintes passos:

1. Geração dos implicantes primos pelo método tabular;
2. Montagem do Tableau;
3. Obtenção de uma base inicial, relaxando-se as restrições de integralidade;
4. Verificação da factibilidade da solução básica inicial obtida;
5. Obtenção de uma base inicial factível , se a base obtida não o for;
6. Minimização da função objetivo;
7. Reconsiderando-se a integralidade das variáveis, faz-se a verificação da factibilidade da solução ótima obtida;
8. Obtenção de uma solução inteira, através do Plano de Corte de Gomory, se a solução obtida não o for;
9. Geração da cobertura singular, para cada uma das funções de saída;
10. Executar os passos de 2 até 8 para cada uma das formulações de cobertura singular geradas no passo anterior.

Como exemplo de aplicação do algoritmo descrito, considere as funções booleanas $F_4(A,B,C,D) = \Sigma m(2,3,6,10) + d(8)$, $F_5(A,B,C,D) = \Sigma m(2,10,12,14) + d(6,8)$ e $F_6(A,B,C,D) = \Sigma m(2,8,10,12) + d(0,14)$.

A primeira fase do método gera os seguintes implicantes primos: 0X10 110, 001X 100, X010 111, 10X0 111, X0X0 001, XX10 010 E 1XX0 011.

A formulação para a cobertura múltipla é dada por:

$$\text{Min } F = 3.(X0X0+XX10+1XX0) + 4.(0X10+001X+X010+10X0)$$

s.a

$$0X10 + 001X + X010 \geq 1$$
$$001X \geq 1$$
$$0X10 \geq 1$$
$$X010 + 10X0 \geq 1$$
$$0X10 + X010 + XX10 \geq 1$$
$$X010 + 10X0 + XX10 + 1XX0 \geq 1$$
$$1XX0 \geq 1$$
$$XX10 + 1XX0 \geq 1$$
$$X010 + X0X0 \geq 1$$
$$10X0 + X0X0 + 1XX0 \geq 1$$
$$X010 + 10X0 + X0X0 \geq 1$$
$$1XX0 \geq 1$$
$$X0X0, XX10, 1XX0, 0X10, 001X, X010, 10X0 \in \{0, 1\}$$

A solução ótima, para esse problema de programação linear, é dada por: 0X10 110, 001X 100, 1XX0 011 e X010 111. As coberturas das funções para a solução obtida são apresentadas no Mapa de Karnaugh da Figura 2.

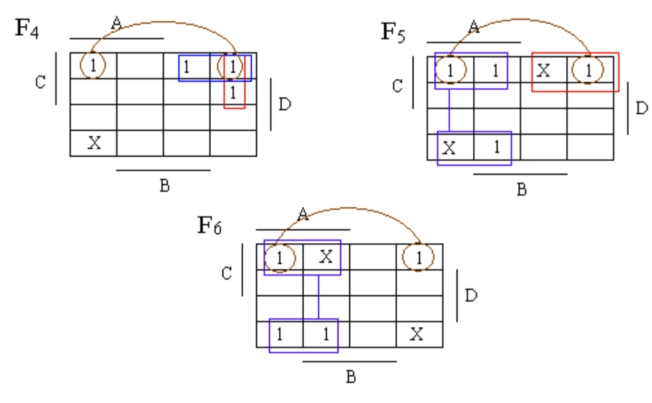

FIGURA. 2

COBERTURAS PARA AS FUNÇÕES BOOLEANAS F_4, F_5 E F_6 APRESENTADAS NO MAPA DE KARNAUGH.

Pode-se notar, pelo Mapa de Karnaugh da função F_5 que o implicante primo 0X10 é redundante, pois cobre mintermos já coberto por outro implicante primo. Portanto, após obter a solução para a cobertura múltipla, deve-se fazer uma cobertura singular, uma para cada função de saída, cujas variáveis são os implicantes primos obtidos como solução da cobertura múltipla.

A cobertura singular para a função F_4 é dada por:

$$\text{Min } F_4 = 4.(0X10 + 001X + X010)$$

s.a

$$0X10 + 001X + X010 \geq 1$$
$$001X \geq 1$$
$$0X10 \geq 1$$
$$X010 + 10X0 \geq 1$$
$$0X10, 001X \text{ e } X010 \in \{0, 1\}$$

A solução para este problema é dada por: 001X, 0X10 e X010.

A cobertura singular para a função F_5 é dada por:

$$\text{Min } F_5 = 3.\ 1XX0 + 4.(0X10 + X010)$$

s.a

$$0X10 + X010 \geq 1$$
$$1XX0 + X010 \geq 1$$
$$1XX0 \geq 1$$
$$1XX0, 0X10, X010 \in \{0, 1\}$$

A solução para este problema é dada por: 1XX0 e X010.

Note que o implicante primo 0X10, pertencente a solução da cobertura múltipla, foi eliminado da cobertura da função F_5, pois esse implicante é essencial somente para a cobertura da função F_4.

A cobertura singular para a função F_6 é dada por:

$$\text{Min } F_6 = 3.\ 1XX0 + 4.\ X010$$

s.a

$$X010 \geq 1$$
$$1XX0 \geq 1$$
$$1XX0 + X010 \geq 1$$
$$1XX0 \text{ e } X010 \in \{0, 1\}$$

A solução para este problema é dada por: 1XX0 e X010.

O custo para a realização das ANDs das três funções, como uma função de múltiplas saídas, corresponde a 11, enquanto o custo das ANDs para a realização das três funções, como funções independentes, corresponde a 17.

Muitas outras funções de uso prático como, por exemplo, o código de linha HDB-3 [10], foram implementadas utilizando-se o algoritmo desenvolvido neste trabalho. O problema de cobertura para o HDB-3, considerado de grande porte, gerou um problema matemático contendo 87 variáveis e 215 restrições. Vale mencionar que o MultPlex obteve os mesmos resultados gerados pelo programa Espresso [8].

Conclusão

Esta pesquisa tratou da minimização de funções booleanas que implementam circuitos digitais com múltiplas saídas, evidenciando a necessidade de se considerar esse tipo de implementação em projetos de sistemas digitais.

O algoritmo MultPlex foi apresentado através de alguns exemplos. Para a fase de geração dos implicantes primos utilizou-se um método tabular, modificado para considerar funções booleanas com múltiplas saídas. Obtido os implicantes primos das funções o problema de cobertura é formulado como um problema de programação matemática.

A fase de cobertura é efetuada em duas etapas, denominadas de cobertura múltipla e cobertura singular.

Na cobertura múltipla considera-se as funções de saída como um todo e formula-se um problema de programação linear inteira com os implicantes primos múltiplos (implicantes pertencentes a uma ou mais funções) e os implicantes primos singulares (pertencente a apenas uma das funções). Com o resultado da cobertura múltipla formulam-se as coberturas singulares, onde as funções de saída são consideradas isoladamente.

O algoritmo MultPlex representa uma contribuição definitiva na simplificação de funções booleanas de múltiplas saídas, pois define o problema de simplificação como um problema de programação matemática. Dessa forma, métodos computacionais eficazes podem ser empregados com o objetivo de solucioná-lo.

Agradecimentos

Os autores agradecem o apoio recebido do PPGEE da Faculdade de Engenharia Elétrica de Ilha Solteira – UNESP e da CAPES.

COM2AHDL: FERRAMENTA CAD DESENVOLVIDA PARA O ENSINO DE CIRCUITOS DIGITAIS

Alexandre César Rodrigues da Silva[1], *Vanderley Balieiro Júnior*[2] *e Gracieli Sartório Cardoso*[3]

Resumo — *A rápida evolução dos sistemas eletrônicos tem motivado o uso, cada vez mais, de ferramentas CAD no ensino de disciplinas envolvendo laboratórios. Na prototipagem rápida, empregando FPGA, torna-se imprescindível o uso de ferramentas de síntese. Muitas linguagens de descrição de hardware compõem os ambientes de projeto disponibilizados para as Universidades através de Programas Universitários. O objetivo deste trabalho foi habilitar estudantes da disciplina Circuitos Digitais I, ministrada na Faculdade de Engenharia de Ilha Solteira, a projetar e desenvolver ferramentas computacionais que pudessem ser utilizadas em conjunto com os ambientes de projeto comerciais. Uma das ferramentas desenvolvidas, denominada COM2AHDL, gera um modelo AHDL para circuitos combinacionais, cuja descrição inicial é feita através da Tabela Verdade que descreve o comportamento do circuito. Esta iniciativa, além de permitir a sinergia entre disciplinas, possibilitou que alunos desenvolvessem suas próprias ferramentas para gerar modelos em alto nível de abstração e com interface para ferramentas comerciais.*

Palavras chave — Ferramentas CAD, Linguagens de Descrição de Hardware, AHDL, Síntese lógica .

INTRODUÇÃO

A rápida evolução da indústria de microeletrônica tem desafiado os atuais currículos acadêmicos em manterem-se adequados de modo a fornecer os conhecimentos necessários aos seus alunos. Os laboratórios tradicionais, dos cursos de graduação em circuitos digitais, têm utilizados software de simulações para o auxílio no projeto e modelagem de pequenos sistemas digitais clássicos. Esses modelos de sistemas têm sido utilizados para explanar ou reforçar muitos dos conceitos e idéias contidas em livros textos. Na descrição desses modelos empregava-se, até então, a captura de esquemático.

Atualmente, muitos desses cursos estão se alicerçando com base no uso da tecnologia de FPGA (Field Programmable Gate Array) e nos ambientes das avançadas ferramentas CAD (Computer Aided Design).

Estes sofisticados ambientes de síntese lógica estão sendo disponibilizados para as universidades através de programas universitários. Dessa forma, tem-se a oportunidade de introduzir os estudantes no uso de HDLs (linguagens de descrição de hardware) e na metodologia de projetos hierárquico (top-down e button-up).

Neste artigo descreve-se a experiência desenvolvida no Curso de Circuitos Digitais I ministrado na Faculdade de Engenharia de Ilha Solteira – UNESP, onde os alunos foram motivados a desenvolverem suas próprias ferramentas para serem utilizadas em conjunto com os sofisticados ambientes comerciais.

Uma dessas ferramentas, denominada COM2AHDL (Combinacional para AHDL), traduz a especificação contida na tabela verdade, descrevendo o comportamento de um circuito combinacional, para um modelo na linguagem de descrição AHDL (Altera Hardware Description Language). Essa iniciativa, além de permitir a sinergia entre disciplinas, possibilitou que alunos desenvolvessem suas próprias ferramentas computacionais para gerarem modelos em alto nível de abstração integráveis com o ambiente comercial Max+Plus II da Altera.

Através do arquivo "report file", gerado no processo de compilação do modelo, os estudantes podem extrair informações relevantes para o entendimento da teoria de circuitos digitais.

METODOLOGIA DE PROJETO

A metodologia de projeto utilizada consiste, basicamente, em 4 passos, sendo que utilizou-se dois conjuntos de ferramentas, a COM2AHDL e a TAB2VHDL [1] em conjunto com o ambiente Max+Plus II. Os passos são os seguintes:

- **Descrição**: Faz-se uma especificação abrangente de como o sistema projetado deve funcionar. Essa descrição deve ser feita, tanto quanto possível, através de linguagens de descrição de hardware. Neste estágio de projeto já é possível efetuar simulações com o objetivo de detectar, antecipadamente, erros de projetos ou má interpretação da especificação inicial. O trabalho humano torna-se mais racional quando emprega-se o diagrama de transição de estados (circuitos seqüenciais) ou a tabela verdade (circuitos combinacionais);
- **Implementação**: O objetivo é decidir sobre a estrutura da implementação e quais blocos funcionais serão utilizados. Isto requer a partição do projeto em blocos menores cujo comportamento pode ser descrito em

[1] Alexandre César Rodrigues da Silva, DEE – FEIS - UNESP, Av. Brasil, 56, 15.385-000, Ilha Solteira, SP, Brasil, acrsilva@dee.feis.unesp.br
[2] Vanderley Balieiro Júnior, DEE – FEIS - UNESP, Av. Brasil, 56, 15.385-000, Ilha Solteira, SP, Brasil, balieiro@dee.feis.unesp.br
[3] Gracieli Sartório Cardoso, DEE – FEIS - UNESP, Av. Brasil, 56, 15.385-000, Ilha Solteira, SP, Brasil, gracieli@dee.feis.unesp.br

de blocos: os blocos disponíveis em dispositivos físicos e os blocos que o próprio projetista necessita descrever. Quando o projeto é implementado, novamente utiliza-se a simulação para verificar se erros não foram introduzidos nesse processo;

termos de hardware. Esta ação resulta em duas espécies

- **Síntese**: A síntese do sistema projetado é feita através de um programa que lê a especificação, descrita em alguma linguagem de descrição ou através de esquemático, e produz um *netlist* otimizado e mapeado dentro da tecnologia destino. As ferramentas de síntese, em geral, fornecem arquivos de relatório contendo parâmetros como tempo de compilação, quantidade de células utilizadas, tempo de atrasos, funções booleanas sintetizadas, e muitas outras informações;
- **Layout**: O layout é também conhecido por *Place* e *Route*. Este passo produz uma descrição exata do dispositivo físico final. A descrição do layout diz exatamente como as partes do dispositivo são usadas e como os fios são conectados dentro do dispositivo.

A ferramenta apresentada nesse trabalho insere-se na fase de descrição do projeto onde, a partir da tabela verdade que descreve o comportamento do circuito combinacional, gera-se um modelo AHDL, a partir do qual o projeto pode ser sintetizado por ferramentas de síntese comercial.

A ferramenta COM2AHDL gera, automaticamente, uma descrição AHDL que seria cansativo quando escrita a mão pelo projetista. Além disso, o arquivo de entrada serve como documentação do projeto. A Figura 1 apresenta a tela inicial do programa COM2AHDL.

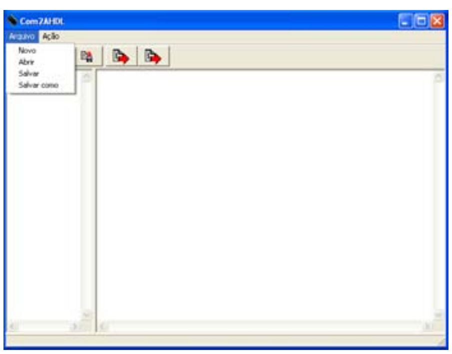

FIGURA. 1
TELA INCIAL DO PROGRAMA COM2AHDL.

O COM2AHDL foi inicialmente programado na linguagem C e posteriormente transcrito em C^{++} Builder oferecendo, dessa forma, uma interface mais amigável com o estudante.

FERRAMENTA COM2AHDL

Um simples exemplo de um circuito codificador BCD8421 para 7 segmentos é utilizado para ilustrar o emprego da ferramenta desenvolvida. O circuito contém um barramento de entrada denominado BCD8421 de dimensão 4, ou seja, pode-se representar essa entrada na forma de vetor como BCD8421[3..0], onde o bit de posição 0 representa o menos significativo e o de posição 3 o mais significativo. Do mesmo modo, o circuito tem um barramento de saída, denominado SEGMENTO que na forma de vetor é represento por SEGMENTO[6..0], ou seja, consiste em um barramento de dimensão 7. A Figura 2 apresenta o esquemático que representa o circuito codificador.

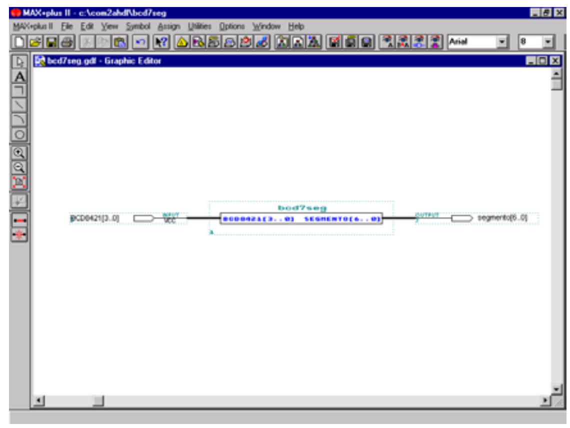

FIGURA. 2
ESQUEMÁTICO DO CODIFICADOR BCD8421 PARA 7 SEGMENTOS.

No programa COM2AHDL transcreve-se, na janela da esquerda, a tabela verdade que descreve o funcionamento do circuito a ser projetado e, após selecionar a opção adequada, é gerado, na janela da direita, uma descrição em AHDL que está pronta para ser sintetizada no ambiente Max + Plus II. A Figura 3 apresenta a descrição do codificador BCD8421 para 7 segmentos e o modelo AHDL gerado.

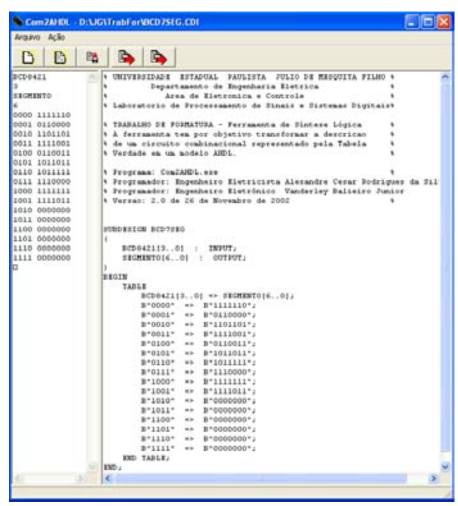

FIGURA. 3
TABELA VERDADE DO BCD8421 PARA 7 SEGMENTOS E O MODELO AHDL.

Com o modelo AHDL gerado a ferramenta de síntese automaticamente executa a minimização das funções lógicas e a síntese lógica a nível de porta lógicas. Em geral, muitas das portas de nível intermediárias são compartilhadas entre as várias saídas do sistema. Pode-se notar que no modelo descrito na linguagem de descrição AHDL não se utilizou equações lógicas, apenas descreveu-se o comportamento que se espera do circuito.

O estudante pode também simular o modelo e analisar o resultado da síntese lógica. A Figura 4 apresenta o modelo em estudo como entrada do ambiente de projeto Max + Plus II.

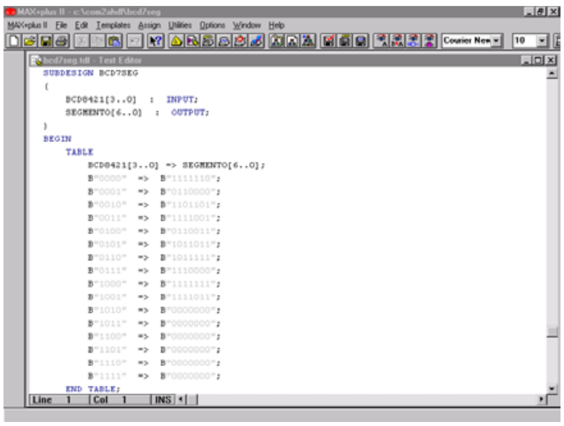

FIGURA. 4
MODELO AHDL DO BCD8421 PARA 7 SEGMENTOS NO MAX+PLUS II.

Para se verificar o perfeito funcionamento do modelo, este pode ser simulado. A Figura 5 apresenta o resultado da simulação.

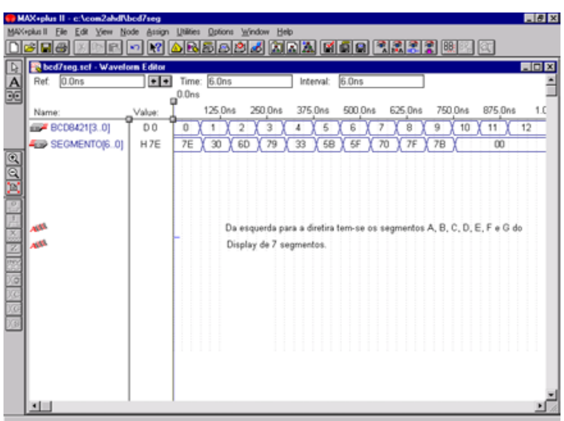

FIGURA. 5
RESULTADO DA SIMULAÇÃO DO CODIFICADOR BCD8421 PARA 7 SEGMENTOS NO AMBIENTE MAX+PLUS II.

Pode-se notar, pelo resultado da simulação apresentado na Figura 5, que o modelo funcionou como o previsto. No barramento de saída, representado na notação hexadecimal, foram acionados os segmentos correspondentes aos números BCD8421 tidos no barramento de entrada em cada instante de tempo.

Da análise do arquivo "report file", gerado pelo ambiente de síntese, o aluno pode extrair as funções combinacionais de cada função de saída. Essas funções, por terem sido otimizadas por algoritmos de minimização, são apresentadas na sua forma mínima. A Figura 6 apresenta parte do arquivo de relatório onde pode-se notar que a função que representa o SEGMENTO1 é dada por:

SEGMENTO1 = LCELL(_EQ002 $!BCD84211);
_EQ002 = !BCD84210 & BCD84211 & BCD84212 & !BCD84213 # BCD84210 & !BCD84211 & !BCD84212 & !BCD84213 # !BCD84211 & BCD84212 & BCD84213;

Nesta representação o símbolo & representa a operação AND, o símbolo # representa a operação OR e o símbolo ! representa a operação NOT. Note que BCD8421n, com n variando entre 0 e 3, representam as variáveis do sistema, ou seja, os sinais de entrada.

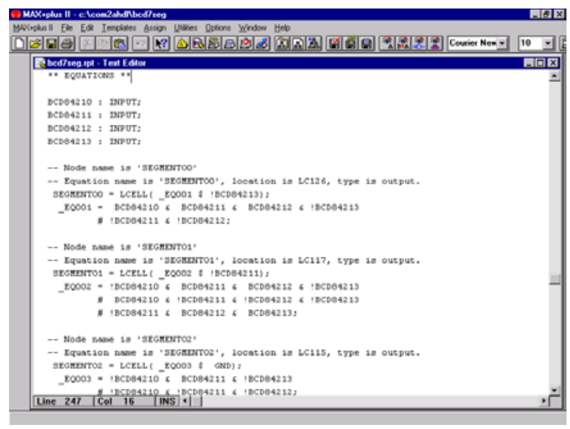

FIGURA. 6
ARQUIVO DE RELATÓRIO APRESENTANDO AS FUNÇÕES COMBINACIONAIS DAS FUNÇÕES DE SAÍDAS.

A LINGUAGEM DE DESCRIÇÃO AHDL

A AHDL (Altera Hardware Description Language) é uma linguagem modular de alto nível empregada para se modelar lógica combinacional complexa, operações em grupos, máquinas de estados e tabelas verdades. A especificação é feita através de uma entrada textual que, posteriormente, é compilada e simulada, podendo então ser utilizada para programar componentes FPGA da Altera. Esta linguagem permite que os projetistas criem projetos hierárquicos que podem incorporar outros arquivos de projeto. A representação simbólica de um projeto AHDL é criado automaticamente no processo de compilação e síntese que pode ser incorporado dentro de uma descrição gráfica (captura de esquemático).

Um modelo AHDL contém partes denominadas de “Sections” e “Statements”. Todo modelo deve conter uma *Design Section* ou uma *Subdesign Section* combinada com uma *Logic Section*. Algumas *Sections* e *Statements* são opcionais. Descreve-se a seguir as seções e declarações aceitas no AHLD:

- **Title Statements** (opcional): gera comentários para o arquivo de relatório (report file) gerado pelo compilador;
- **Constant Statements** (opcional): especifica um nome simbólico que pode ser substituído por uma constante;
- **Function Prototype Statements** (opcional): declara os portos de uma macrofunção ou primitiva e a ordem em que estes portos devem ser declarados na linha de referência;
- **Define Statements** (opcional): define uma função matemática que retorna um valor que está baseado em um argumento;
- **Parameters Statements** (opcional): declara um ou mais parâmetros que controlam a implementação de uma função parametrizável. Um valor default pode ser especificado para cada parâmetro;
- **Design Sections** (necessário): especifica pinos, células lógicas, opções lógicas e atribuição de dispositivos. Também especifica quais os pinos estão ligados juntos na placa. Esta seção é necessária se for a única seção do modelo;
- **Assert Statements** (opcional): permite que o projetista teste condições de uma expressão qualquer e relate o resultado;
- **Subdesign Sections** (necessário): declara os portos de entradas, de saídas e os bidirecionais de um modelo AHDL. Essa seção é necessária a não ser que o modelo consista somente da seção Design;
- **Variable Sections** (opcional): declara uma variável que representa uma informação interna;
- **Logic Section** (necessário): define as operações lógicas do modelo. Essa seção é necessária, a menos que o modelo consista somente da seção Design.

Considere como exemplo o circuito lógico apresentado na Figura 7 na forma de esquemático. O modelo AHDL para o circuito pode ser descrito como:

```
SUBDESIGN  FUNÇÃO
(
   A0, A1, B        :  INPUT;
   Out1, Out2       :  OUTPUT;
)
BEGIN
  Out1  =  A1 & !A0;
  Out2  =  Out1 # B;
END;
```

A seção *Subdesign* descreve os portos de entradas e de saídas e especifica os seus nomes que podem ser referenciados. O *Subdesign* também tem um nome que deve ser o mesmo nome do arquivo contendo o modelo AHDL.

A seção *Logic*, que descreve as operações lógicas do circuito utiliza declarações de atribuições e expressões relacionais.

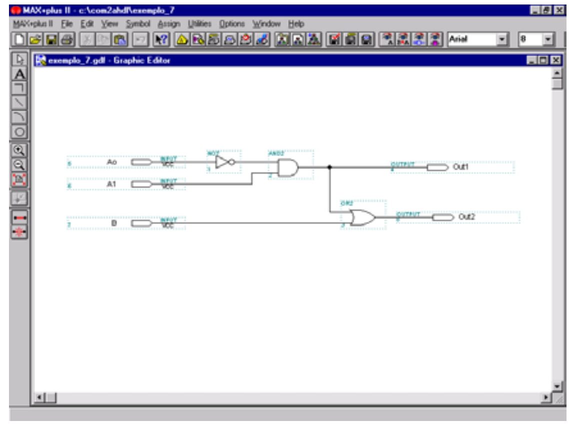

FIGURA. 7
CIRCUITO LÓGICO REPRESENTANDO UMA FUNÇÃO BOOLEANA.

A linguagem também disponibiliza a lógica condicional, onde é possível escolher diferentes comportamentos dependendo do valor de uma entrada lógica. Essa lógica condicional é implementada através das declarações IF e CASE.

A AHDL oferece uma grande facilidade em converter padrões de entradas em valores de saídas. Isto é feito pelo mapeamento das entradas em padrões de saídas através do uso da tabela verdade.

A declaração *Truth Table* contém um cabeçalho que descreve quais entradas são mapeadas para quais saídas e em que ordem. No exemplo apresentado a seguir o padrão de saída para todos os possíveis padrões da entrada, denominada IN[1..0], é descrito através de declaração *Truth Table*.

```
SUBDESIGN  DECODER
(
   IN[1..0]         :  INPUT;

Utilizou-se da declaração *Truth Table* nos modelos gerados pelo programa COM2AHDL.

Dezenas de projetos de circuitos combinacionais, que são deixados como atividade para os alunos, foram implementados em FPGA utilizando-se a ferramenta desenvolvida. Em todos os projetos constatou-se o perfeito funcionamento, tanto através da simulação quanto em teste de bancada.

EXEMPLO DE PROJETO

Projeto 1: Um técnico de laboratório possui 4 produtos químicos (A, B, C e D) e 2 recipientes para guardá-los. É conveniente remover os produtos químicos de um recipiente para outro de tempos em tempos. É perigoso manter B e C juntos a menos que A também esteja presente. C e D não podem estar juntos com A. O projeto consiste em gerar um circuito lógico para indicar as situações perigosas de armazenamento dos produtos químicos [2].

A Figura 8 apresenta a descrição do projeto como entrada para a COM2AHDL e o modelo AHDL gerado. A simulação do modelo comprovou o seu perfeito funcionamento.

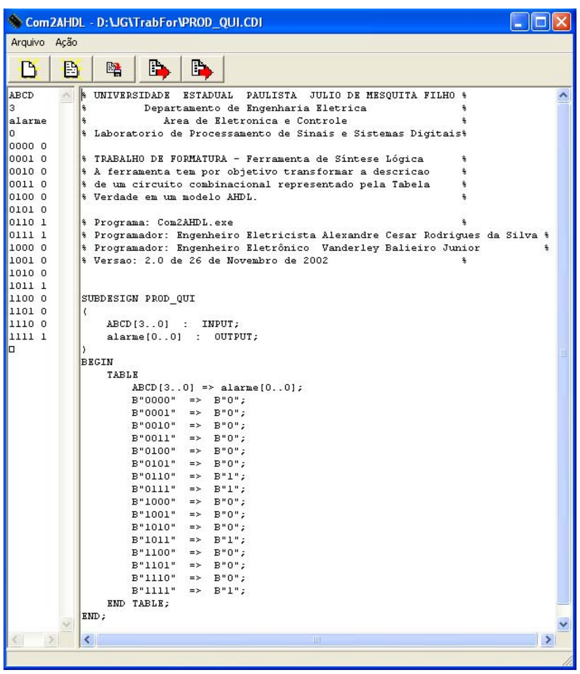

FIGURA. 8
TABELA VERDADE E O MODELO AHDL GERADO PELA FERRAMENTA COM2AHDL.

Uma outra ferramenta, que se utiliza dos mesmos passos de projeto apresentado neste trabalho, está sendo testada para gerar o modelo VHDL para um circuito combinacional.

CONCLUSÃO

Este trabalho apresentou uma ferramenta que, em conjunto com as disponíveis comercialmente, permite que o projeto de um circuito combinacional seja implementado em FPGA a partir da descrição da tabela verdade que descreve o funcionamento do mesmo.

A iniciativa do desenvolvimento desse trabalho surgiu da necessidade de alunos do curso de Circuitos Digitais I, ministrado na Faculdade de Engenharia de Ilha Solteira, criarem as suas próprias ferramentas para o auxílio ao desenvolvimento de projeto de circuito digitais.

A ferramenta desenvolvida permitiu a automatização do projeto de circuitos digitais e se tornou extremamente conveniente, pois retirou do projetista a tarefa da descrição do modelo. Dessa forma, cabe aos alunos apenas a análise crítica das soluções, deixando para a máquina as cansativas tarefas sujeito a erros.

AGRADECIMENTOS

Os autores agradecem o apoio recebido do PPGEE da Faculdade de Engenharia Elétrica de Ilha Solteira – UNESP, da CAPES e da P.I. Componentes.

ENSINO SOBRE ALOCAÇÃO DE ESTADOS EM FSM COM O EMPREGO DA AHDL

Marcos Ikeguchi Ohira[1], Fábio Pieroni Zanella[2] e Alexandre César Rodrigues da Silva[3]

Resumo *— Com o rápido aumento da complexidade dos circuitos e da densidade de integração dos CIs, as ferramentas automáticas de síntese tornaram-se necessárias para o projeto de circuitos digitais. Circuitos seqüenciais são modelados por máquinas de estados finitos (FSM) onde os estados são caracterizados somente por nomes simbólicos. Alocação de estado é o mapeamento do conjunto de estados (nomes simbólicos) de uma FSM para um conjunto de códigos binários com o objetivo de minimizar a área do circuito combinacional necessário para realizar a FSM. Comparou-se alguns algoritmos de alocação de estados utilizados no ambiente de projeto Max+ Plus II da Altera. Vários códigos de linhas foram modelados na linguagem de descrição de hardware AHDL e implementados em FPGA. Este trabalho está sendo desenvolvido junto ao curso de graduação do DEE-FEIS-UNESP na linha de pesquisa de sistemas digitais, com o objetivo de inicializar o aluno no uso de ferramentas de síntese digitais.*

Palavras-Chave — Máquinas de estados finitos, alocação de estado, circuitos combinacionais, AHDL, FPGA e ferramentas de síntese digitais.

INTRODUÇÃO

As máquinas de estados, também chamadas de máquinas seqüenciais, são sistemas que respondem em estados diferentes de acordo com um dado de entrada. Caso o sistema esteja em determinado estado, ele ficará no mesmo estado a não ser que o sinal de entrada, denominado de relógio, se altere [1].

Com relação às dependências de entrada, saída, estado atual e próximo estado, as máquinas podem ser classificadas em dois modelos: Mealy e Moore.

Uma máquina seqüencial é denominada máquina de Moore, se suas saídas forem dependentes apenas dos estados e não da entrada. Uma máquina seqüencial é denominada máquina de Mealy, se suas saídas forem dependentes tanto do estado atual como da entrada. Para ambos os modelos de máquinas, o próximo estado é dependente do estado atual e da entrada.

Uma outra característica muito importante das máquinas seqüenciais é a dependência de um clock. Em geral, uma referência de tempo é muito utilizada em sistemas digitais. Quanto à dependência de um clock, as máquinas seqüenciais podem ser classificadas como: síncronas e assíncronas.

As máquinas síncronas são máquinas cuja mudança de estado acontece de acordo com um clock.

Máquinas assíncronas mudam de estado independente de um clock de referência.

Além das diferenças citadas entre máquinas síncronas e assíncronas, na questão de implementação das duas máquinas, as síncronas são muito mais fáceis em relação às assíncronas.

Conhecidas as propriedades das máquinas de estados, um bom exemplo de máquina de estado é o flip-flop, este tem dois estados para uma entrada, em suma, é um sistema (ou máquina de estado) muito simples. Com uma combinação de flip-flops, pode-se obter sistemas extremamente complexos.

Alocação de Estados

As alocações de estados são métodos para dispor estados de máquina, dependendo da sua aplicação, em combinações diferentes.

Para cada tipo de aplicação existe uma alocação ótima e um tipo de preocupação diferente como, por exemplo, custo lógico do circuito e o comportamento do circuito para cada tipo de elementos de memória. Portanto, a escolha do tipo de alocação é muito importante e isso se dá somente sob tentativa dentre todos os algoritmos de alocação.

Antes de se escolher o tipo de alocação a ser utilizada deve-se, inicialmente, conhecer a quantidade de estados e quantidade de flip-flops necessários para o circuito.

Para uma máquina com n flip-flops a quantidade total de estados para essa máquina é representada pela equação 2^n, e o número mínimo de flip-flops necessários para representar os s estados da máquina é representado pela equação $\log_2 s$.

Tomar conhecimento das quantidades de estados e quantidade de flip-flops são informações iniciais para se determinar o algoritmo de alocação ótimo, porém, como já mencionado, para se determinar o melhor algoritmo de alocação deve-se utilizar todos os algoritmos e verificar o melhor. Como isso é um trabalho muito exaustivo, tem-se algumas considerações a serem feitas para se atingir o tipo de algoritmo com um tempo razoavelmente menor, como, por exemplo, determinar uma condição inicial para a máquina (preset ou reset), fazer as minimizações de estados, etc [2]-[3]-[6].

Tipos de Algoritmos de Alocação de Estados

- **Simplest:** É o algoritmo de alocação mais simples, pois ele utiliza a quantidade de flip-flop mínima que é obtido da equação $\log_2 s$, sendo s o menor número inteiro obtido. Esse tipo de alocação é muito simples para ser utilizado, porém não é muito usual, pois o custo no circuito, principalmente em relação ao circuito de controle, fica muito alto.
- **Decomposed:** É um algoritmo mais apurado em relação ao Simplest, pois este tem o estado inicial em reset e cada um de seus bits pode representar uma operação da máquina. O bit mais significativo (MSB), após a máquina sair da condição de reset, é sempre "1", pois indica que a máquina está em operação, e os outros bits indicam os estados da máquina.
- **One-Hot:** O mais utilizado algoritmo de alocação. Este utiliza apenas um bit por estado de máquina, isso garante que o circuito de controle da máquina se torne muito mais simples, com isso diminui o custo do circuito. Utilizando o algoritmo One-Hot não é necessário um circuito de controle na sua saída [1]. A desvantagem que esse tipo de alocação apresenta ocorre quando se tem uma máquina com muitos estados, pois o circuito da máquina irá utilizar uma quantidade grande de flip-flops aumentando assim o custo do circuito. Este algoritmo também é usado pelo AHDL, que será apresentado a seguir.
- **Almost One-Hot:** Assim como o nome já diz, esse algoritmo de alocação é uma variação do One-Hot, pois ao contrário do One-Hot, o estado inicial do Almost One-Hot é o reset, isso apresenta duas vantagens, pois diminui um flip-flop no circuito, fazendo com que o custo do circuito diminua e facilite a inicialização do circuito, pois é mais simples iniciar uma máquina à partir do reset [3].

Altera Hardware Description Language (AHDL)

A AHDL é uma linguagem muito potente, versátil e de fácil utilização, pois permite descrever um projeto de várias formas, como, por exemplo, na forma hierárquica com compartilhamento entre arquivos.

Como se trata de uma linguagem, todo o circuito, ou projeto, são feitos de forma descritiva que pode ser feita no próprio editor de texto do software MAX+plus II [4], ou em qualquer outro editor de texto, desde que utilize o código ASCII. Contudo, para que se possa simular o circuito descrito, deve-se compilar o arquivo texto, para isso utiliza-se o compilador do software MAX+plus II. Em face disso, a utilização do editor de texto existente no próprio software é muito vantajosa, pois no mesmo software é possível escrever o circuito, compilar e fazer as simulações.

Além de todas essas vantagens, um circuito implementado em AHDL, pode ser transformado em um símbolo para ser utilizado na forma esquemática (.gdf) [4].

Implementação de Máquinas de Estado em AHDL

Uma máquina de estados pode ser facilmente implementada utilizando a AHDL, pois pode utilizar equações Booleanas ou tabelas verdade para fazer a implementação, sendo que as alocações podem ser feitas tanto pelo próprio usuário quanto pelo software.

Para se implementar uma máquina de estados deve-se seguir os seguintes passos:

- Construir uma tabela de próximo estado;
- Declarar a máquina de estados (na estrutura Variable Section);
- Adicionar a tabela verdade (ou de próximo estado), ou se for o caso, as equações booleanas (estrutura Logic Section).

Esses passos são seguidos para que o software faça as alocações. Se o usuário for fazê-las, a única diferença é que se deve declarar os estados e suas alocações.

As máquinas de estados utilizam flip-flops como elemento de memória e para serem implementadas em AHDL é necessário que o clock, reset e enable sejam devidamente designados, visto que o flip-flop depende desses parâmetros para funcionamento, ou seja, a entrada de clock, enable e reset devem ser devidamente declaradas quando necessário, caso contrário, a máquina não funcionará de maneira correta.

Como já mencionado, a implementação de uma máquina de estado pode ser feita de duas formas: alocação direta, na qual o próprio usuário faz as alocações, e a indireta, na qual o software faz as alocações.

Nas alocações indiretas o software faz todas as minimizações de estados necessárias e implementa um tipo de alocação de estado que são basicamente dois tipos, o Simplest e o One-Hot. A escolha do algoritmo utilizado é ditada pela família de FPGA (*Field Programable Gate Array*) utilizado. Para FPGA's da família MAX, o software, por definição, faz a alocação do tipo Simplest e, também, tem-se a possibilidade da utilização do algoritmo One-Hot, através da seleção da opção One-Hot State Machine Encoding. Para os FPGA's da família FLEX a alocação utilizada é o One-Hot, independentemente da opção One-Hot State Machine Encoding [5].

Quanto ao tipo de máquina a ser implementada (Mealy ou Moore) as mudanças são muito pequenas, devido à versatilidade da linguagem [4].

METODOLOGIA

Neste trabalho estudou-se métodos de alocação de estados e a linguagem de descrição de hardware (AHDL), que junto ao docente da área de sistemas digitais do DEE-FEIS-UNESP, está sendo disseminada nas disciplinas de Circuitos Digitais e Projetos de Sistemas Digitais.

Essas duas teorias (alocação e AHDL) estão sendo ensinadas aos alunos de graduação com o intuito de motivar o aprendizado, pois, mostra de uma maneira prática, que um mesmo circuito digital, mais precisamente máquinas de estados finitas síncronas, podem ter variados comportamentos, dependendo de sua alocação de estados, e com a linguagem AHDL os alunos aprendem que um circuito digital pode, também, ser implementado em uma linguagem de alto nível.

Como estudo inicial utilizou-se diferentes técnicas de alocação de estado (Simplest, One-Hot e Almost-One-Hot), cujos códigos foram implementados na linguagem de descrição AHDL.

Escolheu-se para o estudo das alocações de estados os códigos de linha AMI (Alternated Mark Inversion), o código HDB1 (High-Density Bipolar First-Order Coding) e o código HDB3 (High-Density Bipolar Third-Order Coding) devido a sua importância em transmissão de dados em banda base através de um par de fios (par telefônico) que é a maneira mais simples, prática e econômica de comunicação de dados em perímetros urbanos ou distâncias de alguns quilômetros.

Estes códigos foram todos simulados no ambiente Max + Plus II e para o mesmo código foram utilizadas as alocações citadas.

RESULTADOS

Embora cada alocação de estado não altere o funcionamento de cada código de linha utilizado, os resultados obtidos no report file, gerado pelo MAX+plus II, têm diferenças entre si, pois o tipo de alocação altera os custos das funções lógicas, definidos como o número de portos de entradas das portas lógicas em seu formato primitivo, o número de células utilizadas (para uma implementação em FPGA), a quantidade de memória e tempo de síntese. Tais parâmetros foram utilizados para comparação entre as implementações.

Todos os códigos foram implementados no componente programável FPGA MAX7000E, Device: EPM 7128ELC84-7, e as simulações comprovam seu perfeito funcionamento.

As simulações referentes a cada código estão apresentadas na Figura 1.

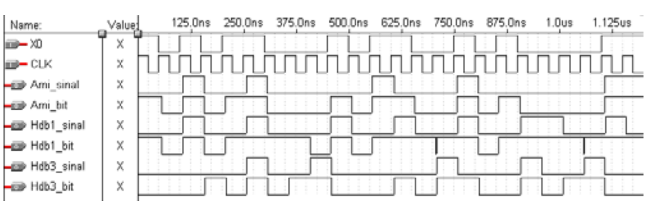

FIGURA 1.
SIMULAÇÃO DOS CÓDIGOS IMPLEMENTADOS.

A partir do Report File gerado pelo software Max+Plus II e das alocações, foram obtidos os custos totais para cada código, cujos resultados estão apresentados na Tabela I.

TABELA I.
CUSTOS OBTIDOS PARA CADA CÓDIGO VARIANDO-SE O TIPO DE ALOCAÇÃO.

Código	Alocação	Custo Lógico	Células Utilizadas	Memória Utilizada	Tempo de Compilação
AMI	Simplest	012	03	3,622 K	00:00:07
	One-Hot	012	04	3,670 K	00:00:03
	Almost One-Hot	012	03	3,499 K	00:00:04
HDB1	Simplest	028	04	3,688 K	00:00:04
	One-Hot	057	06	3,786 K	00:00:04
	Almost One_hot	058	06	6,197 K	00:00:02
HDB3	Simplest	340	14	3,687 K	00:00:09
	One-Hot	268	34	5,598 K	00:00:10
	Almost One-Hot	159	34	3,888 K	00:00:06

CONCLUSÃO

Com esse projeto concluiu-se que determinados tipos de alocações utilizados apresentaram vantagens em diferentes aspectos, por exemplo, para a alocação do tipo Almost One-Hot foi obtido, em geral, a menor tempo de compilação em relação a todas as implementações realizadas. Na alocação Simplest obteve-se a menor quantidade de células utilizadas.

Os resultados apresentados na Tabela I mostram que não existe um método de alocação ideal para otimizar um circuito, pois notou-se que para cada situação e condição (por exemplo células de FPGA utilizadas) há uma alocação específica que torna o circuito otimizado.

O ensino da linguagem AHDL no curso de graduação proporciona ao discente um conhecimento diferenciado, pois através da AHDL, o aluno pode descrever um circuito digital de forma alternativa e muito versátil, unido à facilidade de aprendizado.

Pode-se salientar que para o ambiente utilizado (MAX+plus II) a linguagem AHDL é uma linguagem de alto nível muito poderosa, visto que é uma linguagem desenvolvida pela ALTERA, fabricante do próprio MAX+plus II.

AGRADECIMENTOS

Os autores agradecem à CAPES e à PI Componentes por todo o suporte oferecido durante a realização do projeto, e também aos docentes da área de sistemas digitais do DEE-FEIS-UNESP.

E2HDL: UMA NOVA FERRAMENTA DE SÍNTESE PARA IMPLEMENTAR EQUAÇÕES ALGÉBRICAS EM FPGA

Adriano dos Santos Cardoso[1], Alexandre César Rodrigues da Silva[2] e Aparecido Augusto de Carvalho[3]

Resumo *— O desenvolvimento de ferramentas de síntese automática permite que projetistas gerem uma descrição de Hardware sem a necessidade do conhecimento profundo da tecnologia em que o sistema será implementado. Este artigo apresenta uma ferramenta de síntese para projetos de sistemas digitais denominada E2HDL (Equação para Linguagem de Descrição de Hardware). Com a especificação dos parâmetros da equação, a ferramenta desenvolvida gera um modelo em linguagem de descrição de hardware, podendo ser a AHDL ou a VHDL, que implementa a equação desejada. Esta ferramenta em conjunto de ambientes de síntese comerciais possibilita a configuração, em FPGA, de uma grande quantidade de formas de ondas, utilizando somente recursos digitais. Para avaliar a sua eficiência implementou-se em FPGA uma grande variedade de formas de ondas como, por exemplo, seno, sigmoide, gaussiana e muitas outras. Diferentes especificações puderam ser avaliadas. A ferramenta, apresentou-se como uma poderosa contribuição para a criação automatizada de circuitos digitais.*

Palavras Chave — Ferramenta de Síntese, FES, FPGA, VHDL.

INTRODUÇÃO

Com a evolução dos processos de produção tecnológicos, os sistemas de integração de circuitos se tornaram mais complexos. O mercado demanda por circuitos mais eficientes e pela redução nos prazos de desenvolvimento. Esses fatores, justificam a utilização cada vez mais freqüente da automação dos processos de desenvolvimento dos projetos.

Circuitos com centenas de elementos apresentam uma dificuldade enorme de serem implementados com ferramentas CAD (*Compiter Aid Design*), baseadas em captura de esquemático. Atualmente, os projetos vêm sendo desenvolvidos com ferramentas com níveis mais altos de abstração, usando HDLs (*Hardware Descripton Language*) e métodos de detalhamento e refinamento automático.

Os sistemas e processos digitais podem ser representados em função de um domínio e, em cada domínio por um nível de abstração.

A representação de um modelo que contém os níveis de abstração e os domínos de descrição de um sistema digital foi proposta pela primeira vez por Gajski e Kuhn [1], o chamado Diagrama Y, apresentado na Figura 1.

FIGURA 1.
ELEMENTOS PRIMITIVOS DE CADA NÍVEL DE ABSTRAÇÃO NO DIAGRAMA DE GAJSKI E KUHN (DIAGRAMA Y).

Neste diagrama, os níveis de abstração (Nível de Dispositivo, Nível Lógico, Nível RTL, Nível de Arquitetura) são identificados pelas suas distâncias do centro do diagrama, enquanto os segmentos de reta radiais correspondem a domínios de descrição. Por exemplo, um diagrama de esquemáticos de portas lógicas TTL é uma descrição estrutural lógica, estando, portanto, localizado na intersecção do eixo rotulado Domínio Estrutural com o nível lógico de abstração.

A Figura 2 representa o diagrama de Gajski da ferramenta desenvolvida. A E2HDL leva do nível de abstração de Equações Algébricas para o nível de Equações

Booleanas. O ambiente de projeto MAX + Plus II leva o nível de portas lógicas (Compilador) e, finalmente, para o nível de Planta Baixa (Configurador de FPGA).

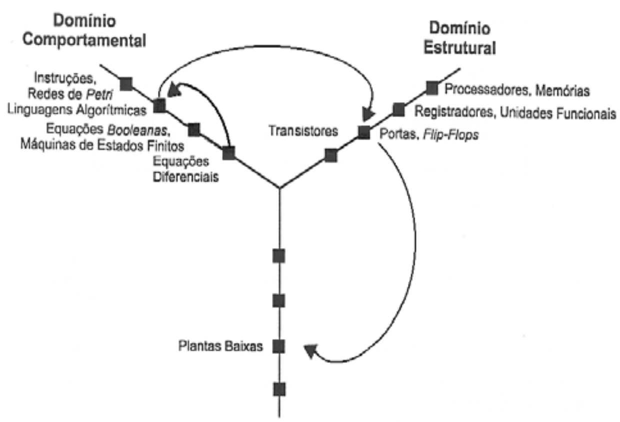

FIGURA 2.
REPRESENTAÇÃO DAS TRANSIÇÕES OCORRIDAS COM A E2HDL.

Uso de Lógica Programável

O uso de Lógica Programável (LP) está ligada intrinsecamente com o uso de tecnologias digitais, ou seja, criar um projeto com tecnologia FPGA (que é a LP escolhida), é criar um projeto digital. Projetos digitais podem-se utilizar de equipamentos variados como microprocessadores, tecnologia discreta e tecnologia de lógica programável, entre outros. A utilização do FPGA é decorrente de algumas vantagens tais como:

- Arquitetura em Hierarquia de Projeto;
- Paralelismo, o que leva a vários processos ou projetos simultâneos;
- Relógio (Clock) Elevado;
- Reutilização de Programas;
- Grande número de E/S (*I/O*);
- Fácil Roteamento;
- Possibilidade de Sistemas-on-Chip;
- Ferramentas de projeto;
- Utilização de funções parametrizáveis;
- Grande número de Células Programáveis.

CRIAÇÃO DE DECOFICADORES DIGITAIS UTILIZANDO FERRAMENTAS DE SÍNTESE AUTOMÁTICA

SISTEMAS DIGITAIS

Um sistema digital é um sistema discreto, isto é, transforma valores discretos de entrada em valores discretos de saída. Ele trabalha aplicando operações ou transformações nos valores de entrada. Os resultados dessas operações são passados a outras operações e, finalmente, para o valores de saída.

A descrição através de uma interpretação funcional do sistema é chamado de Descrição Comportamental. Em linguagem de descrição de hardware, a descrição comportamental é diretamente integrada na linguagem. Assim, pode-se trabalhar em uma descrição com um nível mais alto de abstração.

As ferramentas de síntese, trabalham em torno de modelos funcionais que representam algum conjunto de funções.

Um dos modelos que se pode trabalhar nessas ferramentas são os decodificadores. Estes, representam funções booleanas. Assim, cada um dos pinos de saída é uma função de todas as entradas.

Um decodificador de 7 segmentos representa bem esta ideia, ele possui 4 entradas (A, B, C, D) e 7 saídas (a, b, c, d, e, f, g) e a saída "a", pode ser transcrita como:

$$a = F(A,B,C,D) = \\ = \Sigma(0,2,3,5,6,7,8,10,12,14,15) \quad (1)$$

Extrapolando para as outras saídas, determina-se as funções b, c, d, e, f, g e aplica-se os processos de minimização (fornecidas pelo ambiente de projeto Max + Plus II da Altera).

IMPLEMENTAÇÃO DE FORMAS DE ONDA ANALÓGICAS

O intervalo de valores possíveis de um contador, depende da quantidade de flip-flops que se está trabalhando, ou de outra forma, do número de bits. Assim, um contador de n = 8 bits, por exemplo, apresenta em função da contagem, valores em sua saída entre 0 e 255, ou seja, $2^n - 1$, onde n é o número de bits. Desta forma, a cada pulso de relógio a contagem aumenta em uma unidade percorrendo todos os valores de forma crescente. Acoplando-se a saída do contador a um decodificador com o mesmo número de bits, a cada valor de contagem, tem-se no barramento de saída do decodificador valores em função da contagem atual do contador. A freqüência de saída do sistema, depende do número de bits e do relógio conforme (2). A Figura 3, representa o sistema que gera uma onda analógica partindo de recursos digitais.

$$fsinal = \frac{fclock}{2^n} \quad (2)$$

Onde:
n = número de bits do contador;
fclock = freqüência do relógio (entrada);

$fsinal$ = freqüência do sinal (saída).

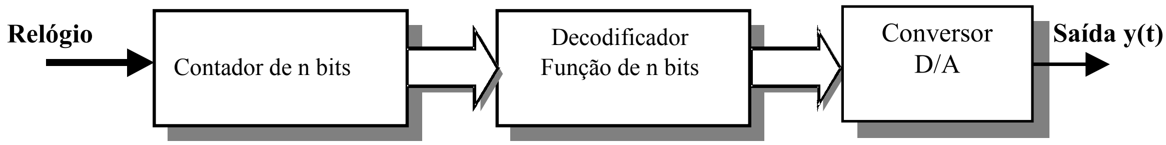

FIGURA 3.
GERAÇÃO DE SINAL ANALÓGICO UTILIZANDO DECODIFICADOR

FERRAMENTAS DE PROJETO BASEADAS EM SÍNTESE AUTOMÁTICA

Métodos de síntese automatizada ótima para equações Booleanas datam das décadas de 50 e 60 e não tinham a capacidade de resolver sistemas muito complexos. A necessidade de manipular quantidades crescentes de informações durante o projeto de sistemas digitais exigia a consideração constante de novas ferramentas. Estas deveriam transcender as atividades de facilitar a captura e de exercitar descrições, passando a ser capazes de gerar novas descrições de forma automatizada e corretas por construção, baseadas nos mesmos requisitos manipulados pelos projetistas. O estilo de projeto estabelecido por estas novas ferramentas baseia-se no uso de ferramentas computacionais e guia o processo de projeto. A ferramenta central possui embutido um conjunto de modelos de síntese, e é capaz de gerar uma descrição correta por construção, bem como uma avaliação do desempenho desta descrição. O laço de realimentação é fechado pelo projetista, que julga os resultados da síntese e aceita a descrição, ou a rejeita e escolhe um novo modelo de síntese para ser usado. Essa escolha pode ser feita com o auxílio de outras ferramentas distintas e apropriadas no processo de validação.

As ferramentas de simulação podem, ainda, ser empregadas, visando fornecer mais detalhes sobre a implementação. Freqüentemente, o sintetizador gera uma descrição a partir dos requisitos, e refina esta descrição através de técnicas de otimização. Somente a descrição resultante deste processo é fornecida ao projetista.

ESTIMULAÇÃO ELÉTRICA FUNCIONAL E FORMAS DE ONDA

A estimulação elétrica funcional (FES) vem sendo aplicada para restaurar e manter a atividade muscular de pacientes paralisados que sofreram lesão medular. Várias formas de onda de corrente e tensão vêm sendo aplicadas com sucesso na recuperação destes pacientes. Equipamentos desenvolvidos comercialmente, entretanto, apresentam de forma geral, serias restrições quanto à variação dos parâmetros do sinal aplicado (freqüência, forma de onda, amplitude, número de pulsos em modulação tipo Burst, tempo de repouso, etc.) o que abre a possibilidade do desenvolvimento de equipamentos mais completos e versáteis.

Uma grande variedade de aparelhos está comercialmente disponível para aplicações eletroterapêuticas. A instrumentação na eletroterapia está se proliferando rapidamente com aos avanços da engenharia, dos desenvolvimentos na pesquisa de eletroterapia e do alcance ampliado dos problemas tratados pela eletroterapia.

Muitos aparelhos projetados antes do início dos anos 80 incluíam geradores de forma de onda capazes de produzir somente um tipo de forma de onda a partir de um único aparelho.

Hoje, contudo, muitos estimuladores disponíveis comercialmente são capazes de produzir várias formas de onda distintas, mas, muitos dos parâmetros de controles não estão disponíveis. Esta dificuldade, abre a possibilidade do uso de novas tecnologias e da introdução de equipamentos com mais recursos, possibilitando uma geração de pulsos mais adequada do ponto de vista fisiológico ao paciente e, também, mais confortável.

Este trabalho apresenta o desenvolvimento de uma ferramenta de síntese automática para a geração de circuitos digitais com o uso de tecnologia de lógica programável. Os circuitos gerados, representam formas de onda de diferentes tipos de especificações e utilizam somente componentes digitais. A ferramenta tem como entrada os principais parâmetros de uma equação.

MATERIAIS E MÉTODOS

A ferramenta foi desenvolvida em linguagem C, e trabalha com funções analógicas para serem implementadas em hardware. A ferramenta gera um arquivo de HDL e para gerar um arquivo bastante pequeno, optou-se pela AHDL (*Altera Hardware Description Language*) da empresa Altera.

As formas de onda são parametrizadas com diferentes especificações, a ferramenta possui parâmetros de entrada para definir a quantidade de bits que o sinal digital deverá possuir e, também, a quantidade de pulsos necessários para percorrer-se um ciclo do sinal. Assim, se uma forma de onda tiver 8 bits de entrada e 12 bits de saída, tem-se uma forma de onda que necessita de um conversor D/A de 12 bits e 256 pulsos de relógio para completar um ciclo.

A ferramenta de síntese E2HDL gera o arquivo texto HDL.

O ambiente de programação MAX + Plus II da Altera simula e compila os arquivos HDLs e gera vários arquivos de reportagem e de interface com outros ambientes de programação.

O aplicativo TBL2M, foi desenvolvido para interpretar dados do arquivo .TBL (arquivo de simulação) e converte-los em um arquivo gráfico do MatLab.

E, de forma geral, podemos descrever os passos para a geração de formas de onda como:

- Descrição da forma de onda (análise espectral);
- Utilização de uma das ferramentas de síntese para gerar o arquivo HDL (AHDL ou VHDL);
- Compilação, Simulação;
- Criação do Arquivo de Simulação TBL;
- Execução do Programa TBL2M;
- Visualização da forma de onda proposta no MatLab;
- Validação do Circuito;

RESULTADOS

A forma de onda escolhida para implementação em FPGA foi a onda denominada farádica. Esta onda tem como característica um pulso de breve duração seguido de um período de decaimento exponencial. A equação farádica, foi modelada de acordo com as especificações da literatura de eletroterapia [7]. A Figura 4, apresenta a onda farádica simulada com 8 bits de entrada e 8 bits de resolução. Na figura, além da forma de onda, são mostrados os valores dos contadores em função do tempo.

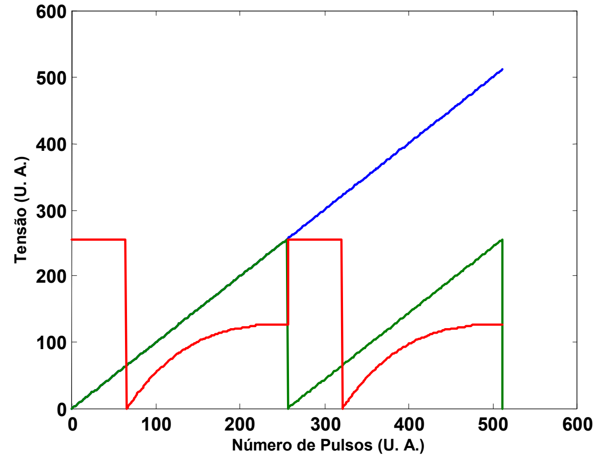

FIGURA 4.
FORMA DE ONDA IMPLEMENTADA EM FPGA

A Figura 5, apresenta a mesma forma de onda plotada com 5 períodos.

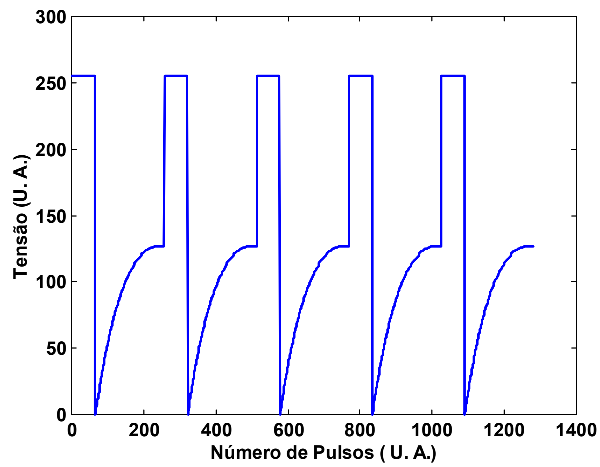

FIGURA 5.
FORMA DE ONDA IMPLEMENTADA EM FPGA

CONCLUSÕES

As ferramentas de síntese automática apresentaram-se como poderosas ferramentas para a geração de circuitos digitais.

A estrutura em hierarquia de projeto permite que, uma vez necessária a modificação da forma de onda previamente descrita, a fácil substituição desta por uma outra mais adequada dentro do projeto.

As freqüências de trabalho realizadas nas medições e simulações, permitem a implementação física das formas de onda, já que o objetivo é a aplicação em sistemas de Estimuladores Neuromusculares onde a freqüência de trabalho é quase sempre menor que 10 KHz.

DA ANÁLISE EM SÉRIE DE FOURIER AO FPGA

Adriano dos Santos Cardoso[1], Alexandre César Rodrigues da Silva[2] e Aparecido Augusto de Carvalho[3]

Resumo *— Sinais analógicos ou digitais são descritos por funções. Dessa forma, a expansão em séries são métodos válidos para a descrição desses tipos de sinais. A expansão em série de Fourier é, provavelmente, a mais utilizada dentre todas as formas de expansões em séries ortogonais. Atualmente, os recursos disponibilizados nos osciloscópios digitais têm permitido a análise espectral de sinais analógicos, gerando, assim, os coeficientes da Série de Fourier. Os coeficientes da Série de Fourier descrevem a forma de onda sob análise. Neste trabalho, desenvolveu-se uma ferramenta de síntese denominada F2HDL (Fourier para HDL), onde os coeficientes da Série de Fourier, obtidos de um sinal analógico, a partir de uma análise espectral, pode ser implementado em FPGA. Estudos realizados com diferentes tipos de sinais comprovaram que a ferramenta desenvolvida possibilita a geração de formas de onda digitais em uma faixa muito grande de freqüência, podendo atingir dezenas de MHz.*

Palavras Chave — Análise Espectral, Ferramentas de Síntese, FPGA, HDL, VHDL.

INTRODUÇÃO

O PROCESSO DE SISTEMAS DIGITAIS

Em [2], o processo de projeto foi definido de forma simples como a especificação e a descrição final. A diferença fundamental entre a descrição inicial e a descrição final está no fato desta última conter todas as informações necessárias à fabricação do sistema, ao contrário da primeira. O processo de projeto pode ser dividido em duas etapas distintas: a de síntese, onde se agrega algum tipo de informação `a descrição, e, assim, desenvolve-se uma descrição mais próxima da descrição final, e a validação, também chamada de análise, onde é verificado os acertos das tomadas de decisões durante as etapas de síntese.

Durante o processo de projeto, dois conceitos devem ser atendidos: Correção e Otimização. Um projeto é correto se e somente se atende todos os requisitos da descrição inicial e é factível. E, ainda, a descrição de um projeto é ótima se é correta e ainda possui menor custo e melhor desempenho dentre todas as soluções.

Em resumo, pode-se dividir os critérios em:

- Espaço – O sistema deve ter o menor tamanho possível;
- Tempo – O sistema deve apresentar o menor tempo de resposta possível;
- Consumo de energia – O sistema deve apresentar o menor consumo possível.

Para se escolher uma dentre as soluções ótimas, deve-se adequar critérios de acordo com o tipo de aplicação do sistema.

A partir de uma descrição abstrata o projetista deve ser capaz de uma descrição detalhada de forma tal que o projeto seja, então, ótimo e mantenha a funcionalidade e desempenho a um custo mínimo.

UM MODELO PARA O PROCESSO DE PROJETO: O DIAGRAMA Y

Em termos de hierarquia, um projeto digital pode ser dividido em quatro níveis ascendentes de abstração:

- nível elétrico – É o mais baixo nível, nele estão contidas informações da teoria de circuitos e da física dos semicondutores, ou ainda, de diagramas elétricos com resistores capacitores, transistores etc;
- nível lógico – Contém informações onde se agrega conceitos da teoria de circuitos digitais tais como equações booleanas, teoria de grafos, tabelas de transição de diagramas de máquinas de estados, etc;
- nível microarquitetura – Carrega informações sobre macroblocos, transferência entre registradores, planta baixa com a localização dos módulos, ULAs, grafos de fluxo de dados, etc;
- nível sistêmico – São descritos algoritmos, fluxogramas, memórias, processadores, etc.

Pode-se decompor as informações de um sistema digital em três diferentes categorias:

- físico - contém informação geométrica sobre os componentes, módulos e sobre a disposição espacial destes no sistema a ser fabricado;
- estrutural - contém informação sobre como interconectar blocos de base de comportamento;

[1] Adriano dos Santos Cardoso, Universidade Estadual Paulista "Júlio de Mesquita Filho", Av Brasil Centro, 56, Ilha Solteira, SP, Departamento de Engenharia Elétrica, cardoso@dee.feis.unesp.br
[2] Alexandre César Rodrigues da Silva, Universidade Estadual Paulista "Júlio de Mesquita Filho", Av Brasil Centro, 56, Ilha Solteira, SP, Departamento de Engenharia Elétrica, acrsilva@dee.feis.unesp.br
[3] Aparecido Augusto de Carvalho, Universidade Estadual Paulista "Júlio de Mesquita Filho", Av Brasil Centro, 56, Ilha Solteira, SP, Departamento de Engenharia Elétrica, aac@dee.feis.unesp.br

- comportamental - carrega informação sobre o comportamento do sistema, sem se envolver em como tal comportamento pode ser obtido, seja do ponto de vista físico, seja do ponto de vista estrutural.

A representação de um modelo que contém os níveis de abstração e os domínos de descrição de um sistema digital foi proposta pela primeira vez por Gajski e Kuhn [1], o chamado Diagrama Y, apresentado na Figura 1.

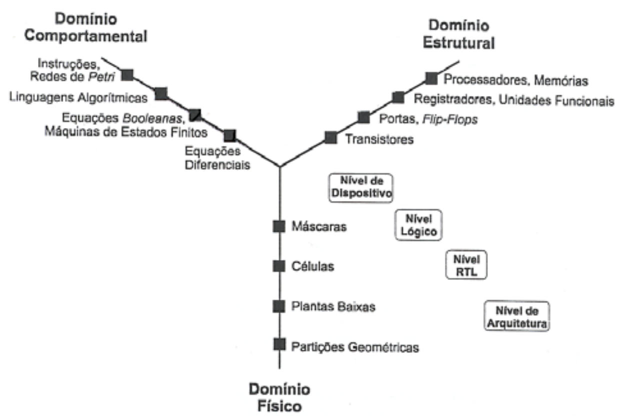

FIGURA 1.
ELEMENTOS PRIMITIVOS DE CADA NÍVEL DE ABSTRAÇÃO NO DIAGRAMA DE GAJSKI E KUHN (DIAGRAMA Y).

Neste diagrama, os níveis de abstração (Nível de Dispositivo, Nível Lógico, Nível RTL, Nível de Arquitetura) são identificados pelas suas distâncias do centro do diagrama, enquanto os segmentos de reta radiais correspondem a domínios de descrição. Por exemplo, um diagrama de esquemáticos de portas lógicas TTL é uma descrição estrutural lógica, estando portanto localizado na intersecção do eixo rotulado Domínio Estrutural com o nível lógico de abstração.

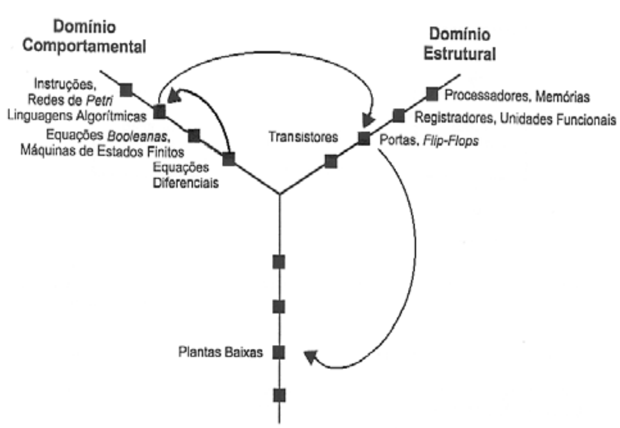

FIGURA 2.
REPRESENTAÇÃO DAS TRANSIÇÕES OCORRIDAS COM A F2HDL.

A Figura 2 representa o diagrama de Gajski da ferramenta desenvolvida. A F2HDL leva do nível de abstração de Equações Algébricas para o nível de Equações Booleanas. O ambiente de projeto MAX + Plus II leva para o nível de portas lógicas (Compilador) e finalmente, para o nível de Planta Baixa (Configurador de FPGA).

FERRAMENTAS DE PROJETO BASEADAS EM SÍNTESE AUTOMÁTICA

Métodos de síntese automatizada ótima para equações Booleanas datam das décadas de 50 e 60 e não tinham a capacidade de resolver sistemas muito complexos. A necessidade de manipular quantidades crescentes de informações durante o projeto de sistemas digitais exigia a consideração constante de novas ferramentas. Estas deveriam transcender as atividades de facilitar a captura e de exercitar descrições, passando a ser capazes de gerar novas descrições de forma automatizada e corretas por construção, baseados nos mesmos requisitos manipulados pelos projetistas. O estilo de projeto estabelecido por estas novas ferramentas baseia-se no uso de ferramentas computacionais e guia o processo de projeto. A ferramenta central possui embutido um conjunto de modelos de síntese e é capaz de gerar uma descrição correta por construção, bem como uma avaliação do desempenho desta descrição. O laço de realimentação é fechado pelo projetista, que julga os resultados da síntese e aceita descrição, ou a rejeita e escolhe um novo modelo de síntese para ser usado. Essa escolha pode ser feita com o auxílio de outras ferramentas distintas e apropriadas no processo de validação.

As ferramentas de simulação podem ainda ser empregadas visando fornecer mais detalhes sobre a implementação. Freqüentemente, o sintetizador gera uma descrição a partir dos requisitos, e refina esta descrição através de técnicas de otimização. Somente a descrição resultante deste processo é fornecida ao projetista.

CRIAÇÃO DE DECOFICADORES DIGITAIS UTILIZANDO FERRAMENTAS DE SÍNTESE AUTOMÁTICA

SISTEMAS DIGITAIS

Um sistema digital é um sistema discreto, isto é, transforma valores discretos de entrada em valores discretos de saída. Ele trabalha aplicando operações ou transformações nos valores de entrada. Os resultados dessas operações são passados a outras operações e finalmente para o valores de saída.

A descrição através de uma interpretação funcional do sistema é chamado de Descrição Comportamental. Em linguagem de descrição de hardware, a descrição comportamental é diretamente integrada na linguagem. Assim, pode-se trabalhar em uma descrição com um nível mais alto de abstração.

As ferramentas de síntese, trabalham em torno de modelos funcionais que representam algum conjunto de funções.

Um dos modelos que se pode trabalhar nessas ferramentas são os decodificadores. Estes representam funções booleanas. Assim, cada um dos pinos de saída é uma função de todas as entradas.

Um decodificador de 7 segmentos representa bem esta idéia, ele possui 4 entradas (A, B, C, D) e 7 saídas (a, b, c, d, e, f, g) e a saída “a”, por exemplo, pode ser transcrita como:

$$a = F(A,B,C,D) = \\ = \Sigma(0,2,3,5,6,7,8,10,12,14,15) \tag{1}$$

Extrapolando para as outras saídas, determina-se as funções b, c, d, e, f, g e aplica-se os processos de minimização (fornecidas pelo ambiente de projeto Max + Plus II da Altera).

Em termos de linguagem de descrição de hardware (HDL), utilizou-se como base o uso de tabelas, assim, descreve-se o comportamento de uma função em todos os valores (passos) possíveis conforme o exemplo da Figura 3.

IMPLEMENTAÇÃO DE FORMAS DE ONDA ANALÓGICAS

O intervalo de valores possíveis de um contador, depende da quantidade de flip-flops que se esta trabalhando, ou de outra forma, do número de bits. Assim, um contador de n = 8 bits, por exemplo, apresenta em função da contagem, valores em sua saída entre 0 e 255 ou seja $2^n - 1$, onde n é o número de bits. Desta forma, a cada pulso de relógio a contagem aumenta em uma unidade percorrendo todos os valores de forma crescente. Acoplando-se a saída do contador a um decodificador com o mesmo número de bits, a cada valor de contagem, tem-se no barramento de saída do decodificador valores em função da contagem atual do contador. A frequência de saída do sistema, depende do número de bits e do relógio conforme descrito em (2). A Figura 4, representa o sistema que gera uma onda analógica partindo de recursos digitais.

$$fsinal = \frac{fclock}{2^n} \tag{2}$$

Onde:
n = número de bits do contador;
fclock = freqüência do relógio (entrada);
fsinal = freqüência do sinal (saída);

FIGURA 4.
GERAÇÃO DE SINAL ANALÓGICO UTILIZANDO DECODIFICADOR

ENGENHARIA REVERSA

A utilização da tecnologia FPGA para a geração e implementação de formas de onda foi descrita em [3]-[4].

Algumas formas de onda podem ser facilmente descritas por meio de equações e, de modo particular, com os coeficientes de um polinômio. Outras, porém, podem apresentar uma forma um tanto complexa para esse tipo de modelagem, ou ainda, pode-se ter apenas a forma visual (ou capturada por Osciloscópio Digital) para a possível reprodução. Deste problema, surgiu a necessidade de se gerar formas de onda, partindo da análise espectral que é facilmente gerada pelos softwares que fazem análises de formas de ondas capturadas por osciloscópios digitais. Uma vez capturada a forma de onda que se quer reproduzir, pode-se efetuar a análise espectral e os resultados serão a entrada para uma Ferramenta de Síntese. Através da superposição dos coeficientes e os respectivos pesos multiplicados por funções senos e cosenos, pode-se reproduzir a forma desejada. Conforme a necessidade, pode-se, ainda, acrescentar ou diminuir a quantidade de bits da forma de onda ou, também, alterar a quantidade de dados da análise espectral fornecida à ferramenta F2HDL.

MATERIAIS E MÉTODOS

Para a geração de formas de onda usando somente recursos digitais, desenvolveu-se uma ferramenta de síntese automática onde a partir da descrição da forma de onda pode-se gerar a descrição em termos de elementos digitais.

A ferramenta de síntese F2HDL gera o arquivo texto de HDL.

O ambiente de programação MAX + Plus II da Altera, simula e compila e gera vários arquivos de reportagem e de interface com outros ambientes de programação.

O aplicativo TBL2M, foi desenvolvido para interpretar dados do arquivo .TBL (arquivo de simulação) e converte-los em um arquivo gráfico do MatLab.

A Figura 5, apresenta o fluxo do processo de geração de arquivos utilizado para implementação e validação das formas de onda. E, de forma geral, podemos descrever os passos para a geração de formas de onda como:

1. Descrição da forma de onda (análise espectral);
2. Utilização de uma das ferramentas de síntese para gerar o arquivo HDL (AHDL ou VHDL);
3. Compilação, Simulação ;
4. Criação do Arquivo de Simulação TBL;
5. Execução do Programa TBL2M;
6. Visualização da forma de onda proposta no MatLab;
7. Validação ou correção do Circuito;

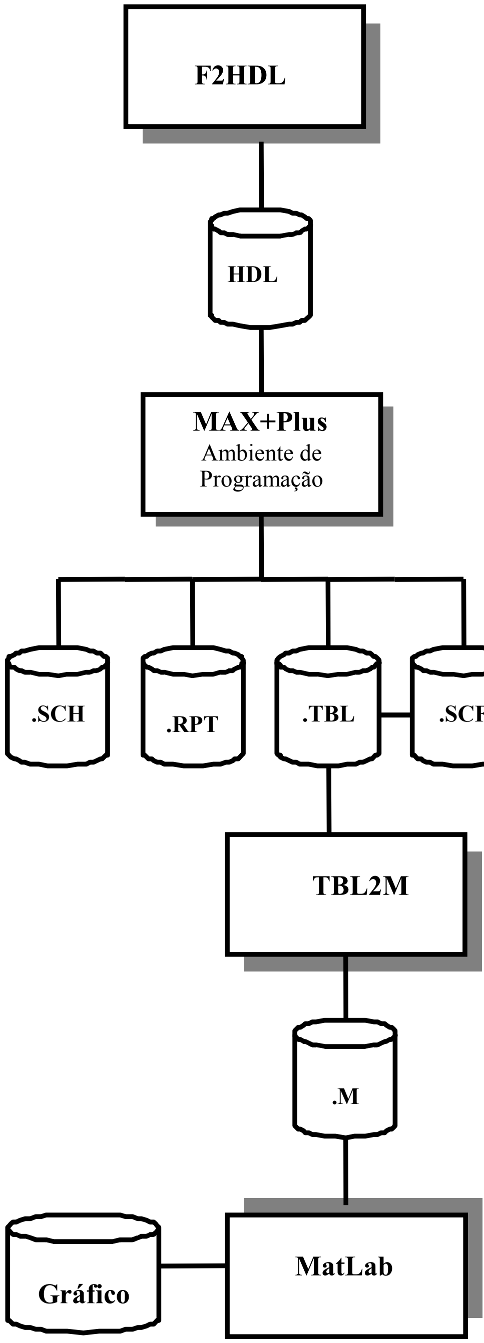

FIGURA 5.
ESQUEMA DE PROCESSO DE GERAÇÃO DE FORMAS DE ONDA EM FPGA

RESULTADOS

A Figura 6, apresenta o resultado de um processo de geração de forma de onda com os dados de entrada apresentado na Tabela I. Na figura 6, a rampa representa a contagem do contador. Quando esta atinge o valor máximo, automaticamente é zerado dando início a um novo ciclo. A forma de onda apresentada é a composição espectral, considerando-se os ângulos de fase, e as respectivas amplitudes de cada harmônica.

TABELA I
Valores de Entrada

N. da Harmônica	Amplitude (p.u)	Defasagem (rad)
1	1	0
2	1	0.7

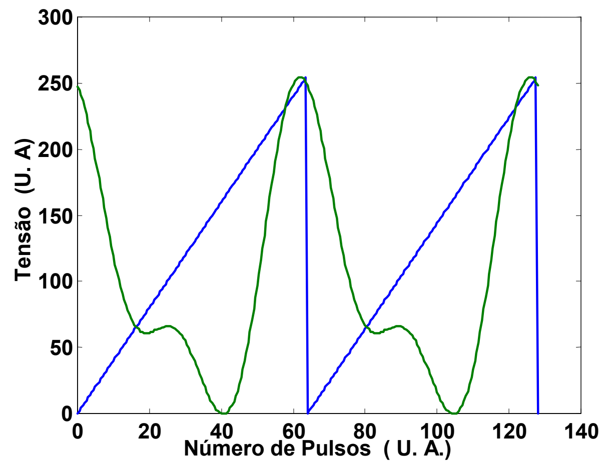

FIGURA 6.
FORMA DE ONDA IMPLEMENTADA EM FPGA

CONCLUSÕES

As ferramentas de síntese automática, desenvolvidas nesse trabalho, apresentaram-se como poderosas ferramentas para a geração de circuitos digitais.

A ferramenta F2HDL apresenta uma nova maneira de se obter uma forma de onda. Através da engenharia reversa pode-se capturar um sinal periódico qualquer, fazer a análise espectral e a partir daí gerar o circuito digital em FPGA correspondente.

A estrutura em hierarquia de projeto permite que uma vez necessária a modificação da forma de onda previamente descrita, é fácil a substituição desta por uma outra mais adequada dentro do projeto.

As freqüências de trabalho realizadas nas medições e simulações permitem a implementação física das formas de onda, uma vez que o objetivo é a aplicação em sistemas de Estimuladores Neuromusculares onde a freqüência de trabalho é quase sempre menor que 10 KHz.

AGRADECIMENTOS

Este trabalho foi parcialmente financiado pela agência Capes, Brasil e pelo Departamento de Engenharia Elétrica – Universidade Estadual Paulista.

SENSOR DE TEMPERATURA MICROCONTROLADO USANDO O MC68HC11

Rodrigo Martins Costa[1], Marcos Ikeguchi Ohira[2] e Alexandre César Rodrigues da Silva[3]

Resumo *— Foi desenvolvido um sistema microcontrolado, baseado no MC68HC11 da Motorola, para medir temperaturas ambientes e apresentar a medida na tela de um microcomputador, em intervalos de 30 segundos por um período de 5 minutos. A faixa de temperatura é de 0º a 100ºC. O trabalho foi dividido em três etapas: na primeira etapa efetuou-se pesquisa de informações relevantes e da funcionalidade do ambiente de desenvolvimento; na segunda etapa desenvolveu-se a interface analógica; na terceira desenvolveu-se o programa do microcontrolador. A interface analógica foi desenvolvida utilizando-se como elemento sensor o transistor 2N2219. O sensor foi calibrado obtendo-se uma resposta linear da tensão em função da temperatura. O programa do microcontrolador foi desenvolvido em sua linguagem Assembler e os valores de temperatura medidos são mostrados na tela do microcomputador. O sistema apresentou boa resposta sendo a margem de erro inferior a 1ºC.*

Palavras chave — Microcontrolador, sensor, temperatura, transistor, interface.

INTRODUÇÃO

Sensores sempre foram muito utilizados em vários segmentos produtivos como, por exemplo, na indústria automotiva, na biomedicina, na automação industrial em geral, nos controles de processos e mais recentemente no monitoramento de condições ambientais onde se exige a análise de diversos pontos do sistema. Em escala global o monitoramento ambiental é feito através de instrumentos baseados em satélites. Esse tipo de monitoramento é denominado de sensoriamento remoto.

Com o advento da microeletrônica e conseqüentemente da tecnologia dos microcontroladores, os sensores têm adquirido muito mais funcionalidades. Pode-se dizer que os sensores adquiriram inteligência (Smart Sensors) e capacidade de comunicação digital.

O rápido desenvolvimento e o emergente emprego dos sensores inteligentes aliados ao campo da tecnologia de rede de computadores têm feito a rede de transdutores (sensores e atuadores) inteligentes uma atrativa e promissora solução para o monitoramento de medidas distribuídas e aplicações de controle [5].

Este trabalho de pesquisa tem como objetivo principal iniciar estudos em sistema de medida de temperatura usando um microcontrolador. Na Figura 1 é apresentado um diagrama de bloco do sistema proposto para estudo.

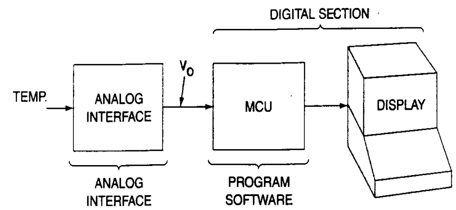

FIGURA 1
SISTEMA PARA MEDIR TEMPERATURA EMPREGANDO UM MICROCONTROLADOR.

Pode-se notar claramente que o sistema de medida é composto por uma interface analógica que converte a variável física (temperatura), em um sinal elétrico (tensão) adequado para o conversor A/D (analógico – digital) do microcontrolador.

Escolheu-se a medição de temperatura por ser um dos problemas mais antigos do homem, pois ela afeta diretamente o meio ambiente e todas as reações físico-químicas da natureza. Certamente os transdutores de temperatura são os mais diversos possíveis. Qualquer componente eletrônico varia suas características com a temperatura. Dessa forma, enquanto alguns componentes são projetados para medir a temperatura, outros o são para serem estáveis com a temperatura [4]. Para se medir a temperatura são necessários dois tipos de componentes: os estáveis, para os circuitos de controle, interface, etc., e o variável que representa o transdutor.

Com essa proposta de trabalho deu-se os primeiros passos no sentido de adquirir o conhecimento necessário para que num futuro próximo possa-se estar trabalhando com o sensor em redes, pois como pode ser notado nos artigos que tratam do assunto, um dos componentes chaves do projeto 1451 são os TEDs (Transducer Electronic Data Sheet) que estão baseados em microprocessador.

OBJETIVOS

Desenvolver um sistema microcontrolado para medir temperaturas ambientes e apresentar as medidas na tela de um microcomputador em intervalos de 30 segundos por um período de 5 minutos. A faixa de temperatura é de 0º a 100

[1] Rodrigo Martins Costa, UNESP/Campus de Ilha Solteira – Departamento de Engenharia Elétrica, Av. Brasil Centro, 56, 15.385-000, Ilha Solteira, SP, Brasil, rmcosta@dee.feis.unesp.br
[2] Marcos Ikeguchi Ohira, UNESP/Campus de Ilha Solteira, Av. Brasil Centro, 56, 15.385-000, Ilha Solteira, SP, Brasil, ikeguchi@dee.feis.unesp.br

ºC. Estas especificações tiveram como objetivo adquirir capacitação para um melhor controle sobre microcontrolador, pois, dessa forma, necessita-se medir a temperatura através da contagem do número de ciclos de relógio (clock) de um oscilador durante o período especificado.

O sistema foi capaz de efetuar leituras de temperaturas com diferentes tipos de elementos sensores (sensores de platina, bimetálicos, etc). Um equipamento desse tipo para ser considerado de boa qualidade e confiabilidade em termos de precisão, deve permitir leituras com erros inferiores a 1ºC.

DESENVOLVIMENTO

Metodologia

Uma primeira etapa do projeto foi a pesquisa de informações relevantes (transdutores de temperatura, faixas de medição, interface serial, dispositivos, componentes, etc.) e da funcionalidade do ambiente de desenvolvimento, a placa MC68HC11EVBU da Motorola.

Após explorar o ambiente de desenvolvimento, o sistema e os componentes primitivos (dispositivos) a interface analógica foi considerada.

Após a interface analógica ter sido desenvolvida (projetada), desenvolveu-se o programa do microcontrolador funcionando em conjunto com o programa para o microcomputador.

O SENSOR DE TEMPERATURA

Junção Semicondutora

Uma opção de termômetro de baixo custo, apresentado na Figura 2, utiliza o transistor 2N2222 como elemento sensor. A não-linearidade de V_{be} com a temperatura é mínima na faixa de –5ºC a 125ºC, o que significa uma imprecisão de apenas ± 1ºC. O diodo Zener regula a tensão de entrada a 1,2V através de R2 para fixar a corrente de operação do sensor. O resistor R4 polariza o amplificador para uma saída zero quando a temperatura for 0ºC. O resistor de realimentação R5 é finalmente ajustado para um coeficiente de temperatura do sistema de 100mV/ºC. Tanto os resistores, como o Zener, quanto o amplificador operacional devem ser estabilizados ou devem variar muito pouco suas características com variações de temperatura ambiente.

Os sensores de temperatura de silício da série MTS 102, 103 e 105 da Motorola são transistores comuns, mas com uma tensão base-emissor otimizada que varia linearmente com a temperatura. Esse circuito é mostrado na Figura 3. Este dispositivo tem uma resposta linear a partir de –40ºC até 150ºC.

Para utilizar este sensor de temperatura, basta polarizar o transistor e medir sua tensão base-emissor com o coletor ligado na base. O circuito da Figura 3 mostra uma aplicação deste dispositivo. O 7812 é utilizado aqui não somente para polarizar o transistor através do resistor de 110kΩ, agindo como fonte de corrente, como também para alimentar os dois amplificadores operacionais. O primeiro deles serve como buffer e o segundo amplifica o sinal para se obter na saída 10 mV/ºC. O resistor R(cal) subtrai 273,16ºC equivalentes à transformação de kelvin para graus centígrados.

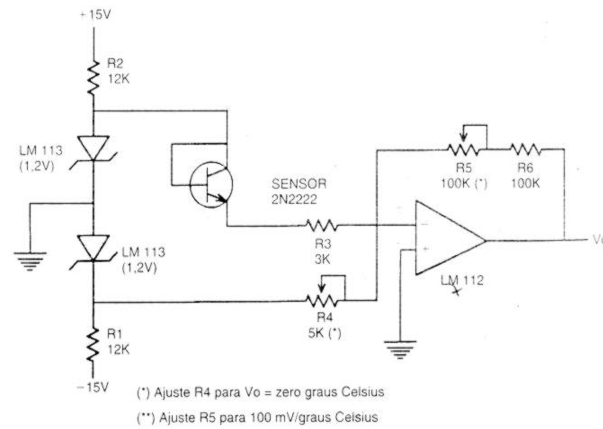

FIGURA 2
UM SISTEMA DE MEDIDA DE TEMPERATURA DE BAIXO CUSTO COM PRECISÃO DE ±1ºC.

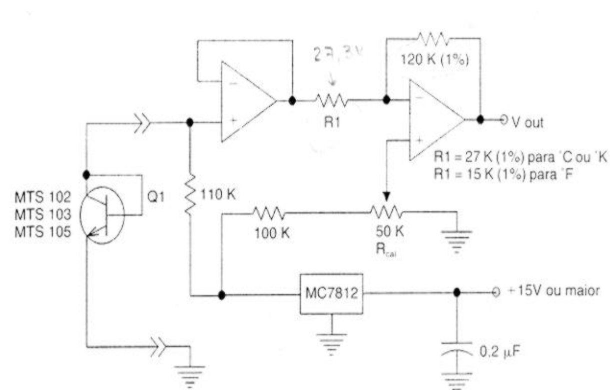

FIGURA 3
APLICAÇÃO PRÁTICA DO MTS 102

RESULTADOS

Dentre as opções de medida apresentadas adotou-se os sensores 2N2219 (semelhante ao 2N2222) e o AD590 por serem comercialmente mais facilmente encontrados e por serem relativamente baratos, tanto os elementos sensores quanto os componentes para o condicionamento do sinal.

Após alguns testes com os circuitos apresentados, considerou-se uma boa resposta com o circuito mostrado na Figura 3, porém utilizando o transistor 2N2219A.

A resposta do circuito apresentado foi de, aproximadamente 100mV/ºC, conforme descrito. O circuito foi implementado em laboratório, e está mostrado na Figura 4.

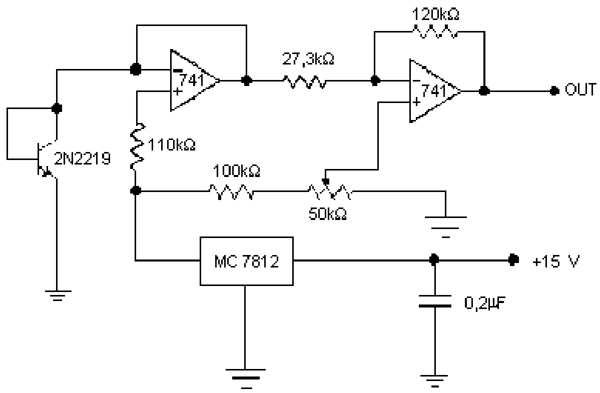

FIGURA 4
CIRCUITO SENSOR DE TEMPERATURA IMPLEMENTADO EM LABORATÓRIO

Realizou-se a calibração desse circuito utilizando-se água com gelo, para se obter uma temperatura de zero grau, e água quente. O procedimento adotado foi o de iniciar com a água fervendo (aproximadamente 100ºC) e esfriar a água misturando-se água fria, diminuindo, assim, a temperatura.

Com esses dados, de tensão de saída em função da temperatura, obteve-se o gráfico apresentado na Figura 5.

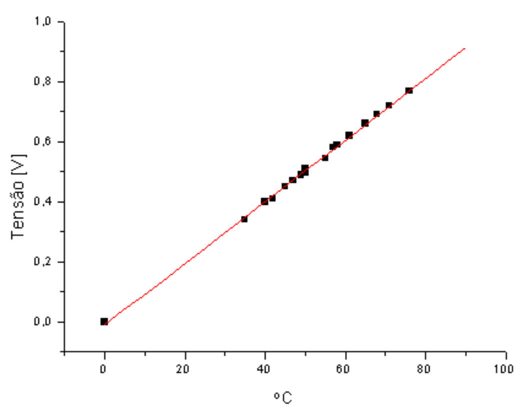

FIGURA 5
GRÁFICO DA TENSÃO DE SAÍDA EM FUNÇÃO DA TEMPERATURA USANDO O 2N2219

Pode-se verificar que a resposta do sensor é linear e é de 100mV/ºC, aproximadamente. Utilizando o software Microcal Origin 4.0, traçou-se este gráfico e obteve-se a equação da tensão em função da temperatura:

$$V = 0{,}01025.T - 0.00992 \qquad (1)$$

A expressão (1) pode ser aproximada para

$$V = 0{,}01.T \qquad (2)$$

Foram realizadas outras calibrações utilizando tensões de alimentação diferentes para verificar sua influência na resposta do circuito. Utilizando uma alimentação de ± 9V, realizou-se mais 4 medições, elevando a temperatura e diminuindo, para verificar também se o dispositivo apresentaria histerese. A Tabela I mostra os dados obtidos e com os quais traçou-se as curvas mostradas no gráfico da Figura 6.

Abstract *– Abordagem da aplicação dos princípios Dale Carnegie relativos ao comportamento e ao relacionamento humano para melhoria da comunicação entre aluno-professor, dentro da sala de aula. Uma rápida visão sobre o cenário atual de algumas faculdades brasileiras e o comportamento dos alunos que as freqüentam, visando a discussão destes princípios com conseqüentes resultados práticos na vivência professor-aluno. Enfatiza a questão do professor como o líder na sala de aula e o aluno como agente multiplicador.*

Index Terms – Didática de ensino, Princípios Dale Carnegie, Relacionamento e Liderança professor-aluno, Comunicação eficaz na sala de aula.

Atualmente vivemos numa sociedade dinâmica, cujo cenário é influenciado pela tecnologia e pelo crescente acesso à informação, principalmente através da Internet, Jornais, Revistas, Noticiários, etc., quase de forma "on line" com os fatos e acontecimentos. Diante disto, podemos fazer uma análise mais profunda do perfil atual das Escolas Brasileiras, na preparação dos seus alunos, focando-se no nível universitário privado, com alunos freqüentadores de cursos noturnos, que enfrentam o cenário acima citado.

Do ponto de vista das escolas, instituições de ensino, o aluno é visto como um cliente, receptor de material didático em tempo e quantidade pré-definidas. As escolas investem pesadamente em recursos materiais e humanos. O MEC exige e monitora os cursos e professores, até Mestrados e Doutorados. Isto é fato, mas a questão é como propiciar o "adequado" interesse e dedicação do aluno pelo tema oferecido.

Do nosso ponto de vista, algumas escolas tendem a manter seus processos de informações de ensino e administrativos com uma dose de fluxos burocratizados, com aulas mais teóricas do que participativas. Este assunto também é citado no artigo do Jornal Administrador, "o que falta para as escolas serem competitivas" [4]. Observam-se escolas com muitos recursos, porém muitas vezes não disponíveis, ou seja, recursos de qualidade e em quantidade, porém mais parados do que utilizados, por não existir o devido planejamento operacional com suas composições e flexibilidades administrativas. Isto vem da cultura Brasileira de não possuir o hábito do "plano de longo prazo". Como exemplo, no caso do professor necessitar algum recurso, é orientado para fazê-lo com muitos dias de antecedência. Daí se constrói um fluxo de ocupação dos recursos na prática, em vez de planejarem o uso de todos os recursos existentes ao longo do período (semestral ou anual), com isso distribuindo esses recursos/disponibilidade entre as matérias/aulas de maior necessidade, ampliando a eficácia do uso e aumentando a abrangência a cada novo recurso adquirido. Outro exemplo pode ser o não uso de ferramentas para modelagem de fluxos de processos, que quando feito manualmente, acaba levando mais de 50 minutos da aula, sendo que com o uso do microcomputador e recursos de softwares específicos ou até mesmo um simples *power point*, poder-se-ia gastar uns 5 minutos em vez dos 50. E os alunos desenvolveriam não só o "layout" (desenho do fluxo), mas também o funcionamento em detalhes, podendo até propor melhorias para esse fluxo, ou ainda simular processos alternativos, desenvolvendo a sua criatividade, aprendendo a analisar preventivamente os desvios e variação de custos, etc. Diante disto, a questão é como estimularmos o interesse do aluno pela matéria/aula.

Já do ponto de vista dos alunos, verifica-se uma postura deles muito cômoda, influenciada pela relação custo x benefício dos cursos, até influenciando a qualidade e o reconhecimento do nível da instituição, popularmente falando. Isto é, pelo fato de estarem pagando a escola, julgam não ser preciso usar de seus próprios esforços para escrever, exercitar-se, pensar e formar seu raciocínio, concluindo o aprendizado. Por essa falta de "vontade aparente" gera uma falta de respeito com os colegas interessados em aprender e com os professores, ávidos a repassar seus conhecimentos. Atribui-se a isso, o fato de, por serem de curso noturno, virem já cansados física e mentalmente para as aulas, alguns com muito fraca formação escolar básica anterior e a acomodação dada pelo uso não adequado da tecnologia. Por exemplo, atender várias vezes o celular em aula, mesmo saindo da sala, não querendo escrever, onde recorrem a cópias reprográficas ou "copy and paste" nos trabalhos, não querendo calcular mentalmente, não sendo pontuais com os horários, não tornando eficaz o seu próprio aprendizado. Externam, com isso, uma falta de compromisso para consigo mesmo, com a sua carreira e sua formação acadêmica, conseqüentemente, correndo o grande risco de não ficarem preparados adequadamente para sua auto-sustentação, para serem grandes empreendedores e líderes no mercado de trabalho, uma selva de pedra, cada vez mais competitiva e selvagem, tornando frágil não só a ele, mas toda uma comunidade, até o País.

Mediante estes cenários, a Escola, Professores e Alunos, todos com grande responsabilidade social, devem comprometer-se em aprender, a praticar, testar, demonstrar e ensinar aos demais a comprarem as "idéias/assuntos" abordados em aula. Citamos abaixo alguns objetivos, que se

[1] Cacilda Andrade, Al. Santos, 1343 # 205, cep 01419-001, São Paulo , SP, Brazil, estrelass@uol.com.br
[2] Marcos Bonavita, Rua Rio Negrinho, cep 11.045-300, Guarulhos, SP, Brazil, marcos.bonavita@procwork.com.br

deve sempre ter em mente, com isso criando seus próprios pilares de uma sólida base:

1) Ser e ter condições de auto-sustentação, de sobrevivência própria e de seus dependentes;
2) Serem multiplicadores, aprendendo e ensinando a gerar riquezas, não sendo somente consumidores;
3) Saber conviver bem com as pessoas, se relacionar formalmente (em termos de postura, diálogo, apresentação e conteúdo), com isso sendo pessoas mais solicitadas e realizadas;
4) Saber ouvir, selecionar e dar a devida interpretação, sabendo dosar o seu discurso;
5) Possuírem um diploma que seja mais que um "canudo" ou "quadro exposto", mas que seja realmente uma "Certificação da Competência", algo que o capacite como um profissional, permita agir por completo, seja um referencial com potencial de crescimento e desenvolvimento próprio.

Assim, sensibilizados com este cenário em que estamos em constante contato, vendo diariamente acontecer na nossa vida de profissionais com uma vasta e variada experiência no mercado industrial Brasileiro e Internacional, também em serviços de informática e consultoria de negócios, sendo orientadores e formadores de pessoas, juntamos forças, reflexões e energia para estarmos encontrando meios de enriquecer as nossas aulas e relacionamentos acadêmicos para servir de base para o futuro desses nossos alunos.

Procurando por melhores formas de comunicação e interação, com conseqüente repassagem dessas informações, fomos buscar uma referência internacional com 90 anos de tradição. Fizemos um auto-investimento em curso, no Instituto Dale Carnegie, especializado em treinamento comportamental e de relacionamento humano, onde aprendemos as técnicas, fomos treinados e colocamos em prática alguns dos princípios ensinados pelo fundador do Instituto, sua forma de aplicação e conseqüentes resultados práticos que vivenciamos com nossos alunos. Aprendemos técnicas para lidar com as pessoas, maneiras de fazer com que gostem uns dos outros, como conquistar estas pessoas a pensarem do seu modo e como ser um líder.

Achamos de extrema importância estarmos repassando esse conhecimento e experiência adquirida, testando o resultado de cada aula, onde adicionamos nossa vivência e o convívio com nossos alunos, cujos princípios já fazem parte de nossas vidas e da didática de ensino. A aplicação dos princípios de Dale Carnegie é constante, diária, e que funciona a partir do momento que os aplicamos e verificamos o retorno em nós mesmos e em quem nos cerca. Ficamos mais entusiasmados, felizes dentro e fora da sala de aula, podendo ser aplicado nas mais diferentes ocasiões e momentos de nossa vida.

A forma de externar sentimentos, sentir emoções, se explicitar, isto é a comunicação de quem fala para quem ouve, podendo ser do aluno ao professor e vice-versa. Mas é de extrema importância que o aluno conviva com esses princípios aplicados pelo professor, pois aí se cria indiretamente o interesse pela matéria, pelo professor, pela sua própria carreira e em si mesmo, para tornar-se um ser humano mais feliz. Isto reforça que a forma de aprendizado vai alem da base técnica. Precisamos estar o tempo todo atento, para o nosso inter-relacionamento e desenvolvimento pessoal, que certamente reflete positivamente em nosso estado de espírito e em nosso dedicado trabalho.

Saber lidar com as pessoas, saber relacionar-se, saber tratá-las devidamente com conseqüência obtenção do apoio do grupo envolvido, isso é a função de um líder. E qual é a função de um líder? Liderar para alcançar a melhoria contínua do trabalho e da convivência humana. A visão que temos é que o professor deva ser o líder dos seus alunos, o exemplo, um amigo, um mestre de referência, respeitar e ser respeitado, pois usando algumas posturas citadas abaixo, estaremos abordando e praticando sobre os princípios do Dale Carnegie, com isso alcançando nosso objetivo de fazer crescer o interesse do aluno pelo conteúdo aprofundado em aula:

- Devemos nos tornar pessoas mais amigáveis;
- Devemos conquistar os alunos, para o nosso modo de pensar;
- Elogiemos os alunos, de forma honesta e sincera;
- Corrijamos suas posturas e trabalhos evitando críticas e condenações;
- Nos mostremos interessados no trabalho e progresso deles;
- Sejamos bons ouvintes: parando, olhando e escutando;
- Respeitemos a opinião expressa pelo aluno, analisando tanto pelo seu ângulo, como também pelo nosso ângulo de professor;
- Orientemos objetivamente ao ponto correto, fazendo com que ele conclua a seu próprio favor, usando analogias e fatos de forma indireta.

Mas uma grande questão é como conseguir que esses temas se tornem metas e até objetivos comuns entre os professores e alunos. Com alguns exemplos desta visão inovadora e prática é que pretendemos divulgar e demonstrar a importância e a possibilidade da melhoria em nossos relacionamentos, que só agrega mais valor à nossa experiência profissional e de vida. Nossa intenção é ir além da exposição da matéria/disciplina, é com isso sensibilizar e realmente acreditando na poderosa frase "querer é poder", transformar o inimigo em amigo, a dificuldade em facilidade, o insucesso em caso de sucesso. A idéia não é mudar as pessoas, mas sim criar um ambiente para que o aluno possa entrar, absorver e começar, ele próprio acreditando em você, no que você pensa, com isso ele mesmo se transforma. Acredite, você consegue melhorar muito o clima se você quiser e tiver as ferramentas apropriadas.

A Escola é voltada para criar conhecimento. A educação vem preparada do lar, para o bom relacionamento, para a vida, mas existem ferramentas que o Líder precisa utilizar, independentemente do seu tempo, da sua época, cujas principais podemos apontar:

- A *força da palavra* é o poder de comunicação, de convencimento, de atenção, de influência, de entendimento do ouvinte. Isto através do seu discurso enfático, dramático, imobilizador e convincente. Por exemplo, o discurso proferido por um General Romano, um Ditador, o Político, o Pastor religioso, um Pai ou o Professor;
- A *expressão corporal* é a maneira e o meio que reforça o entendimento da força da palavra, é a comunicação não verbal. Por exemplo, a postura, a vestimenta, o enfardamento, os gestos e os movimentos físicos realizados para atrair a atenção do ouvinte;
- O *entusiasmo* dentro de si, que é a energia interna contaminando aos ouvintes com alto poder de convencimento. É o próprio querer algo. Usar a força da palavra e da expressão corporal para externar um sentimento em que você primeiramente acredita e com isso poder convencer aos demais. Por exemplo, um discurso seu, normal, mas que ao final as pessoas pedem mais, que continue como no fim de uma excelente apresentação de um show ou de uma peça teatral;
- O *conhecimento da matéria* é o explicar com o naturalismo de quem conhece o assunto, tornando realmente fácil o entendimento. Usando de analogias sobre fatos "comuns e conhecidos". Por exemplo, uma aula de algum assunto difícil, chato, que o professor use de "artifícios ou analogias diretas e indiretas", com exemplos da realidade popular para fixar e absorver o conhecimento.

Todas essas competências reunidas em uma só pessoa nos levam ao professor ideal, um líder. E o que é ser um Líder ou um Facilitador? Melhor ainda, que tal ser um "Líder facilitador"? Já que ser um Líder é saber relacionar-se com outras pessoas, fazendo com que elas lhe sigam e realizem os seus desejos, ser um Facilitador é proporcionar os meios para a solução ou que o aprendizado de um determinado assunto seja alcançado, então ser um Líder facilitador é ter atitudes, comportamentos e comunicação que estimule ao aluno, e com isso consiga um ótimo relacionamento, promovendo a inspiração para que ele alcance sua meta e você o seu objetivo como Líder. Neste caso, é fazer com que os outros saibam fazer, saibam multiplicar e com isto estejam se tornando pessoas melhores, para si próprios e para a sociedade, comprovando a eficácia do aprendizado em sua escola.

Para transformarmos a categoria de professor comum, para um professor líder-facilitador, mostramos abaixo os princípios Dale Carnegie e situações em que mais utilizamos no nosso ambiente acadêmico [1], [2] e [3]:

1) Ao chegar nas salas de aulas, entre sorrindo sempre...comece de maneira amistosa, com empatia, e de forma sincera, refaça sempre um novo contato com os alunos. Por exemplo, ao entrar de cara fechada ou de mau humor, os alunos percebem e até perguntam se houve alguma coisa, já ficam de "pé atrás", o que provoca o atraso do início do interesse pela aula.

Princípio Dale Carnegie: "Sorria".

2) Elimine a crítica ao falar, com isso a pessoa ficará menos ressentida, menos acuada com algum comentário, pois o que ao aluno soa negativo, o faz perder pelo interesse pela aula. Por exemplo, "o aluno diz: Não acho nada na Internet", ao invés de dizer que ele está fazendo algo de errado, inverta e enfatize o positivo. Diga: "Troque de ferramenta de busca, seja persistente, procure por outras palavras chaves, filtros auxiliares, etc".

Princípio Dale Carnegie: "CCQ = Não critique, não condene, não se queixe".

3)Aprecie honesta e sinceramente, fazendo o aluno sentir-se importante, elevando sua auto-estima, pois quando ela se expõe ao comentar ou apresentar algo, se sentirá mais seguro de si. Mesmo que o trabalho não tenha sido do agrado do professor, mantenha o elogio e cite os pontos a melhorar. Elogie verdadeiramente os menores progressos, as respostas e a participação voluntária.

Princípio Dale Carnegie: "Aprecie honesta e sinceramente".

4)Crie o desejo na outra pessoa em querer concluir ou participar, mas sem obrigá-la. Pois o desejo em querer fazer/participar, são sentimentos que estão ocultos dentro dela.

Princípio Dale Carnegie: "Desperte veementemente o desejo nos demais".

5)Seja um bom ouvinte. Ao ouvirmos "algo inadequado", de pronto tendemos a corrigir, sem esperar e entender aonde o aluno quer chegar. Queremos que a nossa visão "correta" seja entendida, aceita e que a outra pessoa concorde de pronto. Mas, precisamos parar, ouvir mais e entender pelo outro lado, tenha paciência, com isso podemos mudar nossa opinião quando o aluno concluir seu pensamento.

Princípio Dale Carnegie: "Seja um bom ouvinte", "Pare, Olhe, Escute".

6)Use exemplos do dia-a-dia e casos práticos, analogias de temas vividos ou em evidência no momento, para que se correlacione com o tema em questão e desperte a curiosidade dos alunos.

Princípio Dale Carnegie: "Fale de coisas que interessem à outra pessoa".

7)Nunca diga ou corrija o aluno, dizendo “você está enganado” ou “você está errado”, respeite a opinião dos outros. Esclareça, dando exemplos de forma indireta, mostrando ao aluno a forma correta que deveria ter utilizado. E se estiver o professor enganado, reconheça o seu erro imediatamente.

Princípio Dale Carnegie: “Se está enganado, reconheça o seu erro rápida e energicamente”.

8)Somente o comprometimento real pode promover o entendimento, portando crie uma situação positiva questionando-o indiretamente, de forma que o aluno responda “sim” ao quanto for solicitado ou referenciado pelo professor. Use analogias e exemplos simples de forma a obter esse sim.

Princípio Dale Carnegie: “Consiga que a outra pessoa diga sim, sim, imediatamente”.

9)Ao explicar algum tema, use da técnica de dramatização para aumentar a aderência do tema na mente dos alunos. Crie situações de analogia ou cenários extremamente opostos à situação normal, exagere muitas vezes. Por exemplo, ao explicar uma situação de pouco interesse coletivo, subi em cima da cadeira, e com isso trouxe os desinteressados a ouvir o que eu dizia, prestando mais atenção.

Princípio Dale Carnegie: “Dramatize as suas idéias”.

10)Testar-se ou mostrar-se competente perante os demais cria um clima de competição e de desafio, que o ser humano adora. Portanto faça desafios possíveis e mensuráveis ao provocar os alunos, e que permita a participação de todos.

Princípio Dale Carnegie: “Lance um desafio”.

11)Quando quiser que os alunos obedeçam, evite dar ordens diretas, faça perguntas que os envolvam na direção do assunto que deseja explicar, com isso a atenção do aluno questionado e dos outros ao redor se prendem na resposta a ser dada, criando a expectativa quanto à resposta e ao próximo questionamento, tornando a classe mais atenta.

Princípio Dale Carnegie: “Faça perguntas em vez de dar ordens diretas”.

BIOGRAFIA

Carnegie, Dale (1888 - 1955) Escritor, orador; nascido em Maryville, Mo. direcionado à arte de falar em público desde os dez anos. Carnegie ao sair da faculdade, trabalhou como vendedor para a "Armorur and company" por dois anos e meio. Mudou-se para Nova Iorque em 1911 a fim de estudar na Academia Americana de Artes Dramáticas. Após ter representado alguns papéis, teve o bom senso de abandonar a carreira de ator e decidiu que daria aulas de oratória em escolas noturnas. Assim, Carnegie teria os dias livres para ler livros, preparar palestras, escrever romances e contos já que seu desejo era "de viver para escrever e escrever para viver". Sua primeira palestra foi na Young Men´s Crhistian Associations (ACM) no dia 22 de outubro de 1912. Num curto período de tempo Carnegie já estava desenvolvendo o seu próprio curso, e escrevendo panfletos que seriam publicados como livros, pois não havia na época materiais didáticos já publicados. Depois de ter servido no exército na Primeira Guerra Mundial, ele conduziu o "tour" das palestras de Lowell Thomas. Em seguida, conduziu o seu próprio "tour" a fim de promover suas idéias acerca do sucesso através da oratória. No início dos anos 30, era conhecido por seus livros e por um programa de rádio, quando publicou o Como Fazer Amigos e Influenciar Pessoas (1930), ganhando sucesso imediato e tornando-se dos maiores best-sellers de todos os tempos. Esse fato foi o suficiente para ele se tornar um orador e um escritor: começou a ter colunas em jornais. Criou o Instituto Dale Carnegie® em 1912, com o objetivo de preparar as pessoas para falar em público, caracterizando respeito, confiabilidade, comunicação e organização que transcenderam no tempo, línguas e culturas dos países. É destinado a desenvolver a Comunicação Eficaz e Relações Humanas, com filiais em todo o mundo; viveu para ver o dia em que o seu nome se tornaria virtualmente sinônimo de tudo o que ele promoveu. Atualmente são mais de 4 milhões de pessoas graduadas pelo treinamento e milhões de livros de cada título seu já lido [1].

CONCLUSÃO

Existe uma lei, fundamental para o relacionamento humano. E, se você respeitar esta lei, conquistará muitos amigos e felicidade. Procure sempre fazer as outras pessoas se sentirem importantes - seja sincero. “Ser importante é o desejo mais profundo do ser humano. É o que nos torna diferentes dos outros animais. Sorria, seja um bom ouvinte e encoraje as pessoas a falarem sobre si mesmas.” Dale Carnegie

Um general, chefe, pai, professor, aluno ou simples ouvinte será que devem somente dar ou cumprir ordens? Ensinar cegamente a fazer! Quantos Pais e Mestres já não falaram que aprenderam com seus erros ou com seus filhos e alunos. Portanto tudo isso tem relação com a participação do aluno nas aulas, com sua transparência e honestidade na troca de experiências, que certamente o professor deveria propiciar ao aluno, facilitando e abrindo sua mente. Portanto, tudo isto tem relação com a participação, transparência e honestidade que devem ter professores líderes de sucesso e com isso teremos bons alunos, seres humanos melhores, verdadeiros multiplicadores, isto é, excelentes futuros professores.

USANDO A LINGUAGEM VRML NO ENSINO DE HISTÓRIA DA CIÊNCIA E DA TECNOLOGIA DA ENGENHARIA ELÉTRICA

Antonio Lopes de Souza[1], José Carlos de Oliveira[2] e Marcelo Paulino de Lima Santos[3]

Resumo *— Este trabalho divide-se em duas partes: a primeira apresenta uma argumentação teórica sobre o uso da linguagem VRML (uma sigla para "Virtual Reality Modeling Language") no ensino da História da Ciência. A segunda parte apresenta a implementação em realidade virtual de um Museu-Laboratório Virtual voltado para ensino de História da Ciência e da Tecnologia da Engenharia Elétrica. Esse museu tem como entrada a replicagem em realidade virtual do ambiente de trabalho de Michael Faraday na Royal Institution de Londres. Essa replicagem foi feita tomando-se como base gravuras da época (século XIX) e é a partir da mesma que todo o projeto do museu se desenvolve. O acervo do museu-laboratório é formado por replicagens em realidade virtual de máquinas, dispositivos e experiências que marcaram o desenvolvimento da ciência da eletricidade e do magnetismo. O projeto vem sendo desenvolvido com foco em dois objetivos principais: o conhecimento histórico em si e o aprendizado de conceitos fundamentais ao estudo da moderna engenharia elétrica através do domínio do conhecimento histórico.*

Palavras-chave — Ensino de Engenharia Elétrica, História da Ciência, Realidade Virtual, VRML.

INTRODUÇÃO

A industrialização cada vez mais presente em todo tipo produção e a crescente preocupação com a:

- melhoria da qualidade dos produtos – como resposta às demandas de um mercado mais exigente;
- qualidade de vida – ampliando desta feita a relação do produto com todos os aspectos da vida e da sociedade;
- busca por inclusão de contingentes maiores de pessoas ao mercado de trabalho – buscando com isso diminuir a miséria e aumentar a eficiência na produção de bens e serviços;

têm exigido dos engenheiros tratar a ciência e a técnica (ou tecnologias) não apenas nos seus meandros intrínsecos, mas sim, como bens culturais. Não são somente os conhecimentos técnicos e científicos que devem ser objetos de apurados, intensos e sólidos estudos – sobre isto não há dúvida nenhuma – mas se impõe cada vez mais que o engenheiro se enverede no conhecimento dos meios e ambientes onde irá depositar o resultado de seu trabalho. Assim o engenheiro atual deverá ter conhecimento eco-social, ou seja, um conhecimento mais globalizado, tanto do meio físico/natural quanto do ambiente humano. Ele deve ser capaz de produzir as tecnologias necessárias a solução dos problemas postos e prever o impacto delas sobre o todo físico e social. Nesse sentido o seu trabalho torna-se cada vez mais de equipe – constituídas de pessoas que detém o conhecimento das mais variadas facetas da sociedade - concitando o engenheiro a ter preocupações com a psicologia, com o relacionamento entre pessoas, com a interlocução e entendimento entre elas, em síntese, o futuro engenheiro deverá ter maior grau tanto de comunicação quanto de sociabilidade. Por esses predicados pode-se dizer que o engenheiro é um poderoso e essencial agente do desenvolvimento econômico e social de uma nação. Nesse sentido o seu treinamento deverá ter como tônica o estabelecimento de ambiente que estimule a criatividade e que desenvolva aptidões para modelar sistemas cada vez mais amplos e complexos.

REALIDADE VIRTUAL e HISTÓRIA da CIÊNCIA

Os treinos estritos em ciência e técnica vem sendo desenvolvidos pelo ensino de engenharia desde as suas origens. No entanto, as habilidades em relacionar os conhecimentos técnicos com as demais órbitas da sociedade, na intensidade hoje requerida, são preocupações que ganharam corpo, só recentemente, no seio das universidades brasileiras. Uma forma de sistematizar essas novas exigências no aprendizado do engenheiro é dinamizar os cursos de história da ciência e da técnica. Ao travar relações dentro da história com os contextos do descobrimento, da invenção, da evolução e desenvolvimento de bens científicos e técnicos, juntamente com um conhecimento dos seus conteúdos habilitar-se-á o aluno com a necessária visão holística do processo de criação do engenheiro. Uma história da ciência e da técnica que busque o entendimento de correlações e interações de conhecimentos pretéritos com o contexto sócio econômico, de então, treina o aluno para sentir-se mais seguro ao tomar decisões na atualidade, ai já

[2] José Carlos de Oliveira, Universidade Federal do Rio de Janeiro - UFRJ , Departamento de Eletroténica, Centro de Tecnologia, Bloco - H, Sala 227, Cidade Universitária, C. Postal 68515, CEP.: 21945-970, Rio de Janeiro, RJ, Brasil, jcarlos@dee.ufrj.br
[3] Marcelo Paulino de Lima Santos, Universidade Federal do Rio de Janeiro - UFRJ , Departamento de Eletroténica, Centro de Tecnologia, Bloco - H, Sala 227, Cidade Universitária, C. Postal 68515, CEP.: 21945-970, Rio de Janeiro, RJ, Brasil, paulino@abeunet.com.br

como engenheiro, com respeito a introdução de novas tecnologias nos novos ambientes sociais complexos.

A idéia aqui desenvolvida é de fornecer um ensino de história da ciência e da técnica, em especial da engenharia elétrica, que leve em conta os atributos apontados acima; que se aproveite das potencialidades das novas tecnologias da informação e que contemple o ensinamento dos aspectos genuinamente técnicos e científicos, sobretudo em suas fundamentações.

A estratégia do ensino é pesquisar na história eventos e experimentos cruciais que fundamentaram um ramo do saber ou então causaram rupturas ou desenvolvimento significativo das teorias existentes. O segundo passo é replicar as condições, os ambientes, as máquinas ou dispositivos inventados que esclareçam ou ilustrem aspectos fundamentais do saber constituído. Essas replicagens seriam objeto de manipulações, por ações no computador, através do "mouse" ou teclado visando modificar a posição dos objetos replicados em 3D, aproximando ou distanciando-se dos objetos criados, acionando chaves e botões que alteram intensidades de variáveis que atuam na RV criada, girando manivelas virtuais, baixando alavancas virtuais, acrescentando objetos, volumes, "pesos", temperatura, correntes etc. Ou seja, criando um ambiente de interatividade onde a meta é se aproximar o mais possível da situação real onde cientistas e técnicos conseguiram estabelecer leis, e fenômenos relevantes para o entendimento do comportamento da natureza no aspecto observado. Essas ações objetivam fazer com que o aluno compreenda o "fenômeno", de forma não apenas escrita, mas através de ações que imitem as atuações de cientistas e técnicos que no passado agiram para determinar leis da natureza. Além de que se pode reproduzir e discutir as condições da formulação das leis e princípios, resgatando a atuação das personalidades científicas, os materiais existentes, as dificuldades, os limites, a interação entre os cientistas. Tudo em bloco, em forma de hipertexto, conjugando RV, animações, visualizações onde a beleza visual/gráfica entra como elemento adicional para motivar e incentivar ainda mais o assunto tratado. Ao trabalhar com a realidade virtual nos moldes postos o aluno estará apto a realizar aplicações também virtuais, dentro dos limites impostos por programação. Treinará então a análise dos resultados obtidos virtualmente, em um contexto já ocorrido.

A história da ciência pode ser considerada um poderoso auxiliar à educação técnica para evitar que o intelectual, que trabalha com a ciência e/ou a técnica, não fique restrito somente aos percalços internos da disciplina em que trabalha. Ela é uma porta que se abre para mostrar ao homem o senso prático das suas pesquisas, dar um sentido que visa não apenas o acúmulo de conhecimentos técnicos e científicos, mas também um engrandecimento cultural e humano. As biografias de muitos cientistas mostram que suas preocupações transcendiam a mera atividade imediata, para atingir questões filosóficas, sociais e humanas. A História da Ciência traz para dentro dos conhecimentos estritamente técnicos a cultura viva dos mais diferentes povos. Mesmo que, nos dias atuais, os conhecimentos científicos de ponta estejam se tornando mercadorias, ela pode mostrar caminhos para superar esses entraves, recuperando sentidos já percebidos por muitos de que a ciência pode ser útil para a paz e para resolver os problemas da miséria material e espiritual da sociedade.

As novas diretrizes curriculares para o curso de engenharia têm chamado a atenção que o profissional de engenharia deve ter além de uma sólida formação técnica e científica capacidade para a "... resolução de problemas considerando os aspectos políticos, econômicos, sociais, ambientais e culturais, com visão ética e humanística, em atendimento às demandas da sociedade" [1]. Certamente para isso ele deve ser capaz de avaliar o impacto das atividades da engenharia no contexto social e ambiental, demonstrando preocupação com a valorização do ser humano e a preservação do meio ambiente. O ensino da História da Ciência e da Técnica em muito contribui para a obtenção de engenheiros com essas características.

A TECNOLOGIA DA REALIDADE VIRTUAL

A Tecnologia da realidade virtual aplica-se ao desenvolvimento, via computador, de ambientes artificiais que conjugam três características: imersão, interatividade e navegabilidade. Atualmente as duas formas mais comuns de implementação da tecnologia da realidade virtual são:

- Realidade virtual imersiva, que faz uso de uma série de dispositivos periféricos para produzir a sensação de realismo tais como capacetes, luvas e sensores especiais.
- A realidade virtual via Internet (também chamada de realidade virtual desktop) que pode ser visualizada em navegadores da web através do uso de plug-ins específicos.

A realidade virtual via Internet pode ser desenvolvida através do uso da linguagem VRML (uma sigla para Virtual Reality Modeling Language). A VRML é uma linguagem independente de plataforma e empregada na descrição de cenas tridimensionais, que podem ser visualizadas e manipuladas tanto através da Internet como a partir de arquivos residentes no computador do usuário. Ela suporta animações em 3D e interações em tempo real com a linguagem Java. Essas características tornam a realidade virtual via *Internet* um recurso potencialmente importante para o processo de ensino aprendizado. Uma parcela considerável de arquivos em VRML disponíveis atualmente na Internet são direcionados para as atividades de ensino e aprendizado.

REALIDADE VIRTUAL NO ENSINO de ENGENHARIA

Em 1948 um grupo de educadores propôs o desenvolvimento de um sistema de classificação de metas e objetivos educacionais dividido três domínios: o cognitivo, o afetivo e o psicomotor. O estudo para o domínio cognitivo (relacionado aos conhecimentos e habilidades intelectuais) foi desenvolvido por Benjamin Bloom et al. e concluído em 1956. Nesse estudo foi feita uma classificação dos objetivos educacionais cognitivos numa hierarquia de seis níveis, do mais simples ao mais complexo, que ficou conhecida como a Taxonomia de Bloom [2].

Os seis níveis são:

1. Conhecimento: recordar informações.
2. Compreensão: compreender a informação memorizada.
3. Aplicação: usar um conceito geral para resolver um problema particular.
4. Análise: dividir um problema em suas partes fundamentais.
5. Síntese: criar algo novo a partir da combinação de diferentes idéias.
6. Avaliação: juntar elementos para criar uma unidade específica, estabelecer um padrão ou definir uma nova abordagem.

Os três primeiros níveis, Conhecimento, Compreensão e Análise se aplicam a aulas puramente expositivas enquanto que os três últimos aparecem em processos onde os alunos tem uma participação mais ativa na construção de seu aprendizado.

Felder e Silverman [3] classificaram cinco dimensões para o processo de aprendizagem: percepção (sensorial ou intuitiva), entrada (visual ou aural) organização (indutiva ou dedutiva), processamento (ativo ou reflexivo) e compreensão (seqüencial ou global). Posteriormente, Felder introduziu algumas mudanças nessa classificação, eliminando a dimensão indutiva/dedutiva e substituindo a categoria visual/aural por visual/verbal. A cada dimensão de estilo de aprendizagem corresponderia um estilo de ensino. Desse modo existiriam, também, cinco dimensões para os estilos de ensino [3]: conteúdo (concreto ou abstrato), apresentação (visual ou verbal), organização (indutiva ou dedutiva), participação do aluno (ativa ou passiva) e perspectiva (seqüencial ou global). A classificação dos domínios de ensino/aprendizagem de Felder e Silverman tem referências na "Teoria dos Tipos Psicológicos" de C. G. Jung [4]. De acordo com a classificação de Felder e Silverman estudantes cujo estilo de aprendizagem é preferencialmente visual teriam melhor desempenho em um estilo de ensino que privilegiasse o uso de imagens, diagramas, mapas, gráficos e demonstrações experimentais. Por outro lado, dados disponibilizados por diferentes educadores [6]-[8] sugerem que o estilo de aprendizado dos estudantes de engenharia é predominantemente visual. Baseado na correção desses dados é possível concluir que o uso de recursos de visualização, modelagem e simulação seriam especialmente úteis no ensino de engenharia. A prática profissional nos mostra que essa assertiva é particularmente verdadeira no caso da Engenharia Elétrica. Os estudantes dessa área da engenharia defrontam-se freqüentemente com conceitos abstratos tais como: campos elétricos, campos magnéticos, funções potenciais, fluxos, correntes, etc. A maioria dessas e outras funções elétricas são comumente visualizadas de modo indireto, pela observação das conseqüências de sua presença. O elevado grau de abstração nos conceitos fundamentais da Engenharia Elétrica força os profissionais na área de formação de engenheiros eletricistas a recorrer, freqüentemente, a técnicas de representação visual. Devido a isso, ganham importância as atividades didáticas voltadas para a modelagem, visualização, simulação e experimentação. Dentro desse contexto, e possível afirmar que a realidade virtual é uma ferramenta potencialmente útil na formação de engenheiros eletricistas. Suas características essencialmente gráficas, aliadas ao uso do som e da a possibilidade de navegação interativa se casam com o estilo de aprendizagem visual da maioria dos estudantes de engenharia, podendo a mesma se transformar ser um instrumento de enriquecimento do processo de ensino/aprendizado. De acordo com Bell e Fogler [9] o uso da realidade virtual no processo educacional beneficia especialmente aqueles estudantes que conjuguem características de aprendizes ativos e visuais onde aprendizes ativos são aqueles que aprendem fazendo, interagindo e participando. Ainda de acordo com os mesmo autores, o uso adequado de recursos educacionais em realidade virtual pode oferecer aos alunos um ambiente educacional rico no qual possam exercer dos níveis mais elevados da taxonomia de Bloom.

UMA VISITA VIRTUAL AO LABORATÓRIO DE MICHAEL FARADAY

A tecnologia da realidade virtual tem sido utilizada em um projeto em desenvolvimento no Departamento de Eletroténica da Universidade Federal do Rio de Janeiro (UFRJ) objetivando a produção de recursos instrucionais para o ensino/aprendizado de engenharia elétrica [10]. Parte dos recursos desse projeto – projeto LANTEG, uma sigla para Laboratório de Novas Tecnologias para o Ensino da Engenharia – estão sendo implementados através do uso da linguagem VRML e várias razões determinaram essa escolha. Uma delas é o custo, ainda muito elevado, da montagem de um ambiente de visualização e interação para realidade virtual imersiva. Esse ambiente precisa ser fixo o que obrigaria o deslocamento do professor e dos alunos até o local onde foi instalado sempre que o seu uso fosse necessário. No caso da linguagem VRML, os arquivos podem ser visualizados em um computador de uso pessoal, facilmente transportável para sala da aula. Além disso, arquivos em VRML podem ser disponibilizados via Internet, o que permite expandir (democratizar) o uso dos recursos em desenvolvimento para um número maior de usuários.

A estrutura do Projeto LANTEG é formada pela união de um conjunto de sub-projetos direcionados para temas distintos (mas complementares) dentro da área da Engenharia Elétrica tais como: Teoria Eletromagnética, Máquinas Elétricas, Eletrônica Analógica e Digital, Eletricidade Aplicada e História da Ciência e da Técnica. O sub-projeto para História da Ciência e da Técnica está associado a uma disciplina de graduação no mesmo tema [11]. Algumas questões surgiram quando do planejamento desse curso. Uma delas foi como estruturar um curso de História da Ciência que se casasse mais proximamente com o estilo de aprendizado predominantemente visual dos alunos de engenharia? O curso deveria discutir a evolução da ciência e da tecnologia do eletromagnetismo e a primeira idéia foi o uso de recursos visuais bidimensionais. Os autores têm catalogado um extenso banco de imagens de máquinas eletrodinâmicas clássicas, relacionadas à evolução da tecnologia do eletromagnetismo, e esse material poderia ser organizado, via um sistema de apresentação, em várias seqüências de slides. No entanto, descrever uma máquina eletrodinâmica clássica, geralmente com estrutura bastante complexa, através de uma imagem bidimensional nem sempre é uma atividade fácil. Havia a dúvida se conceitos fundamentais definidos pelos primeiros cientistas poderiam ser enfatizados, ressaltados, a partir de uma imagem bidimensional (sem com isso cair numa descrição essencialmente verbal). A primeira solução pensada foi concentrar o trabalho nas máquinas cujo desenvolvimento originaram saltos tecnológicos importantes e tentar apresenta-las presencialmente aos alunos. Algumas dessas máquinas ainda podem ser encontradas em museus de ciência de modo que a idéia tinha alguma possibilidade de ser implementada. No entanto havia também uma série de restrições à sua realização: as máquinas em questão são peças raras restando poucos exemplares em Museus de História da Ciência e Tecnologia. Nesses museus o contato é predominantemente contemplativo, não se permitindo o manuseio das peças por razões, óbvias, de segurança. Havia, ainda, outra restrição, de caracter geográfico, associada ao fato de que a maioria dessas peças estarem em museus de ciência localizados fora do Brasil. Desse modo o contato com a informação técnica e histórica transportada pelas máquinas antigas acabaria por se resumir a uma experiência contemplativa, um processo não interativo e menos enriquecedor. Surgiu, então a idéia do uso da realidade virtual nesse processo. Com a replicagem das máquinas através do uso da tecnologia da realidade virtual permitir-se-ia ao aluno o acesso a modelos tridimensionais interativos. Ele poderia manipular os objetos, escolher aqueles com os quais gostaria de interagir, observa-los de diferentes ângulos, decompô-los em suas partes constitutivas, acioná-los com segurança (mais precisamente, simular o acionamento) e entender os princípios de seu funcionamento. Como conseqüência da idéia de replicagem das máquinas eletrodinâmicas, surgiram duas novas questões. A primeira delas relacionava-se o fato de que as máquinas eletrodinâmicas focalizadas faziam parte de um contexto experimental e que, em função disso, seria interessante replicar não apenas as máquinas mas as próprias experiências nas quais foram usadas, ou para as quais foram criadas. A outra questão, uma conseqüência da argumentação do parágrafo anterior, lembrava que o material desenvolvido fazia parte de um contexto mais amplo, ainda, que envolvia o próprio homem, na figura do cientista, que desenvolveu a técnica estudada. Essa última questão direcionou o projeto para a replicagem em realidade virtual do próprio ambiente de trabalho dos cientistas. Desse modo o aluno teria a possibilidade de visualizar, explorar e interagir com uma réplica do local de trabalho do cientista foco de seu estudo. Teria, também, concentrada (organizada) em um único ambiente, uma visão global da produção do pesquisador estudado. Foi feita, então, uma relação inicial de cientistas cujos trabalhos produziram marcos na ciência da Engenharia Elétrica. Dessa lista inicial fazem parte: Michael Faraday, Charles Coulomb, Hans Christian Oersted, André Marie Ampère, e Alessandro Volta. Para cada cientista foi previsto um Laboratório-Museu virtual cujas portas de entrada seriam as replicagens dos seus ambientes de trabalho. A partir desses laboratórios virtuais o aluno encontraria informações sobre o cientista, o contexto histórico de seu trabalho, suas experiências fundamentais e os equipamentos desenvolvidos, tudo apresentado de forma predominantemente visual e interativa. Esse artigo apresenta o estágio atual de desenvolvimento do Laboratório-Museu Virtual de Michael Faraday.

O LABORATÓRIO-MUSEU de MICHAEL FARADAY

A informação visual sobre o laboratório de Michael Faraday foi obtida a partir de uma imagem, largamente difundida na Internet, que mostra o cientista trabalhando em seu laboratório, localizado em um porão do prédio da Royal Institution de Londres. De acordo com informações adicionais, colhidas também na Internet, essa imagem é uma reprodução em preto e branco de uma aquarela feita pela artista Harriet Jane Moore (1801-1884) em meados do século dezenove. Harriet Moore produziu uma série de trabalhos sobre o interior do prédio da Royal Institution usando a técnica da aquarela. A imagem citada acima é reproduzida em escala na Figura 1 para efeito de comparação. Tomando-se como base a pintura de Harriet Moore o interior do laboratório de Faraday foi replicado. A Figura 2 mostra o ambiente do laboratório vazio, apenas com os móveis, sem a inclusão dos instrumentos e material de trabalho. A Figura 3 apresenta uma vista do laboratório replicado tomada de um ângulo ligeiramente diferente da pintura original. Nessa imagem o laboratório já aparece com os instrumentos e material de trabalho. A Figura 4 mostra detalhes da bancada de trabalho e recipientes de vidro nas prateleiras ao fundo. A Figura 5 mostra um conjunto de objetos replicados para compor a cena da aquarela de Harriet Moore. Nesse conjunto podem ser identificados uma peça semelhante a um alambique que é localizada em primeiro plano, no canto inferior direito da aquarela. Há também outra peça, também localizada em primeiro plano, sobre a mesa, no lado direito da aquarela. É uma espécie de garrafa metálica da qual sai um tubo que termina em uma espécie de tigela metálica. Não conseguimos, ainda, identificar a finalidade dessas peças. As Figuras 6 e 7 são imagens tomadas de duas replicagens em VRML para a reconstrução duas experiências clássicas realizadas por Faraday: os "Copos de Faraday" e o "Disco Gerador de Faraday", respectivamente. A experiência dos Copos de Faraday foi uma das primeiras demonstrações da relação entre fluxo de corrente, campo magnético e força magnética. O Disco de Faraday permite demonstrar os princípios de funcionamento de um gerador elementar: um disco metálico condutor gira dentro de um campo magnético uniforme e o resultado é o surgimento de uma força eletromotriz induzida radialmente no disco.

O desenvolvimento do Laboratório Museu Virtual de Michael Faraday não está ainda completo. Inúmeros problemas precisam ser resolvidos, principalmente no que diz respeito ao tamanho dos arquivos. É necessário um trabalho consistente de otimização para que os tamanhos exagerados dos arquivos (da ordem de 50Mb) possam ser reduzidos a dimensões passíveis de serem processados e transmitidos via Internet. Várias técnicas para otimização de arquivos de computação gráfica estão sendo testadas eficientemente e os resultados desse trabalho serão brevemente anunciados em outra publicação dos autores.

CONCLUSÃO

O uso adequado de recursos disponibilizados pela tecnologia da realidade virtual pode proporcionar ao aluno de engenharia estímulos complementares importantes para a construção de seu conhecimento. O presente trabalho apresentou alguns produtos do uso da tecnologia da realidade virtual no desenvolvimento de material educacional para um curso de História da Ciência e da Técnica. Uma breve análise sobre a importância do conhecimento da História da Ciência na formação de engenheiro foi desenvolvida. Discorreu-se também sobre o uso de ferramentas da computação gráfica, mais especificamente da realidade virtual, no desenvolvimento de recursos educacionais objetivando adequá-los ao estilo de aprendizado visual, predominante entre os estudantes da área da engenharia. O conceito de Laboratório-Museu Virtual analisado e os uma implementação de mesmo, através da reconstrução do ambiente de trabalho de Michael Faraday foi elaborado. O trabalho realizado ressalta a importância dos recursos da computação (Internet, realidade virtual e animações interativas) como ferramenta de visualização e modelagem no ensino/aprendizado da engenharia elétrica, uma das mais abstratas das engenharias. O uso adequado e planejado desses recursos educacionais pode contribuir para a disseminação do saber e democratização do acesso ao conhecimento.

A GRUPOTERAPIA NA FORMAÇÃO CONTINUADA DE PROFESSORES DO ENSINO SUPERIOR

Karina Perez Mokarzel Carneiro[1]

Resumo — *A proposta deste trabalho é analisar a ação preventiva das grupoterapias com professores de ensino superior e de pós-graduação. Durante muitos séculos, o ensino baseou-se num paradigma: o professor é detentor dos conhecimentos e os transmite a um grupo de estudantes, que depois devolvem o que aprenderam por intermédio de provas. O estudante é assim considerado, não sendo observadas as diferenças existenciais entre crianças, adolescentes e adultos em salas de aula. A maioria dos professores em atividade hoje não teve no seu currículo profissional capacitação para exercer esse papel de formador. Muitos estão desgastados, lutando contra muitas dificuldades. A própria forma de ser da Educação entrou em crise. Aponta-se como uma das saídas para esses problemas a implantação de programas de formação continuada de professores, sob orientação psicopedagógica, com o objetivo de criar uma cultura de formação, melhorando, assim, a qualidade no ensino.*

Palavras chaves — Ensino superior, formação continuada, grupoterapia preventiva, professor.

INTRODUÇÃO

A orientação educacional surgiu para atender àqueles que apresentavam problemas e dificuldades escolares, principalmente nas escolas de primeiro e segundo graus, pois, nesta faixa etária as estruturas cognitivas e a personalidade da criança ainda estão sendo formadas. Pensava-se que atuando neste nível de aprendizagem evitavam-se dificuldades futuras. Acreditava-se que alunos de cursos superiores eram adultos e responsáveis pelos seus atos e que eram capazes de conduzir sua própria formação. Porém, a realidade mostra que existem universitários e pós-graduandos que também apresentam dificuldades de aprendizagem, sejam em aspectos cognitivos, afetivos e/ou sociais.

A grupoterapia tem auxiliado na prevenção e solução de tais dificuldades, atuando junto aos alunos, professores, funcionários, dirigentes e familiares. Assim, cada escola deve ter o seu próprio serviço de orientação, viabilizando o atendimento a todos de modo efetivo e permanente.

As razões do fracasso escolar são inúmeras e estão relacionadas com todos os envolvidos com a aprendizagem. Não se deve cometer a injustiça de se culpar apenas o aluno, em quaisquer casos de insucesso escolar, deixando de analisar cada situação de maneira mais crítica e abrangente, considerando-se a dimensão política e filosófica da educação, a situação da escola e as responsabilidades dos professores.

A intenção de um programa de formação continuada de professores, através de um processo grupal, é desencadear perturbações no professor que o levem a refletir sobre sua prática e incentivar o desenvolvimento de instrumentos didático-pedagógicos que possam restabelecer a motivação e a criatividade nas escolas. Estas reflexões devem ser proporcionadas pela escola, juntamente com um psicopedagogo, visando melhorar a qualidade no ensino.

CONTEXTUALIZAÇÃO

As dificuldades na aprendizagem surgem a partir de vários fatores: neurológicos, psicológicos, familiares, sociais, uso de drogas, relacionamento com o professor, etc. As discussões em torno das dificuldades que acometem o ensino superior nos congressos nacionais e internacionais, revelam a imensidão e a complexidade do problema. Porém, as providências tomadas pelas instituições de ensino e políticas, tais como: mudanças na grade curricular, diminuição da carga de aulas expositivas, melhoria dos laboratórios e o incentivo aos cursos de mestrado e doutorado apenas em áreas técnicas, não são suficientes para reverter o quadro. Para que haja mudança efetiva na situação em que se encontra o ensino no Brasil, é imprescindível a orientação educacional constante e periódica do corpo discente e docente.

O educador, por estar em contato direto com o educando e ser o principal responsável pela construção do conhecimento, pode tanto promover a aprendizagem como também dificultá-la. Muitas das dificuldades dos alunos estão relacionadas com a antipatia que estes nutrem pelo professor, com a relação professor-aluno, com o autoritarismo desmedido, com as metodologias inadequadas de ensino, com frustrações e fantasmas dos ensinantes e com a desmotivação. Na maioria das vezes os professores desconhecem os efeitos malignos de sua atuação ineficiente e acham que a culpa é sempre do aluno.

Existem fatores intervenientes nos resultados acadêmicos, entre os quais, a maioria nada tem a ver com o processo específico da aprendizagem. Por isso, a prevenção efetuada através da orientação de professores e de apoio continuado aos alunos, oferece a possibilidade de um desenvolvimento adequado e crescente na educação.

---

[1] Karina Perez Mokarzel Carneiro, Instituto Nacional de Telecomunicações (INATEL), Av João de Camargo, 510, 37.540-000, Santa Rita do Sapucaí, MG, Brazil, karina@inatel.br.

O trabalho preventivo de orientação de professores nas instituições de ensino superior é feito individualmente ou em grupos, sob a forma de grupoterapias, palestras, assessorias, treinamentos, intervenções periódicas, congressos, mini cursos, mesas redondas, etc.

A orientação individual acontece por solicitação do próprio professor que deseja melhorar a eficiência de seu trabalho ou dos alunos que se sentem prejudicados com a atuação do docente. O docente é orientado quanto às metodologias de ensino e de avaliação da(s) disciplina(s) por ele ministrada(s), quanto as bibliografias de áreas diversas que o ajude no aprimoramento de seu trabalho, quanto ao relacionamento com seus alunos, ao processo de transferência e contratransferência, ao controle de frustrações, etc.

Os trabalhos em grupo devem ser programados de maneira que não atrapalhe os professores, afastando-os por muito tempo de suas atividades. É essencial o caráter interdisciplinar no preparo de tais atividades, contando com a ajuda de profissionais como médicos, neurologistas, fonoaudiólogos, neurolingüistas, pedagogos e psicólogos. A participação do orientador é importante no incentivo a participação de todos nas atividades propostas.

Um dos desafios da orientação educacional é a quebra da resistência à mudanças por parte dos professores na transposição das metodologias de ensino tradicionais para metodologias mais modernas, dinâmicas e motivadoras.

O PROFESSOR DO ENSINO SUPERIOR

Nos cursos superiores brasileiros são considerados habilitados a seguir a carreira docente, aqueles que possuem um título superior, qualquer que seja ele. Assim, para ser professor de medicina, basta ser médico; para ser professor de história, basta ser historiador; para lecionar na área de engenharia, basta ser engenheiro. Tal procedimento deve ter origem no entendimento de que o domínio dos saberes técnicos da profissão é suficiente para transformar um indivíduo legalmente diplomado num professor.

Como resultado disso, os professores aprendem a ser docentes, quando isso acontece de fato, pela própria experiência, o que em geral se dá como um esforço solitário.

O modelo de ensino onde o professor é o detentor do saber e o elemento ativo do processo ensino-aprendizagem, e o aluno é totalmente passivo, aceita o conhecimento como uma verdade não contestável, é desmotivador. Não basta que o professor aprimore o seu conhecimento técnico, é preciso ser mestre. Ser um mestre é mais que repassar conhecimentos, é promover situações desafiadoras para o aluno, que o transporte para um nível de conhecimento superior ao já existente. Portanto, além da capacitação técnica é indispensável ao professor o conhecimento de técnicas de ensino e de relacionamento humano.

Na reflexão de Bazzo [1], “A competição da escola com os meios modernos de divulgação de informações nos coloca uma séria questão com relação à motivação dos estudantes: as aulas tradicionais deixam definitivamente de ser atraentes, quando confrontadas com a televisão com seus múltiplos canais e seus programas cada vez mais bem produzidos, com a ‘navegação’ via Internet, com os programas multimídia, com a realidade virtual. As avaliações, nos moldes ainda atualmente empregados, tornam-se mais que ultrapassadas, são inócuas ou mesmo um obstáculo para a aprendizagem. Como resultado, colhem-se cada vez mais a desilusões, desistências e inconformismos com o sistema de ensino”.

A relação que o professor estabelece com o aluno é uma das características fundamentais para a permanência e o aproveitamento do indivíduo nas atividades propostas pelo docente. Muitas das dificuldades apresentadas pelos alunos estão relacionadas com a antipatia pelo professor.

Tanto o professor quanto os alunos trazem consigo experiências anteriores ao encontro na sala de aula. A relação professor-aluno vai depender principalmente da maturidade afetiva do professor. A orientação educacional grupal contribui para esta maturidade, porém, se o professor não conseguir lidar com seus fantasmas e frustrações, deve procurar a orientação individual do psicopedagogo.

As atividades propostas pelo grupoterapeuta devem contribuir para a diminuição, ou até eliminação, de características antipáticas dos professores como: autoritarismo, insegurança, frieza, desprezo, desinteresse, agressividade e ironia, e passem a ter atitudes que os tornem mais simpáticos. Os alunos apreciam professores calmos, pacientes, alegres, atenciosos, pontuais, que gostam do que fazem e que se preocupam com o aprendizado. A autoridade e a disciplina para o professor simpático surgem naturalmente.

As aulas puramente expositivas, onde o professor é quem estabelece o ritmo e a seqüência, não são atrativas e contribuem com a não permanência do aluno na escola. Há que se mudar a estratégia hoje utilizada para trabalhos mais dinâmicos, atrativos, que desenvolva além do conhecimento puramente intelectual, outras qualidades como liderança, trabalho em grupo, criatividade, perseverança, percepção, etc. Apesar de existirem inúmeras metodologias de ensino, será sempre necessária a criação de outras, mais atrativas e adequadas ao estágio de desenvolvimento histórico e à realidade imediata dos alunos.

Os alunos se sentem motivados pelos professores que se interessam pelo aprendizado. A utilização de estratégias de ensino criativas, dinâmicas e que incentivem a participação ativa dos alunos torna os trabalhos escolares mais atraentes e competitivos quando comparados à TV, à Internet e a outras atividades.

Devido às constantes mudanças sociais ocorridas no mundo, o ensino altamente baseado na memorização e na reprodução de tarefas repetitivas, não é mais apropriado ao perfil do atual profissional. Portanto, as avaliações individuais centradas na memorização, na repetição de métodos, na reprodução precisa e detalhada das explicações do professor e na punição do erro, se tornaram inadequadas para os dias atuais.

Um dos principais aspectos debatidos nas instituições de ensino são as formas de avaliação e as maneiras de quantificar o aproveitamento escolar. Por ser uma das maiores causas da desmotivação, da repetência e da evasão escolar, o sistema de avaliação deve ser repensado e arduamente discutido. Porém, isto não deve implicar em um relaxamento dos níveis de exigência, mas em se adotar uma forma mais eficaz de valorizar a aquisição do conhecimento, observando as capacidades adquiridas pelo indivíduo quanto a generalizações, comparações, análises, sínteses, críticas, discriminações, organizações, estruturas lógicas, etc.

Não existe uma maneira única de se avaliar um grupo de alunos, pois há diferenças entre disciplinas, escolas, número de alunos e abordagem. Cabe ao professor analisar qual o melhor sistema de avaliação a ser adotado na sua disciplina. O orientador educacional deve incentivar os docentes a experimentarem novos métodos de avaliação e aperfeiçoar os já existentes.

Toda experiência deve ser relatada aos outros docentes da instituição, colocando os pontos positivos e negativos, as dificuldades encontradas na execução de tal trabalho e os resultados obtidos. Ao expor e ouvir experiências diversas e ao debater sobre o assunto, o professor aumenta seu senso crítico podendo, assim, reavaliar sua metodologia de avaliação, identificar falhas e saná-las.

Alguns professores gostam de ser detentores do saber. Submetem seus alunos a massacres psicológicos e se vangloriam por serem os responsáveis pelos mais altos índices de reprovação da escola. Suas avaliações não valorizam a construção do conhecimento, conseguem, apenas, qualificar informações retidas naquele momento.

Outros professores, com medo de críticas e de perderem a posição que ocupam, aplicam provas fáceis para que a maioria dos alunos obtenha a aprovação, o que não avalia a construção do aprendizado.

Os professores extremistas normalmente apresentam forte resistência a mudanças. Com o trabalho do grupoterapeuta há que se instalar na instituição a cultura de que as metodologias de avaliação devem realmente quantificar e qualificar a construção do conhecimento.

Outro ponto de igual importância a ser tratado é o significado do erro nas avaliações. O grupoterapeuta deverá desenvolver nos educadores a capacidade crítica de analisar se o erro é proveniente de problemas relacionados ao aluno, ao próprio professor, à escola ou à sociedade. Os erros dos alunos devem fornecer elementos para o professor refletir sobre sua prática e modificar sua estratégia de ensino.

As escolas e seus educadores tendem a se preocupar mais com a quantificação do acerto e a punição do erro do que com o raciocínio do aluno, desconsiderando totalmente a construção do conhecimento.

CONCEITUAÇÃO DE GRUPO

Todo indivíduo deve ser estudado dentro do contexto social, pois em toda a sua existência, convive com outros indivíduos, partilhando o mesmo espaço e os mesmos desejos, interesses e ambições.

Pichon-Rivière [2] relata que "Todo conjunto de pessoas ligadas entre si por constantes de tempo e espaço, e articuladas por sua mútua representação interna (dimensão ecológica), configura uma situação grupal. Tal situação está sustentada por uma rede de motivações e nela interagem entre si, por meio de um complexo mecanismo de assunção e adjudicação de papéis. É nesse processo que deverá surgir o reconhecimento de si e do outro no diálogo e no intercâmbio permanente. Essa situação grupal constitui o instrumento mais adequado para essa aprendizagem de papéis (aprendizagem social), em que consiste a internalização operativa da realidade".

Nas palavras de Zimerman [3], "O ser humano é gregário, e ele só existe, ou subsiste, em função de seus inter-relacionamentos grupais. Sempre, desde o nascimento, ele participa de diferentes grupos, numa constante dialética entre a busca de sua identidade individual e a necessidade de uma identidade grupal e social".

Segundo o Novo Dicionário Aurélio, "grupo é uma pequena associação ou reunião de pessoas ligadas para um fim comum". Para alguns autores, o conjunto de duas pessoas (por exemplo, um casal) já configura um grupo. Pode-se conceituar também através do grupo familiar, escolar, terapêutico, profissional, esportivo, religioso, etc. Estes grupos estão constantemente sendo renovados e ampliados no decorrer da vida do indivíduo.

As pessoas levam seu universo pessoal ao grupo, composto pelas suas características de personalidade, vivências pessoais e experiência profissional. Por isso, o resultado de um grupo como um todo é diferente do somatório de suas partes.

Inseridos numa situação grupal, os indivíduos reagirão diferentemente em função destas características, focados num processo de interação, no qual as ações e reações individuais influirão e serão influenciadas pelo grupo.

Ao trabalhar com um grupo, um coordenador deve levar em consideração as características pessoais dos membros do grupo, sejam elas características de personalidade, físicas, econômico-sociais ou profissionais.

OBJETIVOS DO GRUPO

A existência de um grupo ou uma equipe deve ser fundamentada numa razão de ser que justifique sua própria existência. Esta razão de ser chama-se objetivos. A definição clara dos objetivos de um grupo por si só não garante o sucesso do mesmo. Ao se trabalhar com grupos, deve-se ter o entendimento aprofundado de como os objetivos grupais estão em interação com os objetivos individuais dos membros do grupo. Os objetivos individuais e grupais podem sofrer alterações ao longo do processo do grupo; assim, faz-se necessário a revisão constante destes objetivos.

Os objetivos do grupo especificam e definem os seus fins; identificam os alvos para os quais as atividades do grupo estão apontadas. Quando eficazmente desenvolvidos, diminuem as angústias dos integrantes do grupo, ampliam a base dos interesses comuns, sentimentos de identificação, motivações, padrões do grupo, participações úteis e satisfação dos membros do grupo.

A maioria dos grupos tem dificuldade em fazer com que os membros participem ativa e objetivamente. Este problema está relacionado com a falta de conhecimento claro dos objetivos, com a concordância sobre os propósitos do grupo ou da impossibilidade de perceber como as atividades se congregam para a consecução dos objetivos fixados.

Vivemos numa sociedade que está rapidamente se modificando. Os interesses e necessidades dos membros do grupo mudam com rapidez, aconselhando revisões e discussões sobre seus fins e objetivos. Tais revisões podem conduzir à mudança de objetivos, à fixação de outros, à reorientação das prioridades e, mesmo, ao reconhecimento da necessidade de se dissolver o grupo.

Às vezes, a complexidade da organização, o excesso de formalidade e a execução de um só tipo de trabalho impedem que o grupo procure os objetivos realmente importantes. Isto pode acontecer com qualquer grupo. A relação entre os objetivos definidos e as atividades estabelecidas formalmente permite superar tais dificuldades.

O propósito do grupo pode ser modificar o grupo e seus membros, ou, no caso do grupo de ação, decidir e executar programas específicos. Na designação dos objetivos deve-se indicar as modificações ou o tipo de ação que se espera do grupo e de seus membros.

Ao chegarem novos membros, é importante que os objetivos lhes sejam apresentados. O grau de satisfação e de participação dos membros antigos influencia os novos a aceitarem os objetivos e trabalharem a favor do grupo.

Uma vez determinados os objetivos, as futuras experiências e atividades do grupo tendem a ser moldadas e avaliadas segundo os seus termos. O grau com que os objetivos dos membros do grupo estão incorporados aos objetivos grupais influencia diretamente a fidelidade e a participação dos membros nas atividades organizadas.

CLASSIFICAÇÃO DOS GRUPOS

A classificação aqui utilizada se baseia no critério das finalidades a que se propõe o grupo. Será dividido em dois grandes ramos genéricos: Operativos e Terapêuticos. Na prática essas ramificações se completam. Cada um destes ramos, por sua vez, se subdivide em outras ramificações, conforme o esquema abaixo.

- **Grupos operativos**:
  (1) Ensino-aprendizagem (através da técnica de "Grupos de Reflexão").
  (2) Institucionais (empresas, escolas, igreja, exército, associações, etc.).
  (3) Comunitários (programas de saúde mental).
- **Grupos terapêuticos**:
  (1) De auto-ajuda – na área médica em geral (diabéticos, reumáticos, idosos, etc.); na área psiquiátrica (alcoolistas anônimos, pacientes, etc.).
  (2) Psicoterápicos (base psicanalítica, psicodrama, teoria sistêmica, cognitivo-comportamental, abordagem múltipla).

GRUPOS OPERATIVOS

Na ação preventiva da grupoterapia junto aos docentes, a modalidade de grupo utilizada é a de grupos operativos.

A conceituação e a aplicação dos grupos operativos, devem ao psicanalista argentino Pichon-Rivière [2]. Este autor enfoca que "A técnica de grupos por nós criada, chamada de grupos operativos, caracteriza-se por estar centrada, de forma explícita, em uma tarefa que pode ser a aprendizagem, a cura (abrange os grupos terapêuticos), o diagnóstico das dificuldades de uma organização profissional, etc. Sob esta tarefa subjaz outra, implícita, que aponta para a ruptura, através do esclarecimento das pautas estereotipadas que dificultam a aprendizagem e a comunicação, significando um obstáculo frente a toda situação de progresso ou mudança".

Zimerman [3] observa que o termo "grupo operativo" é muito genérico, sendo que, em essência, designa mais propriamente uma ideologia do que uma técnica específica. Essa ideologia, visa sempre um aprendizado conectado com uma mudança psicológica (atitudes), especialmente a de aprender a aprender.

CONCLUSÕES

A preocupação das escolas superiores sempre foi de formar profissionais com o perfil estipulado pelo mercado de trabalho. Devido às grandes mudanças pelas quais o país vem passando, a educação brasileira precisa ser revisada e reestruturada.

O processo de reavaliação do ensino não é tarefa fácil, pois além da imensidão territorial, é totalmente dependente dos interesses político e da boa vontade das instituições. Um ensino de qualidade, motivador, criativo e dinâmico, requer dedicação de todas as partes envolvidas no processo de ensino-aprendizagem.

O professor é a figura mais próxima do aluno, portanto pode atuar tanto como gerador de dificuldades ou como promotor da aprendizagem, dependendo do seu equilíbrio emocional e psíquico. Controlar suas frustrações ajuda a amenizar a resistência à mudanças abrindo espaço para a orientação educacional. Não basta que o docente domine o conhecimento técnico, é preciso conhecer metodologias de ensino dinâmicas, estimulantes e desafiadoras.

Neste sentido, pode-se compreender a importância da orientação educacional preventiva no âmbito escolar. Acredita-se que uma das saídas para o caos em que se encontra a educação no Brasil é a formação continuada dos docentes, através de grupoterapias. Nas atividades em grupo, os docentes poderão discutir, analisar e refletir sobre seu trabalho e, assim, adquirir formação didática e humanística, tão necessária para a construção do conhecimento do aluno.

É fundamental que o grupoterapeuta goste e acredite na modalidade de trabalho escolhida, pois só assim, resultados realmente satisfatórios serão conseguidos.

O que se espera é uma educação tão prazerosa quanto a internet, a TV a cabo e os bailes, onde os professores possam ensinar aprendendo e, acima de tudo, despertar e exteriorizar o aprendizado do aluno.

A GRUPOTERAPIA NA FORMAÇÃO CONTINUADA DE PROFESSORES DO ENSINO SUPERIOR

Karina Perez Mokarzel Carneiro[1]

Resumo *— A proposta deste trabalho é analisar a ação preventiva das grupoterapias com professores de ensino superior e de pós-graduação. Durante muitos séculos, o ensino baseou-se num paradigma: o professor é detentor dos conhecimentos e os transmite a um grupo de estudantes, que depois devolvem o que aprenderam por intermédio de provas. O estudante é assim considerado, não sendo observadas as diferenças existenciais entre crianças, adolescentes e adultos em salas de aula. A maioria dos professores em atividade hoje não teve no seu currículo profissional capacitação para exercer esse papel de formador. Muitos estão desgastados, lutando contra muitas dificuldades. A própria forma de ser da Educação entrou em crise. Aponta-se como uma das saídas para esses problemas a implantação de programas de formação continuada de professores, sob orientação psicopedagógica, com o objetivo de criar uma cultura de formação, melhorando, assim, a qualidade no ensino.*

Palavras chaves — Ensino superior, formação continuada, grupoterapia preventiva, professor.

INTRODUÇÃO

A orientação educacional surgiu para atender àqueles que apresentavam problemas e dificuldades escolares, principalmente nas escolas de primeiro e segundo graus, pois, nesta faixa etária as estruturas cognitivas e a personalidade da criança ainda estão sendo formadas. Pensava-se que atuando neste nível de aprendizagem evitavam-se dificuldades futuras. Acreditava-se que alunos de cursos superiores eram adultos e responsáveis pelos seus atos e que eram capazes de conduzir sua própria formação. Porém, a realidade mostra que existem universitários e pós-graduandos que também apresentam dificuldades de aprendizagem, sejam em aspectos cognitivos, afetivos e/ou sociais.

A grupoterapia tem auxiliado na prevenção e solução de tais dificuldades, atuando junto aos alunos, professores, funcionários, dirigentes e familiares. Assim, cada escola deve ter o seu próprio serviço de orientação, viabilizando o atendimento a todos de modo efetivo e permanente.

As razões do fracasso escolar são inúmeras e estão relacionadas com todos os envolvidos com a aprendizagem. Não se deve cometer a injustiça de se culpar apenas o aluno, em quaisquer casos de insucesso escolar, deixando de analisar cada situação de maneira mais crítica e abrangente, considerando-se a dimensão política e filosófica da educação, a situação da escola e as responsabilidades dos professores.

A intenção de um programa de formação continuada de professores, através de um processo grupal, é desencadear perturbações no professor que o levem a refletir sobre sua prática e incentivar o desenvolvimento de instrumentos didático-pedagógicos que possam restabelecer a motivação e a criatividade nas escolas. Estas reflexões devem ser proporcionadas pela escola, juntamente com um psicopedagogo, visando melhorar a qualidade no ensino.

CONTEXTUALIZAÇÃO

As dificuldades na aprendizagem surgem a partir de vários fatores: neurológicos, psicológicos, familiares, sociais, uso de drogas, relacionamento com o professor, etc. As discussões em torno das dificuldades que acometem o ensino superior nos congressos nacionais e internacionais, revelam a imensidão e a complexidade do problema. Porém, as providências tomadas pelas instituições de ensino e políticas, tais como: mudanças na grade curricular, diminuição da carga de aulas expositivas, melhoria dos laboratórios e o incentivo aos cursos de mestrado e doutorado apenas em áreas técnicas, não são suficientes para reverter o quadro. Para que haja mudança efetiva na situação em que se encontra o ensino no Brasil, é imprescindível a orientação educacional constante e periódica do corpo discente e docente.

O educador, por estar em contato direto com o educando e ser o principal responsável pela construção do conhecimento, pode tanto promover a aprendizagem como também dificultá-la. Muitas das dificuldades dos alunos estão relacionadas com a antipatia que estes nutrem pelo professor, com a relação professor-aluno, com o autoritarismo desmedido, com as metodologias inadequadas de ensino, com frustrações e fantasmas dos ensinantes e com a desmotivação. Na maioria das vezes os professores desconhecem os efeitos malignos de sua atuação ineficiente e acham que a culpa é sempre do aluno.

Existem fatores intervenientes nos resultados acadêmicos, entre os quais, a maioria nada tem a ver com o processo específico da aprendizagem. Por isso, a prevenção efetuada através da orientação de professores e de apoio continuado aos alunos, oferece a possibilidade de um desenvolvimento adequado e crescente na educação.

O trabalho preventivo de orientação de professores nas instituições de ensino superior é feito individualmente ou em grupos, sob a forma de grupoterapias, palestras, assessorias, treinamentos, intervenções periódicas, congressos, mini cursos, mesas redondas, etc.

A orientação individual acontece por solicitação do próprio professor que deseja melhorar a eficiência de seu trabalho ou dos alunos que se sentem prejudicados com a atuação do docente. O docente é orientado quanto às metodologias de ensino e de avaliação da(s) disciplina(s) por ele ministrada(s), quanto as bibliografias de áreas diversas que o ajude no aprimoramento de seu trabalho, quanto ao relacionamento com seus alunos, ao processo de transferência e contratransferência, ao controle de frustrações, etc.

Os trabalhos em grupo devem ser programados de maneira que não atrapalhe os professores, afastando-os por muito tempo de suas atividades. É essencial o caráter interdisciplinar no preparo de tais atividades, contando com a ajuda de profissionais como médicos, neurologistas, fonoaudiólogos, neurolingüistas, pedagogos e psicólogos. A participação do orientador é importante no incentivo a participação de todos nas atividades propostas.

Um dos desafios da orientação educacional é a quebra da resistência à mudanças por parte dos professores na transposição das metodologias de ensino tradicionais para metodologias mais modernas, dinâmicas e motivadoras.

O Professor do Ensino Superior

Nos cursos superiores brasileiros são considerados habilitados a seguir a carreira docente, aqueles que possuem um título superior, qualquer que seja ele. Assim, para ser professor de medicina, basta ser médico; para ser professor de história, basta ser historiador; para lecionar na área de engenharia, basta ser engenheiro. Tal procedimento deve ter origem no entendimento de que o domínio dos saberes técnicos da profissão é suficiente para transformar um indivíduo legalmente diplomado num professor.

Como resultado disso, os professores aprendem a ser docentes, quando isso acontece de fato, pela própria experiência, o que em geral se dá como um esforço solitário.

O modelo de ensino onde o professor é o detentor do saber e o elemento ativo do processo ensino-aprendizagem, e o aluno é totalmente passivo, aceita o conhecimento como uma verdade não contestável, é desmotivador. Não basta que o professor aprimore o seu conhecimento técnico, é preciso ser mestre. Ser um mestre é mais que repassar conhecimentos, é promover situações desafiadoras para o aluno, que o transporte para um nível de conhecimento superior ao já existente. Portanto, além da capacitação técnica é indispensável ao professor o conhecimento de técnicas de ensino e de relacionamento humano.

Na reflexão de Bazzo [1], "A competição da escola com os meios modernos de divulgação de informações nos coloca uma séria questão com relação à motivação dos estudantes: as aulas tradicionais deixam definitivamente de ser atraentes, quando confrontadas com a televisão com seus múltiplos canais e seus programas cada vez mais bem produzidos, com a 'navegação' via Internet, com os programas multimídia, com a realidade virtual. As avaliações, nos moldes ainda atualmente empregados, tornam-se mais que ultrapassadas, são inócuas ou mesmo um obstáculo para a aprendizagem. Como resultado, colhem-se cada vez mais a desilusões, desistências e inconformismos com o sistema de ensino".

A relação que o professor estabelece com o aluno é uma das características fundamentais para a permanência e o aproveitamento do indivíduo nas atividades propostas pelo docente. Muitas das dificuldades apresentadas pelos alunos estão relacionadas com a antipatia pelo professor.

Tanto o professor quanto os alunos trazem consigo experiências anteriores ao encontro na sala de aula. A relação professor-aluno vai depender principalmente da maturidade afetiva do professor. A orientação educacional grupal contribui para esta maturidade, porém, se o professor não conseguir lidar com seus fantasmas e frustrações, deve procurar a orientação individual do psicopedagogo.

As atividades propostas pelo grupoterapeuta devem contribuir para a diminuição, ou até eliminação, de características antipáticas dos professores como: autoritarismo, insegurança, frieza, desprezo, desinteresse, agressividade e ironia, e passem a ter atitudes que os tornem mais simpáticos. Os alunos apreciam professores calmos, pacientes, alegres, atenciosos, pontuais, que gostam do que fazem e que se preocupam com o aprendizado. A autoridade e a disciplina para o professor simpático surgem naturalmente.

As aulas puramente expositivas, onde o professor é quem estabelece o ritmo e a seqüência, não são atrativas e contribuem com a não permanência do aluno na escola. Há que se mudar a estratégia hoje utilizada para trabalhos mais dinâmicos, atrativos, que desenvolva além do conhecimento puramente intelectual, outras qualidades como liderança, trabalho em grupo, criatividade, perseverança, percepção, etc. Apesar de existirem inúmeras metodologias de ensino, será sempre necessária a criação de outras, mais atrativas e adequadas ao estágio de desenvolvimento histórico e à realidade imediata dos alunos.

Os alunos se sentem motivados pelos professores que se interessam pelo aprendizado. A utilização de estratégias de ensino criativas, dinâmicas e que incentivem a participação ativa dos alunos torna os trabalhos escolares mais atraentes e competitivos quando comparados à TV, à Internet e a outras atividades.

Devido às constantes mudanças sociais ocorridas no mundo, o ensino altamente baseado na memorização e na reprodução de tarefas repetitivas, não é mais apropriado ao perfil do atual profissional. Portanto, as avaliações individuais centradas na memorização, na repetição de métodos, na reprodução precisa e detalhada das explicações do professor e na punição do erro, se tornaram inadequadas para os dias atuais.

Um dos principais aspectos debatidos nas instituições de ensino são as formas de avaliação e as maneiras de quantificar o aproveitamento escolar. Por ser uma das maiores causas da desmotivação, da repetência e da evasão escolar, o sistema de avaliação deve ser repensado e arduamente discutido. Porém, isto não deve implicar em um relaxamento dos níveis de exigência, mas em se adotar uma forma mais eficaz de valorizar a aquisição do conhecimento, observando as capacidades adquiridas pelo indivíduo quanto a generalizações, comparações, análises, sínteses, críticas, discriminações, organizações, estruturas lógicas, etc.

Não existe uma maneira única de se avaliar um grupo de alunos, pois há diferenças entre disciplinas, escolas, número de alunos e abordagem. Cabe ao professor analisar qual o melhor sistema de avaliação a ser adotado na sua disciplina. O orientador educacional deve incentivar os docentes a experimentarem novos métodos de avaliação e aperfeiçoar os já existentes.

Toda experiência deve ser relatada aos outros docentes da instituição, colocando os pontos positivos e negativos, as dificuldades encontradas na execução de tal trabalho e os resultados obtidos. Ao expor e ouvir experiências diversas e ao debater sobre o assunto, o professor aumenta seu senso crítico podendo, assim, reavaliar sua metodologia de avaliação, identificar falhas e saná-las.

Alguns professores gostam de ser detentores do saber. Submetem seus alunos a massacres psicológicos e se vangloriam por serem os responsáveis pelos mais altos índices de reprovação da escola. Suas avaliações não valorizam a construção do conhecimento, conseguem, apenas, qualificar informações retidas naquele momento.

Outros professores, com medo de críticas e de perderem a posição que ocupam, aplicam provas fáceis para que a maioria dos alunos obtenha a aprovação, o que não avalia a construção do aprendizado.

Os professores extremistas normalmente apresentam forte resistência a mudanças. Com o trabalho do grupoterapeuta há que se instalar na instituição a cultura de que as metodologias de avaliação devem realmente quantificar e qualificar a construção do conhecimento.

Outro ponto de igual importância a ser tratado é o significado do erro nas avaliações. O grupoterapeuta deverá desenvolver nos educadores a capacidade crítica de analisar se o erro é proveniente de problemas relacionados ao aluno, ao próprio professor, à escola ou à sociedade. Os erros dos alunos devem fornecer elementos para o professor refletir sobre sua prática e modificar sua estratégia de ensino.

As escolas e seus educadores tendem a se preocupar mais com a quantificação do acerto e a punição do erro do que com o raciocínio do aluno, desconsiderando totalmente a construção do conhecimento.

CONCEITUAÇÃO DE GRUPO

Todo indivíduo deve ser estudado dentro do contexto social, pois em toda a sua existência, convive com outros indivíduos, partilhando o mesmo espaço e os mesmos desejos, interesses e ambições.

Pichon-Rivière [2] relata que "Todo conjunto de pessoas ligadas entre si por constantes de tempo e espaço, e articuladas por sua mútua representação interna (dimensão ecológica), configura uma situação grupal. Tal situação está sustentada por uma rede de motivações e nela interagem entre si, por meio de um complexo mecanismo de assunção e adjudicação de papéis. É nesse processo que deverá surgir o reconhecimento de si e do outro no diálogo e no intercâmbio permanente. Essa situação grupal constitui o instrumento mais adequado para essa aprendizagem de papéis (aprendizagem social), em que consiste a internalização operativa da realidade".

Nas palavras de Zimerman [3], "O ser humano é gregário, e ele só existe, ou subsiste, em função de seus inter-relacionamentos grupais. Sempre, desde o nascimento, ele participa de diferentes grupos, numa constante dialética entre a busca de sua identidade individual e a necessidade de uma identidade grupal e social".

Segundo o Novo Dicionário Aurélio, "grupo é uma pequena associação ou reunião de pessoas ligadas para um fim comum". Para alguns autores, o conjunto de duas pessoas (por exemplo, um casal) já configura um grupo. Pode-se conceituar também através do grupo familiar, escolar, terapêutico, profissional, esportivo, religioso, etc. Estes grupos estão constantemente sendo renovados e ampliados no decorrer da vida do indivíduo.

As pessoas levam seu universo pessoal ao grupo, composto pelas suas características de personalidade, vivências pessoais e experiência profissional. Por isso, o resultado de um grupo como um todo é diferente do somatório de suas partes.

Inseridos numa situação grupal, os indivíduos reagirão diferentemente em função destas características, focados num processo de interação, no qual as ações e reações individuais influirão e serão influenciadas pelo grupo.

Ao trabalhar com um grupo, um coordenador deve levar em consideração as características pessoais dos membros do grupo, sejam elas características de personalidade, físicas, econômico-sociais ou profissionais.

OBJETIVOS DO GRUPO

A existência de um grupo ou uma equipe deve ser fundamentada numa razão de ser que justifique sua própria existência. Esta razão de ser chama-se objetivos. A definição clara dos objetivos de um grupo por si só não garante o sucesso do mesmo. Ao se trabalhar com grupos, deve-se ter o entendimento aprofundado de como os objetivos grupais estão em interação com os objetivos individuais dos membros do grupo. Os objetivos individuais e grupais podem sofrer alterações ao longo do processo do grupo; assim, faz-se necessário a revisão constante destes objetivos.

Os objetivos do grupo especificam e definem os seus fins; identificam os alvos para os quais as atividades do grupo estão apontadas. Quando eficazmente desenvolvidos, diminuem as angústias dos integrantes do grupo, ampliam a base dos interesses comuns, sentimentos de identificação, motivações, padrões do grupo, participações úteis e satisfação dos membros do grupo.

A maioria dos grupos tem dificuldade em fazer com que os membros participem ativa e objetivamente. Este problema está relacionado com a falta de conhecimento claro dos objetivos, com a concordância sobre os propósitos do grupo ou da impossibilidade de perceber como as atividades se congregam para a consecução dos objetivos fixados.

Vivemos numa sociedade que está rapidamente se modificando. Os interesses e necessidades dos membros do grupo mudam com rapidez, aconselhando revisões e discussões sobre seus fins e objetivos. Tais revisões podem conduzir à mudança de objetivos, à fixação de outros, à reorientação das prioridades e, mesmo, ao reconhecimento da necessidade de se dissolver o grupo.

Às vezes, a complexidade da organização, o excesso de formalidade e a execução de um só tipo de trabalho impedem que o grupo procure os objetivos realmente importantes. Isto pode acontecer com qualquer grupo. A relação entre os objetivos definidos e as atividades estabelecidas formalmente permite superar tais dificuldades.

O propósito do grupo pode ser modificar o grupo e seus membros, ou, no caso do grupo de ação, decidir e executar programas específicos. Na designação dos objetivos deve-se indicar as modificações ou o tipo de ação que se espera do grupo e de seus membros.

Ao chegarem novos membros, é importante que os objetivos lhes sejam apresentados. O grau de satisfação e de participação dos membros antigos influencia os novos a aceitarem os objetivos e trabalharem a favor do grupo.

Uma vez determinados os objetivos, as futuras experiências e atividades do grupo tendem a ser moldadas e avaliadas segundo os seus termos. O grau com que os objetivos dos membros do grupo estão incorporados aos objetivos grupais influencia diretamente a fidelidade e a participação dos membros nas atividades organizadas.

CLASSIFICAÇÃO DOS GRUPOS

A classificação aqui utilizada se baseia no critério das finalidades a que se propõe o grupo. Será dividido em dois grandes ramos genéricos: Operativos e Terapêuticos. Na prática essas ramificações se completam. Cada um destes ramos, por sua vez, se subdivide em outras ramificações, conforme o esquema abaixo.

- **Grupos operativos**:
  (1) Ensino-aprendizagem (através da técnica de "Grupos de Reflexão").
  (2) Institucionais (empresas, escolas, igreja, exército, associações, etc.).
  (3) Comunitários (programas de saúde mental).
- **Grupos terapêuticos**:
  (1) De auto-ajuda – na área médica em geral (diabéticos, reumáticos, idosos, etc.); na área psiquiátrica (alcoolistas anônimos, pacientes, etc.).
  (2) Psicoterápicos (base psicanalítica, psicodrama, teoria sistêmica, cognitivo-comportamental, abordagem múltipla).

GRUPOS OPERATIVOS

Na ação preventiva da grupoterapia junto aos docentes, a modalidade de grupo utilizada é a de grupos operativos.

A conceituação e a aplicação dos grupos operativos, devem ao psicanalista argentino Pichon-Rivière [2]. Este autor enfoca que "A técnica de grupos por nós criada, chamada de grupos operativos, caracteriza-se por estar centrada, de forma explícita, em uma tarefa que pode ser a aprendizagem, a cura (abrange os grupos terapêuticos), o diagnóstico das dificuldades de uma organização profissional, etc. Sob esta tarefa subjaz outra, implícita, que aponta para a ruptura, através do esclarecimento das pautas estereotipadas que dificultam a aprendizagem e a comunicação, significando um obstáculo frente a toda situação de progresso ou mudança".

Zimerman [3] observa que o termo "grupo operativo" é muito genérico, sendo que, em essência, designa mais propriamente uma ideologia do que uma técnica específica. Essa ideologia, visa sempre um aprendizado conectado com uma mudança psicológica (atitudes), especialmente a de aprender a aprender.

CONCLUSÕES

A preocupação das escolas superiores sempre foi de formar profissionais com o perfil estipulado pelo mercado de trabalho. Devido às grandes mudanças pelas quais o país vem passando, a educação brasileira precisa ser revisada e reestruturada.

O processo de reavaliação do ensino não é tarefa fácil, pois além da imensidão territorial, é totalmente dependente dos interesses político e da boa vontade das instituições. Um ensino de qualidade, motivador, criativo e dinâmico, requer dedicação de todas as partes envolvidas no processo de ensino-aprendizagem.

O professor é a figura mais próxima do aluno, portanto pode atuar tanto como gerador de dificuldades ou como promotor da aprendizagem, dependendo do seu equilíbrio emocional e psíquico. Controlar suas frustrações ajuda a amenizar a resistência à mudanças abrindo espaço para a orientação educacional. Não basta que o docente domine o conhecimento técnico, é preciso conhecer metodologias de ensino dinâmicas, estimulantes e desafiadoras.

Neste sentido, pode-se compreender a importância da orientação educacional preventiva no âmbito escolar. Acredita-se que uma das saídas para o caos em que se encontra a educação no Brasil é a formação continuada dos docentes, através de grupoterapias. Nas atividades em grupo, os docentes poderão discutir, analisar e refletir sobre seu trabalho e, assim, adquirir formação didática e humanística, tão necessária para a construção do conhecimento do aluno.

É fundamental que o grupoterapeuta goste e acredite na modalidade de trabalho escolhida, pois só assim, resultados realmente satisfatórios serão conseguidos.

O que se espera é uma educação tão prazerosa quanto a internet, a TV a cabo e os bailes, onde os professores possam ensinar aprendendo e, acima de tudo, despertar e exteriorizar o aprendizado do aluno.

PROPOSTAS PARA A MELHORIA DOS CURSOS DE ENGENHARIA DEPOIS DE UM PROCESSO DE AVALIÇÃO. ESTUDO DE CASO: MACKENZIE

Castanheira, Ana Maria P [1];Hellmeister, Ana Catarina P[2]; Masetto, Marcos T[3]

Resumo: —*Esse trabalho apresenta uma síntese dos resultados obtidos a partir da iniciativa da realização de um processo de avaliação, feito através de levantamentos de dados junto a alunos ingressantes, alunos veteranos, alunos egressos e professores dos cursos de Engenharia da Universidade Presbiteriana Mackenzie durante o ano de 2001. Serão apresentados os cruzamentos e análises dos resultados obtidos que direcionaram discussões entre docentes, chefes de departamentos, diretores e reitoria. O processo de avaliação e suas conseqüências visaram a melhoria das relações professor - instituição, professor – aluno, conteúdo – aprendizado, assim como, reformulações nos procedimentos didáticos-pedagógicos. A análise dos resultados do levantamento realizado junto aos alunos egressos teve como objetivo verificar se esses profissionais estavam colocados no mercado de trabalho e se atendiam ás necessidades da sociedade atual. Essas informações foram úteis nas reformulações dos perfis dos profissionais que se espera formar. A pesquisa junto aos alunos ingressantes permitiu formar nova imagem do perfil sócio – econômico – cultural desse grupo. Foi também realizada um avaliação docente junto a todos os alunos da Escola de Engenharia. Cada aluno respondeu um questionário sobre quatro de seus professores , de tal forma que todos os docentes foram avaliados. Os professores, por sua vez, responderam, de forma anônima, a um documento que apresentava somente duas questões: quais os pontos positivos e os negativos dos cursos aonde atuavam.*

PRINCIPAL CONTRIBUIÇÃO: O objetivo principal desse trabalho é propor discussões que possam culminar em mudanças necessárias nas abordagens didático – pedagógicas, em metodologias motivadoras que envolvam o aluno e na própria revisão dos projetos pedagógicos dos cursos em questão.

1-INTRODUÇÃO

O objetivo deste trabalho é relatar e interpretar os procedimentos avaliativos realizados durante os anos 2001-2002 nos cursos de Engenharia da Universidade Presbiteriana Mackenzie (UPM).

Observamos que sempre que tratamos de avaliação institucional de cursos, é comum encontrar uma reação negativa ao processo, uma vez que a ele se associa uma característica de punição, de perseguição ou de valorização apenas dos aspectos negativos daquele curso. Justamente por isso, inicialmente nos preocupamos por esclarecer junto ao Diretor e Chefes de Departamento da Faculdade de Engenharia da UPM, bem como aos professores e alunos qual o sentido que estávamos dando ao processo avaliativo, o qual explicamos a seguir.

2- CONCEITO DE AVALIAÇÃO E SEUS PRINCÍPIOS FUNDAMENTAIS.

Entendemos por Avaliação um processo voltado para o desenvolvimento e evolução de uma situação qualquer. Tratando-se da avaliação de um curso de graduação, ela deverá sempre estar voltada para a melhoria da qualidade deste curso.

O processo de avaliação possui duas dimensões: a primeira é de diagnóstico de uma situação, que se realiza através de levantamento de informações que nos permitam conhecê-la melhor. A segunda é prospectiva, quer dizer, um olhar para frente, enquanto tomam-se decisões para fortalecer os pontos fortes e adequar melhor ou corrigir aqueles que, por ventura estejam deixando a desejar, sempre visando para o desenvolvimento da situação avaliada.

Um processo de avaliação assim considerado, para ser eficaz, exige que os participantes daquela realidade que se pretende avaliar assumam um compromisso tanto com o diagnóstico como com as propostas alavancadoras de evolução.

[1] Comissão Permanente de Avaliação- Universidade Presbiteriana Mackenzie Rua da Consolação896 cep01302-907email: castanheira@mackenzie.com.br
[2] Comissão Permanente de Avaliação- Universidade Presbiteriana Mackenzie Rua da Consolação896 cep01302-907email: cpa@mackenzie.com.br
[3] Comissão Permanente de Avaliação e Pós Graduação:Educação, Arte e História da Cultura- Universidade Presbiteriana Mackenzie Mackenzie Rua da Consolação896 cep01302-907email: cpa@mackenzie.com.br

A partir dessa concepção de avaliação, fundamentamo-nos em alguns princípios orientadores para realizarmos a avaliação dos Cursos de Engenharia da UPM, que passamos a enumerar:

1. Avaliação como processo crítico – transformador, e não como tarefa tecno-burocrática.

2. Avaliação como processo democrático, contando com o envolvimento e participação de todos os integrantes do curso: alunos, professores, chefias de departamento e diretor.

3. Avaliação como uma proposta pedagógica e formativa para os participantes do processo

4. Avaliação como recurso para encontrar formas alternativas de revitalização e de perspectivas interdisciplinares que signifiquem evolução do curso.

5. Na avaliação de um curso, os procedimentos avaliativos deverão se dirigir não unicamente para as pessoas, com o fim de responsabilizá-las ou culpá-las pelo que se observa ou pelos dados colhidos, mas a avaliação deverá orientar-se para a organização, como um todo, seus objetivos, os processos que nela têm curso, as atividades através dos quais os processos são conduzidos, o exercício das diferentes e complementares funções administrativas e pedagógicas, a participação e o envolvimento dos diferentes participantes, suas atividades, os "produtos" ou "resultados" que são ou deixam de ser obtidos, os padrões de desempenho e de qualidade com que tudo isso se processa em relação às necessidades ou expectativas.

3—ETAPAS DO PROCESSO DE AVALIAÇÃO DOS CURSOS DE ENGENHARIA DA UPM.

A realização do processo de avaliação dos cursos de Engenharia da UPM constou de várias etapas:

1. Levantamento da documentação já existente e elaboração do histórico das iniciativas já tomadas na Escola de Engenharia, em relação a avaliação institucional, desde 1991.

2. Consultas com especialistas externos:

Reunião com o assessor da Pró-Reitoria de Graduação da USP (Universidade de São Paulo) para apresentação e discussão de procedimentos de avaliação realizados na USP.

Visita à Comissão de Avaliação Institucional da PUC- RIO, já estabelecida há alguns anos, para obtenção de informações de atividades lá realizadas, além de auxílio nos processos operacionais.

Reuniões com o Diretor e Chefes de Departamentos da Faculdade de Engenharia para:

esclarecimentos e discussão sobre possíveis iniciativas isoladas de avaliação, já realizadas ou a realizar;identificar situações e acontecimentos que possam ter influenciado o andamento dos cursos oferecidos pela Unidade, como aumento significativo de vagas, critérios para contratação de docentes, condições de trabalho oferecidas pela instituição, etc.

3. De posse desses dados, demos início às atividades do processo avaliativo, apresentando aos alunos ingressantes nos cursos de Engenharia/2002 um questionário a ser preenchido, buscando identificar o perfil dos jovens que se matriculavam nesses cursos na UPM. Conhecer as características do público com o qual trabalhamos, através de um instrumento científico, e não apenas através de nossas impressões, permite um diagnóstico mais seguro das necessidades e possibilidades de atuação dos alunos, e, como decorrência, o professor e coordenação podem planejar melhores as atividades a serem desenvolvidas no decorrer do curso.

4- OUVINDO OS PROFESSORES

O passo seguinte foi a elaboração de um levantamento diagnóstico que seria feito junto aos professores dos cursos de engenharia e a realização de reuniões de sensibilização, inicialmente com o Diretor e Chefes de Departamento, e em seguida com todos os professores da Faculdade.

O objetivo das reuniões foi alertar Chefias e Professores para o significado daquele processo de avaliação: sua concepção, a proposta que apresentávamos, a necessidade da participação, do envolvimento e do compromisso de todos na direção de se obter melhorias detectáveis na qualidade dos cursos de engenharia.

A proposta apresentada consistia em que os professores respondessem voluntária e anonimamente, a duas questões em aberto (anexo 2) visando levantar os pontos positivos (fortes) e negativos (fracos) de cada curso, além de medidas, a curto,médio e longo prazo, que poderiam resolver problemas identificados pelos docentes.

5- OUVINDO OS ALUNOS

Os alunos de todas as turmas dos cursos de Engenharia responderam, em outubro de 2001, a um questionário que procurou avaliar as condições de oferta das disciplinas do curso, o trabalho docente , o envolvimento dos alunos e sua participação, e as condições de entorno do desenvolvimento das disciplinas.

Foi desenvolvido um sistema onde cada aluno respondeu um questionário sobre quatro professores de disciplinas que ele estava cursando na época, dando para cada questão de 1- muito ruim a 5- muito bom .

O aluno recebeu em classe, através da Comissão Permanente de Avaliação, um documento contendo as disciplinas sobre as quais ele deveria responder, disciplinas essas escolhidas de forma aleatória. O aluno, depois de destacar seu nome (e responder de forma anônima) devolveu para a Comissão, o questionário.

O departamento de Sistemas, depois da leitura óptica, calculou as médias por questão e a média geral de cada

professor . Também foi calculada a média por questão de cada Curso.
Cada professor recebeu, em envelope fechado, seu próprio resultado. No documento encaminhado a cada professor também foi informada a média docente em cada modalidade.
As respostas foram analisadas e os resultados disponibilizados também na intranet com acesso restrito às Chefias.

6- CRUZAMENTO DE DADOS OFERECIDOS POR PROFESSORES E ALUNOS DO MESMO CURSO, ANÁLISE DOS MESMOS E PROPOSTAS

De posse dos dados e informações dos alunos e dos professores, procuramos verificar a freqüência dos aspectos indicados como fortes ou fracos, a convergência ou não de pontos avaliados e sua respectiva pontuação e os tipos de medidas oferecidas para a solução dos problemas indicados.
Este material foi muito significativo. Fizemos uma análise sobre ele e preparamos um novo documento que foi discutido pelos professores em um Encontro de Avaliação realizado em uma manhã. Nessa reunião foi elaborado um plano de prioridades de ações a serem desenvolvidas visando a melhoria das condições de ensino.
Dados que foram alvo do estudo deste encontro:

As repostas obtidas pelos alunos dos curso foram
Os professores dominam o conteúdo ensinado.
Há respeito, por parte dos alunos, ao professor e seu trabalho.
Os alunos se consideram pontuais, assíduos e que têm comportamento adequado nas aulas,
Os alunos consideram as disciplinas cursadas importantes para a sua formação.
Os professores usualmente preparam suas aulas.
Os professores são pontuais.
Os professores são assíduos.
Os professores têm disponibilidade para responder perguntas e respeitam as dificuldades dos alunos.
Há continuidade lógica dos conteúdos ministrados.
Há uso adequado do horário atribuído às aulas.
Há coerência entre conteúdo ministrado e exigido nas avaliações.

No entanto os alunos acham que:
As condições de sala de aula podem melhorar.
O resultado das avaliações nem sempre reflete o real aprendizado do aluno.
A Biblioteca poderia ser melhor com atendimento mais eficiente

Professores: As repostas dadas pelos professores dos curso foram:
Os professores responderam um questionário com apenas duas questões abertas: Pontos positivos e negativos da Escola.
Foram levantados vários problemas e suas consequências na qualidade do ensino. Muitos professores contribuíram com sugestões possíveis de e de implantação imediata.

6.1-Análise e cruzamento

A avaliação do Curso de Engenharia realizada pelos docentes e alunos aponta para alguns pontos positivos: Os professores de Engenharia Civil avaliam o curso como essencialmente prático e abrangente, e com um currículo organizado de acordo com a prática profissional, buscando aperfeiçoar as visitas técnicas e incentivando a apresentação de projetos em várias disciplinas (Engenharia Mecânica). Isto certamente colabora para que os alunos tenham descoberto a importância das disciplinas. .
Os professores de Engenharia Mecânica afirmam que é alta a qualificação do seu corpo docente, o que vem de encontro às afirmações dos alunos de que o professor domina o conteúdo, prepara as aulas, que eles respeitam o trabalho do professor, reconhecem a pontualidade e assiduidade do mesmo, vêm uma qualidade importante no docente que é sua disponibilidade em responder perguntas, e que os professores têm respeito aos alunos e às suas dificuldades.
Os professores da Engenharia Civil julgam boa a distribuição da carga horária e usam recursos computacionais, que em parte é confirmado pelos alunos quando estes avaliam que há um uso adequado do horário atribuído às aulas e há continuidade lógica nos conteúdos ministrados. Os professores de Engenharia Mecânica chamam a atenção para a divisão das turmas para aulas práticas como um fator muito importante para o trabalho deles, assim como o processo de melhoria da biblioteca e de laboratórios indicados pelos docentes da Engenharia Civil.
Os professores levantam alguns aspectos que podem ser melhorados com providências simples:dificuldade para realizar visitas técnicas, laboratórios deficientes em número e equipamentos, falta de disciplinas optativas e de outras condições como espaço para atendimento de alunos, ou convivência dos professores e falta de apoio para participação em congressos e seminários.
Já os alunos, juntamente com os professores, identificam que as condições das salas de aula podem melhorar e que o número de alunos, as vezes, é grande, que a bibliografia indicada nem sempre facilita a compreensão dos conteúdos. A forma de ensinar nem sempre motiva muito os alunos e não há incentivo suficiente às atividades acadêmicas fora de aula. São unânimes também os alunos não têm disponibilidade para estudo fora do horário das aulas.
Frente a esses dados, algumas perguntas aparecem de imediato:
Se os alunos não consultam a bibliografia como afirmar que ela não é apta para facilitar a compreensão dos conteúdos?

Como afirmar que a biblioteca não atende às necessidades da disciplina?
De um lado os professores são elogiados por dominarem os conteúdos, prepararem as aulas, terem disponibilidade para responder as perguntas, usarem bem o horário das aulas e por outro a forma de ensinar não é motivadora. O que estaria faltando?

Ainda: como poderiam os professores ajudar a desenvolver o espírito crítico ao ensinar suas matérias? O que significa "desenvolver o espírito crítico"?

Os alunos dizem não ter disponibilidade para estudar fora do período de aula; por que? Porque trabalham? Porque não foram motivados para tal? Será que é possível se fazer seriamente um curso universitário sem estudar?
Porque não há uma boa orientação para as atividades extra classe? Porque não se programam adequadamente outras atividades para além das aulas?
Estas são algumas perguntas que poderíamos fazer a partir dos dados obtidos de professores e alunos, quando analisados conjuntamente. Certamente, outras poderão ser interessantes também. para um planejamento de trabalho entre os professores. Nesse sentido apresentamos algumas sugestões que nos pareceram válidas e que encaminharemos às Chefias e Professores dos cursos de Engenharia**:**
Que sejam realizadas reuniões com os diretores de cada unidade e com suas chefias departamentais. Posteriormente sugerimos a organização de mais seminários, a exemplo do primeiro, com os professores de cada Engenharia permitindo que todos possam participar da análise dos dados obtidos e a partir desta análise oferecer subsídios para definição de prioridades da unidade e um planejamento de ações que permitam um desenvolvimento dos próprios cursos. Um processo avaliativo só tem significado se permitir a realização de um plano de ações que permitam corrigir os pontos falhos e melhorar os pontos positivos. Simultaneamente propomos reuniões com os alunos para apresentação e discussão das informações obtidas, e as sugestões que direção e professores estão fazendo para o desenvolvimento daquela unidade, visando envolver a todos os participantes do curso no processo de melhoria.

7. PESQUISA COM OS ALUNOS EGRESSOS

Para fecharmos o círculo de buscas de informações sobre os cursos de Engenharia da UPM, entendemos que é necessário conhecer o que pensam nossos ex-alunos sobre o exercício de sua profissão e a contribuição dos cursos para o exercício competente, atualizado e social de sua profissão. Por essa razão, iniciamos em 2002 um contato com os alunos egressos da Engenharia Mackenzie, através de um questionário (anexo 4) .

Até agora já obtivemos cerca de 70 .alunos egressos respondentes ao questionário. A tabulação e análise destes primeiros dados parecem corroborar as informações que obtivemos a respeito dos mesmos cursos por parte dos alunos atuais. Esse fato aponta para a objetividade das informações que nossos alunos atuais nos querem passar e como, de fato, precisam ser levadas em conta nas medidas a serem tomadas para a efetiva melhoria dos cursos de graduação de Engenharia da UPM.

8-CONSIDERAÇÕES FINAIS

Processos de avaliação passam a ser de suma importância para a melhoria dos cursos de Engenharia. Através das informações obtidas nesse levantamentos as decisões tomadas serão para possíveis modificações de grades, currículos, conteúdos e até professores terão suporte mais adequado e mais chances de acerto, contribuindo para um projeto pedagógico próximo da realidade.
Algumas decisões já foram tomadas levando em conta os resultados obtidos pelo processo:

- O Currículo e a grade de horário foi reformulada de tal forma a envolver mais o aluno nas atividades
- O número de alunos em sala já foi reduzido para cinqüenta
- As bibliotecas estão cada vez mais ágeis para atender os discentes
- A direção vem incentivando a participação docente em congressos
- Foi criada a Coordenadoria de Iniciação Científica visando estimular a participação discente em projetos de pesquisa.
- As visitas técnicas vem sendo mais organizadas e incentivadas.

Depois da discussão dos resultados desta avaliação no I Encontro de Avaliação dos Professores da Escola de Engenharia elaborou-se um documento com algumas propostas para melhorias imediatas e outras para melhorias a longo prazo.

ELABORAÇÃO DE PROJETO DIDÁTICO-PEDAGÓGICO CONTEMPLANDO AS PROPOSTAS DO EXAME NACIONAL DE CURSOS

Terezinha Jocelen Masson, Ana Maria Porto Castanheira*, Leila Figueiredo de Miranda**

Resumo:*A elaboração de um projeto Didático-Pedagógico de um curso, atendendo a Lei de Diretrizes e Bases nº 9394 de 20 de dezembro de 1996 deverá envolver todos os segmentos acadêmicos, levando em conta os objetivos gerais da Universidade, os objetivos específicos do curso, procurando formar "cidadãos conscientes, capazes de exercer a liderança nos grupos sociais nos quais irão atuar", com* capacidade científica *adquiridos por meio do desenvolvimento de conceitos sólidos e eficazes técnicas didático-pedagógicas possibilitando que as fronteiras tecnológicas sejam facilmente assimiladas facilitando o ensino continuado, com elevados códigos éticos e morais, resultando na solução de problemas de forma moderna, criativa, competitiva, com uma preocupação com a Qualidade Total em todos os segmentos, para que o compromisso com a comunidade seja honrado, orientando ações sociais, buscando a consciência crítica e a participação.*

O projeto pedagógico deverá contemplar as atividades complementares, com ênfase no processo participativo, levando o acadêmico a se tornar um elemento ativo no processo ensino-aprendizagem, com uma programação de estudos coerentemente integrados, explicitando competências e habilidades a serem adquiridas.

Como o projeto deverá ser real, inovador e um agente facilitador do ensino-aprendizagem, o perfil do aluno deverá ser traçado, para que a abordagem seja centrada no próprio aluno e a partir daí, a avaliação seja baseada na aferição das competências e habilidades, com um currículo baseado em competências, pois o futuro profissional deverá possuir características de tomar decisões, trabalhar em equipe e principalmente enfrentar desafios de várias origens, começando pelo Exame Nacional de Cursos ("Provão"), que deverá ser encarado não como uma finalidade em si, mas sim como mais um passo a ser dado e com sucesso, num processo continuado de aprendizagem.

Dessa forma, o Projeto Didático Pedagógico de um Curso, deverá contemplar também uma estrutura curricular que possua a identidade da Instituição e do Curso para o desenvolvimento de um conjunto de capacidades referenciais e metodológicas, com um diferencial que serão as habilidades adquiridas pelos acadêmicos, capacitados e competentes.

Palavras-Chaves: *projeto didático-pedagógico, provão, habilidades, competências.*

INTRODUÇÃO

A palavra ***projeto*** etimologicamente, deriva do latim ***projetus*** e significa algo como um jato lançado para frente. Com relação ao prefixo, a palavra **projeto** é articulada com os significados de problema e programa e com relação à raiz partilha de uma ambigüidade fecunda com palavras como sujeito, objeto, trajeto.

Projeto designa igualmente tanto aquilo que é proposto realizar quanto o que será feito para atingir tal meta. Os indivíduos não sobrevivem sem os seus projetos pessoais, mas também não vivem só para eles, pois é inerente do ser humano a busca de metas e objetivos mais amplos, pois existe uma necessidade maior que é o da participação com o coletivo[1].

No século XVII o ***projeto*** foi encarado simplesmente como uma idéia de ação; no decurso do século XVIII, a palavra assumiu o sentido de plano que visa realizar essa idéia"[2]. Atualmente, tal definição do ponto de vista pedagógico pode e deve ser ainda mais abrangente, assumindo um caráter de um ***Projeto Didático-Pedagógico,*** deixando de ser apenas uma idéia de ação, mas também uma responsabilidade da realização de um ideal que deverá ser proposto, envolvendo um universo de seres humanos, que acreditam nas propostas e nas expectativas de que um futuro bem sucedido venha a se tornar realidade, ao final do curso escolhido.

PROJETO DIDÁTICO-PEDAGÓGICO

De um modo geral, a importância especial do projeto, deve ser associada à singular mediação realizada entre a criação individual, a intenção de reprodução, a habilidade de criação e o desenvolvimento, levando a uma realização pessoal abrangente, entre as expectativas do novo e a consolidação de padrões no imaginário coletivo, numa busca contínua pela excelência da qualidade, o que deve se tornar um padrão da Instituição de Ensino.

Um bom projeto, desenvolvido de forma correta, com adequação à realidade e às peculiaridades da Instituição de Ensino, resultará certamente na satisfação dos envolvidos no processo [3].

O projeto didático-pedagógico é uma proposta coletiva de trabalho que descreve um conjunto de capacidades, referenciais adotados e metodologias a serem utilizadas, por meio de um levantamento da situação atual, seguido da elaboração do diagnóstico e de uma programação, culminado com uma avaliação de qualidade.

A elaboração de um projeto didático-pedagógico deve ser norteada pelos seguintes itens:

- Objetivos Gerais da Universidade;
- Objetivos Gerais do Curso;
- Objetivos Específicos do Curso;
- Competências;
- Habilidades;
- Diferencial do Curso;
- Interdisciplinaridade;
- Fronteiras Tecnológicas;
- Solução de Problemas;
- Avaliação.

O projeto didático pedagógico ainda deve contemplar as exigências do Exame Nacional de Cursos, que é uma conseqüência de um programa de qualidade e um instrumento de avaliação, pois as Instituições foram motivadas a iniciar uma corrida direcionada à formação de um profissional com melhor nível, que é um objetivo só realizável por meio de investimentos na qualidade do corpo docente, na atualização curricular, na modernização dos laboratórios e no acervo das bibliotecas e na avaliação do valor agregado durante o curso.

Portanto o projeto didático-pedagógico atualmente se reveste da maior importância, pois além da competência, o profissional a ser formado, deve ter uma consciência ética e moral dentro de sua área de atuação.

Paralelamente, se as novas diretrizes curriculares flexibilizam os projetos pedagógicos respeitando a comunidade onde a IES está inserida, o provão funciona como elemento contrário a esta abertura, de certa forma engessando conteúdos e esquecendo peculiaridades.

Assim o projeto pedagógico deverá deixar claro quais são os objetivos e de que forma poderão ser alcançados, explicitando processos de avaliação que deverão verificar a eficácia ou não de suas estratégias pedagógicas e administrativas, sem deixar de contemplar as funções básicas da Universidade, que são o Ensino, a Pesquisa e a Extensão.

O Ensino, que recebe a maior parte das energias e recursos do sistema universitário, nutre-se principalmente de conhecimentos de países mais adiantados que em geral, têm uma restrita relação com os problemas da comunidade em que se insere. A Pesquisa estuda problemas que muitas vezes não oferecem a oportunidade de uma participação significativa dos acadêmicos. A Extensão Universitária recebe uma atenção marginal do sistema, levando à comunidade, de forma paternalista e unilateral, os resíduos mais frívolos das preocupações universitárias.

Nota-se que existe um paralelismo e um isolamento entre as três funções, de tal modo que a pesquisa não alimenta o ensino, nem a extensão tem uma interação significativa com ambos[4]. A problemática está em elaborar um plano, com um ensino de excelência inserido na comunidade, com uma educação continuada por meio dos Cursos de Extensão Universitária atrativa e inserida no contexto do curso, que consiga direcionar e despertar o aluno para uma pesquisa de ponta.

Para que tais objetivos sejam alcançados, a interdisciplinaridade e a flexibilidade que devem nortear um Projeto Pedagógico de um curso de Engenharia deve levar em conta o ensino centrado no aluno, ou por competências, que é direcionado para que todos os alunos possam atingir o domínio total dos objetivos específicos mínimos de um assunto (disciplina ou curso), consistindo num esforço para evitar a mediocridade ou a superficialidade da aprendizagem, assegurando aos alunos que possam realizar as atividades propostas da melhor maneira possível, o que pode ser traduzido por modalidades estruturais da inteligência, das ações e das operações.

Portanto, a educação centrada no aluno promove a criação de ambientes inovadores auxiliando na ligação da nova informação à anterior, pesquisando sobre a informação relevante e pensando acerca do seu próprio pensamento, evidenciando a necessidade de se proceder ao desenvolvimento do projeto educacional num sentido integrador do aluno, das tecnologias de informação e dos contextos de construção e produção da própria aprendizagem.

Entretanto, antes de se definir o currículo por competências, deve-se repensar nas competências do currículo. A razão dessa exigência é a freqüente comprovação que tradicionalmente os objetivos mais amplos de ensino não são capazes de assegurar um bom desempenho profissional futuro.

Os princípios que norteiam para a competência são:

- Informar ao aluno o que dele se espera (objetivos específicos acessíveis);
- Respeitar as individualidades dos alunos (tempo e velocidade de aprendizagem);
- Verificar a aprendizagem em quantidade e qualidade e utilizar mecanismos de correção e superação das dificuldades.

A diferença entre o ensino tradicional e o ensino por competências é formar um profissional com as características:

- Ensino centrado no aluno;
- Maior responsabilidade atribuída ao aluno para a superação das dificuldades;
- Enfrentar desafios;
- Maior atenção aos pré-requisitos;
- Maior flexibilidade;
- Incentivar a criatividade;
- Maior aptidão para resolver problemas; tomar decisões; trabalhar em grupo e de comunicação.

O ensino por competências exige não só um planejamento mais detalhado de ensino, mas também maior cuidado na verificação da aprendizagem, com uma avaliação muita bem elaborada, que forneça ao aluno condições de encarar com tranqüilidade todos os desafios futuros, tais como a prova de final de curso, o aprimoramento intelectual e pessoal, o mercado de trabalho, a aprendizagem continuada, a pesquisa, entre outros.

Além disso, o Projeto pedagógico também deve incluir as habilidades que se espera dos alunos. As habilidades podem ser definidas grosseiramente, como a capacidade de realizar determinadas tarefas com absoluto êxito. Entretanto a capacidade de realizar determinadas tarefas passa necessariamente por uma gama de etapas, onde nenhuma delas pode ser suprimida e todas precisam ser atrativas, o que não é uma tarefa fácil em se tratando de ciências exatas.O futuro não é uma mera continuação do passado, mas dele conserva muitos conceitos, que servem tanto para o desenvolvimento das fronteiras tecnológicas, como para uma absoluta inaptidão tecnológica [5].

Um homem universal é aquele que possui uma instrução completa que lhe possibilita aprender a aprender e ao mesmo tempo, se adaptar, criar ou mudar as condições de trabalho quando possível, ou seja, ser flexível. De acordo com as abordagens sócio-construtivistas da educação, a aprendizagem é um fator primordial, sendo um processo ativo e participativo, por meio do qual a formação do conhecimento é uma atividade construtiva de experiências e significados socialmente negociados e partilhados.

Nesta perspectiva, a aprendizagem é um processo de construção da representação interna do conhecimento, uma interpretação pessoal da experiência. A construção do conhecimento resulta num modelo conceitual do mundo realizado a partir da experiência do indivíduo sobre este.

No campo das instituições e sistemas organizacionais, a flexibilidade aparece como uma meta a ser alcançada, ou seja, como um valor a ser agregado no campo da formação profissional, que é uma adaptação dos sistemas produtivos às situações inesperadas, uma nova relação entre competitividade e educação, em que se destaca a necessidade de saber fazer, ser, pensar e agir.

Assim sendo, os planos pedagógicos devem contemplar as novas tecnologias educacionais que complementam o ensino teórico e as práticas em laboratórios com as tecnologias modernas utilizando equipamentos atualizados com a realidade atual do mercado de atuação futura dos alunos. Tais ações irão proporcionar um salto na melhoria da qualidade dos resultados obtidos, para que as competências sejam adquiridas em um espaço de tempo reduzido.

Desta forma pode-se delinear as diretrizes gerais para o desenvolvimento de um Projeto Pedagógico do Curso de Engenharia.

CONCLUSÃO

Para a elaboração de um projeto didático-pedagógico eficiente, devem ser definidos objetivos gerais e específicos, bem como o perfil do profissional a ser formado, enfatizando o tipo de especialização, ou seja, a vocação do curso, as ações necessárias para cumprir esses objetivos e o suporte operacional para implementar e acompanhar as ações necessárias à consecução dos objetivos além de uma avaliação de qualidade.

Para a consecução dos objetivos estabelecidos e a formação de profissionais com o perfil adequado, ações devem ser definidas. Esta etapa corresponde à determinação de **o que fazer** e **como fazer** para implantar o Projeto Pedagógico. Os meios que se dispõe para isso são o rol de disciplinas, a metodologia de ensino e as atividades de formação complementar.

Para a realização das ações com a finalidade de alcançar os objetivos do Projeto Pedagógico proposto, deve-se criar um suporte operacional que permita realizar essas ações e avaliar seus resultados, visando corrigir possíveis desvios observados durante a implementação deste currículo em relação às propostas iniciais e aquelas realmente alcançadas. Compõem este suporte operacional, a **organização do curso**, a **implantação das medidas** necessárias e o **acompanhamento** das ações desenvolvidas, não se esquecendo do perfil pretendido.

Para que se consiga uma inevitável associação entre a pesquisa científica e tecnológica e a engenharia de produtos e de processos intensificada[6], um projeto didático pedagógico, deve contemplar uma a estrutura curricular com disponibilidade para atividades complementares, como parte da integralização curricular; o estimulo a iniciação científica por meio de projetos inovadores e multidisciplinares, possuindo ainda uma identidade com Instituição de Ensino e com o Curso de Engenharia, para o desenvolvimento de um conjunto de capacidades referenciais e metodológicas, com um diferencial que serão as habilidades adquiridas pelos acadêmicos, capacitados e competentes.

CURRICULUM MÍNIMO: UM RETROCESSO OU UM AVANÇO?

Terezinha Jocelen Masson[1], Ana Maria Porto Castanheira[2], Leila Figueiredo de Miranda[3]

RESUMO - *Atualmente, os cursos de Engenharia, nas suas diversas modalidades, teoricamente não necessitam obedecer a qualquer tipo de currículo mínimo, pois de acordo com a Lei de Diretrizes e Bases de 11/03/2002, onde somente é elencado uma série de matérias, não é mais necessário que se obedeça à Resolução 48/76 do CFE.*

Entretanto os cursos das áreas de ciências exatas necessitam invariavelmente, de sólida formação básica e, nos cursos de Engenharia, as disciplinas responsáveis pela formação básica: Matemática, Física, Química, Informática, Desenho, Eletricidade, Resistência dos Materiais e Fenômenos de Transporte são aquelas que irão possibilitar o desenvolvimento e o avanço necessários às rápidas transformações do cenário científico-tecnológico, capacitando os acadêmicos à aquisição de competências e habilidades dentro de sua área respectiva.

Como os sólidos conceitos básicos fundamentais independem da nacionalidade, da regionalidade, da política sócio-econômica vigente, entre outros, e os meios escolhidos para o seu desenvolvimento podem levar a modificações dos objetivos, deve haver uma quantificação e qualificação desses conceitos, com uma abrangência capaz de suprir as suas necessidades, criando por fim um modelo de interação científica, que deve ser objeto permanente de discussões, debates e reflexões, garantindo a identidade, mas proporcionando uma competitividade sadia entre as diferentes Instituições (Públicas e Privadas), desde que a qualidade mínima e necessária esteja garantida por um currículo básico e uniforme, para cada uma das áreas, que deve ser aferida periodicamente, como atualmente, por meio dos Exames Nacionais de Cursos, ou, preferencialmente pelas instituições dos Exames de Ordem.

Assim, o aspecto criativo, regional, e os diferenciais serão responsáveis pelo modelo interativo entre a Ciência e a Sociedade, criando condições para o exercício da cidadania, propiciando a liberdade e o direito à tomada de decisões, partindo de uma sólida estrutura criada pela Instituição para, a partir daí, desenvolver a continuidade do currículo com as especificidades exigidas pela área, atendendo aos objetivos gerais da Universidade e aos objetivos específicos do Curso.

A finalidade é formar "cidadãos conscientes, capazes de exercer a liderança nos grupos sociais nos quais irão atuar", com capacidade científica adquirida por meio do desenvolvimento de conceitos básicos sólidos e eficazes, e de um projeto didático-pedagógico que deve contemplar também uma estrutura curricular que possua a identidade da Instituição e do Curso para o desenvolvimento de um conjunto de capacidades referenciais e metodológicas, com um diferencial que são as habilidades adquiridas pelos acadêmicos, capacitados e competentes.

Portanto o elenco das disciplinas do ***currículo mínimo*** *e o seu conteúdo é um dos elementos agregadores da mesma área que vai possibilitar o afloramento das diferenças individuais, tanto das Escolas, quanto dos alunos, quando das Avaliações, tanto as internas, quanto às externas, inclusive, para obter-se um padrão mínimo de exigências no Exame de Avaliação Nacional dos Cursos Superiores, o " Provão".*

Palavras-Chaves: *cursos de engenharia, currículo mínimo, habilidades, competências.*

INTRODUÇÃO

A Legislação Brasileira estabeleceu pela primeira vez em 1961 na Lei de Diretrizes e Bases (LDB), alguns requisitos mínimos e a duração de cursos superiores, aplicáveis ao ensino e ao exercício profissional da Engenharia.

Em 1962, o Conselho Federal de Educação (CFE) fixou os currículos mínimos dos cursos de Engenharia Civil, Mecânica, Elétrica (especialização em Eletrônica e Eletrotécnica), de Minas, Metalúrgica, Química e Naval. Outros currículos mínimos de Engenharia foram estabelecidos no campo das Ciências Agrárias e também visando a formação Engenheiros de Operação, voltados para atividades do setor industrial, uma carreira que posteriormente foi extinta.

Em 1968 o assunto foi novamente analisado, e o capítulo da LDB referente ao ensino superior foi substituído pela Lei n^{o} 5540. Em meados da década de 1970, as habilitações da Engenharia já tinham funcionamento regular e em 1973, após dez anos da implementação dos primeiros currículos mínimos, o Ministério da Educação e Cultura (MEC) julgou conveniente uma revisão do assunto, encarregando uma Comissão de Especialistas de Ensino de Engenharia (CEEEng) a fazer os estudos necessários e formular uma nova proposta de currículo mínimo, a qual foi encaminhada em 1974 ao Conselho Federal de Educação (CFE), ocasião em que, além das modalidades tradicionais da Engenharia, ainda foi fixado o currículo mínimo de Engenharia de Produção.

Tais estudos e análises originaram a Resolução n° 48/76 – CFE, ficando estabelecido que a estrutura de currículo mínimo definida pela referida Resolução seria a única a vigorar no País a partir de 1982[1].

Do ponto de vista educacional, existem outras razões que também justificam a existência do **currículo mínimo**, como a necessidade de se garantir uma qualidade mínima na formação do engenheiro e uma homogeneidade mínima entre os cursos equivalentes.

Em outubro de 1997, as Instituições CEEEng, ABENGE e CONFEA, participaram de discussões no Congresso Anual da ABENGE, realizado em 1997, em Salvador-Bahia, sobre a resolução 48/76, cujas conclusões claramente configuravam duas tendências[2].

Na primeira, preconizava-se a manutenção da estrutura da Resolução 48/76, aumentando-se o número de áreas para atender às necessidades já apontadas pela sociedade.

A segunda tendência, que defendia a redução do número de áreas, evoluiu para uma proposta de eliminação das áreas definidas pela Resolução, e pelo estabelecimento de um **núcleo único tecnológico** que caracterizasse o curso de Engenharia. Foi discutida a forma como essa mesma proposta estava sendo executada nos Estados Unidos da América pelas Escolas de Engenharia pertencentes à *Coalitions Foundation,* um dos oito projetos que serviram de inspiração para o Projeto de Reengenharia no Brasil (REENGE), apoiados pela *National Science Foundation*[1].

Os resultados das análises realizadas no Congresso da ABENGE sobre as perspectivas para o estabelecimento de diretrizes curriculares para as habilitações do curso de engenharia, foram discutidas por meio de um levantamento feito na ocasião, que contabilizou um número provável muito elevado para as Áreas preconizadas na estrutura da Resolução 48/76 modificada, caso fosse adotada a tendência favorável à manutenção do conceito de Áreas e ao seu aumento em função da demanda qualificada.

Atualmente, como resultado de novas análises sobre o assunto, foram geradas novas interpretações da Lei de Diretrizes e Bases que foram revisadas e aprovadas pelo Conselho Nacional de Educação (CNE), e pela resolução CNE/CES n^{o} 11/2002, onde os cursos de Engenharia, nas suas diversas modalidades, teoricamente não necessitam obedecer a qualquer tipo de currículo mínimo [3].

Na realidade, a nova LDB gerou novas diretrizes curriculares para todos os Cursos, porém sem contradizer a resolução 48/76, confirmando o seu teor mas possibilitando uma flexibilização na aplicação dos conceitos ali contidos, necessária para que os currículos possam acompanhar a velocidade com que as transformações ocorrem na sociedade.

ANÁLISE DA SITUAÇÃO

A rapidez com que a ciência e a tecnologia são transformadas e transformam o mundo atual, bem como o cenário político, econômico e social, envolvidos nesta dinâmica, apresentam desafios constantes para as Instituições que trabalham com o ensino de engenharia, dada as dimensões deste cenário e a sua relação com um projeto social, do qual o currículo se constitui numa de suas principais peças.

De acordo com a Lei de Diretrizes e Bases de 11/03/2002, são salientadas as competências e habilidades desejadas, tais como aplicar conhecimentos matemáticos, científicos, tecnológicos e instrumentais à engenharia; projetar e conduzir experimentos e interpretar resultados; identificar, formular e resolver problemas de engenharia; comunicar-se eficientemente nas formas escrita, oral e gráfica; atuar em equipes multidisciplinares; avaliar o impacto dessa atividade de engenharia no contexto social e ambiental [4].

A LDB modificada, se insere num cenário internacional e relaciona uma série de matérias que orientam os currículos dos cursos indicando as percentagens de áreas de conhecimento relativas à formação básica e à formação profissionalizante a serem mantidas, que, entretanto, já constavam na resolução 48/76.

Observa-se que estas exigências são precárias, pois currículos com conteúdos e estruturas deficientes em determinados campos, tanto da formação básica quanto da profissional, não conduzem efetivamente a uma mudança plena sobre a visão da Ciência e da Tecnologia e as suas interações com a Sociedade. Assim, o papel da formação é fundamental e deve ser constantemente analisado[5], pois a importância do conhecimento para o desenvolvimento não é uma novidade na história da humanidade e se constitui numa variável de destaque para o desenvolvimento econômico e tecnológico, resultante de um esforço contínuo de educação com elevados padrões de excelência[6].

Não se pode esperar que novos conceitos sejam absorvidos completamente apenas por efeito do discurso lógico-formal. Ao contrário, há todo um percurso a ser realizado, de forma a dotar e embasar de algum sentido o novo conceito, relacionando-o gradativamente com aqueles já sedimentados. Este percurso começa pela imitação, passa pelo uso, para só então alcançar a compreensão e depois a criação [7].

Essa compreensão será modificada ao longo da vida do acadêmico, passando por diferentes teorias e por níveis mais abstratos de explicação. A passagem de um nível de abstração a outro pode ser facilitada pela discussão do processo de aprendizado em si, colocando em questão o sujeito, o que Piaget chama de "abstração reflexionante" [8].

A publicação da nova Lei de Diretrizes e Bases da Educação e das peças jurídicas suplementares gerou grandes expectativas em toda a comunidade educacional do país. Algumas boas, pelas oportunidades de abertura e flexibilidade prenunciadas, mas outras inquietantes, motivada pela preocupação com a completa eliminação de um balizamento mínimo, visto por muitos como desejável e mesmo necessário, especialmente em cursos técnicos e científicos comprometidos com a responsabilidade civil e social, como nos cursos de Engenharia[1, 9].

Várias opiniões desencontradas têm sido emitidas com relação à substituição do conceito antigo dos **currículos mínimos** pelo conceito mais moderno das **diretrizes curriculares**. Têm sido ouvidas afirmações que vão desde um extremo: "... superação da camisa de força imposta pelos currículos mínimos...” até o extremo oposto: “...diretrizes curriculares são currículo mínimo e mais alguma coisa”.

Desde o início de suas atividades, a Comissão de Especialistas de Ensino de Engenharia–CEEng, da Secretaria da Educação Superior (SESu/MEC), tem exposto a sua interpretação sobre a questão, a respeito dos cursos de Engenharia. Entende que desde a publicação da Resolução n° 48/76–CFE, as estruturas curriculares das habilitações do curso de engenharia já estão sendo normalizadas por um sistema de diretrizes curriculares, que só precisa de aprimoramento e atualização. Na verdade as diretrizes curriculares deveriam nortear os cursos, balizando as condições mínimas necessárias a sua área de atuação.

De acordo com o parecer emitido pela CEEEng sobre o Processo 23000.000078/96-36, encaminhado ao Conselho Nacional de Educação, essa tarefa, embora muito delicada, será grandemente facilitada pela existência da Resolução n° 48/76, do antigo CFE, reconhecida por muitos como um passo importante já em 1976, para a substituição das estruturas curriculares rígidas, por um sistema de diretrizes flexível, versátil e descentralizado. Entretanto, é consenso um outro nível de preocupações, quanto ao caráter conceitual fundamental relativo aos atributos esperados do futuro engenheiro, que também deve ser levado em consideração.

O emprego morre, mas o trabalho não. Este precisa e vai continuar, só que de forma diferente da anterior. Deverá ser realizado por meio de projetos que têm princípio, meio e fim. Ao fim de cada projeto, novos projetos terão de ser concebidos e executados. Nessa ciranda do trabalho, as pessoas deverão ser cada vez mais polivalentes e competentes. Muito mais competentes que seus pares e seus concorrentes.

Para que este diferencial seja alcançado será necessário que a base científica, que é imprescindível, seja disponibilizada para todos os cursos de engenharia, de forma a proporcionar uma formação tecnológica sem traumas, para que o aluno não seja desmotivado e adquira confiança em si mesmo e na sua capacitação. Desta forma, o desenvolvimento e a criação de um **currículo mínimo, principalmente nas disciplinas envolvidas no ciclo básico** se faz necessária, para suprir as necessidades impostas pelas disciplinas de formação tecnológica.

Para o profissional deste milênio, não haverá trabalho para a mão-de-obra não qualificada e muito menos para a mão-de-obra apenas adestrada em determinada profissão, não capacitada para atuar em projetos complexos.

Essas considerações conduzem o curso para uma linha de formação polivalente, num ensino por competências, porém com **sólida formação básica**, com um conhecimento tecnológico adaptável às rápidas transformações impostas pelas fronteiras tecnológicas onde não são admitidos enganos. Tais fronteiras necessitam de soluções corretas, rápidas, seguras, criativas e economicamente viáveis. As soluções passam necessariamente pela descrição matemática precisa do problema, por sua análise físico-química e pela criação de modelos, resultado das habilidades adquiridas pelos alunos, principalmente nas **disciplinas básicas**, que serão aplicadas nas suas diferentes peculiaridades, resultando em criatividade, no aumento de produtividade, na melhoria na qualidade dos produtos, na redução dos custos, na eliminação de desperdícios, de modo a torná-los agentes modificadores não só do mercado como da sociedade.

Paralelamente, já ocorre uma demanda de profissionais preparados para planejar, desenvolver e supervisionar a execução de quaisquer projetos de engenharia interfaciados por computadores e por sistemas de computação, além de instalar e operar equipamentos, respondendo pela manutenção deles e dos sistemas.

O acadêmico ingressante numa Universidade espera e deve receber uma formação profissional que lhe assegure condições de competir pelas reais oportunidades oferecidas no mercado de trabalho vigente.

É importante destacar que, por melhor que seja a preparação universitária proporcionada aos alunos, ela não será suficiente para acompanhar o avanço tecnológico. Estes deverão ser continuamente reciclados, por meio de cursos de atualização profissional, exigindo constantes esforços dirigidos a um contínuo aprendizado. Somente a adoção, por parte do aluno, de uma filosofia de educação permanente assegurará a existência de profissionais polivalentes, multifuncionais, com capacidade de domínio das inovações, tão exigidos pelo mercado de trabalho, voltando-se novamente à questão da **sólida formação básica**.

O ensino direcionado para a interdisciplinariedade possibilita uma melhor estruturação dos conceitos e, somente os programas definidos com metodologias compartilhadas por várias disciplinas facilitam o desenvolvimento das habilidades, atitudes e valores que ajudarão o aluno a incorporar-se efetivamente à sociedade em geral e ao mundo do trabalho em especial. Se essa interdisciplinaridade consegue se firmar logo nas **etapas iniciais do curso**, a aprendizagem fluirá naturalmente.

A interdisciplinaridade é vista no Curso de Engenharia fundamentalmente como um **processo** e uma **filosofia** de trabalho, que entra em ação na hora de se enfrentar os problemas e questões que se avolumam em cada campo de conhecimento. Este processo e esta filosofia devem ser aplicadas desde as etapas iniciais do curso[9].

Os cursos de Engenharia podem evitar a excessiva compartimentação dos conhecimentos, o que prejudica seu caráter polivalente, optando pela filosofia da interdisciplinaridade como uma linha mestra da implementação curricular.

A construção de um **currículo mínimo,** com disciplinas de introdução à Engenharia, facilitaria o direcionamento das aplicações específicas em cada uma das habilitações, despertando a motivação do aluno na sua área de interesse.

CONCLUSÃO

A conceituação básica necessária ao exercício de uma profissão é imutável, mas a forma como as competências e habilidades são desenvolvidas e definidas dentro do contexto institucional podem e devem se alterar em função das necessidades técnicas e sociais. O currículo não pode ser uma mera seqüência de disciplinas, mas um poderoso instrumento institucional, que possa direcionar o acadêmico para o binômio **saber** – **fazer**, baseando-se nos princípios definidos e fundamentados na Lei de Diretrizes e Bases.

O que se busca, portanto, com referência a um **perfil básico**, é sinalizar as características importantes para que o profissional possa se inserir no mundo produtivo, mantendo-se atualizado e contribuindo, efetivamente, para o desenvolvimento da tecnologia e o exercício da técnica. A rapidez da evolução tecnológica fornece um caráter de rápida obsolescência às informações técnicas.

Ao contrário, as competências representam um instrumento perene e capacitam o formando a atuar diante de "situações novas", libertando-o de condicionamentos e facilitando-lhe o exercício do aprendizado autônomo e continuado, uma vez que sua **sólida formação fundamental** o permite.

A elaboração do currículo de um curso deve apresentar as características formais da estrutura curricular das habilitações do curso de Engenharia, de caráter conceitual, quanto aos atributos esperados do futuro engenheiro, que deve ser levado em consideração.

Se o aluno consegue adquirir uma sólida formação básica, os núcleos de formação profissional geral e de formação específicas do Curso serão beneficiados, pois as barreiras impostas pelas disciplinas de ciências exatas, tais como física, matemática e química, serão eliminadas ou minimizadas e as disciplinas profissionalizantes, contando com o atrativo da sua vocação, se tornarão os meios para alcançar os objetivos finais do Curso, na habilidade escolhida, motivando o aluno a se aprofundar nos domínios tecnológicos, tornando o Engenheiro do Século XXI, um profissional competente e eficaz, capacitado a vencer os desafios profissionais e incentivando-o a uma busca de maiores conhecimentos e técnicas por meio do ensino continuado, obtendo uma plena satisfação dos seus ideais.

Assim sendo, a manutenção dos currículos mínimos para as disciplinas de formação básica nos Cursos de Engenharia, continua a se constituir num **avanço** educacional, desde que sejam ministradas com tecnologia educacional atualizada e atraente, com as justificativas da sua existência, concebida como um degrau facilitador ao entendimento das ciências da engenharia, com aplicações direcionadas nas suas especificidades.

Além disso, torna-se incompatível uma avaliação dos egressos dos Cursos de Engenharia, como o Exame Nacional de Cursos, sem um referencial que é fornecido pelo currículo mínimo, pois toda avaliação está balizada por um objetivo, que é norteado pelas competências requeridas para cada uma das habilitações dos Cursos de Engenharia.

TRATAMENTO DO GÁS DIÓXIDO DE ENXOFRE EM UM REATOR DE LEITO GOTEJANTE DE CARVÃO ATIVADO: COMPARAÇÃO DOS MODOS CONTÍNUO E PERIÓDICO DE OPERAÇÃO

Sandro Megale Pizzo[1] e Deovaldo de Moraes Jr.[2]

Resumo — *Num leito de 77,92 (di) × 80,00mm de carvão ativado realizou-se a depuração de uma mistura de SO_2 em ar, comparando-se o desempenho dos modos contínuo e periódico de operação. Foram analisadas a concentração inicial de SO_2 (500, 1.000 e 1.500ppm em ar), a velocidade superficial da fase gasosa (20, 40 e 60mm/s) e da fase líquida (2mm/s), o período (10 e 20 minutos) e a fração de descarga (0,1, 0,2 e 0,3). A eficiência de remoção da operação periódica variou de 40 a 100% e sofreu maior influência da variação da velocidade superficial de gás e de sua concentração inicial. Foram obtidas eficiências de remoção de 100% nos casos da operação contínua. A taxa de produção de ácido sulfúrico variou entre $0,6\times10^{-8}$ e $2,5\times10^{-7}$mol/g.s. A operação periódica possibilitou obter maiores taxas de produção de ácido sulfúrico e menores perdas de carga que a operação em estado estacionário.*

Palavras chave — *carvão ativado, dióxido de enxofre, leito fixo, operação periódica.*

INTRODUÇÃO

Depois do CO_2, o SO_2 é o poluente com maior volume de emissões na atmosfera. O dióxido de enxofre é um gás incolor, corrosivo, de forte odor irritante, eliminado como subproduto da queima de combustíveis fósseis, carvão e em fundições de minérios. Sua distribuição na atmosfera se dá de forma heterogênea e na presença de luz solar e de material particulado suspenso, origina os sulfatos que reagem com vapor d'água precipitando-se como chuva ácida. A acidificação de solos e das águas causa danos ao aos ecossistemas ao solubilizar os metais pesados tóxicos as todas as formas de vida e lixiviar micronutrientes importantes ao desenvolvimento dos vegetais. A inalação do SO_2 pelos animais e pelos seres humanos pode causar problemas crônicos no aparelho cardio-respiratório e, nos casos de exposição severa, pode matar por asfixia [1].

Visando a atender a legislação ambiental cada vez mais restritiva, na sociedade industrializada contemporânea buscam-se formas limpas de geração de energia através de combustíveis tratados antes da queima, para a eliminação do enxofre. Nos casos em que a geração do poluente é inevitável, devem ser adotados procedimentos que minimizem sua emissão nas chaminés.

O tratamento do gás, normalmente, utiliza-se dos lavadores contendo recheios aleatórios ou estruturados, nos quais o SO_2 é absorvido em uma solução de cal ou cal hidratada [2]. Essas mesmas substâncias podem ser empregadas nos reatores de leito fluidificado, nos quais se produz gesso a partir de uma reação gás-sólido em altas temperaturas [3].

Um processo regenerativo que apresenta a possibilidade de produzir soluções ácidas é a oxidação e hidratação do SO_2 em reatores de leito fixo gotejante, constituído de carvão ativado. Nessa via de tratamento, o SO_2 adsorvido é oxidado cataliticamente pelo oxigênio nas partículas porosas de carvão produzindo trióxido de enxofre. O SO_3 não dessorve espontaneamente e o leito é regenerado mediante a lavagem contínua com água, obtendo-se soluções diluídas de ácido sulfúrico na temperatura ambiente [4].

Contudo, a presença da fase líquida em escoamento contínuo dificulta a difusão dos reagentes gasosos até os sítios ativos do catalisador pois são formados filmes de água ao redor das partículas do leito. A fase líquida não pode ser suprimida porque isso implicaria na saturação do leito, tornando-o incapaz de adsorver o SO_2.

Uma alternativa para superar esse obstáculo é a lavagem periódica do leito [5]. Nesse caso, o escoamento da fase líquida é intermitente, o que permite a drenagem do leito e a exposição da superfície das partículas de carvão à mistura gasosa reacional, graças à evaporação dos filmes de líquido. As descargas de água acontecem a intervalos regulares de tempo e têm uma duração preestabelecida. Denomina-se período (τ) o intervalo de tempo decorrido entre as etapas de lavagem e fração de descarga (σ) a relação entre a duração dessas etapas e o período.

Dessa forma, é possível tratar o gás e produzir soluções mais concentradas variando-se a duração e a freqüência da lavagem [5]. Porém, o escoamento da fase

[1] Sandro Megale Pizzo, PPG/DEQ/UFSCar, Via Washington Luis, km 235, C.P. 676, 13.565-905, São Carlos, SP, Brasil, smpizzo@hotmail.com

líquida só pode ser minimizado desde que se proporcione a regeneração suficiente do catalisador e a relação do desempenho do processo com os parâmetros característicos da operação periódica deve ser determinada [6]. Uma outra vantagem da operação periódica é a menor perda de carga através do leito [7].

O objetivo desse trabalho foi comparar o desempenho dos modos periódico e contínuo de operação de um reator de leito fixo de carvão ativado no tratamento de uma mistura de SO_2 e ar, em termos da eficiência de remoção e da taxa de produção de ácido sulfúrico.

MATERIAIS E MÉTODOS

O reator de leito gotejante para o tratamento do gás contendo SO_2 é representado na Figura 1. Uma coluna de aço inox acondicionava um leito fixo de 77,92(d.i.)×80,00mm. Ele era constituído de partículas porosas de carvão de casca de coco, ativado em corrente de vapor d'água a alta temperatura, de 2,00-2,36mm de diâmetro, área superficial específica de aproximadamente $700m^2/g$ e poros com diâmetro médio de 10Å.

A corrente gasosa de entrada era formada a partir da mistura de SO_2, proveniente de um cilindro, e ar da linha de ar comprimido. O líquido de lavagem era água na temperatura ambiente, bombeada a partir de um reservatório. O escoamento das fases gasosa e líquida era concorrente descendente. As medidas de vazão dos gases e da água eram feitas em rotâmetros. Uma válvula de solenóide acionada por um temporizador controlava a lavagem intermitente do leito no caso da operação periódica. Na operação contínua, essa válvula permanecia sempre aberta.

O gás podia ser coletado na entrada e na saída do reator para análise de concentração do SO_2 em analisador de gases Horiba PG-250, conectado a um microcomputador para aquisição de dados. A partir das concentrações de entrada e de saída do gás eram calculadas as eficiências médias de remoção de SO_2. A solução líquida resultante da lavagem ao final dos experimentos era analisada através de titulações para se determinar a concentração dos ácidos produzidos. A concentração de ácido sulfuroso era medida utilizando-se solução de iodo e amido como indicador. A titulação dos ácidos totais empregava solução de hidróxido de sódio e fenolftaleína. A concentração de ácido sulfúrico era calculada, então, pela diferença entre os resultados das titulações [4].

Na parede da coluna de aço, próximo ao topo e à base do leito, foram instalados dois termopares para se observar a variação da temperatura e duas tomadas de pressão, para as medidas de perda de carga.

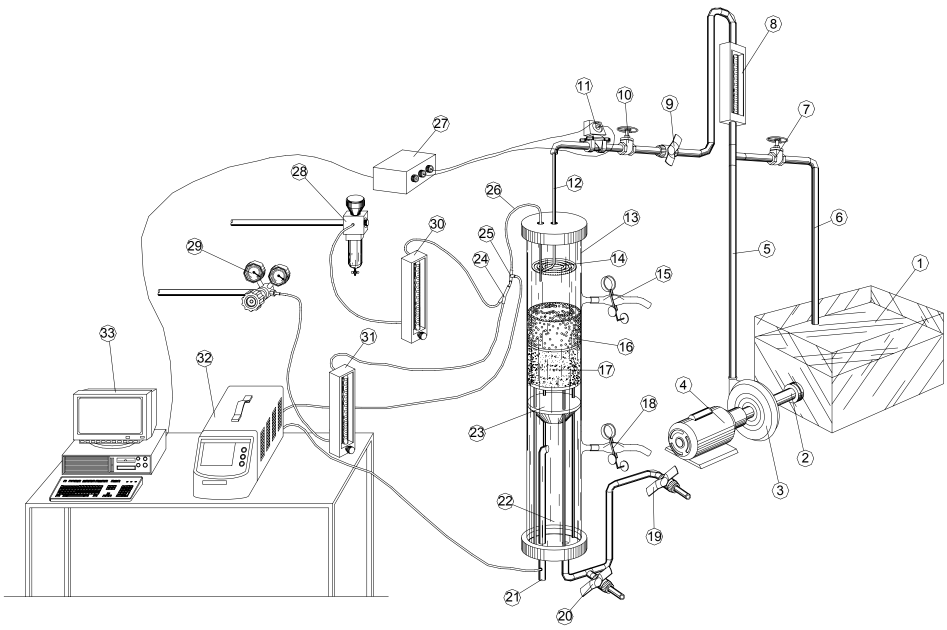

FIGURA 1
REATOR DE LEITO GOTEJANTE PARA TRATAMENTO DO GÁS CONTENDO SO_2.

Na análise de desempenho do reator de leito gotejante foram consideradas a concentração inicial (500, 1.000 e 1.500ppm de SO_2) e a velocidade superficial do gás (20, 40 e 60mm/s). A velocidade superficial de líquido foi mantida constante em 2mm/s. Os experimentos de operação periódica foram realizados com períodos de 10 e 20 minutos e frações de descarga de 0,1, 0,2 e 0,3. Foram realizadas réplicas de alguns dos experimentos de operação contínua e de operação periódica.

RESULTADOS E DISCUSSÃO

As eficiências médias de remoção de SO_2 foram calculadas a partir das concentrações médias de saída e de entrada e variaram de 40 a 100% nos experimentos de operação periódica. Em todos os experimentos de operação contínua a concentração média de saída foi praticamente nula e a eficiência de remoção aproximou-se de 100%. Na Figura 2 são mostrados os resultados da eficiência média de remoção em função da velocidade superficial de gás para experimentos com concentração inicial de 1.500ppm.

O escoamento ininterrupto de água nos casos da operação contínua proporcionou a absorção de grandes quantidades de SO_2. Notou-se que a eficiência de remoção aumentava na medida em que se diminuía o período e se aumentava a fração de descarga, situação em que o modo periódico se aproximava da operação contínua. Porém, as variáveis que mais afetaram a eficiência de tratamento do gás na operação periódica foram a concentração inicial e a velocidade superficial do gás. Quando se aumentou a velocidade superficial do gás ou a sua concentração inicial, a eficiência média de remoção diminuiu.

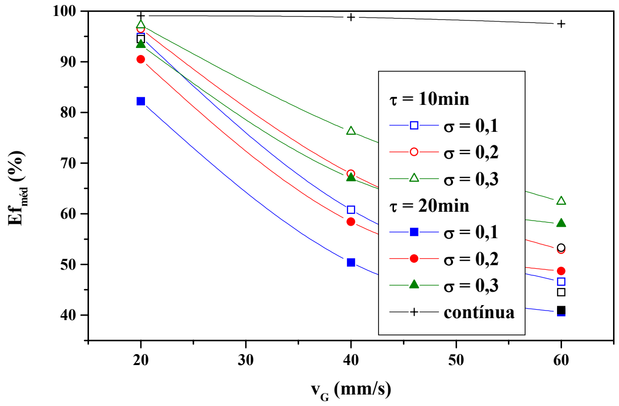

FIGURA 2
EFICIÊNCIA MÉDIA DE REMOÇÃO DE SO_2 NOS EXPERIMENTOS COM CONCENTRAÇÃO INICIAL DE 1.500PPM.

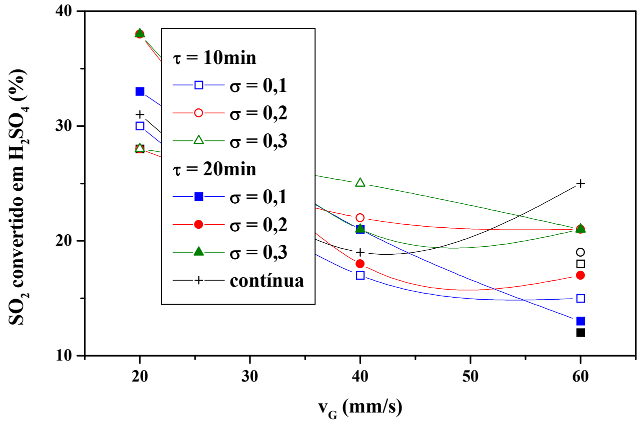

FIGURA 3
CONVERSÃO DE SO_2 A H_2SO_4 NOS EXPERIMENTOS COM CONCENTRAÇÃO INICIAL DE 1.500PPM.

Embora tenha apresentado altos níveis de remoção do SO_2, a operação contínua não foi capaz de efetivamente produzir ácido sulfúrico em comparação com algumas situações da operação periódica. Um exemplo disso é dado na Figura 3, que traz as porcentagens de SO_2 convertido em H_2SO_4 correspondentes aos resultados anteriores. Esses resultados confirmam a idéia de que a lavagem intermitente do leito facilitaria a adsorção e a oxidação do SO_2.

As concentrações de ácido sulfúrico em solução variaram entre 0,14 e 0,50milimol/L. As taxas de produção resultantes situaram-se entre $0{,}6\times10^{-8}$ e $2{,}5\times10^{-7}$mol/g.s. Ainda com relação aos experimentos realizados com 1.500ppm de SO_2, a Figura 4 apresenta as taxas de produção de H_2SO_4.

As taxas de produção de ácido sulfúrico obtidas foram aproximadamente dez vezes menores que aquelas relatadas em trabalhos utilizando concentrações iniciais de SO_2 uma ordem de grandeza superiores na operação periódica [5]. De todo modo, não houve uma tendência definida da variação da taxa de produção de H_2SO_4 com respeito aos períodos e frações de descarga analisadas neste trabalho.

Por fim, na Figura 5 estão representadas as perdas de carga médias observadas nos experimentos de operação contínua e periódica.

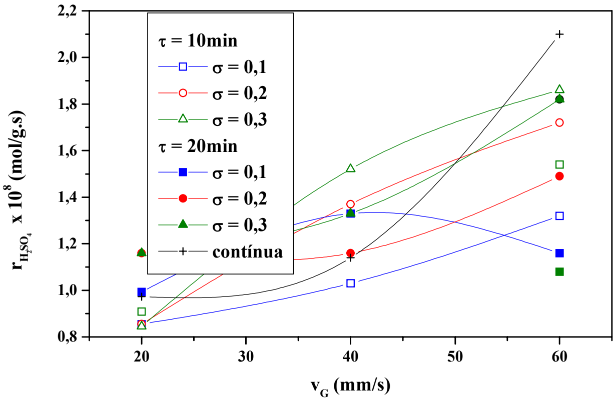

FIGURA 4
TAXA DE PRODUÇÃO DE ÁCIDO SULFÚRICO PRODUZIDO NOS EXPERIMENTOS COM 1.500PPM DE SO_2.

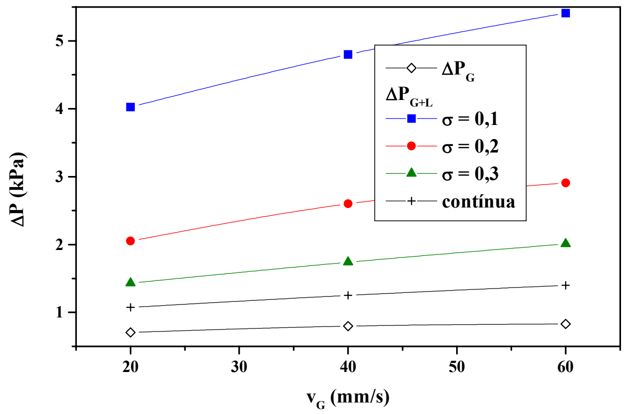

FIGURA 5
PERDAS DE CARGA ATRAVÉS DO LEITO PARA OS EXPERIMENTOS DE OPERAÇÃO CONTÍNUA E PERIÓDICA.

Apesar das medidas terem sido imprecisas e os valores terem sido muito baixos, vê-se que nos experimentos de operação periódica a perda de carga no leito é inferior, na maior parte do período, àquela apresentada pela operação contínua [7].

CONCLUSÃO

Em algumas situações, a lavagem periódica de um leito gotejante de carvão ativado empregado no tratamento de uma mistura gasosa contendo SO_2 permitiu obter soluções aquosas de ácido sulfúrico diluídas, com maior concentração que aquelas da operação contínua.

Comumente, as soluções mais concentradas foram produzidas na maior velocidade superficial do gás e concentração inicial do SO_2. A obtenção de soluções mais concentradas é possível, também, ao se diminuir a fração de descarga em um período fixo ou ao se aumentar o período para uma dada fração de descarga, desde que o catalisador seja suficientemente regenerado [6]. Entretanto, nessas condições operacionais, a eficiência de remoção do gás pode ser baixa, do ponto de vista do controle ambiental. Uma alternativa viável consistiria em utilizar as próprias soluções diluídas para se efetuar a lavagem do leito [7], desde que a concentração de H_2SO_4 não inibisse a solubilização do SO_2 [4].

Outras formas de se conseguir bons níveis de remoção do gás e a produção de soluções mais concentradas consistem em alterações das características físicas e químicas do material adsorvente. No caso do SO_2, a capacidade de adsorção pelo carvão ativado não se relaciona exclusivamente com a área superficial específica, mas também com a distribuição adequada de tamanho de poros [8].

AGRADECIMENTOS

Os autores agradecem à Fundação de Amparo à Pesquisa do Estado de São Paulo (FAPESP), financiadora do trabalho de Doutorado Processo n.° 99/00443-0.

COMPARAÇÃO DO PERFIL DE ALUNOS DO CURSO DE ENGENHARIA QUÍMICA DOS PERÍODOS DIURNO E NOTURNO DE UMA ESCOLA PARTICULAR

Sonia Braunstein Faldini[1], *Raquel Cymrot*[2], *Maria Olívia Argüeso Mengod*[3], *Maria Elizabeth Brotto*[4] *e Luiz Henrique Schiavon*[5].

Resumo — *Foram comparados os perfis de estudantes, dos períodos diurno e noturno, de Engenharia Química da Escola Superior de Química "Oswaldo Cruz", uma faculdade particular, localizada na cidade de São Paulo; quanto à idade, ao sexo, ao número de disciplinas cursadas, ao tempo de estudo, a percentagem de aprovação, ao exercício de atividades profissionais e ao tempo despendido com a condução. Os dados avaliados foram obtidos mediante aplicação de questionários que foram respondidos por alunos do primeiro, segundo e terceiro anos, perfazendo um total de duzentos alunos do período noturno e cinqüenta alunos do período diurno. Verificou-se que: os alunos do diurno em sua maioria são egressos de escolas de ensino médio particular diurna, enquanto os alunos do noturno são egressos de escolas noturnas e os alunos do diurno apesar de cursarem um maior número de disciplinas tem maior percentagem de aprovação do que os alunos do noturno. Em relação ao tempo de estudo, os alunos do período diurno estudam com maior freqüência, dedicando mais horas por disciplina, mesmo cursando mais disciplinas; quando comparados aos do noturno, que se dedicam ao estudo preponderantemente no período de provas. As turmas do diurno são mais heterogêneas do que as do noturno, observando-se um grupo de alunos que realmente estuda e um outro que estuda o mínimo necessário para a aprovação. Os alunos do noturno têm mais atividades profissionais e também despendem mais tempo em condução do que os do diurno.*

Índice de termos — engenharia química, ensino particular, períodos diurno e noturno, testes de comparação.

Introdução

Pesquisas indicam que as universidades em geral, têm pouco conhecimento sobre as características de seus alunos [1].

Repensar a universidade implica em repensar os diferentes graus de ensino e a diferenciação entre a escola diurna e a noturna [2].

No Brasil existem 2,5 milhões de alunos matriculados no ensino superior [3], 55% estudam no período noturno; e em São Paulo, 86% do alunado do noturno está na rede particular [2].

Os estudantes entram na vida universitária com uma visão utilitarista e imediatista sobre o ensino superior, reconhecendo nela uma instituição social que presta serviços à sociedade e deve oferecer a melhor qualidade possível [4]. Por outro lado, os resultados obtidos no provão e devido as mudanças curriculares dos cursos de engenharia, torna-se necessária a comparação dos perfis dos estudantes dos períodos diurno e noturno destes cursos [5].

Os alunos do ensino superior diurno são normalmente vistos pelos professores com as seguintes características: experiências escolares eficientes antes do ingresso no ensino superior; não ingressaram ainda no mercado de trabalho, ou estagiam; como não trabalham dispensam maior tempo para o estudo. A rotina deste estudante é regulada pelo tempo disponível para: o período de aulas, o tempo para o descanso e o sono, o horário para as refeições e tempo despendido da residência para a universidade e vice-versa.

Os alunos do ensino superior noturno, em geral, trabalhadores estudantes, por sua vez: apresentam experiências escolares deficientes antes do ingresso no ensino superior; ingressaram precocemente no mercado de trabalho; necessitam trabalhar oito ou mais horas por dia, e portanto, dispõem de pouco tempo para o estudo. A rotina deste estudante é regulada pelo tempo disponível para as atividades do aluno do diurno, acrescida de: jornada de trabalho e tempo despendido da residência para o trabalho, do trabalho para a universidade e da universidade para a residência [2].

A formação de um bom profissional necessita de ensino de boa qualidade que resulte em aprendizagem. O curso noturno de Engenharia Química das Faculdades Oswaldo Cruz foi aberto na década de sessenta, e o diurno na década de noventa. Os registros acadêmicos mostram que estes alunos em sua maioria são técnicos químicos formados e trabalhadores de indústrias químicas, nas quais ocupam posições de destaque [5].

Baseando-se na importância do tempo de estudo na aprendizagem, foram aplicados questionários aos alunos do período diurno e noturno visando conhecer a parcela de tempo dedicada ao estudo, em período de provas e fora dele, o número de disciplinas cursadas e aprovadas, o sexo, a idade, a porcentagem de aprovação, o tempo despendido com condução, a escola de origem no ensino médio e o exercício de atividades extracurriculares. A amostra consistiu de 250 alunos, sendo 200 do período noturno e 50 do diurno, do primeiro, segundo e terceiro anos, do curso de Engenharia Química. Convém lembrar que em ambos

[1]Sonia Braunstein Faldini, [2]Raquel Cymrot, [3]Maria Olívia Argüeso Mengod, [4]Maria Elizabeth Brotto e [5]Luiz Henrique Schiavon,
Faculdades Oswaldo Cruz, Rua Brigadeiro Galvão, 540, prédio 4, 011151-000, São Paulo, SP, Brasil, soniafal@uninet.com.br

períodos o curso é oferecido apenas até o terceiro ano, a partir do quarto ano só há o período noturno.

Metodologia

Os alunos pesquisados foram os alunos matriculados no ano de 2001, que cursaram disciplinas no ano de 2000 na Instituição. A pesquisa foi aplicada em sala de aula entre os dias oito e treze de março de 2001.

Foi realizada uma análise descritiva das variáveis aleatórias estudadas com cálculo para as variáveis quantitativas da média, moda, mediana, variância, desvio padrão, coeficiente de variação e intervalo com confiança de 95% para a média.

Para compararmos os perfis dos alunos do período diurno com os perfis dos alunos do período noturno foram realizados testes de diferença de média ou diferença de proporção.

Os testes para diferença de média foram precedidos de teste para diferença de variâncias, uma vez que o teste para diferença de médias depende das suposições quanto à igualdade ou não das variâncias nos dois grupos.

A fim de testarmos se existe independência entre as variáveis período e origem do ensino médio, utilizou-se o teste Quiquadrado com 3 graus de liberdade

Nível de significância do teste é a probabilidade de rejeitarmos a hipótese testada, quando tal hipótese é verdadeira. Para todos os testes realizados utilizamos um nível de significância de 5%.

Denotamos por "p" o nível descritivo do teste, isto é, a probabilidade de rejeitarmos a hipótese testada se encontrarmos um valor igual ou mais extremo que o encontrado na amostra. Toda vez que $p > 0,05$ não rejeitamos a hipótese testada. Quando há rejeição da hipótese de independência, analisamos os valores observados e esperados para confirmar as prováveis causas da dependência.

A validação da amostra também foi feita através de teste de independência entre as variáveis pertencerem ou não à amostra e a variável conhecida na população (sexo, faixa etária e nº de disciplinas cursadas).

Foram utilizados os programas de computação EXCEL e SPSS.

Resultados

A. Análise descritiva das variáveis consideradas:

1. Quanto ao sexo: A porcentagem de mulheres no curso no período diurno é de 52,17% e no período noturno de 40%.
2. Quanto a idade: A idade média dos alunos do período diurno é 21,52 anos, com intervalo de confiança [20,46; 22,58], e no período noturno é de 22,57 anos, com intervalo de confiança [22,05; 23,10].
3. Quanto a série: Com relação ao período diurno, o número de alunos na primeira série é praticamente o dobro dos alunos da Segunda e terceira séries, ao que se atribui em parte a entrada do aluno no mercado de trabalho no período diurno, e a transferência do aluno para o período noturno a fim de conciliar ambas atividades.
4. Quanto ao número de disciplinas cursadas: Praticamente, 92% dos alunos cursam de seis a oito disciplinas no período diurno. O número médio de disciplinas cursadas é de 6,75, com intervalo de confiança [6,45;7,05]. No período noturno, a porcentagem é de 60% para os alunos que cursam de seis a oito disciplinas. O número médio de disciplinas cursadas é de 5,83, com intervalo de confiança [5,67; 5,98].
5. Quanto a porcentagem de aprovação: Obteve-se esta porcentagem relacionando-se o número de disciplinas aprovadas e o número de disciplinas cursadas.

Os resultados são mostrados nas tabela I e II, para os períodos diurno e noturno, respectivamente.

TABELA I
Porcentagem de aprovação em função do número de questionários respondidos – Período diurno.

% de aprovação	Freqüência	%
0← 60	0	0,00
60 ← 80	1	2,13
80 ←100	3	6,38
100	43	91,49
Total	47*	100,00

* Excetuando-se a variável tempo de estudo, as outras variáveis podem não ter sido respondidas por todos os alunos que participaram da pesquisa.

Para os alunos do período diurno encontrou-se: média = 98,38; moda = 100,00; mediana = 100,00; variança = 31,58; desvio padrão = 5,62; coeficiente de variação = 0,06 e intervalo de confiança [96,77; 99,98].

TABELA II
Porcentagem de aprovação em função do número de questionários respondidos – Período noturno.

% de aprovação	Freqüência	%
0← 60	9	4,64
60 ← 80	7	3,61
80 ←100	21	10,82
100	157	83,93
Total	194*	100,00

* Excetuando-se a variável tempo de estudo, as outras variáveis podem não ter sido respondidas por todos os alunos que participaram da pesquisa.

Para os alunos do período noturno encontrou-se: média = 93,99; moda = 100,00; mediana = 100,00; variança =

230,05; desvio padrão = 15,17; coeficiente de variação = 0,16 e intervalo de confiança [91,85; 96,12].

6. Quanto ao tempo de estudo: Os períodos considerados foram: de segunda a sexta feira sem provas, de segunda a sexta feira com provas, final de semana sem provas, final de semana com provas, semanal sem provas e semanal com provas. O termo semanal é relativo ao período de segunda a domingo. Realizou-se também um levantamento do número de horas de estudo por disciplina, sem provas e com provas, e a % de horas estudados na época de provas.

Considerando-se o tempo de estudo de segunda a sexta feira sem provas, no período diurno, o valor médio é de 6,05h, com intervalo de confiança [4,04; 8,06], e com provas 11,77h, com intervalo de confiança [8,68; 14,86]. No período noturno, o valor médio do tempo de estudo de segunda a sexta feira sem provas é 1,92h, com intervalo de confiança [1,60; 2,24], e com provas 5,15h, com intervalo de confiança [4,48; 5,82].

O valor médio do tempo de estudo no final de semana sem provas no período diurno é 2,39h, com intervalo de confiança [1,61; 3,17], e com provas 6,14h, com intervalo de confiança [4,82; 7,46].

No período noturno, o tempo de estudo médio no final de semana sem provas é 1,61h, com intervalo de confiança [1,33; 1,88], e com provas 5,25h, com intervalo de confiança [4,69; 5,81].

Considerando-se o período correspondente a uma semana, de segunda a domingo, o valor médio do tempo de estudo sem provas no período diurno é 8,44h, com intervalo de confiança [5,87; 11,01], e com provas 17,91h, com intervalo de confiança [13,85; 21,97]. No período noturno o valor médio sem provas é 3,53h, com intervalo de confiança [3,05;4,00], e com provas é 10,40h, com intervalo de confiança [9,36; 11,44].

A porcentagem do número de horas de estudo com provas, em relação ao número de horas total (sem e com provas), resulta em um valor médio de 71,09% h/h, com intervalo de confiança [66,85; 75,34] para o período diurno, e 76,37% h/h, com intervalo de confiança [74,20; 78,54] para o período noturno.

7. Quanto a escola de origem do ensino médio e o período: A escola cursada no ensino médio pode ter sido pública ou particular, e o período diurno ou noturno. Dos estudantes do período diurno, 76% freqüentaram escolas particulares diurnas, 12% freqüentaram escolas públicas diurnas e 12% freqüentaram escolas noturnas. Dos estudantes do período noturno, 31% freqüentaram escolas particulares diurnas, 15% freqüentaram escolas públicas diurnas e 54% freqüentaram escolas noturnas.

8. Quanto a atividade profissional: Esta pode ser estágio ou trabalho, na área do curso ou não. No período diurno 27,08% dos alunos estagiam e 64,58% dos alunos trabalham. 78% exercem alguma atividade profissional, sendo que destes 63,89% atuam na área de Engenharia Química. No período noturno 31,09% dos alunos estagiam e 69,43% dos alunos trabalham. 95,70% exercem alguma atividade profissional, sendo que destes 79,67% atuam na área de Engenharia Química.

9. Quanto ao tempo gasto diariamente com a atividade profissional, com a condução e com a atividade profissional e a condução. Período diurno. Na atividade profissional considerando-se todos os alunos pesquisados, inclusive os que não têm atividade, o valor médio é de 5,22h, com intervalo de confiança [4,26; 6,17], e entre aqueles que tem atividade profissional o valor médio é 6,77h, com intervalo de confiança [6,12; 7,42]. Na condução trajeto: casa, trabalho, faculdade e casa) o valor médio é 2,18h, com intervalo de confiança [1,87; 2,49]. Praticamente, 52% dos alunos despendem de duas a quatro horas diárias com condução. No total, atividade profissional e condução, o valor médio é 7,45h, com intervalo de confiança [6,34; 8,55].

Período noturno. Na atividade profissional considerando-se todos os alunos pesquisados, inclusive os que não têm atividade, o valor médio é de 7,85h, com intervalo de confiança [7,52; 8,19], e entre aqueles que tem atividade profissional o valor médio é de 8,44h, com intervalo de confiança [8,28; 8,61]. Na condução (trajeto: casa, trabalho, faculdade e casa) o valor médio é 2,80h, com intervalo de confiança [2,62; 2,97]. Praticamente, 54% dos alunos despendem de duas a quatro horas diárias com a condução. No total, atividade profissional e condução, o valor médio é 10,65h, com intervalo de confiança [10,22; 11,08].

B. Discussão dos testes para diferença de médias, proporções e de independência

As Tabelas III, IV e V ilustram os resultados dos testes realizados que serão discutidos a seguir.

A Tabela III contém testes de comparação de médias.

A Tabela IV contém um resumo dos testes de comparação de proporções.

TABELA III

Testes para diferenças de médias - Comparação diurno e noturno.

Variável	variância noturno	variância diurno	p	Conclusão	média noturno	média diurno	p	Conclusão
Idade	14,20	14,54	0,476	N/ Rej H_0	22,57	21,52	0,078	N/ Rej H_0

H_o: as variáveis estudadas nos dois períodos têm, respectivamente, a mesma variância e a mesma média.

TABELA IV

Testes de diferenças de proporções

Variável	Noturno	Diurno	p	Conclusão
Sexo	0,40	0,52	0,132	N/Rej Ho
Estágio	0,31	0,27	0,589	N/RejHo
Trabalho	0,69	0,65	0,518	N/Rej Ho
Ativ. Prof.	0,96	0,78	0,000	Rej Ho
Ativ. Prof. Área	0,80	0,64	0,040	Rej Ho

Ho: a proporção do período diurno e do noturno é a mesma para a variável estudada.

A Tabela V contém um teste de independência entre as variáveis ensino médio e período de estudo.

TABELA V

Testes de independência

Variáveis	p	Conclusão
Ensino médio X período	0,00	Rej Ho

Ho: as duas variáveis são independentes.

1. Sexo, idade e período: O período cursado não depende do sexo e da idade do estudante.
2. Número de disciplinas e período: Os alunos do diurno fazem mais disciplinas.
3. % aprovação e período: Os alunos do noturno aprovam menos e são mais heterogêneos. Há maior variabilidade no noturno, existem alunos com maior porcentagem de aprovação e outros com menor porcentagem de aprovação.
4. Tempo de estudo e período: de segunda a sexta feira, sem e com provas, os alunos do noturno estudam menos que os do diurno e são mais homogêneos, todos estudam pouco; já, entre os alunos do diurno alguns estudam muito. Em termos percentuais, alguns alunos no noturno estudam mais em época de provas do que os alunos do diurno. Quanto ao número total de horas estudadas, sem e com provas, os alunos do noturno estudam menos que os do diurno e entre os alunos do diurno alguns estudam muito, com maior variabilidade.
5. Horas de estudo de fim de semana e período: No fim de semana não houve diferença no tempo médio de estudo no diurno e no noturno.
6. Estudo por disciplina e período: A análise do tempo de estudo por disciplina, sem e com provas, mostra que os alguns alunos do noturno estudam menos horas por disciplina, e que alguns alunos do diurno estudam muito, com maior variabilidade.
7. % de horas de estudo totais e período: A porcentagem das horas de estudo totais em época de provas não diferiu nos dois períodos.
8. Horas de atividade e condução e período: A proporção de alunos com atividade profissional e com atividade profissional na área no noturno é maior que no diurno e tem menor variabilidade. Menos alunos trabalham no diurno, e entre os que trabalham os alunos do noturno exercem mais horas de atividade profissional. Os alunos do noturno despendem mais horas na condução do que os do diurno. Dessa forma os alunos do noturno

despendem mais horas em atividade profissional e condução do que os do diurno.

9. Horas de atividade profissional e período: Os alunos do noturno exercem mais atividade profissional e também mais atividade profissional na área do que os do diurno.
10. Ensino médio e período: Os estudantes que cursam o período diurno são provenientes de escolas de ensino médio particulares diurnas mais do que o esperado, já os estudantes do período noturno são provenientes de escolas de ensino médio noturnas acima do nível esperado.

Conclusão

As variáveis sexo e idade não apresentam diferenças significativas entre as populações do curso diurno e noturno. Não há predominância de sexo masculino no período noturno nem estudantes mais velhos.

O número de disciplinas cursadas pelo estudante do diurno é maior que do noturno.

A aprovação do estudante do período noturno é inferior a do período diurno.

Os alunos do diurno estudam mais que os do noturno. Existe uma variabilidade no tempo de estudo. As classes do diurno são mais heterogêneas quanto ao tempo de estudo, isto é, há alunos que estudam muito e alunos que estudam pouco. No período noturno, o tempo de estudo varia pouco com a população.

O aluno do noturno estuda pouco, isto é, menos horas que o aluno do diurno pois gasta mais tempo com atividades profissionais e condução. Em época de provas, entretanto, o tempo de estudo aumenta muito quando comparado com o do aluno diurno.

Agradecimentos

Os autores agradecem às “Faculdades Oswaldo Cruz” pela permissão concedida para a realização desta pesquisa entre os alunos da Escola Superior de Química.

TRABALHOS DE SÉRIE, O DESAFIO DE UMA EXPERIÊNCIA MULTIDISCIPLINAR

Amaury Pessoa Gebran

Resumo *- "Trabalhos de Série", relato da experiência realizada no Curso de Engenharia Elétrica da Universidade Tuiuti do Paraná, a partir da dissertação de Mestrado apresentada no Programa de Pós-Graduação em Tecnologia Educacional do CEFET-PR.*

O Trabalho de Série tem por objetivo integrar as disciplinas de cada série, e busca uma forma de como pode-se e deve-se adaptar o ensino de engenharia aos novos conceitos de Comportamento e Postura, tanto Técnica como Gerencial; dando a este problema, um tratamento multidisciplinar ou mesmo Interdisciplinar.

Procurou-se portanto criar uma sistematização de trabalhos que pudessem dar ao aluno uma experiência teórico / prática, buscando formar um engenheiro que seja reflexivo (Análise, Síntese e Resolução) e com capacidade de abstração.

Palavras-chave: Multidisciplinaridade, Formação, Ensino de Engenharia, Pesquisa.

1.) INTRODUÇÃO

Nosso ponto de partida é o trabalho industrial moderno, que nos últimos anos está passando pelas grandes modificações que a ciência e a tecnologia estão promovendo no modelo produtivo e na sociedade como um todo.

O processo de globalização da economia, o binômio produtividade/qualidade, as telecomunicações estendendo as fronteiras dos países, e o marketing multimídia são, entre outros indícios implacáveis de que os avanços científicos e tecnológicos estão preconizando o que poderíamos chamar de a terceira revolução, protagonizada pelos imensos avanços da cibernética, tendo como expoente maior a informática.

Os países em desenvolvimento, como o Brasil, sentiram fortemente o impacto desta mudança de base tecnológica, em virtude da sua frágil posição na divisão internacional do trabalho, imposta pelo novo "paradigma produtivo", tendo em vista a concentração de capitais e de novas tecnologias nos próprios países geradores de inovações.

Vários cursos de Engenharia, atualmente oferecidos em diversos países, espelham em muito a filosofia e o ideal da universidade da década de 50. Houve a reestruturação para um currículo abrangente com o foco em ciência da engenharia contra as necessidades das habilidades técnicas. Neste contexto, o objetivo era atender à dinâmica das mudanças da tecnologia com forte ênfase nas pesquisas, principalmente nas décadas de 60 e 70. Na década de 80, houve a expansão da matrícula com a população estudantil engajada na expectativa da expansão de empregos no setor produtivo das respectivas áreas de formação. No entanto, o setor produtivo passou a ter características muito diferentes das que eram tradicionalmente conhecidas. Grande número das empresas emergentes passaram a competir com as existentes, demandando por profissionais com habilidades multidisciplinares e capazes de dar respostas aos novos problemas, exigindo táticas flexíveis para resolvê-los.

Portanto, neste trabalho, tentamos iniciar uma reflexão, sobre como a ruptura deste novo "paradigma produtivo" poderá modificar o Ensino da Engenharia , uma vez que parece estar havendo um estreitamento na relação oferta e procura de profissionais da área, ou seja, de que forma podemos e devemos adaptar nosso ensino aos novos conceitos de Comportamento e Postura, tanto Técnica como Gerencial; e de que forma dar a este problema, um tratamento Interdisciplinar, definida por Landsheere(1992) como: caminhada no sentido da integração onde se opera a fusão unificante entre duas ou várias disciplinas, ou alguns temas problemáticos.

2.) PROPOSTA

Um dos mais significativos problemas que envolvem o processo de aprendizagem na área tecnológica, em particular, é a questão metodológica que permeia todo este processo.

Este tem sido dissecado década após década e novas teorias trazem uma melhor compreensão do processo de internalização do conhecimento. Saber como o ser humano aprende é, sem dúvida, um passo decisivo na busca do melhor método.

Estudos importantes tratam da capacidade de integração dos diversos conhecimentos. Por outro lado, incrementa-se a instrumentalização de apoio ao processo, como forma material e dinâmica de enriquecimento dos recursos colocados à disposição tanto dos docentes quanto dos discentes.

Com toda a riqueza de recursos teóricos e materiais existentes, ainda existem problemas inerentes à educação em geral, ao longo de toda a sua história.

Amaury Pessoa Gebran – Coordenador do Curso de Engenharia Elétrica da Universidade Tuiuti do Paraná, Mestre em Educação Tecnológica.

Trata-se de um problema de múltiplas variáveis, que não se limitam somente ao educando, ao educador, ao método ou ao material de apoio, dentre outras variáveis. Como possibilitar a integração intelectual das disciplinas ? Como garantir que os conhecimentos desenvolvidos pelos alunos venham a se transformar em habilidades e/ou competências ?

Evidentemente há muito o que se explorar mesmo baseando-se a discussão na força da experimentação. Processos didáticos que se comprovem como bem sucedidos e que se consagrem pelo poder da repetitividade, precisam ser aprimorados e difundidos para que, o saber científico desta área de investigação cresça em qualidade e contribua efetivamente para o progresso da educação.

Face ao exposto, procurou-se criar uma sistematização de trabalhos que pudessem dar ao aluno uma experiência teórico / prática, buscando formar um engenheiro que seja reflexivo (Análise, Síntese e Resolução), com capacidade de abstração que é qualidade extremamente importante, como cita Teilhard de Chardin (1989), "o desenvolvimento humano depende de nossa capacidade de reflexão, do aprimoramento da capacidade de pensar e saber, o que significa saber que se sabe".

Desta forma pesou-se na realização dos ***Trabalhos de Série***, onde a interdisciplinaridade será sempre privilegiada, e em alguns casos poderíamos arriscar dizer que estaríamos inclusive utilizando a transdisciplinaridade, uma vez que conhecimento extra Universidade adquiridos através de experiências profissionais, pessoais e sociais estariam sendo utilizados, desta forma além de incentivarmos o trabalho em grupo estaríamos dando a chance dos alunos solidificarem seus conhecimentos.

3.) OS TRABALHOS DE SÉRIE

Hoje há necessidade de utilização de uma nova prática dos currículos de engenharia, tornando-se necessário cultivar no educando de forma bastante incisiva, a liderança e a criatividade, além de logicamente, lutar para deixá-los profissional e mentalmente preparados, com as ferramentas tecnológicas que os cursos de engenharia tenham lhes passado. Desta forma, pode-se dizer, que o currículo deve preparar o indivíduo para criar sobre a aprendizagem, para desenvolver suas próprias idéias, para ter capacidade de analisar todas as coisas e, portanto para saber em que fontes buscar suas respostas, e principalmente para sintetizar todas estas idéias, evitando assim a frustração das imposições sociais.

Os currículos devem privilegiar a interdisciplinaridade. Se isto não ocorrer, a parte mais difícil ficará então com por conta do educando, montar toda a estrutura a partir de dados esparsos recebidos, como exemplo, pode-se pensar em trabalhar um assunto de diversas formas, talvez até a sua exaustão nas mais variadas formas e nos mais diversos conteúdos, ou seja, ter-se-ia um currículo não estático e que poderia ser adaptado de forma rápida em função das necessidades dos educandos.

Lembrando sempre que, o engenheiro na sua essência deve estar voltado não só para a técnica, a tecnologia, mas também para a sociedade, pois estas a alguém deverão servir, e na nova postura do engenheiro não se pode esquecer a ênfase humanística a ele delegada, pois caso contrário, a que causa estará ele servindo?

Tendo-se como base que os conteúdos de uma disciplina estejam em consonância com os de outra, até o desenvolvimento de características de trabalho em grupo, passando-se pela inserção do social, o incentivo da busca contínua de conhecimentos e ainda no sentido de motivar os alunos buscando incitar e incentivar a sua participação no curso, pensou-se em trabalhar com a realização de projetos para cada uma das séries do curso, conforme descrito a seguir.

Caracterização:

O Trabalho de Série, é um trabalho acadêmico anual, requisito parcial obrigatório, na complementação das notas bimestrais de todos os alunos do Curso de Engenharia Elétrica da Universidade Tuiuti do Paraná, envolvendo todas as disciplinas da série[1].

O aluno não deixará de cumprir, sob nenhuma hipótese , as demais obrigações acadêmicas exigidas pela instituição.

Objetivos:

O Trabalho de Série tem os seguintes objetivos:

I – **integrar** de forma multidisciplinar, as disciplinas de cada série;

II - **motivar** o aluno, a aperfeiçoar seu grau de sociabilidade(trabalhos em grupo);

(1) Na UTP o regime ensino é seriado anual

III - **aperfeiçoar** o grau de desenvolvimento técnico de cada aluno;

IV- **desenvolver** a criatividade de cada aluno;

V – **incentivar** o aluno a realização de pesquisa;

VI – **possibilitar** a realização de produção teórica e crítica desta atividade visando a vida profissional;

VII – **colaborar** com a comunidade acadêmica e a sociedade por meio de idéias e projetos inovadores voltados para a solução de seus problemas, melhor qualidade de vida do ser humano e menor impacto ambiental;

VIII – **possibilitar** a avaliação global da prática para que possa se integrar ao mercado de trabalho;

IX – **aproximar** o aluno ao meio produtivo, tanto a indústria de bens de consumo e de capital como de prestação de serviço;

Avaliação:

Os Trabalhos de Série serão avaliados através da

(1) Na UTP o regime de ensino é seriado anual

entrega pelas equipes de relatórios técnicos, monografia, maquete funcional e defesa perante banca.

As avaliações serão válidas para as provas de segunda chamada respeitando-se o bimestre a qual ela se refere.

No primeiro bimestre a entrega da proposta aos professores, eqüivalerá até 5% do valor da nota total do bimestre.

No segundo bimestre a entrega do primeiro relatório técnico aos professores, eqüivalerá até 10% do valor da nota total do bimestre**.** Este relatório será analisado em reunião de colegiado, que é realizada quinzenalmente.

No terceiro bimestre a entrega do relatório técnico final aos professores, eqüivalerá até 20% do valor da nota total do bimestre.

No quarto bimestre, serão avaliados a confecção da

maquete funcional e defesa perante banca da monografia; a realização completa desta etapa, eqüivalerá até 40% do valor da nota total do bimestre.

Desta forma, pelo menos um conteúdo de cada disciplina da série corrente deverá ser utilizado na realização do trabalho de série, e este deverá ser mostrado de forma separada durante a defesa perante banca.

4.) CONCLUSÃO

Em um primeiro momento a reação contrária dos alunos foi muito grande, pois além de sentirmos que para eles, estes trabalhos não tinham finalidade e era somente mais um trabalho, vimos que esta reação passava digamos pelo "medo" da realização de algo desconhecido, situação corriqueira no cotidiano da atividade produtiva, já ressaltamos que esta forma de trabalho era experimental, e como era a primeira vez que implementávamos este tipo de trabalho, houve uma certa ressalva por partes dos alunos, tanto que trabalhos não obedeceram exatamente a seqüência que havíamos proposto, portanto nem todos os bimestres as avaliações puderam ser realizadas exatamente desta forma, fato aliás, que chamou bastante atenção, a preocupação com a avaliação.

Cabe aqui ressaltar que houve também uma certa ressalva por parte dos professores, logicamente que um tipo de formulação desta envolve muito mais trabalho por parte dos professores, pois as orientações que estes precisavam dispor aos alunos custavam-lhes muito mais tempo e desta forma um envolvimento cada vez maior.

Podemos dizer que após os resultados alcançados na primeira edição que acabamos de relatar, houve toda uma motivação nova tanto entre os alunos, como entre os professores que após a participação nas bancas elogiaram não só a iniciativa mas também a forma com foi desenvolvido o trabalho.

Sentimos que as dificuldades que foram encontradas pelos alunos para a implementação das maquetes, trouxe um novo alento e questionamentos, que fizeram inclusive que houvesse uma mudança na postura dos mesmo na forma de encarar o curso.

Esta mudança de postura foi tão forte que tivemos que modificar a idéia deste trabalho pois pensávamos que teríamos que propor o problema a ser resolvido todos os anos, ao invés os alunos passaram a sugerir idéias, propor trabalhos, o que a nosso ver é uma postura muito melhor, desta forma os alunos acabam ficando, muito mais envolvidos e se responsabilizando pelas idéias, se tornado "pais" destes trabalhos.

Interessante notar que na visão desta nova forma de trabalho, alguns alunos deixam bem claro que os seus desenvolvimentos serão realizados no decorrer não só de uma determinada série mas também uma continuidade, quer dizer um produto está a caminho de ser desenvolvido, o espírito empreendedor está sendo de alguma forma induzido.

Portanto, um novo profissional pode estar sendo de alguma forma preparado, tornando-se aquele que constantemente está preocupado com três grandes qualidades:

- Excelência
- Inovação
- Agilidade

Excelência, pois não basta mais ser bom, tem que procurar ser o melhor, como profissional e ser humano;

Inovar, a cada dia, a contínua busca do novo, hoje fui melhor que ontem e sou pior que amanhã;

Agilidade, a garantia que estou fazendo antes dos outros, na busca pela sobrevivência.

APLICABILIDADE DE UM AMBIENTE PRÓ-ATIVO PARA A EDUCAÇÃO A DISTÂNCIA EM UMA SITUAÇÃO REAL

Janaine Cristiane de Souza[1] e Sérgio Donizetti Zorzo[1]

Abstract *— Este artigo mostra a aplicabilidade de um ambiente pró-ativo, que consiste na expansão de um ambiente de Educação a Distância baseado na Web para desktops, em uma situação real. Essa expansão foi realizada para prover mecanismos de acesso ao ambiente através de dispositivos móveis, especificamente telefones celulares. O emprego de dispositivos celulares nesse novo ambiente, como uma forma de auxiliar o processo de ensino-aprendizagem, propõe uma inversão na interação aluno-ambiente. Na interação ambiente-aluno, o ambiente age pró-ativamente nesse processo através do envio de mensagens curtas aos alunos de um curso, com o propósito de motivar a sua participação e reforçar o conteúdo estudado. Os celulares utilizados no acesso ao ambiente ainda apresentam algumas limitações, que impossibilitam a utilização de alguns recursos didático-pedagógicos, mas, por outro lado, esses dispositivos têm a facilidade de atingir o aluno a qualquer momento e em qualquer lugar, devido principalmente à mobilidade oferecida pela Rede Celular.*

Index Terms *— Ambiente pró-ativo, apoio ao processo de ensino-aprendizagem, dispositivos móveis, educação a distância.*

INTRODUÇÃO

Nos últimos anos, a educação vem passando por um processo de desenvolvimento e modernização devido aos avanços tecnológicos. Com isso, meios mais desenvolvidos e modernos têm sido utilizados no processo de ensino-aprendizagem. A utilização de *desktops* combinada com o uso da Internet possibilita a oferta de cursos a distância, através de ambientes para a EAD (Educação a Distância). Nesses ambientes, o aluno é considerado um ser ativo, responsável pela iniciativa de acesso e uso, podendo utiliza-los pelo tempo que desejar, com periodicidade determinada apenas por ele próprio. Tais ambientes podem fazer o registro do acompanhamento e emitir relatórios gerenciais sobre as atividades dos alunos, mas não chegam a interferir no processo de interação aluno-ambiente, porque os *desktops* não propiciam mobilidade aos alunos [1].

Com o surgimento da Computação Móvel [2], os usuários ganharam acesso a informações e serviços, independentemente de localização física. Esse acesso é possível através da utilização de dispositivos móveis, tais como: laptops, palmtops, telefones celulares e diferentes tipos de PDAs (*Personal Digital Assistants*).

No Ambiente Pró-Ativo para a EAD apresentado neste trabalho, telefones celulares 2G (Segunda Geração) que operam com o WAP (*Wireless Application Protocol*) são empregados para apoio ao processo de ensino-aprendizagem. O emprego desses dispositivos propõe uma inversão na interação aluno-ambiente, na medida em que permite ao ambiente agir pró-ativamente nesse processo.

Os telefones celulares 2G ainda apresentam algumas limitações, que impossibilitam a utilização de alguns recursos didático-pedagógicos. Por outro lado, com o emprego desses dispositivos os alunos podem conciliar estudo e trabalho, mesmo estando em constante deslocamento, devido às vantagens oferecidas pela Rede Celular, que são: mobilidade, flexibilidade, portabilidade, disponibilidade, conforto e comunicação facilitada.

Com o propósito de mostrar a aplicabilidade do Ambiente Pró-Ativo para a EAD em uma situação real e o emprego de telefones celulares como apoio ao processo de ensino-aprendizagem, neste artigo são apresentados a descrição desse novo ambiente, a sua arquitetura, bem como um estudo de caso voltado para a classe de aplicação Treinamento em Vendas. Finalmente, discute algumas conclusões sobre este trabalho.

AMBIENTE PRÓ-ATIVO

O ambiente pró-ativo consiste na expansão de um ambiente de EAD baseado na Web para *desktops* [3], desenvolvido por pesquisadores do GSDR (Grupo de Sistemas Distribuídos e Redes) desta Universidade. Esse novo ambiente permite que os professores e os alunos realizem tarefas relacionadas com o processo de ensino-aprendizagem dentro de um determinado curso, utilizando *desktops* e telefones celulares.

O emprego de dispositivos celulares nesse ambiente, como uma forma de auxiliar o processo de ensino-aprendizagem, propõe uma inversão na interação aluno-ambiente, na medida em que permite ao ambiente agir pró-ativamente nesse processo [1]-[4]-[5].

Nesse novo ambiente, a pró-atividade é estimulada através do envio de mensagens curtas, referentes ao conteúdo das aulas, aos alunos de um curso, com o propósito de motivar a sua participação e reforçar o conteúdo já estudado. Por outro lado, outros tipos de mensagens curtas relacionados com o acompanhamento poderiam ser incorporados ao ambiente para explorar a pró-atividade, tais como: alerta, informativa e congratulação.

[1] Janaine Cristiane de Souza e Sérgio Donizetti Zorzo, Universidade Federal de São Carlos (UFSCar), Departamento de Computação, Rodovia Washington Luís, Km 235, Caixa Postal 676, 13565-905, São Carlos, SP, Brazil, {janaine, zorzo}@dc.ufscar.br

As mensagens do tipo alerta seriam enviadas em duas situações: caso o aluno alcançasse uma porcentagem de acerto em um teste considerada inferior àquela determinada pelo professor ou um teste fosse realizado em um tempo superior ao que o professor estipulou. Já as mensagens do tipo informativa seriam enviadas assim que o aluno revolvesse todos os testes do curso, para informá-lo sobre a média final obtida. Por sua vez, as mensagens do tipo congratulação seriam enviadas quando o aluno realizasse um teste em um tempo inferior àquele estipulado pelo professor.

No processo de ensino-aprendizagem, o professor é responsável pela criação e edição de cursos, determinação da política de autorização de acesso e envio desses cursos para uma área temporária do Servidor Web utilizado pelo ambiente. Ele também pode enviar mensagens curtas a todos os alunos de um curso.

O aluno, por sua vez, deve efetuar seu cadastro no ambiente para poder realizar os cursos oferecidos. No decorrer de um curso, ele pode assistir às aulas, fazer as provas e os testes, receber as mensagens curtas e interagir com o professor e com os outros alunos, utilizando dois tipos de comunicação: unidirecional (*e-mail*) e bidirecional (*chat)*.

O ambiente ainda proporciona funcionalidades relativas ao cadastro e remoção de professores, à publicação, visualização e remoção de cursos, à remoção e visualização de informações sobre os alunos cadastrados, bem como à configuração do Servidor Web.

ARQUITETURA DO AMBIENTE PRÓ-ATIVO

Para realizar a expansão do ambiente de EAD baseado na Web para *desktops*, foi proposta uma extensão da sua arquitetura [6], como ilustra a Figura 1.

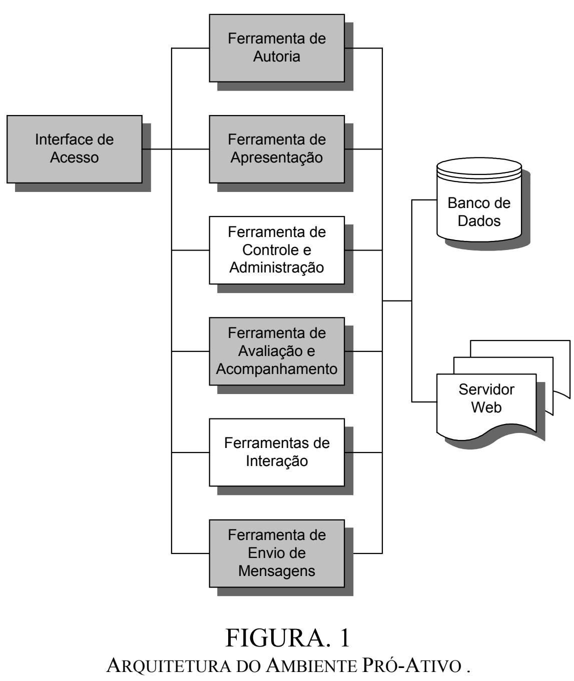

FIGURA. 1
ARQUITETURA DO AMBIENTE PRÓ-ATIVO .

A arquitetura, mostrada na Figura 1, é composta por sete módulos: Interface de Acesso, Ferramenta de Autoria, Ferramenta de Apresentação, Ferramenta de Controle e Administração, Ferramentas de Interação, Ferramenta de Envio de Mensagens e Ferramenta de Avaliação e Acompanhamento. Além desses módulos, essa arquitetura também possui um BD (Banco de Dados) e um Servidor Web. O BD é utilizado para o armazenamento dos dados dos alunos, dos professores e dos cursos, enquanto o Servidor Web contém os arquivos referentes aos cursos.

Os módulos em destaque na Figura 1, como a Interface de Acesso, a Ferramenta de Avaliação e Acompanhamento, a Ferramenta de Apresentação e a Ferramenta de Autoria foram novamente implementados e adequados ao novo ambiente. Por outro lado, a Ferramenta de Envio de Mensagens é um módulo novo acrescentado a essa arquitetura para dar suporte à interação ativa com os alunos. Segue abaixo uma breve descrição sobre cada módulo.

A Interface de Acesso permite o cadastro de novos alunos, a autenticação de alunos já cadastrados, a seleção de cursos e a navegação entre os outros módulos do ambiente. Sua funcionalidade no telefone celular consiste apenas na autenticação do aluno.

A Ferramenta de Autoria auxilia o professor na criação e edição de cursos (aulas e provas), na determinação da política de autorização de acesso e no envio desses cursos para uma área temporária do Servidor Web utilizado pelo ambiente. Com o emprego do telefone celular, algumas novas funcionalidades foram adicionadas: a criação e edição de testes e de mensagens curtas, o envio de mensagens curtas aos alunos de um curso.

A Ferramenta de Apresentação permite a exibição das páginas de aulas e provas que compõem um curso, de acordo com a seqüência e o critério de apresentação previamente determinados pelo professor com o auxílio da Ferramenta de Autoria, através de um *browser*. Por outro lado, no telefone celular os alunos podem, aleatoriamente, realizar os testes, obedecendo apenas o critério de apresentação que o professor definiu.

A Ferramenta de Controle e Administração, desenvolvida para *desktops*, auxilia o administrador na manutenção do ambiente. Para a manutenção, essa ferramenta disponibiliza as seguintes operações: cadastro e remoção de professores, publicação, visualização e remoção de cursos, remoção e visualização de informações sobre os alunos cadastrados e configuração do Servidor Web.

A Ferramenta de Avaliação e Acompanhamento permite a correção das provas feitas por um aluno, calculando a sua nota. Um histórico do aluno contendo dados relativos a sua participação e o seu desempenho no curso também é gerado por essa ferramenta. Já a sua correspondente para telefones celulares provê a correção dos testes realizados por um aluno, exibindo o número de acertos na tela do seu celular.

As Ferramentas de Interação, desenvolvidas para *desktops*, permitem duas formas de comunicação entre as pessoas envolvidas com os cursos: unidirecional através do *e-mail* e bidirecional pelo *chat*.

A Ferramenta de Envio de Mensagens para telefones celulares possibilita o envio de mensagens curtas referentes ao conteúdo das aulas, bem como daquelas do tipo lembrete, criadas pelo professor através da Ferramenta de Autoria, aos alunos de um curso.

ESTUDO DE CASO

Com o objetivo de mostrar a viabilidade da aplicação do Ambiente Pró-Ativo para a EAD em uma situação real e o emprego de telefones celulares nesse ambiente, como uma forma de auxiliar o processo de ensino-aprendizagem, um estudo de caso [6] voltado para a classe de aplicação Treinamento em Vendas é apresentado. Esta seção descreve a aplicação, mostra os processos de elaboração, criação e publicação do curso, além de algumas considerações sobre a interação aluno-ambiente e ambiente-aluno.

Descrição da Aplicação

Tendo como base a classe de aplicação Treinamento em Vendas, foi realizada a simulação da aplicabilidade do Ambiente Pró-Ativo para a EAD em uma distribuidora que comercializa papéis, suprimentos de informática e materiais para escritório, devido às questões práticas e também econômicas da empresa.

Nessa distribuidora, existem três tipos de funcionários: atendentes, entregadores e vendedores. Os atendentes são responsáveis por receber os pedidos dos clientes via telefone. Os entregadores estão encarregados de realizar as entregas dos produtos solicitados pelos clientes, com agilidade e rapidez. Os vendedores se deslocam pela região em que a empresa atua, buscando novos clientes e procurando manter um relacionamento com os clientes já existentes, dispondo de telefones celulares.

Como os vendedores não agendam visitas com os seus clientes, muitas vezes precisam aguardar para serem atendidos. Dessa maneira, o telefone celular pode ser empregado no tempo em que os vendedores ficam aguardando a disponibilidade do cliente. Neste estudo de caso, a aplicação está voltada para esses funcionários, que têm a oportunidade de se aperfeiçoar, mesmo estando em constante deslocamento, devido às vantagens oferecidas pelas Redes Celulares. Segundo Rosenberg [7], a EAD é perfeita para treinar vendedores, que costumam passar muito tempo na rua.

Elaboração, Criação e Publicação do Curso

Para a elaboração do curso, denominado HEV (Habilidades Específicas da Venda), o professor utilizou alguns materiais específicos da área de vendas, disponibilizados pelo SENAC (Serviço Nacional de Aprendizagem Comercial) [8].

Depois de elaborado, o curso HEV foi criado pelo professor com o auxílio da Ferramenta de Autoria, integrada ao ambiente proposto. A estrutura parcial desse curso pode ser visualizada na Figura 2.

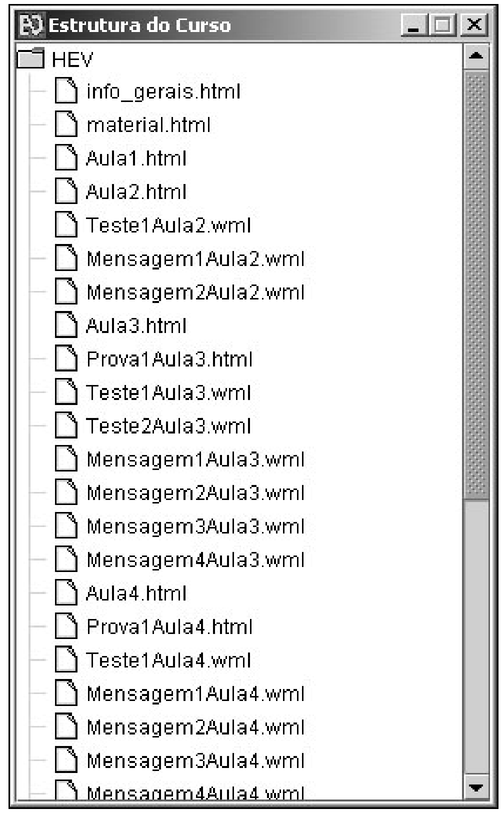

FIGURA. 2
ESTRUTURA PARCIAL DO CURSO.

A estrutura parcial do curso HEV, ilustrada na Figura 2, é composta por informações gerais, material, aulas, provas, testes e mensagens curtas. As informações gerais incluem o objetivo do curso e o seu conteúdo programático. O material contém as referências bibliográficas utilizadas para a sua elaboração. As provas e os testes permitem que os alunos avaliem seu desempenho, enquanto as mensagens curtas reforçam o conteúdo já estudado. As aulas abordam as etapas necessárias para o sucesso no processo de venda.

Para o curso HEV, o professor habilitou a ferramenta de interação *chat* na interface da Figura 3, permitindo uma comunicação bidirecional entre aluno-professor e aluno-aluno. Além disso, o professor também determinou uma política de autorização de acesso ao curso, dividida em três passos: Script de Aulas e Provas, Script de Testes e Script de Mensagens.

No Script de Aulas e Provas, mostrado na Figura 3, duas restrições foram estabelecidas: a aula 4 (Aula4.html) estaria acessível ao aluno se ele tivesse um aproveitamento de no mínimo 70% na prova referente à aula 3 (Prova1Aula3.html) e só assistiria à aula 5 (Aula 5.html) caso alcançasse 100% de acerto na prova da aula 4 (Prova1Aula4.html).

No Script de Testes, foi definido que o aluno realizaria os testes relativos a uma aula do curso somente após ter assistido a ela. Por exemplo: o aluno só poderia resolver o teste 1 (Teste1Aula2.wml) da aula 2 (Aula2.html) ao finalizar essa aula.

No Script de Mensagens, algumas restrições relacionadas com o envio das mensagens curtas aos alunos foram definidas. Assim como no Script de Testes, cada mensagem referente a uma determinada aula só seria enviada ao aluno quando ele terminasse de assistir a ela. Por exemplo: o aluno receberia as mensagens 1 (Mensagem1Aula2.wml) e 2 (Mensagem2Aula2.wml) da aula 2 (Aula2.html) depois de assistir a essa aula.

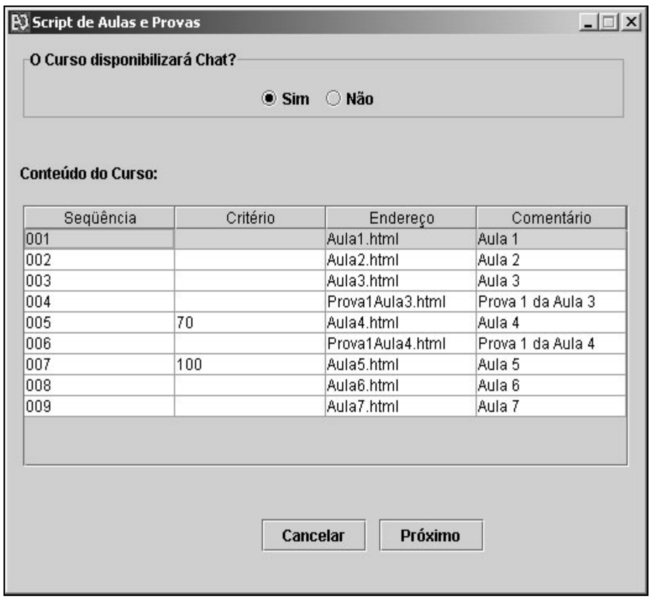

FIGURA. 3.
SCRIPT DE AULAS E PROVAS

Após a determinação da política descrita anteriormente, todos os arquivos gerados durante a criação do curso foram transferidos para uma área temporária do Servidor Web. Por fim, o administrador do ambiente efetuou o cadastro do professor responsável pelo curso e realizou a sua publicação. Nesse momento, o curso tornou-se acessível aos alunos cadastrados no ambiente.

Interação Aluno-Ambiente e Ambiente-Aluno

Na interação aluno-ambiente, o aluno é considerado um ser ativo, responsável pela iniciativa de acesso e uso do ambiente, podendo utilizá-lo pelo tempo que desejar com periodicidade determinada apenas por ele próprio. Inicialmente, os alunos acessaram o ambiente, especificando a URL (http://200.18.98.121/ead/index.html) da página principal (Figura 4) no *browser* de seus *desktops*. Através dessa página, os alunos efetuaram seu cadastro no ambiente, informando seus dados pessoais em um formulário acessível através do link Inscrição, como ilustrado na Figura 4.

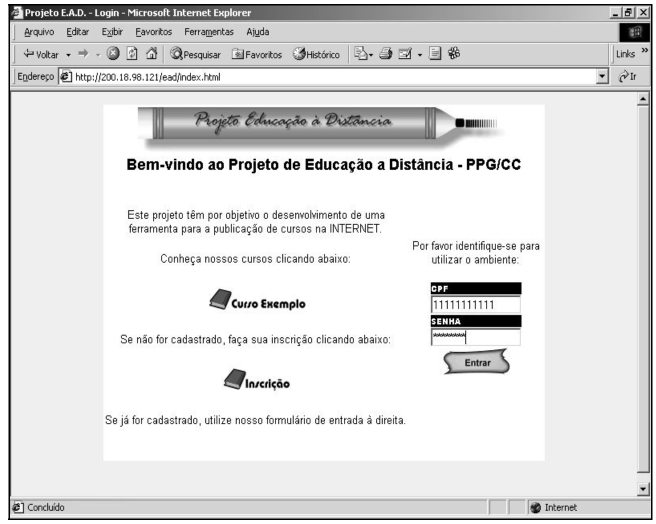

FIGURA. 4
INTERFACE PRINCIPAL DE ACESSO AO AMBIENTE PRÓ-ATIVO.

Em seguida, os alunos realizaram a sua matrícula no curso HEV oferecido pelo ambiente. A partir desse momento, ao informarem CPF (Cadastro de Pessoas Físicas) e senha no formulário de *login*, ilustrado na Figura 4, os alunos tornaram-se aptos a assistir às aulas, a fazer as provas em *desktops* e a realizar os testes nos telefones celulares. A Figura 5 mostra um teste apresentado aos alunos no decorrer do curso HEV.

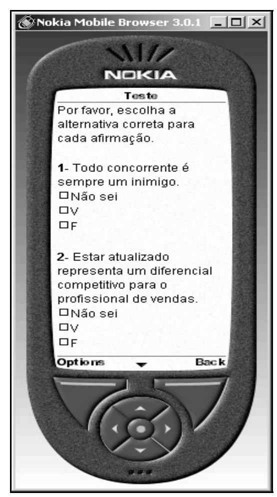

FIGURA. 5
TESTE APRESENTADO.

Enquanto os alunos estavam realizando o curso HEV, puderam se comunicar com o professor e entre si, bem como solucionar suas dúvidas, via *e-mail* e *chat*.

Na interação ambiente-aluno, o ambiente age pró-ativamente no processo de ensino-aprendizagem através do envio de mensagens curtas aos alunos de um curso, com o propósito de incentivar a sua participação e reforçar o conteúdo já estudado. A Figura 6 mostra uma mensagem enviada aos alunos.

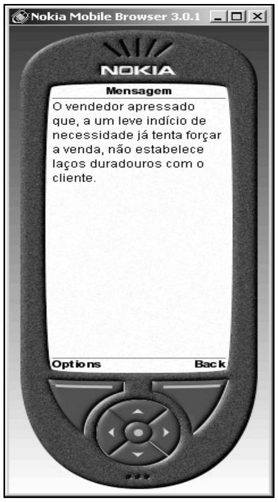

FIGURA. 6
MENSAGEM ENVIADA.

No decorrer do curso HEV, o ambiente realizou as correções das provas e dos testes realizados pelos alunos. Tais correções foram feitas a partir da comparação das respostas dos alunos com as dos arquivos de gabaritos armazenados no Servidor Web. O ambiente também gerou um histórico para cada aluno com dados relativos à sua participação e ao seu desempenho no curso. A Figura 7 apresenta o resultado da correção de um teste realizado por um aluno.

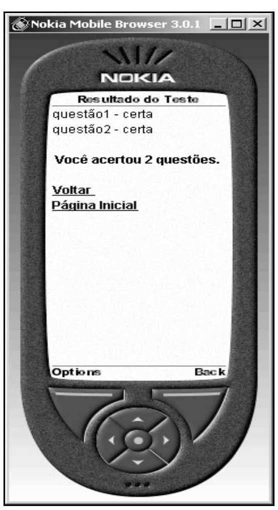

FIGURA. 7
RESULTADO DA CORREÇÃO DE UM TESTE.

CONCLUSÕES

Este artigo apresentou um estudo de caso voltado para a classe de aplicação Treinamento em Vendas, com o propósito de mostrar a viabilidade da aplicação do Ambiente Pró-Ativo para a EAD em uma situação real e o emprego de telefones celulares nesse ambiente como uma forma de auxiliar o processo de ensino-aprendizagem.

Para testar as funcionalidades do ambiente implementado, uma distribuidora que comercializa papéis, suprimentos de informática e materiais para escritório, foi escolhida a partir da classe de aplicação definida. Por questões práticas e também econômicas, decidiu-se simular a aplicabilidade desse ambiente nessa distribuidora. Embora uma simulação tenha sido realizada, o ambiente se comportou de forma esperada durante os testes de utilização das ferramentas que o compõem.

Pelos resultados obtidos na simulação, esse novo ambiente poderia ser facilmente aplicado em uma situação real. Apesar da classe de aplicação Treinamento em Vendas ter sido escolhida como objeto de estudo, outras classes de aplicação poderiam ser utilizadas para testar a aplicabilidade do ambiente, como Apresentações e Ensino de Idiomas.

O emprego de telefones celulares 2G WAP nesse novo ambiente, como uma forma de auxiliar o processo de ensino-aprendizagem, propõe uma inversão na interação aluno-ambiente. Na interação ambiente-aluno, o ambiente age pró-ativamente nesse processo através do envio de mensagens curtas aos alunos de um curso, com o propósito de motivar a sua participação e reforçar o conteúdo já estudado.

Embora telefones celulares ainda limitados tenham sido utilizados no acesso ao ambiente para esse estudo de caso, os alunos puderam conciliar estudo e trabalho, mesmo estando em constante deslocamento, devido principalmente à mobilidade oferecida pela Rede Celular. Segundo Souza e Zorzo [1], as tecnologias tradicionais usadas para oferecer cursos a distância não seriam adequadas para o treinamento de funcionários que se deslocam por uma região.

APLICABILIDADE DE UM AMBIENTE PRÓ-ATIVO PARA A EDUCAÇÃO A DISTÂNCIA EM UMA SITUAÇÃO REAL

Janaine Cristiane de Souza[1] *e Sérgio Donizetti Zorzo*[1]

Abstract *— Este artigo mostra a aplicabilidade de um ambiente pró-ativo, que consiste na expansão de um ambiente de Educação a Distância baseado na Web para desktops, em uma situação real. Essa expansão foi realizada para prover mecanismos de acesso ao ambiente através de dispositivos móveis, especificamente telefones celulares. O emprego de dispositivos celulares nesse novo ambiente, como uma forma de auxiliar o processo de ensino-aprendizagem, propõe uma inversão na interação aluno-ambiente. Na interação ambiente-aluno, o ambiente age pró-ativamente nesse processo através do envio de mensagens curtas aos alunos de um curso, com o propósito de motivar a sua participação e reforçar o conteúdo estudado. Os celulares utilizados no acesso ao ambiente ainda apresentam algumas limitações, que impossibilitam a utilização de alguns recursos didático-pedagógicos, mas, por outro lado, esses dispositivos têm a facilidade de atingir o aluno a qualquer momento e em qualquer lugar, devido principalmente à mobilidade oferecida pela Rede Celular.*

Index Terms — Ambiente pró-ativo, apoio ao processo de ensino-aprendizagem, dispositivos móveis, educação a distância.

INTRODUÇÃO

Nos últimos anos, a educação vem passando por um processo de desenvolvimento e modernização devido aos avanços tecnológicos. Com isso, meios mais desenvolvidos e modernos têm sido utilizados no processo de ensino-aprendizagem. A utilização de *desktops* combinada com o uso da Internet possibilita a oferta de cursos a distância, através de ambientes para a EAD (Educação a Distância). Nesses ambientes, o aluno é considerado um ser ativo, responsável pela iniciativa de acesso e uso, podendo utiliza-los pelo tempo que desejar, com periodicidade determinada apenas por ele próprio. Tais ambientes podem fazer o registro do acompanhamento e emitir relatórios gerenciais sobre as atividades dos alunos, mas não chegam a interferir no processo de interação aluno-ambiente, porque os *desktops* não propiciam mobilidade aos alunos [1].

Com o surgimento da Computação Móvel [2], os usuários ganharam acesso a informações e serviços, independentemente de localização física. Esse acesso é possível através da utilização de dispositivos móveis, tais como: laptops, palmtops, telefones celulares e diferentes tipos de PDAs (*Personal Digital Assistants*).

No Ambiente Pró-Ativo para a EAD apresentado neste trabalho, telefones celulares 2G (Segunda Geração) que operam com o WAP (*Wireless Application Protocol*) são empregados para apoio ao processo de ensino-aprendizagem. O emprego desses dispositivos propõe uma inversão na interação aluno-ambiente, na medida em que permite ao ambiente agir pró-ativamente nesse processo.

Os telefones celulares 2G ainda apresentam algumas limitações, que impossibilitam a utilização de alguns recursos didático-pedagógicos. Por outro lado, com o emprego desses dispositivos os alunos podem conciliar estudo e trabalho, mesmo estando em constante deslocamento, devido às vantagens oferecidas pela Rede Celular, que são: mobilidade, flexibilidade, portabilidade, disponibilidade, conforto e comunicação facilitada.

Com o propósito de mostrar a aplicabilidade do Ambiente Pró-Ativo para a EAD em uma situação real e o emprego de telefones celulares como apoio ao processo de ensino-aprendizagem, neste artigo são apresentados a descrição desse novo ambiente, a sua arquitetura, bem como um estudo de caso voltado para a classe de aplicação Treinamento em Vendas. Finalmente, discute algumas conclusões sobre este trabalho.

AMBIENTE PRÓ-ATIVO

O ambiente pró-ativo consiste na expansão de um ambiente de EAD baseado na Web para *desktops* [3], desenvolvido por pesquisadores do GSDR (Grupo de Sistemas Distribuídos e Redes) desta Universidade. Esse novo ambiente permite que os professores e os alunos realizem tarefas relacionadas com o processo de ensino-aprendizagem dentro de um determinado curso, utilizando *desktops* e telefones celulares.

O emprego de dispositivos celulares nesse ambiente, como uma forma de auxiliar o processo de ensino-aprendizagem, propõe uma inversão na interação aluno-ambiente, na medida em que permite ao ambiente agir pró-ativamente nesse processo [1]-[4]-[5].

Nesse novo ambiente, a pró-atividade é estimulada através do envio de mensagens curtas, referentes ao conteúdo das aulas, aos alunos de um curso, com o propósito de motivar a sua participação e reforçar o conteúdo já estudado. Por outro lado, outros tipos de mensagens curtas relacionados com o acompanhamento poderiam ser incorporados ao ambiente para explorar a pró-atividade, tais como: alerta, informativa e congratulação.

[1] Janaine Cristiane de Souza e Sérgio Donizetti Zorzo, Universidade Federal de São Carlos (UFSCar), Departamento de Computação, Rodovia Washington Luís, Km 235, Caixa Postal 676, 13565-905, São Carlos, SP, Brazil, {janaine, zorzo}@dc.ufscar.br

As mensagens do tipo alerta seriam enviadas em duas situações: caso o aluno alcançasse uma porcentagem de acerto em um teste considerada inferior àquela determinada pelo professor ou um teste fosse realizado em um tempo superior ao que o professor estipulou. Já as mensagens do tipo informativa seriam enviadas assim que o aluno revolvesse todos os testes do curso, para informá-lo sobre a média final obtida. Por sua vez, as mensagens do tipo congratulação seriam enviadas quando o aluno realizasse um teste em um tempo inferior àquele estipulado pelo professor.

No processo de ensino-aprendizagem, o professor é responsável pela criação e edição de cursos, determinação da política de autorização de acesso e envio desses cursos para uma área temporária do Servidor Web utilizado pelo ambiente. Ele também pode enviar mensagens curtas a todos os alunos de um curso.

O aluno, por sua vez, deve efetuar seu cadastro no ambiente para poder realizar os cursos oferecidos. No decorrer de um curso, ele pode assistir às aulas, fazer as provas e os testes, receber as mensagens curtas e interagir com o professor e com os outros alunos, utilizando dois tipos de comunicação: unidirecional (*e-mail*) e bidirecional (*chat)*.

O ambiente ainda proporciona funcionalidades relativas ao cadastro e remoção de professores, à publicação, visualização e remoção de cursos, à remoção e visualização de informações sobre os alunos cadastrados, bem como à configuração do Servidor Web.

ARQUITETURA DO AMBIENTE PRÓ-ATIVO

Para realizar a expansão do ambiente de EAD baseado na Web para *desktops*, foi proposta uma extensão da sua arquitetura [6], como ilustra a Figura 1.

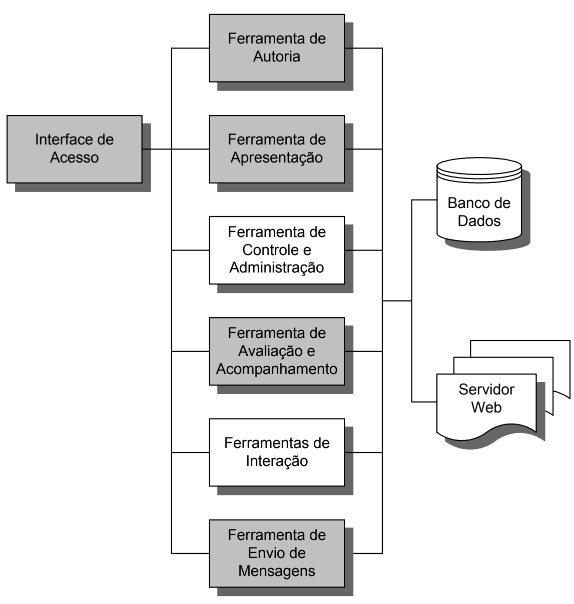

FIGURA. 1
ARQUITETURA DO AMBIENTE PRÓ-ATIVO .

A arquitetura, mostrada na Figura 1, é composta por sete módulos: Interface de Acesso, Ferramenta de Autoria, Ferramenta de Apresentação, Ferramenta de Controle e Administração, Ferramentas de Interação, Ferramenta de Envio de Mensagens e Ferramenta de Avaliação e Acompanhamento. Além desses módulos, essa arquitetura também possui um BD (Banco de Dados) e um Servidor Web. O BD é utilizado para o armazenamento dos dados dos alunos, dos professores e dos cursos, enquanto o Servidor Web contém os arquivos referentes aos cursos.

Os módulos em destaque na Figura 1, como a Interface de Acesso, a Ferramenta de Avaliação e Acompanhamento, a Ferramenta de Apresentação e a Ferramenta de Autoria foram novamente implementados e adequados ao novo ambiente. Por outro lado, a Ferramenta de Envio de Mensagens é um módulo novo acrescentado a essa arquitetura para dar suporte à interação ativa com os alunos. Segue abaixo uma breve descrição sobre cada módulo.

A Interface de Acesso permite o cadastro de novos alunos, a autenticação de alunos já cadastrados, a seleção de cursos e a navegação entre os outros módulos do ambiente. Sua funcionalidade no telefone celular consiste apenas na autenticação do aluno.

A Ferramenta de Autoria auxilia o professor na criação e edição de cursos (aulas e provas), na determinação da política de autorização de acesso e no envio desses cursos para uma área temporária do Servidor Web utilizado pelo ambiente. Com o emprego do telefone celular, algumas novas funcionalidades foram adicionadas: a criação e edição de testes e de mensagens curtas, o envio de mensagens curtas aos alunos de um curso.

A Ferramenta de Apresentação permite a exibição das páginas de aulas e provas que compõem um curso, de acordo com a seqüência e o critério de apresentação previamente determinados pelo professor com o auxílio da Ferramenta de Autoria, através de um *browser*. Por outro lado, no telefone celular os alunos podem, aleatoriamente, realizar os testes, obedecendo apenas o critério de apresentação que o professor definiu.

A Ferramenta de Controle e Administração, desenvolvida para *desktops*, auxilia o administrador na manutenção do ambiente. Para a manutenção, essa ferramenta disponibiliza as seguintes operações: cadastro e remoção de professores, publicação, visualização e remoção de cursos, remoção e visualização de informações sobre os alunos cadastrados e configuração do Servidor Web.

A Ferramenta de Avaliação e Acompanhamento permite a correção das provas feitas por um aluno, calculando a sua nota. Um histórico do aluno contendo dados relativos a sua participação e o seu desempenho no curso também é gerado por essa ferramenta. Já a sua correspondente para telefones celulares provê a correção dos testes realizados por um aluno, exibindo o número de acertos na tela do seu celular.

As Ferramentas de Interação, desenvolvidas para *desktops*, permitem duas formas de comunicação entre as pessoas envolvidas com os cursos: unidirecional através do *e-mail* e bidirecional pelo *chat*.

A Ferramenta de Envio de Mensagens para telefones celulares possibilita o envio de mensagens curtas referentes ao conteúdo das aulas, bem como daquelas do tipo lembrete, criadas pelo professor através da Ferramenta de Autoria, aos alunos de um curso.

ESTUDO DE CASO

Com o objetivo de mostrar a viabilidade da aplicação do Ambiente Pró-Ativo para a EAD em uma situação real e o emprego de telefones celulares nesse ambiente, como uma forma de auxiliar o processo de ensino-aprendizagem, um estudo de caso [6] voltado para a classe de aplicação Treinamento em Vendas é apresentado. Esta seção descreve a aplicação, mostra os processos de elaboração, criação e publicação do curso, além de algumas considerações sobre a interação aluno-ambiente e ambiente-aluno.

Descrição da Aplicação

Tendo como base a classe de aplicação Treinamento em Vendas, foi realizada a simulação da aplicabilidade do Ambiente Pró-Ativo para a EAD em uma distribuidora que comercializa papéis, suprimentos de informática e materiais para escritório, devido às questões práticas e também econômicas da empresa.

Nessa distribuidora, existem três tipos de funcionários: atendentes, entregadores e vendedores. Os atendentes são responsáveis por receber os pedidos dos clientes via telefone. Os entregadores estão encarregados de realizar as entregas dos produtos solicitados pelos clientes, com agilidade e rapidez. Os vendedores se deslocam pela região em que a empresa atua, buscando novos clientes e procurando manter um relacionamento com os clientes já existentes, dispondo de telefones celulares.

Como os vendedores não agendam visitas com os seus clientes, muitas vezes precisam aguardar para serem atendidos. Dessa maneira, o telefone celular pode ser empregado no tempo em que os vendedores ficam aguardando a disponibilidade do cliente. Neste estudo de caso, a aplicação está voltada para esses funcionários, que têm a oportunidade de se aperfeiçoar, mesmo estando em constante deslocamento, devido às vantagens oferecidas pelas Redes Celulares. Segundo Rosenberg [7], a EAD é perfeita para treinar vendedores, que costumam passar muito tempo na rua.

Elaboração, Criação e Publicação do Curso

Para a elaboração do curso, denominado HEV (Habilidades Específicas da Venda), o professor utilizou alguns materiais específicos da área de vendas, disponibilizados pelo SENAC (Serviço Nacional de Aprendizagem Comercial) [8].

Depois de elaborado, o curso HEV foi criado pelo professor com o auxílio da Ferramenta de Autoria, integrada ao ambiente proposto. A estrutura parcial desse curso pode ser visualizada na Figura 2.

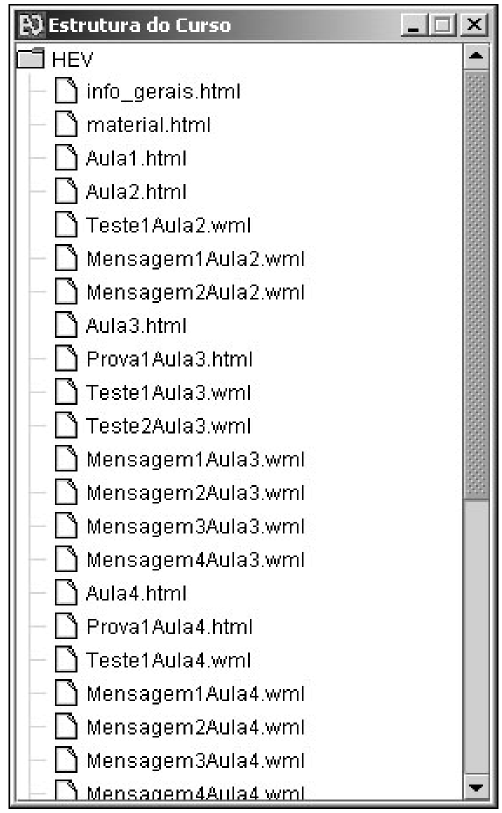

FIGURA. 2
ESTRUTURA PARCIAL DO CURSO.

A estrutura parcial do curso HEV, ilustrada na Figura 2, é composta por informações gerais, material, aulas, provas, testes e mensagens curtas. As informações gerais incluem o objetivo do curso e o seu conteúdo programático. O material contém as referências bibliográficas utilizadas para a sua elaboração. As provas e os testes permitem que os alunos avaliem seu desempenho, enquanto as mensagens curtas reforçam o conteúdo já estudado. As aulas abordam as etapas necessárias para o sucesso no processo de venda.

Para o curso HEV, o professor habilitou a ferramenta de interação *chat* na interface da Figura 3, permitindo uma comunicação bidirecional entre aluno-professor e aluno-aluno. Além disso, o professor também determinou uma política de autorização de acesso ao curso, dividida em três passos: Script de Aulas e Provas, Script de Testes e Script de Mensagens.

No Script de Aulas e Provas, mostrado na Figura 3, duas restrições foram estabelecidas: a aula 4 (Aula4.html) estaria acessível ao aluno se ele tivesse um aproveitamento de no mínimo 70% na prova referente à aula 3 (Prova1Aula3.html) e só assistiria à aula 5 (Aula 5.html) caso alcançasse 100% de acerto na prova da aula 4 (Prova1Aula4.html).

No Script de Testes, foi definido que o aluno realizaria os testes relativos a uma aula do curso somente após ter assistido a ela. Por exemplo: o aluno só poderia resolver o teste 1 (Teste1Aula2.wml) da aula 2 (Aula2.html) ao finalizar essa aula.

No Script de Mensagens, algumas restrições relacionadas com o envio das mensagens curtas aos alunos foram definidas. Assim como no Script de Testes, cada mensagem referente a uma determinada aula só seria enviada ao aluno quando ele terminasse de assistir a ela. Por exemplo: o aluno receberia as mensagens 1 (Mensagem1Aula2.wml) e 2 (Mensagem2Aula2.wml) da aula 2 (Aula2.html) depois de assistir a essa aula.

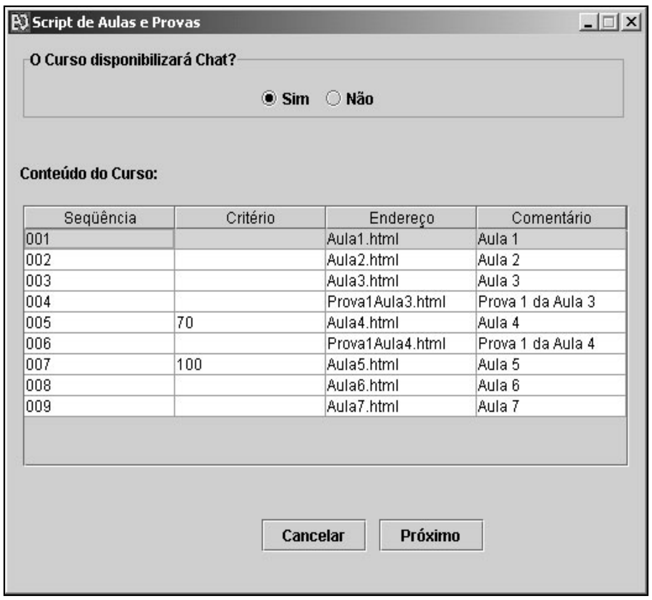

FIGURA. 3.
SCRIPT DE AULAS E PROVAS

Após a determinação da política descrita anteriormente, todos os arquivos gerados durante a criação do curso foram transferidos para uma área temporária do Servidor Web. Por fim, o administrador do ambiente efetuou o cadastro do professor responsável pelo curso e realizou a sua publicação. Nesse momento, o curso tornou-se acessível aos alunos cadastrados no ambiente.

Interação Aluno-Ambiente e Ambiente-Aluno

Na interação aluno-ambiente, o aluno é considerado um ser ativo, responsável pela iniciativa de acesso e uso do ambiente, podendo utilizá-lo pelo tempo que desejar com periodicidade determinada apenas por ele próprio. Inicialmente, os alunos acessaram o ambiente, especificando a URL (http://200.18.98.121/ead/index.html) da página principal (Figura 4) no *browser* de seus *desktops*. Através dessa página, os alunos efetuaram seu cadastro no ambiente, informando seus dados pessoais em um formulário acessível através do link Inscrição, como ilustrado na Figura 4.

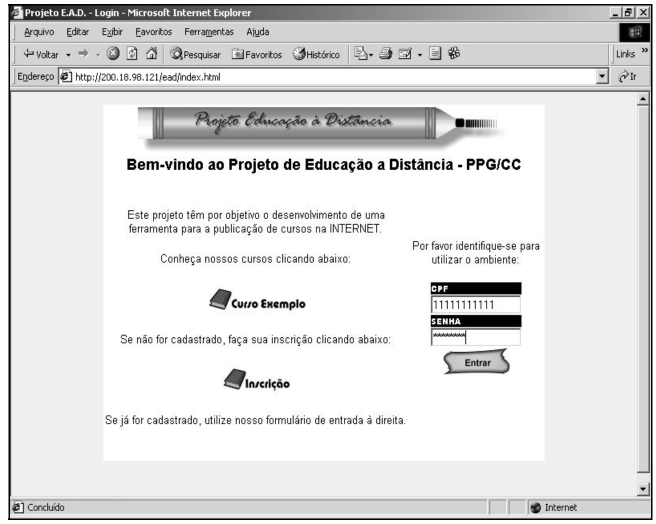

FIGURA. 4
INTERFACE PRINCIPAL DE ACESSO AO AMBIENTE PRÓ-ATIVO.

Em seguida, os alunos realizaram a sua matrícula no curso HEV oferecido pelo ambiente. A partir desse momento, ao informarem CPF (Cadastro de Pessoas Físicas) e senha no formulário de *login*, ilustrado na Figura 4, os alunos tornaram-se aptos a assistir às aulas, a fazer as provas em *desktops* e a realizar os testes nos telefones celulares. A Figura 5 mostra um teste apresentado aos alunos no decorrer do curso HEV.

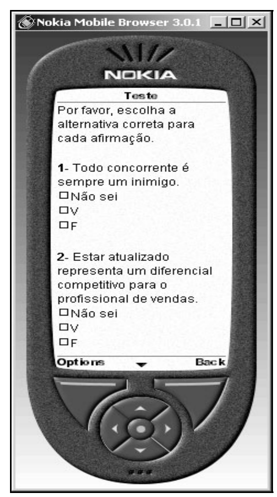

FIGURA. 5
TESTE APRESENTADO.

Enquanto os alunos estavam realizando o curso HEV, puderam se comunicar com o professor e entre si, bem como solucionar suas dúvidas, via *e-mail* e *chat*.

Na interação ambiente-aluno, o ambiente age pró-ativamente no processo de ensino-aprendizagem através do envio de mensagens curtas aos alunos de um curso, com o propósito de incentivar a sua participação e reforçar o conteúdo já estudado. A Figura 6 mostra uma mensagem enviada aos alunos.

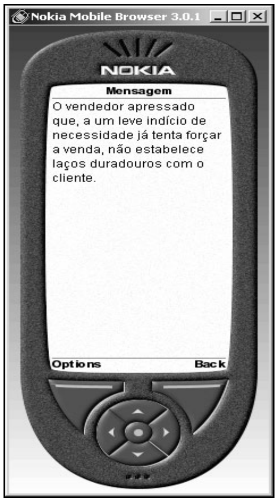

FIGURA. 6
MENSAGEM ENVIADA.

No decorrer do curso HEV, o ambiente realizou as correções das provas e dos testes realizados pelos alunos. Tais correções foram feitas a partir da comparação das respostas dos alunos com as dos arquivos de gabaritos armazenados no Servidor Web. O ambiente também gerou um histórico para cada aluno com dados relativos à sua participação e ao seu desempenho no curso. A Figura 7 apresenta o resultado da correção de um teste realizado por um aluno.

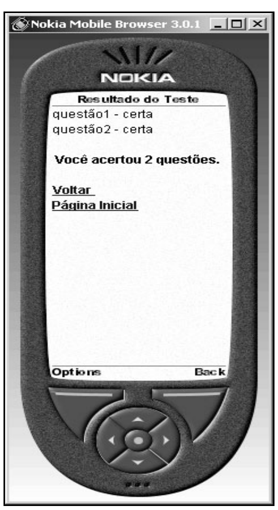

FIGURA. 7
RESULTADO DA CORREÇÃO DE UM TESTE.

CONCLUSÕES

Este artigo apresentou um estudo de caso voltado para a classe de aplicação Treinamento em Vendas, com o propósito de mostrar a viabilidade da aplicação do Ambiente Pró-Ativo para a EAD em uma situação real e o emprego de telefones celulares nesse ambiente como uma forma de auxiliar o processo de ensino-aprendizagem.

Para testar as funcionalidades do ambiente implementado, uma distribuidora que comercializa papéis, suprimentos de informática e materiais para escritório, foi escolhida a partir da classe de aplicação definida. Por questões práticas e também econômicas, decidiu-se simular a aplicabilidade desse ambiente nessa distribuidora. Embora uma simulação tenha sido realizada, o ambiente se comportou de forma esperada durante os testes de utilização das ferramentas que o compõem.

Pelos resultados obtidos na simulação, esse novo ambiente poderia ser facilmente aplicado em uma situação real. Apesar da classe de aplicação Treinamento em Vendas ter sido escolhida como objeto de estudo, outras classes de aplicação poderiam ser utilizadas para testar a aplicabilidade do ambiente, como Apresentações e Ensino de Idiomas.

O emprego de telefones celulares 2G WAP nesse novo ambiente, como uma forma de auxiliar o processo de ensino-aprendizagem, propõe uma inversão na interação aluno-ambiente. Na interação ambiente-aluno, o ambiente age pró-ativamente nesse processo através do envio de mensagens curtas aos alunos de um curso, com o propósito de motivar a sua participação e reforçar o conteúdo já estudado.

Embora telefones celulares ainda limitados tenham sido utilizados no acesso ao ambiente para esse estudo de caso, os alunos puderam conciliar estudo e trabalho, mesmo estando em constante deslocamento, devido principalmente à mobilidade oferecida pela Rede Celular. Segundo Souza e Zorzo [1], as tecnologias tradicionais usadas para oferecer cursos a distância não seriam adequadas para o treinamento de funcionários que se deslocam por uma região.

APLICATIVO EM PLATAFORMA CAD PARA AUXÍLIO NO DESENHO DE PROJETOS ELÉTRICOS EM BAIXA TENSÃO

Vanderlei César Schmitt[1], Ewerton Eyre de Morais Alonso [2]

Resumo *— O propósito deste trabalho consiste em apresentar o ELE-PROJ, uma ferramenta CAD desenvolvida para auxiliar o desenho de projetos elétricos em baixa tensão, proporcionando agilidade na inserção dos componentes elétricos, eletrodutos e nos desenhos relativos a projetos elétricos, automatizando parte do trabalho através da geração de listas de materiais, quadro de cargas e diagrama unifilar. Este trabalho ainda tem como objetivo proporcionar que engenheiros, arquitetos, professores e alunos que desenvolvem projetos elétricos em baixa tensão possam desfrutar de um ambiente que permite agilidade nas atividades de criação e correção. O sistema foi modelado a partir do diagrama de classes, proposto pela UML, sendo implementado em AUTOLISP e DCL, e executado a partir do ambiente de trabalho do AUTOCAD. O tempo de desenho de um projeto elétrico em baixa tensão foi reduzido significativamente com a utilização do ELE-PROJ, se comparado com o processo de desenho convencional no AUTOCAD.*

Index Terms —AutoCad, AutoLisp, DCL, Projetos Elétricos em Baixa Tensão.

INTRODUÇÃO

Neste trabalho são apresentados alguns conceitos utilizados na elaboração de projetos elétricos em baixa tensão enfatizando a necessidade do mesmo para a execução de uma obra, seja ela residencial ou comercial. São abordados o AutoCAD e as necessidades de uma ferramenta específica para a elaboração de um projeto elétrico de baixa tensão. Além disso, uma breve descrição das ferramentas usadas na implementação do ELE-PROJ [1]: a modelagem a partir do diagrama de classes - proposta pela UML [2]- e a programação através do AutoLISP e da DCL.

O presente trabalho surgiu da constatação de que a maioria dos profissionais de engenharia que atuam no mercado utiliza-se do AutoCAD para a elaboração dos desenhos relativos ao projeto elétrico. Analisando os procedimentos executados pelos profissionais, percebeu-se que muitos deles poderiam ser otimizados ou automatizados através de programação LISP, diminuindo sensivelmente o tempo gasto na elaboração dos desenhos. No mercado existem vários aplicativos específicos para desenvolvimento de projetos elétricos, no entanto, não são utilizados por serem considerados de alto custo para aquisição se comparado ao grau de utilização pela maioria dos profissionais e por exigir que os mesmos “migrem” de plataforma de trabalho e adaptem seus procedimentos ao software escolhido. Dessa forma, o esforço se deu no sentido de fornecer uma ferramenta que agilizasse os procedimentos usuais, sem a necessidade de mudança de procedimentos ou plataformas de trabalho, com baixo custo e de maneira a ser acessível a qualquer profissional – arquiteto, engenheiro, etc. – ou aluno que desenvolva projetos elétricos em baixa tensão.

Através do ELE-PROJ é possível:

- Inserir componentes (tomadas, interruptores, lâmpadas, etc.) do projeto elétrico nos desenhos em CAD;
- Gerar automaticamente através dos cálculos padrões o *dimensionamento de cabos elétricos* em função dos componentes inseridos;
- Elaboração automática do *diagrama unifilar* e do *quadro de cargas* em função dos cabos e componentes inseridos;
- *Lista de materiais* contendo quantidades e especificações dos materiais inseridos e calculados, desde a quantidade de tomadas, de interruptores, até o total em metros de fio necessário para execução do projeto.

Acredita-se que o trabalho aqui proposto irá colaborar, na medida do possível, propondo uma solução baseada num aplicativo computacional de uso freqüente, como é o AutoCAD.

PROJETOS ELÉTRICOS EM BAIXA TENSÃO

Um projeto elétrico em baixa tensão consiste basicamente em representar uma solução da engenharia para problemas da necessidade humana. Dessa forma, o projeto elétrico faz uma mediação entre duas situações ou dois estados, sendo o primeiro a energia elétrica na rede de distribuição e o segundo a energia elétrica na casa do consumidor. Sendo esse projeto bem resolvido, o consumidor terá uma garantia de responsabilidade de um profissional da área, seja ele Engenheiro Civil, Arquiteto, Engenheiro Eletricista ou Mecânico Eletricista – conforme Decreto Federal N. º 23.569/33 de 11/12/1933 [1] - tendo a certeza de que não terá nenhum problema na execução de sua obra.

O projeto da instalação elétrica de uma edificação seja ela residencial ou comercial, consiste basicamente em:

[1] Vanderlei César Schmitt, Universidade do Vale do Itajaí, Rua 254, 628, 88000-000, Meia Praia - Itapema, SC, Brazil, vando.s@terra.com.br
[2] Ewerton Eyre de Morais Alonso, Universidade do Vale do Itajaí, Rua Uruguai, 458 Bloco 07, 88302-202, Itajaí, SC, Brazil, ewerton@cttmar.univali.br

- *Quantificar:* determinar os tipos e localização dos pontos de utilização de energia;
- *Dimensionar:* definir o tipo e o caminhamento dos condutores e condutos e sua divisão em circuitos;
- *Dimensionar:* definir o tipo e a localização dos dispositivos de proteção, de comando, de medição de energia elétrica e dos demais acessórios.

Conforme Lima [3] "o objetivo de um projeto de instalações elétricas é garantir a transferência de energia desde uma fonte, em geral a rede de distribuição da concessionária ou geradores particulares, até os pontos de utilização (pontos de luz, tomadas, motores, etc.)".

O projeto de instalações elétricas é a previsão escrita da instalação com todos seus detalhes, localização dos pontos de utilização de energia elétrica, comandos, trajetos dos condutores, divisão em circuitos, seção dos condutores, dispositivos de manobra, carga de cada circuito, carga total, etc. [4].

Processos Para Execução de um Projeto Elétrico em Baixa Tensão

Os processos utilizados para se conceber um projeto elétrico em baixa tensão descritos nesta sub-seção tiveram como base o padrão exigido pela concessionária CELESC (Centrais Elétricas de Santa Catarina) [1].

Um projeto elétrico sempre é feito a partir do projeto arquitetônico, que deverá obrigatoriamente conter:

- Planta baixa, contendo a divisão interna dos ambientes da edificação, suas medidas e distribuição do mobiliário (camas, guarda-roupas, tanque, máquina de lavar roupa, máquina de lavar louça, etc.), além de equipamentos especiais a serem instalados (ar-condicionado, torneira elétrica, fornos elétricos, aquecedores, etc.);
- Cortes e fachadas, com cotas e número de pavimentos.

Normalmente na maioria dos projetos existem arquivos eletrônicos, no formato DWG ou DXF, que servirão de base para a elaboração do projeto elétrico. Nos casos em que não exista o projeto arquitetônico em arquivo eletrônico este deverá ser desenhado através do auxilio de algum software específico.

Os procedimentos para a elaboração do projeto elétrico são:

- Eliminação dos elementos de desenho não necessários, constantes do projeto arquitetônico, tais como denominação das dependências, áreas, cotas, dimensões das aberturas, representação de tipo de piso, etc., formando assim a base do projeto elétrico;
- Lançamentos dos elementos do projeto elétrico, de acordo com a disposição dos móveis e aberturas previstos no projeto arquitetônico (tomadas, interruptores, ponto de luz no teto e paredes, tomadas para ar condicionado dentre outras);
- Determinação e lançamento do sistema de alimentação (local do quadro de disjuntores, quadro de medição e entrada de energia);
- Divisão das cargas dos elementos elétricos lançados em circuitos de acordo com sua utilização, localização, carga e características dos mesmos;
- Lançamento dos eletrodutos que servirão de caminho para os cabos elétricos conduzirem a corrente do quadro de disjuntores até o ponto de consumo ou elementos elétricos;
- Determinação dos cabos elétricos de acordo com sua função no circuito quanto ao seu tipo (fase, neutro, retorno, terra) em cada trecho de eletroduto lançado;
- Elaboração do quadro de cargas contendo para cada circuito, sua composição e carga, (carga de iluminação, de tomadas), bem como a dimensão do cabo a ser utilizado e sua proteção (disjuntor);
- Dimensionamento dos eletrodutos em função do número e diâmetro dos cabos elétricos que passam em cada trecho;
- Elaboração do diagrama unifilar de cargas, contendo o número do circuito, carga e proteção de cada um deles. Carga total instalada em cada unidade;
- Cálculo do cabo de alimentação e proteção geral da unidade;
- Elaboração da lista de materiais necessários para execução da obra.

Depois de concluídos todos esses passos o projeto está pronto para ser plotado (impresso) e entregue ao cliente para que possa ser analisado pela concessionária de energia elétrica. Após a aprovação do projeto pela mesma, o cliente pode partir para execução de sua obra e compra dos materiais listados no projeto.

MODELAGEM DO ELE-PROJ

A modelagem é um ponto essencial para uma correta implementação e resultado final de um sistema. Nela é possível solucionar problemas que eventualmente surjam durante a fase de implementação, tornando possível um planejamento mais preciso do sistema. Ela deve apresentar o que o sistema tem como objetivo, os relacionamentos, os atributos e as operações das classes.

O ELE-PROJ foi modelado com base no diagrama de classes, proposto pela UML. A escolha pela UML deveu-se a fácil representação do sistema proposto e a facilidade de compreensão e modelagem que o diagrama de classes fornece sendo muito sucinto e informativo - qualidades desejáveis em uma notação. O diagrama de classes é a essência da UML, sendo esta um padrão que está sendo muito aceito para a modelagem orientada a objeto.

Apesar da modelagem ter sido desenvolvida orientada a objeto, a programação não o foi pelo fato de que a linguagem de programação LISP é uma programação em listas.

O diagrama apresentado na Figura 1 fornece uma modelagem conceitual das classes utilizadas pelo sistema.

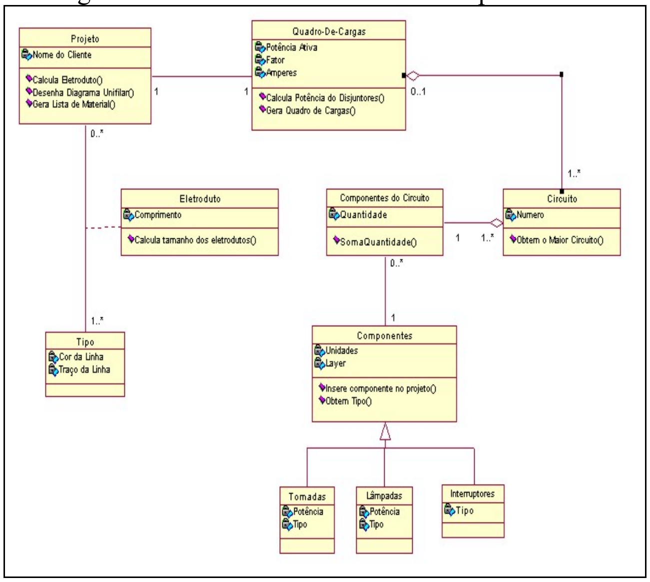

FIGURA 1
MODELAGEM DO ELE-PROJ – DIAGRAMA DE CLASSE.

IMPLEMENTAÇÃO DO ELE-PROJ

O AutoCAD (CAD: Computer Aided Design/Drafting) é uma ferramenta para o auxílio de desenhos e projetos em computador, caracterizando-se numa poderosa ferramenta de computação gráfica que permitiu a substituição da antiga prancheta de desenhos por um computador com um nível de produtividade e qualidade sem precedentes.

A dupla precisão do AutoCAD permite que se trabalhe com desenhos muito grandes facilitando eventuais alterações num projeto, o que na prancheta às vezes se tornaria praticamente impossível sem que o projeto fosse todo redesenhado. É o padrão da indústria para projetos e desenhos auxiliados por computador. Por esta razão é hoje o programa CAD mais sofisticado e flexível que pode ser adquirido no mercado para o uso num computador [5].

O AutoCAD trata cada entidade do desenho como um objeto. Dessa forma, existem vários objetos: uma linha, um arco, um texto, dentre outros. Assim, é possível ler o código DXF de cada objeto, pois para cada componente selecionado existem informações tais como: nome do componente, tipo, coordenada de inserção, tamanho, dentre outras. Baseado nesta característica é que o sistema foi desenvolvido.

Normalmente um grande número de pessoas utiliza o AutoCAD apenas para fins de desenho, tendo pouco convívio com manuais e leitura especializada. Na realidade, o AutoCAD possui um universo de recursos que acabam sendo pouco explorados como é o caso do AutoLISP.

Uma característica importante do AutoLISP que o torna muito interessante é a possibilidade de utilizar comandos que interagem diretamente com o AutoCAD. Através do AutoLISP pode-se construir programas que solicitem ao usuário determinadas informações, processem essas informações e interfiram sobre a área de trabalho do AutoCAD.

Para algumas áreas como a engenharia, por exemplo, esse recurso representa um grande potencial. Pode-se obter informações estratégicas a partir do desenho que permitirão calcular e definir outros elementos que podem ser desenhados automaticamente. Assim, o usuário pode começar um desenho e assistir a conclusão dele numa velocidade bem maior do que se conseguiria fazendo a mesma tarefa manualmente. Com o conhecimento do AutoLISP tornam-se inúmeras as possibilidades de melhoria de performance num projeto.

Com base nessas características, utilizou-se o AutoLISP para implementar funções com a finalidade de gerar o quadro de cargas, lista de materiais, diagrama unifilar, inserção de componentes, desenho dos eletrodutos e cálculo do comprimento dos eletrodutos de um projeto elétrico em baixa tensão desenhado no AutoCAD.

A interface do sistema foi desenvolvida a partir da programação DCL. Pode se dizer que a linguagem DCL é um complemento do AutoLISP ou, ainda, é possível considerar que a linguagem DCL é a ferramenta que gera a interface de um AutoLISP, possibilitando ao usuário implementar interfaces próprias podendo assim fornecer aos elementos personalizados a mesma aparência e facilidade de uso existentes no formato de quadro de diálogo do AutoCAD.

Interface do ELE-PROJ

O ELE-PROJ foi incorporado à interface do AutoCAD, sendo que foram acrescentadas uma abertura no menu superior e uma barra de tarefas, conforme pode ser observado nas Figura 2 e 3, respectivamente.

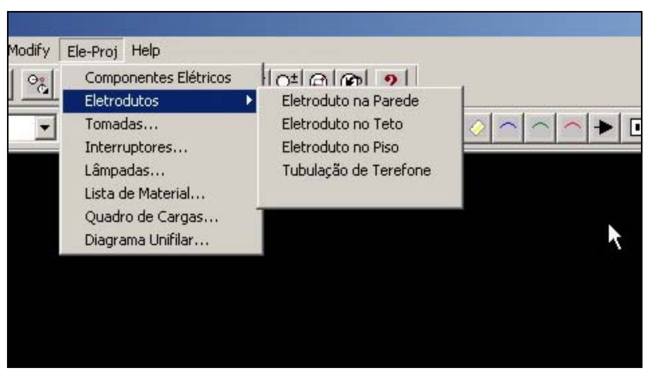

FIGURA 2
MENU SUPERIOR.

As caixas de diálogo, programadas em DCL, são chamadas toda vez que uma função LISP é executada. Conforme exposto em [6], deve-se evitar caixas de diálogos muito complexas e com muitas variáveis, pois a probabilidade de erros aumenta muito. Com base nisso, foi evitado o excesso de caixas de diálogo.

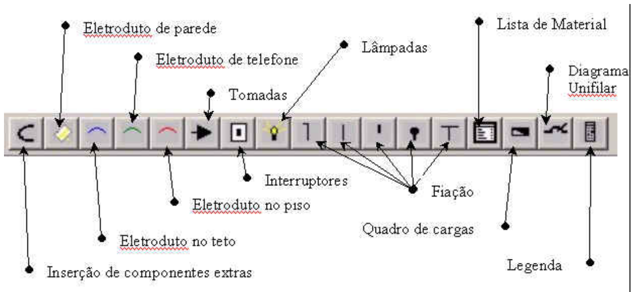

FIGURA 3
BARRA DE TAREFAS.

A Figura 4 apresenta uma das caixas de diálogo do ELE-PROJ.

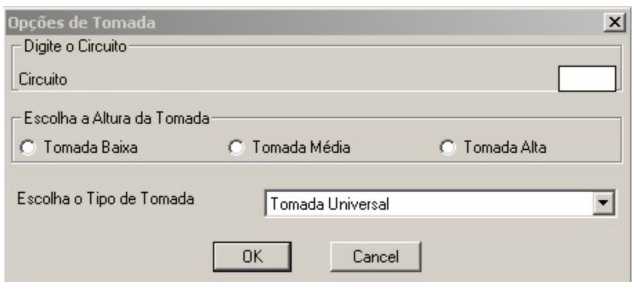

FIGURA 4
CAIXA DE DIÁLOGO PARA INSERÇÃO DE TOMADAS.

FUNCIONAMENTO DO ELE-PROJ

O ELE-PROJ é executado automaticamente com a inicialização do AutoCAD no microcomputador em que ele estiver instalado. Dessa maneira, parte-se do principio que é preciso obter o projeto arquitetônico para, a partir daí, iniciar os procedimentos do desenho de um projeto elétrico em baixa tensão. Na maioria das vezes o projeto arquitetônico já está em um arquivo do AutoCAD, o que facilita o trabalho.

Para usar o ELE-PROJ o usuário deverá ter conhecimentos sobre o ambiente de trabalho do AutoCAD, nem tanto pelo ELE-PROJ que é um sistema simples quanto à utilização, mas devido ao fato de que o arquivo referente a um projeto arquitetônico contém muitas informações desnecessárias para o projeto elétrico devendo-se proceder à eliminação dos mesmos.

A Figura 5 mostra a planta baixa de um projeto arquitetônico padrão pronta para o início do desenho do projeto elétrico.

O próximo passo para o desenho de um projeto elétrico em baixa tensão é o lançamento dos componentes. Efetua-se logo em seguida o lançamento dos eletrodutos/condutores. Dessa forma, o projeto já está quase preparado para que seja possível gerar os cálculos e quantitativos de forma automática, o que por sinal se constitui no ponto forte do sistema ELE-PROJ. Nesses quantitativos é que se torna possível mostrar todo o potencial da programação em AutoLISP.

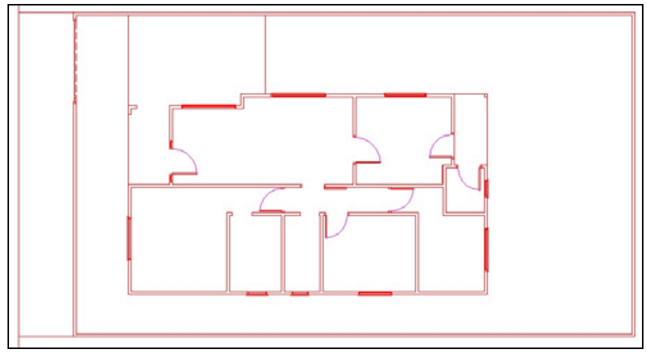

FIGURA 5
PLANTA BAIXA PREPARADA PARA A INICIAÇÃO DO DESENHO DE UM PROJETO ELÉTRICO.

A Figura 6 mostra, em ampliação de parte da planta baixa, o lançamento dos fios sobre dois dormitórios e suas chegadas ao quadro de cargas.

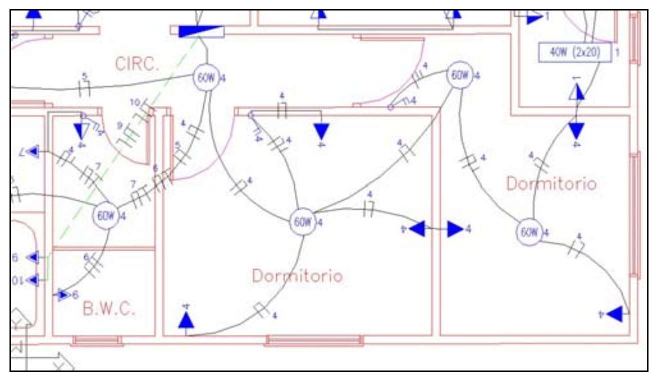

FIGURA 6
LANÇAMENTO DA FIAÇÃO.

Após o lançamento dos fios é possível gerar os quantitativos, ou seja, a lista de materiais, o quadro de cargas e o diagrama unifilar - Figuras 7, 8 e 9 respectivamente.

DIAGRAMA UNIFILAR.

VALIDAÇÃO E TESTES

Obteve-se um ótimo resultado tendo como referencial nos testes o tempo de trabalho com e sem o sistema ELE-PROJ. O trabalho que levaria de 5 a 7 horas para ser executado – neste caso o projeto apresentado na seção de funcionamento do ELE-PROJ, no ambiente do AutoCAD e sem qualquer ferramenta específica - foi concluído em apenas 1 hora e 30 minutos, tendo assim um excelente ganho de produtividade.

A Tabela 1 contém dados coletados quando foram feitos os testes do sistema ELE-PROJ. Para que se pudesse ter uma idéia exata de horas de trabalho de um determinado projeto foram colocadas as metragens quadradas de cada projeto testado.

TABELA 1
COLETA DE DADOS DOS TESTES DO ELE-PROJ.

Projeto	Horas Trabalhadas sem o ELE-PROJ	Horas Trabalhadas com o ELE-PROJ	m2
Casa 1	08:00	01:50	97,56
Casa 2	09:30	02:30	115,23
Casa 3	07:10	01:30	73,15
Casa 4	10:00	02:55	134,87
Casa 5	09:20	01:45	92,45
Casa 6	10:00	02:40	124,67

Os testes foram feitos em 6 projetos de casas já executados e devidamente aprovados, onde se obteve uma produtividade muito grande com significativa redução da carga horária gasta no desenvolvimento dos projetos – conforme Tabela 1 - pois o que toma tempo é o lançamento dos componentes, sendo que este dependente do usuário. Já os quantitativos estão completamente automatizados, sendo este o maior ganho de produtividade no projeto.

CONCLUSÃO

Considera-se que o ELE-PROJ é um excelente sistema de auxílio para elaboração de projetos elétricos em baixa tensão que pode ser usado por engenheiros, arquitetos, professores e alunos, pois é acessível até mesmo para usuários com pouca experiência em AutoCAD.

O AutoLISP permite muito mais otimizações de serviços e tarefas, mas ressalta-se que esse projeto está em fase inicial de desenvolvimento.

Finalmente, não se tem a pretensão de transformar o ELE-PROJ na solução definitiva para a elaboração de projetos elétricos em baixa tensão porque ele visa apenas auxiliar o projetista nas suas tarefas de desenho. A análise criteriosa dos resultados, feita pelo engenheiro eletricista, é indispensável para o resultado final do projeto.

O CONCEITO DE GRADUAÇÃO MODULADA E SUA IMPLEMENTAÇÃO EM UM CURSO DE CIÊNCIA DA COMPUTAÇÃO

Roberto Ferrari[1]*, André Luiz Battaiola*[2] *e Patrícia Dátilo*[3]

Abstract *— A Universidade Anhembi-Morumbi adota em todos os seus cursos o conceito de Graduação Modulada, que possibilita ao aluno obter, de forma integrada, dois ou três diplomas de nível superior: diploma de Curso Superior de Formação Específica ao final dos dois primeiros anos, diploma de Curso Superior de Tecnologia ao final de três anos, e diploma de Bacharel ao final de quatro ou cinco anos. Este artigo apresenta o conceito de Graduação Modulada, analisa as questões pertinentes a sua adoção em um plano pedagógico de um curso de Ciência da Computação - a luz da LDB, dos critérios de avaliação estabelecidos pelo INEP e das diretrizes curriculares da SBC de 1999 - e apresenta os resultados preliminares da implantação da Graduação Modulada no curso de ciência da computação da Universidade Anhembi-Morumbi.*

Index Terms — *Ciência da Computação, Cursos Superiores de Formação Específica, Grade Curricular, Graduação Modulada.*

CONCEITO DE GRADUAÇÃO MODULADA

A Graduação Modulada é um conceito de ensino superior que propicia ao aluno a oportunidade de adquirir, de forma integrada, dois ou três diplomas de nível superior - diploma de Curso Superior de Formação Específica (ao final dos dois primeiros anos), diploma de Curso Superior de Tecnologia (ao final de três anos em média) e diploma de Bacharel (ao final de quatro ou cinco anos).

A motivação para a Graduação Modulada é possibilitar ao aluno:

- ingressar no ensino superior sem ficar limitado a um curso de graduação específico, podendo migrar de um curso para outro, aproveitando ao máximo as disciplinas já cursadas;
- ingressar mais rapidamente no mercado de trabalho a partir da capacitação mínima necessária para o exercício de atividades profissionais específicas;
- educação continuada para sua atualização profissional constante;
- suprir suas demandas pessoais por conhecimentos, permitindo-lhe, na sua formação, selecionar as disciplinas mais adequadas ao seu desenvolvimento profissional específico.

A Graduação Modulada é implementada a partir da integração curricular entre cursos de graduação regulares (quatro ou cinco anos de duração) com cursos de formação específica ou de tecnologia (dois anos de duração). Naturalmente, os cursos a serem integrados precisam ser de áreas afins pois o que possibilita a integração curricular é a convergência das áreas do conhecimento ou, na prática, a oferta de disciplinas comuns a vários cursos.

A Figura 1 ilustra, de forma simplificada, o conceito de Graduação Modulada. Ao término de dois anos o aluno completa o primeiro módulo da Graduação Modulada, e recebe um diploma de Curso Superior de Formação Específica (CSFE). Espera-se que neste momento o aluno esteja apto a entrar no mercado de trabalho, se assim desejar ou necessitar. As disciplinas que o aluno cursou nos dois primeiros anos, para o Curso Superior de Formação Específica, compõem também o currículo do curso de graduação regular, de quatro anos (Bacharelado). Assim o aluno tem a possibilidade de continuar estudando por mais dois anos para concluir o seu Bacharelado.

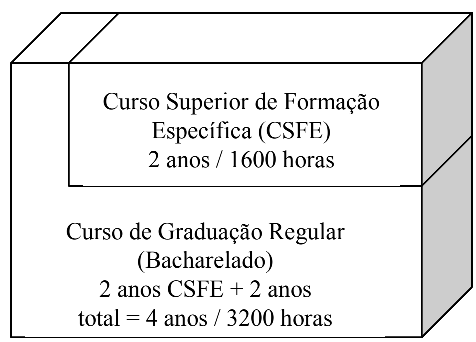

FIGURA. 1
CONCEITO DE GRADUAÇÃO MODULADA.

Uma segunda possibilidade é o aluno optar por um dentre dois ou mais cursos de Formação Específica e então prosseguir por mais dois anos e obter também o Bacharelado. Nestes casos, ambos os cursos de Formação Específica são integrados ao Bacharelado através de conjuntos distintos de disciplinas eletivas. Nos dois

© 2003 ICECE

primeiros anos o aluno precisa cursar apenas um dos dois conjuntos de eletivas (ou seja, o aluno precisa concluir apenas um dos dois Cursos Superiores de Formação Específica) para continuar por mais dois anos e concluir o Bacharelado, como mostra a Figura 2.

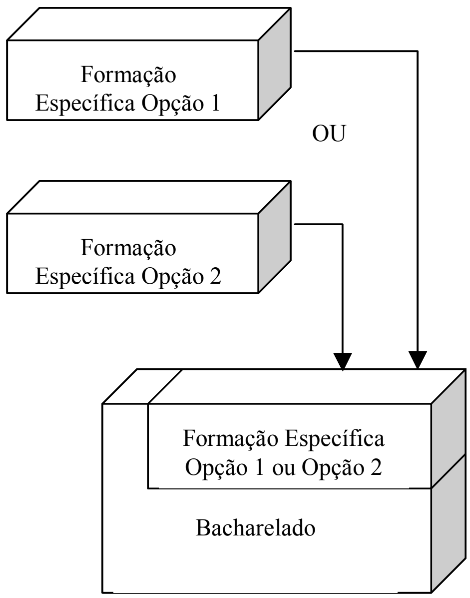

FIGURA. 2
DUAS OPÇÕES PARA CURSOS SUPERIORES DE FORMAÇÃO ESPECÍFICA.

Existe também a possibilidade de implementação de Cursos Superiores de Tecnologia integrados aos dois últimos anos do Bacharelado. Assim como no caso dos Cursos Superiores de Formação Específica, as disciplinas são integradas às disciplinas do Bacharelado. No caso de existirem dois ou mais Cursos Superiores de Tecnologia, a opção do aluno por um desses cursos significa, no Bacharelado, a opção por um dentre dois conjuntos de eletivas.

A integração entre cursos é possibilitada por uma estrutura curricular planejada cuidadosamente, na qual as disciplinas são organizadas em grupos bem definidos. Todos os cursos de graduação, regulares ou de curta duração, têm em suas grades curriculares disciplinas classificadas como:

- **Disciplinas de Fundamentação Geral – FDG.** São disciplinas que compõem o núcleo comum a todos os cursos da Universidade e visam a formação humanista ao aluno. Este núcleo tem carga horária de 400 horas, distribuídas nas disciplinas Comunicação e Expressão, Metodologia Científica, Filosofia, Ciências Sociais e Psicologia;
- **Disciplinas de Fundamentação da Área – FDA.** São disciplinas comuns a vários cursos de uma mesma área do conhecimento (como exatas, humanas, negócios e saúde), que oferecem base teórica e prática para as disciplinas profissionalizantes. Em todos os cursos nos quais são oferecidas, essas disciplinas têm conteúdos iguais, a mesma nomenclatura, carga horária e ementa. Quando possível, são oferecidas nos mesmos períodos das grades curriculares;
- **Disciplinas Eletivas da Formação Específica - ELFE.** São as disciplinas que definem o Curso Superior de Formação Específica. O bloco é composto por até 5 disciplinas, compondo um máximo de 400 horas-aula, dependendo da concepção de cada curso. Essas disciplinas são obrigatórias na Formação Específica, e também compõem o currículo pleno do curso de Graduação Regular; e
- **Disciplinas de Formação Profissional da Graduação – FPRG**. São as disciplinas que definem a formação profissional do aluno e completam a composição do currículo pleno da Graduação Regular.

Como mostra a Figura 3, nos dois primeiros anos os alunos cursam as disciplinas FDG (Fundamentação Geral), que fazem parte do currículo dos Cursos Superiores de Formação Específica (CSFE), do currículo da Graduação Regular e também do currículo de qualquer curso superior da Universidade. Também nos dois primeiros anos o aluno cursa as disciplinas FDA (Fundamentação da Área), que também compõem ambos os CSFE, a Graduação Regular, e currículos de outros cursos na mesma área (exatas, negócios, humanas ou saúde). As disciplinas ELFE fazem parte de um dos CSFE e da Graduação Regular. Nos dois últimos anos o aluno cursa as disciplinas FPRG para concluir a Graduação Regular. Outras classes de disciplinas, omitidas da Figura 3 para simplificação, são ELTC (Eletivas da Tecnologia), ELGR (Eletivas da Graduação), além das Atividades Complementares.

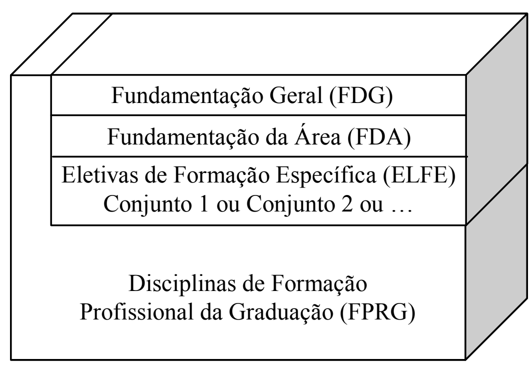

FIGURA. 3
CLASSES DE DISCIPLINAS.

FUNDAMENTAÇÃO LEGAL

Graduação modulada não é algo usual no ensino superior no Brasil. Assim, para que a sua adoção não infrinja normas e critérios estabelecidos, três documentos devem ser considerados: a LDB, a proposta de diretriz curriculares elaborada pela SBC em 1999 e em exame no CNE e o relatório do sistema de avaliação de cursos de Bacharelado em Ciência da Computação (BCC) definido pelo INEP.

Lei de Diretrizes e Bases da Educação

O Art. 208, parágrafo V da Constituição Federal [1] explicita que o Estado deve garantir *acesso aos níveis mais elevados do ensino, da pesquisa e da criação artística**, segundo a capacidade de cada um***. Ao analisar a nova LDB [5], com a finalidade de fundamentar o Parecer CES/CNE 968/98 [6], do qual emanou a Resolução Nº 1, de 27 de janeiro de 1999 [7], que regulamentou os cursos seqüenciais, o então Conselheiro da Câmara de Educação Superior do Conselho Nacional de Educação, Jacques Velloso, comentou que a *"redação dada ao art. 44 deve ser interpretada à luz do diapasão que prevalece na maioria dos demais dispositivos do novo diploma legal. Ao leitor atento não escapará a preocupação do legislador com a flexibilidade de que devem gozar os sistemas de ensino e as instituições, em suas formas de organização e modos de atuar. O princípio da flexibilidade reflete-se tanto na letra como no espírito da Lei. Pode ser notado em várias de suas determinações, que freqüentemente admitem mais de uma forma para seu cumprimento, assim como no caráter aberto, intencionalmente inacabado que transparece em diversos de seus dispositivos. A nova figura dos cursos seqüenciais é elemento típico desse espírito...*" [6] (p.2).

Conselheiro argumenta também que "deve-se ter sempre presente que uma pessoa pode realizar vários cursos seqüenciais ao longo da sua vida. Insere-se, assim, na educação continuada de terceiro grau" [6] (p 8). Finalmente, no mesmo parecer, o Conselheiro conclui que "nas instituições onde os cursos de graduação forem oferecidos de forma modular, os diferentes módulos poderão vir constituir e serem ofertados como cursos superiores de formação específica, caso sejam concebidos para tanto, ampliando assim a flexibilidade da oferta destes" [6] (p 12).

Em função deste parecer a Câmara de Ensino Superior/Conselho Nacional de Educação do MEC aprovou a Resolução Nº 1 de 27 de janeiro de 1999 [7], homologada pelo Ministro Paulo Renato, regulamentando os cursos seqüenciais com duração mínima de 1600 horas e 400 dias letivos.

A LBD – Lei 9394/96 [5] prevê a oferta de educação profissional, conduzindo ao permanente desenvolvimento de aptidões da vida produtiva. O Parecer CNE/CES 436/01 [8], homologado pelo Ministério da Educação em 06/04/01 trata da oferta dos Cursos Superiores de Tecnologia, voltados para áreas de uso intenso de tecnologias e permitindo uma formação especializada em consonância com as necessidades do mercado de trabalho em áreas como lazer, gestão, saúde, agropecuária, indústria, construção civil e outras. Os Cursos Superiores de Tecnologia se pautam pela flexibilidade na oferta e na organização curricular, com duração variável de 1600 a 2400 horas, conforme a área.

Critérios de Avaliação do INEP

O INEP, através de um processo denominado Avaliação das Condições de Ensino, verifica, *in loco*, a situação dos cursos de graduação, levando em conta três grandes dimensões: 1) a Organização Didático-Pedagógica, 2) a Qualificação do Corpo Docente e 3) as Instalações Físicas, com ênfase na biblioteca. Realizada por uma comissão de professores, a avaliação é um instrumento utilizado pelo Ministério da Educação para reconhecer ou renovar o reconhecimento de um curso.

A graduação modulada afeta a dimensão 1, Organização Didático-Pedagógica, a qual se subdivide em três categorias: 1.1) Administração-Acadêmica, 1.2) Projeto do Curso e 1.3) Atividades Acadêmicas articuladas ao Ensino de Graduação. Destas, somente a categoria 1.2 é afetada substancialmente pela graduação modulada. Neste contexto, os parâmetros de avaliação se relacionam essencialmente com a coerência entre a concepção do curso (objetivos e perfil do egresso), a grade curricular e o sistema de avaliação. Assim, se a graduação modulada estiver obedecendo esta coerência, o processo de avaliação do INEP não deve constituir um obstáculo para a aprovação do curso.

Diretrizes Curriculares para Computação e Informática

As diretrizes curriculares definem os princípios, fundamentos, condições e procedimentos da formação de um determinado egresso.

Como mencionado anteriormente, os cursos de BCC não possuem ainda uma diretriz curricular aprovada pelo CNE, dado que a proposta elaborada pelo SBC em 1999 ainda se encontra em exame neste conselho.

A diretriz proposta pela SBC define um perfil para o egresso em BCC baseado em quatro categorias de cursos para a área de computação: 1) os cursos que têm predominantemente a computação como atividade fim; 2) como atividade meio; 3) os cursos de Licenciatura em Computação e 4) os Cursos de Tecnologia (cursos seqüenciais). Sendo BCC e Engenharia de Computação considerados como cursos onde computação é atividade fim, a SBC planejou estes cursos como aqueles onde o aluno deve ter uma forte formação teórica em conceitos considerados como fundamentais da área. A exposição destes conceitos obedece a uma sequência pouco flexível, em especial nos dois primeiros anos de curso, o que dificulta a elaboração de grades curriculares radicalmente diferenciadas das convencionais. Esta questão é o ponto central para se incorporar o conceito de graduação modulada a um curso de BCC, o que é tratado a seguir.

GRADUAÇÃO MODULADA NO BACHARELADO EM CIÊNCIA DA COMPUTAÇÃO DA UNIVERSIDADE ANHEMBI MORUMBI

A Graduação Modulada é um conceito que faz parte do plano pedagógico institucional da Universidade Anhembi Morumbi. Cursos como os bacharelados em Administração, Comunicação Social, Turismo e Moda são integrados a três ou quatro áreas alternativas para a Formação Específica nos dois primeiros anos. Outros cursos como o Bacharelado em Economia e Bacharelado em Marketing possuem uma única alternativa para a Formação Específica, como mostra a Tabela 1 [4].

O conceito de Graduação Modulada foi implementado no curso de BCC da Universidade Anhembi Morumbi no ano de 2002, a partir de uma reestruturação curricular. Um dos objetivos fundamentais da reestruturação curricular era implementar a Graduação Modulada, garantindo-se o respeito aos critérios do de avaliação do INEP [2] e às Diretrizes Curriculares [3].

TABELA I
EXEMPLOS DA INTEGRAÇÃO ENTRE BACHARELADOS E CURSOS SUPERIORES DE FORMAÇÃO ESPECÍFICA NA UNIVERSIDADE ANHEMBI MORUMBI

Bacharelado	Alternativas para a Formação Específica nos Dois Primeiros Anos
Administração	Gestão e Planejamento Financeiro
	Gestão e Planejamento de Marketing e Vendas
	Gestão de Sistemas Administrativos e Tratamento da Informação
Economia	Análise de Indicadores Socioeconômicos
Marketing	Gestão e Planejamento de Marketing e Vendas
Turismo	Gestão Hoteleira
	Organização e Gestão de Eventos
	Gestão dos Negócios de Viagens e Turismo
	Planejamento de Marketing Turístico
Comunicação Social	Criação de Roteiros para Produções
	Gestão de Comunicação Empresarial
	Pesquisa de Mercado
Moda	Criação e Desenvolvimento de Produto de Moda
	Merchandising, Comunicação Visual e Vitrinismo
	Produção de Moda
	Varejo de Moda

A Escolha do Tema para a Formação Específica

As Diretrizes Curriculares [3] recomendam, para cursos de BCC, uma formação sólida nos fundamentos da computação (algoritmos, programação, arquitetura de computadores, matemática). As disciplinas que tratam esses fundamentos são classificadas como sendo da área de formação Básica. Além dos fundamentos da computação os BCCs precisam oferecer disciplinas nas áreas de formação Tecnológica (engenharia de software, banco de dados, redes de computadores), Complementar (administração, negócios ou outras áreas) e Humanística (ética, sociologia, empreendedorismo).

Para cumprir as orientações das Diretrizes, na área de formação Básica não há muita flexibilidade em termos de seleção de disciplinas e carga horária. Além disso, há uma indicação implícita ("fundamentos", formação "básica") de que este conjunto de disciplinas deve ser oferecido antes das disciplinas que compõem as outras áreas de formação. Nas áreas de formação Tecnológica, Complementar e Humanística o espaço para alterações em função da vocação institucional ou outros fatores é maior.

O processo de reestruturação curricular para implantação do conceito de Graduação Modulada no BCC iniciou com a identificação de três alternativas quanto ao foco do Curso Superior de Formação Específica – CSFE – que seria integrado aos dois primeiros anos do Bacharelado:

- Foco em algum tema específico da área de formação tecnológica, como redes de computadores, por exemplo;
- Foco em algum tema multidisciplinar, como multimídia ou design de jogos;
- Foco em algum tema da área de formação Básica, como algoritmos e programação.

Sendo a Formação Específica implantada nos dois primeiros anos do Bacharelado, a primeira alternativa para o tema do CSFE (redes de computadores) foi descartada pois implicaria em uma alteração na seqüência lógica das disciplinas do Bacharelado. Disciplinas da área de formação Tecnológica (como Redes de Computadores) precisariam ser oferecidas antes de algumas das disciplinas da área de formação Básica (Matemáticas, Arquitetura de Computadores, Programação).

A segunda alternativa (temas multidisciplinares como Multimídia, Design de Jogos) seria a mais apropriada para a oferta em paralelo de duas ou mais opções de temas para a Formação Específica, porém também foi descartada pelo inconveniente de "empurrar" disciplinas básicas do Bacharelado para os dois últimos anos.

A estratégia adotada foi a terceira alternativa – um tema da área de formação Básica – e o tema escolhido foi Desenvolvimento de Software. Esse tema não implicaria em uma alteração significativa na seqüência "natural" para as disciplinas do Bacharelado. Porém, esse tema não possibilita a oferta de duas ou mais "opções" para a Formação Específica nos dois primeiros anos. As disciplinas que compõem a formação em Desenvolvimento de Software são obrigatórias para o Bacharelado. Não seria cabível dar ao aluno a opção de escolher entre Desenvolvimento de Software e um outro tema.

Curso Superior de Formação Específica em Desenvolvimento de Software

As disciplinas que caracterizam a formação em Desenvolvimento de Software nos dois primeiros anos são:

- 1º semestre: Introdução à Ciência da Computação; Construção de Algoritmos;
- 2º semestre: Programação de Computadores I;
- 3º semestre: Estruturas de Dados; Programação de Computadores II;
- 4º semestre: Programação Avançada; Banco de Dados; e Pesquisa, Ordenação e Técnicas de Armazenamento.

O objetivo da disciplina Construção de Algoritmos é capacitar o aluno no desenvolvimento de algoritmos. Em paralelo – e de forma integrada - o aluno cursa a disciplina Introdução à Ciência da Computação, que inclui aulas de programação em laboratório, levando o aluno a implementar algoritmos em uma linguagem de programação. Ambas as disciplinas são oferecidas no primeiro semestre. No segundo semestre o aluno aumenta suas habilidades em programação através da disciplina Programação de Computadores II. Estruturas de Dados e Pesquisa, Ordenação e Técnicas de Armazenamento, no terceiro e quarto semestres, apresentam ao aluno conceitos sobre armazenamento e manipulação de dados em algoritmos e programas. A disciplina Programação Avançada é administrada de forma integrada à disciplina Banco de Dados. Juntas, essas disciplinam capacitam os alunos ao desenvolvimento de aplicações de software, a partir de linguagens visuais, conexas a bancos de dados implementados em sistemas de gerenciamento de banco de dados – tecnologia adotada em boa parte dos produtos comerciais de software hoje em dia.

Nos dois primeiros anos o aluno está capacitado ao desenvolvimento de software com produtos e conceitos tecnológicos utilizados comercialmente. A capacitação precoce do aluno, associada à credibilidade outorgada pelo diploma de Formação Específica em Desenvolvimento de Software, facilita e antecipa seu ingresso no mercado de trabalho. Assim, a implementação da Graduação Modulada cumpre a meta de oferecer mecanismos para antecipar o tanto quanto possível o ingresso dos alunos no mercado de trabalho da área de computação, sem abrir mão da solidez e abrangência de sua formação.

Bacharelado em Ciência da Computação

Nos dois últimos anos, além de disciplinas em outras áreas do conhecimento, o aluno cursa disciplinas que complementam sua formação em Desenvolvimento de Software. As disciplinas Engenharia de Software e Projeto de Sistemas de Informação fornecem ao aluno conceitos sobre o desenvolvimento de produtos de software, possivelmente no contexto de sistemas de informação. As disciplinas Introdução à Teoria dos Grafos, e Computabilidade e Análise de Algoritmos fornecem aos alunos condições de amadurecer suas habilidades relativas ao desenvolvimento de software através de uma visão formal e analítica do tema. A disciplina optativa Tópicos em Programação e Linguagens permite, aos alunos que se dispuserem a cursá-la, o estudo ou atualização em conceitos, técnicas e produtos emergentes na área. Assim, nos dois últimos anos o aluno complementa sua formação em desenvolvimento de software, aproveitando integralmente a formação dos dois primeiros anos, e possivelmente a experiência profissional resultante do ingresso precoce do aluno no mercado de trabalho.

CONCLUSÕES

Um dos resultados da implantação da Graduação Modulada é a flexibilização curricular, o que permite ao aluno migrar de um curso para outro aproveitando ao máximo as disciplinas já cursadas. Essa possibilidade de escolha transfere ao aluno a responsabilidade sobre suas escolhas profissionais. A flexibilização curricular ocorre por meio da adoção de disciplinas de fundamentação geral comuns a todos os cursos, disciplinas básicas de tronco comum a uma mesma área do conhecimento (exatas, negócios, etc.), e através da cuidadosa integração dos currículos de cursos superiores de curta duração com currículos de cursos de graduação de maior duração (Bacharelados).

O conceito de Graduação Modulada foi implementado no âmbito do curso de BCC da Universidade Anhembi Morumbi através da integração de seu currículo com o de um Curso Superior de Formação Específica em Desenvolvimento de Software. A escolha do tema Desenvolvimento de Software foi motivada, principalmente, por preservar a seqüência "natural" das disciplinas do Bacharelado, segundo o recomendado pelas Diretrizes Curriculares.

As disciplinas dos dois primeiros anos do Bacharelado se equivalem às disciplinas necessárias para a conclusão da Formação Específica em Desenvolvimento de Software. Nos dois primeiros anos o aluno está capacitado ao desenvolvimento de software com produtos e conceitos tecnológicos utilizados comercialmente. A capacitação precoce do aluno, associada à credibilidade outorgada pelo diploma de Formação Específica em Desenvolvimento de Software, facilita e antecipa seu ingresso no mercado de trabalho, sem abrir mão da solidez e abrangência de sua formação.

Embora um único curso de Formação Específica tenha sido integrado ao Bacharelado, a estrutura curricular desenvolvida permite a integração de novas opções, sobretudo aos dois últimos anos do curso, aumentando ainda mais as possibilidades para o aluno compor o seu próprio currículo, segundo sua vocação, maturidade e interesses, preparando-o para uma formação profissional continuada.

AVALIAÇÃO TEMPORAL DOCENTE ATRAVÉS DE QUESTIONÁRIOS COM ESCALAS NÃO-NUMÉRICAS

Fabiana Queiroga[1] e Ronei Marcos de Moraes[2]

Resumo — *Diversos são os estudos na literatura que buscam compreender o processo de aprendizagem bem como os métodos mais adequados de avaliação da mesma. Assim, o presente trabalho apresenta a proposta do uso de escalas não-numéricas como instrumento para avaliar o conhecimento transmitido pelo professor e a receptividade deste por parte dos alunos. Para tanto é apresentada a evolução temporal de um docente no decorrer de uma disciplina ou nas diversas vezes que leciona esta disciplina, conforme respostas fornecidas por alunos que utilizaram a escala não-numérica. Através dos resultados pôde-se verificar a estabilidade do comportamento do docente durante as várias vezes que ministrou a disciplina, permitindo observar a eficácia da utilização dos questionários com escalas não-numéricas visto que com uso destas escalas o índice de respostas válidas ficou muito próximo a 100%, fato que pode ser atribuído a maior liberdade do sujeito para expressar suas respostas.*

Palavras-Chave — Escalas não-numéricas, aprendizagem, comportamento docente, evolução temporal.

INTRODUÇÃO

No âmbito acadêmico, diversas são as discussões a respeito da maneira mais adequada de avaliar o desempenho do estudante como também a qualidade de tais avaliações. Apesar das práticas docentes não serem condizentes com esta preocupação, a literatura tem apontado vários estudos que caminham no sentido de melhor compreender o processo de aprendizagem bem como os seus métodos de mensuração [3, 4, 1, 11].

De acordo com Luckesi [3, p.33], a avaliação constitui-se "num processo de julgamento de valor sobre manifestações relevantes da realidade, tendo em vista uma tomada de decisão". No caso da avaliação da aprendizagem, essa tomada de decisão se refere à decisão do que fazer com o aluno frente a sua manifestação de aprendizagem, seja ela satisfatória ou não. De acordo com este autor, quando se omite esta tomada de decisão o ato de avaliar tem seu ciclo constitutivo incompleto. Todavia, há também que se ressaltar que as práticas docentes em sala de aula estão diretamente relacionadas com a quantidade e principalmente com a qualidade da aprendizagem apreendida pelos alunos.

Outros estudos têm sido realizados nessa linha na tentativa não apenas de compreender a postura do professor em sala de aula, mas também de avaliar o conhecimento transmitido pelo docente e a receptividade deste por parte dos alunos [ver 5, 6, 7, 10,]. Trata-se de estudos menos preocupados com os aspectos sociais da aprendizagem e mais voltados para uma discussão sobre um instrumento alternativo de avaliação deste construto.

No trabalho realizado por Moraes [5], este tema é abordado a partir da utilização do modelo de Questionário com Respostas em Escalas Não-numéricas. Diferente dos questionários convencionais que utilizam questões fechadas que não necessariamente contemplam a realidade do aluno, este modelo de questionário visa analisar o comportamento do professor dentro e fora da sala de aula através das repostas fornecidas pelos alunos para os quais eram ministradas as aulas. Para manter a fidedignidade de tais respostas foram instituídas perguntas de "cheque" com relação à ementa, freqüência do aluno, interesse pela disciplina, entre outras.

Neste trabalho são apresentadas algumas alternativas para o uso da escala não-numérica: fazer uma análise pergunta a pergunta do questionário, utilizando uma turma de cada vez; trabalhar uma turma em dois momentos diferentes ou em duas ou mais turmas fazendo uma comparação entre elas das respostas obtidas nas questões.

Visando contribuir para a melhoria do ensino no âmbito acadêmico, o presente estudo procura analisar como o professor transmite o conhecimento em sala de aula e a receptividade deste por parte dos alunos, apresentando para tanto a evolução temporal de um docente no decorrer de uma disciplina (ou seja, dentro da turma), bem como nas diversas vezes que leciona esta disciplina (ou seja, entre as turmas), acordo com as respostas obtidas com os alunos, através do uso de uma escala não-numérica [5].

INSTRUMENTO

O instrumento utilizado para a realização deste estudo foi o Questionário com Escalas Não-Numéricas proposto por Moraes [5], onde o comportamento do docente é analisado

[1] Fabiana Queiroga, Departamento de Psicologia, Universidade Federal da Paraíba, Cidade Universitária s/n CEP 58.051-900 João Pessoa – PB - Brasil, tel.: +55 83 216-7006, fabianaq@yahoo.com
[2] Ronei Marcos de Moraes, Departmento de Estatística, Universidade Federal da Paraíba, Cidade Universitária s/n CEP 58.051-900 João Pessoa – PB - Brasil, tel.: +55 83 216-7075, ronei@de.ufpb.br

dentro e fora da sala de aula partindo das respostas dadas pelos alunos. Além do comportamento do professor são enfocados também alguns comportamentos dos alunos.

O questionário é composto ao todo por 21 questões, sendo 13 delas respondidas numa escala fixa possuindo 8cm de comprimento onde o aluno expressa a resposta que melhor condiz com a sua realidade. Conforme o que mostra Figura 1 [5], as repostas próximas a "zero" são as entendidas como a Atitude Fortemente Positiva ao passo que a pontuação máxima expressa a Atitude Fortemente Negativa. As demais perguntas seguem o padrão de múltipla escolha ou de resposta aberta.

|---|

Atitude Fortemente Positiva — Atitude Fortemente Negativa

FIGURA. 1

O TIPO DE ESCALA UTILIZADO, COM AS EXTREMIDADES DO SEGMENTO DE RETA IDENTIFICADOS RESPECTIVAMENTE, COMO UMA ATITUDE POSITIVA E ATITUDE NEGATIVA POR PARTE DO PROFESSOR.

AMOSTRA

Os alunos que participaram deste estudo pertenciam às turmas da disciplina de Estatística IV onde eram ministradas aulas por um mesmo professor sendo grande maioria dos alunos do curso de Psicologia da UFPB.

A coleta dos dados foi realizada em dois momentos para cada uma das três turmas consideradas neste estudo que foram: a turma da manhã do período 98.2 e do período 99.2 as turmas da manhã e noite. A referência que separa as coletas dos dados é a realização de uma prova, que no caso da turma da manhã do período 98.2 trata-se da primeira prova realizada na turma enquanto que nas demais a referência é a segunda das três provas realizadas.

Durante a primeira aplicação do questionário, participaram do estudo um total de 54 alunos distribuídos da seguinte forma: 26 pertencentes a turma da manhã do período 98.2, 15 alunos da turma da manhã e 13 da turma da noite, sendo ambas do período 99.2. Na segunda aplicação, a turma da manhã do período 98.2 teve a participação de 24 alunos, a turma da manhã do período 99.2 teve 15 alunos e a da noite 14, perfazendo um total de 53 estudantes.

PROCEDIMENTO

O próprio professor se encarregou da aplicação dos questionários e de passar as instruções de como respondê-lo. Ficou também a cargo deste esclarecer as eventuais dúvidas dos alunos e fazer as devidas observações.

A aplicação foi realizada coletivamente na sala onde ocorriam as aulas da disciplina Estatística IV. Os alunos foram avisados que seria dado início a uma coleta de informações sobre o que eles pensavam a respeito da disciplina visando um melhor andamento desta. Em média foi necessário um tempo de 20 minutos para que cada aluno respondesse o questionário por completo.

ANÁLISE E DISCUSSÃO DOS RESULTADOS

Procurando verificar o uso das escalas não-numéricas na aplicação de questionários, este estudo propõe-se observar a estabilidade do comportamento de um docente com o passar do tempo, segundo a opinião dos alunos para os quais ele ministra as aulas.

Visando um conhecimento mais amplo deste tipo de escala, ou seja, a escala não-numérica, foi verificada a estabilidade das respostas a respeito do comportamento do professor e dos alunos tanto entre as turmas quanto dentro delas. Para tanto fez-se necessário a utilização dos testes não-paramétricos de Kruskal-Wallis (para a análise entre as turmas) e o Teste de Postos Sinalizados de Wilcoxon para Dados Emparelhados (para a análise dentro das turmas) [12].

Para a realização das análises entre as turmas foi requerida a versão 8.0 do *SPSSSWIN* onde também foram gerados dos histogramas referentes a freqüência das repostas de cada turma. No entanto, não foi possível utilizar o mesmo programa para realizar as análises dentro das turmas, dado a particularidade deste tipo de análise. Visto que o número de questionários disponíveis para analisar a estabilidade dentro das turmas é inferior a 20, não pode ser feita a aproximação para a distribuição normal [2], que é realizada pelo programa *SPSSWIN*.

Portanto, o Teste de Postos Sinalizados de Wilcoxon para Dados Emparelhados teve sua execução realizada com o auxílio de uma planilha eletrônica de acordo com os métodos propostos pelo próprio Wilcoxon. A tabela utilizada para a verificação da estatística de prova *Vs* foi a Tabela H impressa no livro de Lehmann e D'Abrera [2].

A seguir são mostrados separadamente os resultados encontrados nas duas análises realizadas – entre as turmas e dentro delas, utilizando a questão 2.1. *O seu professor preocupa-se com seu desempenho na sala de aula?* para exemplificação.

ANÁLISE ENTRE AS TURMAS

Visto que os dados obtidos neste estudo são de amostras não-emparelhadas e o número das turmas é superior a dois, o teste mais adequado é o Teste de Kruskal-Wallis. A hipótese nula (H_0) a ser testada será a mesma em cada questão para as três turmas: de acordo com as respostas dadas pelos alunos, existe uma estabilidade de comportamento docente com o passar do tempo entre as três turmas analisadas; contra uma hipótese alternativa (H_1): não existe uma estabilidade de comportamento docente em pelo menos uma das turmas analisadas, segundo a opinião do alunado.

Portanto, a aceitação da hipótese nula não está vinculada à uma boa postura por parte do professor mas enfatiza apenas a *manutenção* do comportamento conforme as respostas obtidas pelos alunos. O nível de significância (designado pela letra grega α) utilizado foi fixado em 0,05 (5%) para as três turmas em todas questões.

Uma vez que a coleta dos dados foi realizada em dois momentos, a execução do teste de Kruskal-Wallis foi realizada tanto antes da prova tida como referência (que contou com um número de questionários de N = 54) como depois deste (N = 53). Para uma maior evidência do trabalho realizado, será exposto adiante os resultados encontrados em cada questão bem como os histogramas referentes à freqüência das respostas dos alunos em cada turma.

De acordo com o resultado mostrado na Tabela 1 sobre a realização do Teste de Kruskal-Wallis para a primeira aplicação, podemos observar que houve a aceitação da hipótese nula, ou seja, o professor manteve uma postura constante para esta questão nas três turmas em que ministrou a disciplina, segundo a opinião dos alunos.

TABELA 1
Resultado da primeira aplicação do Teste de Kruskal-Wallis para a questão 2.1

Turmas*	1	2	3	Total	Graus de Liberdade	Qui-Quadrado
Número de Observações	26	15	13	54	2	2,954
Postos Médios	28,85	30,70	21,12	-	-	-

* Os números 1,2 e 3 referem-se as turmas da manhã 98.2 e manhã e noite 99.2, respectivamente.

Embora as respostas não tenham apresentado rigorosa homogeneidade, não chegaram a se distanciar negativamente do ponto médio da escala, que seria de 4 cm.

As análises efetuadas para a segunda aplicação mostraram novamente a aceitação de H_0, ou seja, a opinião dos alunos sobre a preocupação do professor com desempenho deles é constante entre as três turmas também neste segundo momento Seguem os resultados na Tabela 2:

TABELA 2
Resultado da segunda aplicação do Teste de Kruskal-Wallis para a questão 2.1

Turmas*	1	2	3	Total	Graus de Liberdade	Qui-Quadrado
Número de Observações	24	15	14	53	2	2,825
Postos Médios	28,85	29,57	21,07	-	-	-

* Os números 1,2 e 3 referem-se as turmas da manhã 98.2 e manhã e noite 99.2, respectivamente.

ANÁLISE DENTRO DAS TURMAS

Outra maneira de observar a utilização das escalas não-numéricas é verificar a estabilidade das respostas dos alunos dentro das turmas. Para tanto, foi tomado como referência a aplicação de uma prova e feito o emparelhamento dos questionários obtidos *antes* com aqueles obtidos *depois* desta prova. No caso da primeira turma, a manhã do período 98.2, a prova considerada como referência foi a primeira realizada nesta turma e para as demais, a manhã e noite do período 99.2, a prova referenciada é a segunda das três realizadas nestas turmas.

O número total de questionários utilizados para a realização das análises em cada turma ficou distribuído da seguinte forma: 13 questionários para a turma da manhã do período 98.2, 9 para a turma da manhã do período 99.2 e para turma na noite deste mesmo período, 8 questionários.

Frente a esses fatos, julga-se que o teste mais adequado para efetuar as análises dos comportamentos do docente e dos discentes com o passar do tempo seria o Teste de Postos Sinalizados de Wilcoxon para Dados Emparelhados.

A hipótese nula (H_0)a ser testada será a mesma para as questões de cada uma das turmas: segundo a opinião dos alunos, existe uma estabilidade do comportamento docente na turma ora analisada após a realização da prova tida como referência; contra uma hipótese alternativa (H_1): não existe uma estabilidade de comportamento na turma ora analisada após a realização da prova tida como referência, segundo a opinião dos alunos. Também será fixado um nível de significância (designado pela letra grega α), para todas as questões nas três turmas, igual a 5%. Adiante seguem os resultados encontrados na questão 2.1 para cada uma das turmas.

De acordo com o que é apresentado na Tabela 3, os alunos da turma da manhã do período 98.2 não apresentaram respostas constantes com o passar do tempo, corroborando dessa forma, na rejeição da hipótese nula.

TABELA 3
Resultado do Teste de Wilcoxon para a turma da manhã de 98.2 para a questão 2.1

Depois – Antes*	1	2	3	Total de observações	Vs**
Número de Observações	1	10	2	13	0,0002
Soma dos Postos	1	90	-	-	-

Nota: * Os números 1, 2 e 3 referem-se aos postos negativos, positivos e o número de empates, respectivamente
** Baseado nos postos negativos

Como se pode observar, no total das 13 observações obtidas nesta turma, houve dois postos empatados com sinal positivo. O que se pode inferir a partir destes resultados é que os alunos desta turma mudaram de opinião sobre a preocupação do professor com o desempenho deles na sala de aula após a realização de uma prova. Vale ressaltar que se trata da primeira prova realizada nesta turma.

A respeito da turma da manhã do período 99.2, já havia sido realizada a primeira prova quando ocorreu a primeira aplicação dos questionários e talvez este seja um dos fatores que explique a diferença dos resultados obtidos nesta turma. Conforme o que mostra a Tabela 4, houve a aceitação de H_0

e, os momentos considerados nesta turma são antes e depois da *segunda* prova.

TABELA 4
Resultado do Teste de Wilcoxon para a turma da manhã de 99.2 para a questão 2.1

Depois – Antes*	1	2	3	Total de observações	Vs**
Número de Observações	5	4	-	9	0,4551
Soma dos Postos	24,0	21,0	-	-	-

Nota: * Os números 1, 2 e 3 referem-se aos postos negativos, positivos e o número de empates, respectivamente
** Baseado nos postos positivos

Estes resultados indicam que houve a aceitação da hipótese nula para esta turma.

Em relação ao momento das provas, os alunos da turma da noite do período 99.2 estavam em situação semelhante quando responderam aos questionários: também já haviam feito uma prova. Não houve diferença na decisão da aceitação da hipótese nula em relação a turma anterior. Os resultados são apresentados na Tabela 5:

TABELA 5
Resultado do Teste de Wilcoxon para a turma da noite de 99.2 para a questão 2.1

Depois – Antes*	1	2	3	Total de observações	Vs**
Número de Observações	4	4	-	8	0,2734
Soma dos Postos	23,0	13,0	-	-	-

Nota: * Os números 1, 2 e 3 referem-se aos postos negativos, positivos e o número de empates, respectivamente
** Baseado nos postos positivos

Portanto, tanto na turma da manhã quanto na turma da noite do período 99.2, os alunos tiveram uma opinião constante com o passar do tempo, a respeito da preocupação do professor com desempenho deles na sala de aula.

CONCLUSÃO

Frente aos resultados expostos, julga-se que o objetivo do presente estudo foi cumprido. Através das análises efetuadas a partir das respostas dos alunos de três turmas diferentes, onde eram ministradas aulas da disciplina de Estatística IV por um mesmo professor, foi possível verificar a estabilidade do comportamento do docente utilizando os questionários com escalas não-numéricas.

O uso destas escalas permitiu observar um índice de respostas válidas muito próximo a 100%, fato que pode ser atribuído a maior liberdade que o aluno teve para expressar suas respostas. Por não apresentarem "níveis" explícitos de reposta (mas apenas dois extremos que expressam sua negatividade e positividade), as escalas não-numéricas eliminam também a dúvida sobre a quantificação dos níveis entre um intervalo e outro observados, por exemplo, nas escalas do tipo *likert* [8, 9].

No entanto, ao mesmo tempo que a ausência de níveis apresenta-se como uma vantagem para o pesquisador, constitui-se também numa desvantagem, pois torna-se problemático interpretar o que o aluno está pretendendo responder quando indica sua resposta neste tipo de escala.

É preciso ressaltar ainda que a coleta dos dados não ter sido realizada no mesmo momento para todas as turmas pode ser uma variável externa responsável pela produção de um efeito importante nas respostas. A primeira turma (manhã do período 98.2) teve a coleta dos dados feita antes e depois da *primeira* prova enquanto que nas demais turmas (manhã e noite do período 99.2) esta ocorreu antes e depois da s*egunda*.

É possível que este fato seja a explicação para que nas análises dentro das turmas, realizadas através do Teste de Postos Sinalizados de Wilcoxon para Dados Emparelhados, as duas últimas turmas apresentarem resultados semelhantes no que diz respeito a aceitação da hipótese nula, já que elas estavam em situações similares e diferente da primeira turma. Além disso, este fato também torna mais fácil a visualização da mudança de opinião nas respostas dos alunos da turma da manhã do período 98.2, pois se tratam de alunos que estavam em contextos bastante distintos (antes de uma prova e depois dela).

No geral, tanto nos resultados obtidos no teste do Kruskal-Wallis como no teste do Wilcoxon, houve um maior índice de aceitação da hipótese nula. No entanto, isto não significa que aconteceu a predominância de uma atitude *positiva*, mas que se observou uma *estabilidade* de comportamento, tanto do docente como dos discentes. Talvez a verificação da predominância de comportamento que se manteve sirva de tema para estudos posteriores.

LIA - UM SISTEMA ADAPTATIVO APLICADO AO ENSINO A DISTÂNCIA

Aline Donini Valsirolli[1],Claudia Midori Nakahata[2] ,Cristiane Gomes Bastos[3],Margaret Yea Wei Ng[4]

Abstract*—This project shows an adaptive system that supports learning features by using Intelligent Tutorial System techniques. The knowledge base is modeled using Conceptual Maps, which leads to a more efficient apprentice modeling. The main goal is to optimize the learning process in a way that it would be possible to divide the knowledge in interdependent levels. Thus, intelligent tests can be used to determine in which level of knowledge apprentices' skills must be classified, as well as to evaluate if the student has the needed skills to start learning at some desired level, or if it is advisable to review some previous topics, in order to get the expected background for learning at such level. The work proposes a reusable, adaptive framework for supporting pedagogical contents' modeling. In this way, it is expected to increase students' motivation, since they can start accessing such contents in a more profitable, individualized form, according to their own learning needs.*

Index Terms— *Adaptive Systems, Apprentice Modeling, Intelligent Tutorial Systems, Learning by Distance.*

1. INTRODUÇÃO

Com as crescentes mudanças na sociedade, muitas formas de treinamento e ensino generalizado não se justificam mais. Perde-se muito tempo ensinando, desperdiça-se muito dinheiro com cursos e acaba-se aprendendo pouco, muito menos do que o esperado**.**

Isto vem acontecendo porque encontram-se pessoas em vários graus de maturidade, motivação e de competência. Assim torna-se cada vez mais difícil colocá-las em uma única sala de aula para aprenderem as mesmas coisas.

Para uniformizar os níveis de conhecimento dessas pessoas, é necessário utilizar abordagens diferenciadas. que atendam às necessidades específicas de cada aluno. Desta forma, este artigo vem apresentar um sistema adaptativo de apoio ao aprendizado caracterizado pela utilização de técnicas de ITS – (*Intelligent Tutoring System* - Sistemas Tutores Inteligentes).

Na segunda seção será feita uma explanação do problema a ser abordado . A seção 3 mostrará como é obtida a adaptabilidade do sistema através dos Sistemas Tutores Inteligentes. A seção 4 apresenta um exemplo de modelagem para a base do conhecimento do sistema. A seção 5 trata da arquitetura do sistema. A seção 6 mostra como o sistema funciona. A seção 7 tem como objetivo apresentar as tecnologias utilizadas no protótipo do sistema. A seção 8 apresenta as considerações finais.

2. CONSIDERAÇÕES INICIAIS

Atualmente encontramos sistemas de ensino generalizados, isto é, que procuram atender a todos sem se interessar com as necessidades de cada aprendiz individualmente.

Estes sistemas de ensino, geralmente apoiados em uma estratégia pedagógica expositivista, exibem o mesmo conteúdo para todos os aprendizes e não se preocupam em analisar o aproveitamento deste, tampouco analisar se o mesmo possui certas competências prévias necessárias ao aprendizado do conteúdo em questão. Não existe um mecanismo nestes sistemas de ensino que guiem - o aprendiz - ao ponto do conteúdo mais adequado, a fim de ajuda-lo a tirar maior proveito.

Conforme já mencionado acima, em geral, esses sistemas educacionais sugerem uma abordagem linear e expositiva. Isto pode fazer com que o aprendiz perca a motivação para continuar a estudar, uma vez que todo o processo de ensino-apredizagem torna-se rotineiro e massificado.

3. ADAPTABILIDADE DO SISTEMA

A adaptabilidade do sistema está baseada na utilização de técnicas dos Sistemas Tutores Inteligentes(ITS), que são sistemas computacionais com modelos de conteúdo instrucionais que especificam o que ensinar e estratégias de ensino que especificam como ensinar. Esses sistemas educacionais são modelados de maneira a levar em consideração o tipo de aluno que está interagindo com o sistema.

Estes sistemas estão divididos em 4 módulos: módulo *tutor,* módulo *aprendiz*, módulo *domínio* e módulo *comunicação* ou *interface[1]*.

[1] Aline Donini Valsirolli, Universidade Presbiteriana Mackenzie, São Paulo, SP, Brasil,lia@mackenzie.com.br
[2] Claudia Midori Nakahata, Universidade Presbiteriana Mackenzie, São Paulo, SP, Brasil,lia@mackenzie.com.br
[3] Cristiane Gomes Bastos, Universidade Presbiteriana Mackenzie, São Paulo, SP, Brasil,lia@mackenzie.com.br
[4] Margaret Yea Wei Ng, Universidade Presbiteriana Mackenzie, São Paulo, SP, Brasil,lia@mackenzie.com.br

O *módulo tutor* faz o reconhecimento do usuário, no caso o aprendiz, e suas necessidades para que se possa propor conteúdo, percursos ou mesmo uma estratégia de aprendizado adequada a cada tipo de aprendiz.

O *módulo aprendiz* guarda as informações de cada aprendiz. Mantém um histórico de todas as ações do aprendiz: seus erros, seus acertos, o que já estudou e o que falta aprender. Representa o conhecimento e as competências do aprendiz. Já o *módulo domínio* armazena todo o conteúdo que precisa ser ensinado ao aprendiz, ao passo que o *módulo de comunicação (interface)* é a interação entre o módulo tutor e o módulo aprendiz, mostrando o conteúdo adequado ao conhecimento do aprendiz.

A interação centre estes módulos pode ser vista na Figura 1[1].

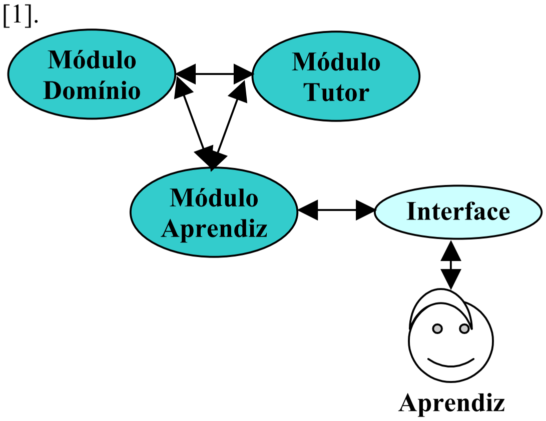

FIGURA 1
ARQUITETURA CLÁSSICA DE STI

A Figura 1 mostra como os módulos são relacionados em um Sistema Tutor Inteligente, mas para obtermos a adaptabilidade desejada, é necessário um relacionamento diferente. Este relacionamento pode ser observado na Figura 2.

A Figura 2 mostra que a adaptabilidade do sistema de ensino é obtida através da ligação direta do módulo interface com o módulo tutor. Assim, o módulo tutor consulta o modelo estático do aluno no módulo aprendiz e acessa o conteúdo disponível no módulo domínio. Com essas duas informações ele provê avaliações e fornece o conteúdo adequado ao aprendiz .

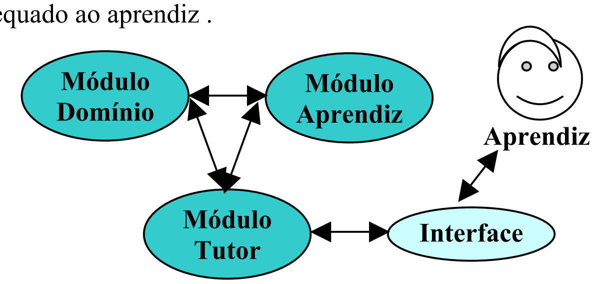

FIGURA 2
ARQUITETURA DOS SISTEMAS ADAPTATIVOS

O módulo tutor obtém algumas dessas necessidades do aprendiz através de avaliações eletrônicas. Vários métodos de avaliação podem ser utilizados como: questionários, entrevistas com alunos, comparação com resultados de cursos tradicionais e observação direta do instrutor online. Com vários tipos de questões, pode-se tentar aproximar o ambiente cibernético com a situação real do aluno . Alguns tipos de questões são: corrigir uma frase invertida, completar frases, verdadeiro ou falso. As questões podem ter vários graus de dificuldades como: fácil, médio, difícil [8] .

4. MODELAGEM DO CONHECIMENTO

A base de conhecimento do sistema é modelada usando Mapas Conceituais. Isto permite uma modelagem do aprendiz eficaz o suficiente para otimizar o processo de aprendizado, de forma que torna possível dividir o conhecimento em níveis.

Esses Mapas Conceituais são representações gráficas que auxiliam na ordenação e na sequenciação hierarquizada dos conteúdos do ensino, de forma a oferecer estímulos ao aprendiz [6].

Os Mapas Conceituais servem como instrumentos para facilitar o aprendizado do conteúdo sistematizado em conteúdo significativo para o aprendiz.

Esse tipo de modelagem do conhecimento torna a aprendizagem mais significativa, pois ajuda o aprendiz a fazer ligações entre o novo conhecimento e o conhecimento que já possui.

Os Mapas Conceituais podem ser descritos sob 3 perspectivas diferentes [3]:

- sob uma perspectiva abstrata, onde o mapa é constituído por nós ligados por arcos, podendo ser visto como hipergrafos ordenados, sendo que a ligação entre eles pode ser direcionada ou não;
- sob perspectiva de visualização, onde o mapa pode ser visto como diagramas; e
- sob a perspectiva dialética, onde os mapas conceituais são considerados uma forma de representação e comunicação do conhecimento através de linguagens visuais.

O nível pelo qual o aprendiz deverá começar é definido através de testes inteligentes, na qual é possível identificar por quais níveis o aluno deve passar ou não, ou ainda avaliar se o aluno tem condições de dar início ao aprendizado na etapa em que ele deseja, ou se deve rever alguns tópicos necessários, para só então aprender o que deseja de forma mais proveitosa.

O primeiro protótipo do LIA(*Learning by Intelligent Adaptiveness*) baseia-se em um conteúdo relativo ao ensino de matemática, tendo como sub-domínio específico o estudo de matrizes para ilustrar o uso dos Mapas Conceituais.

A Figura 3 ilustra a modelagem do conhecimento em níveis.

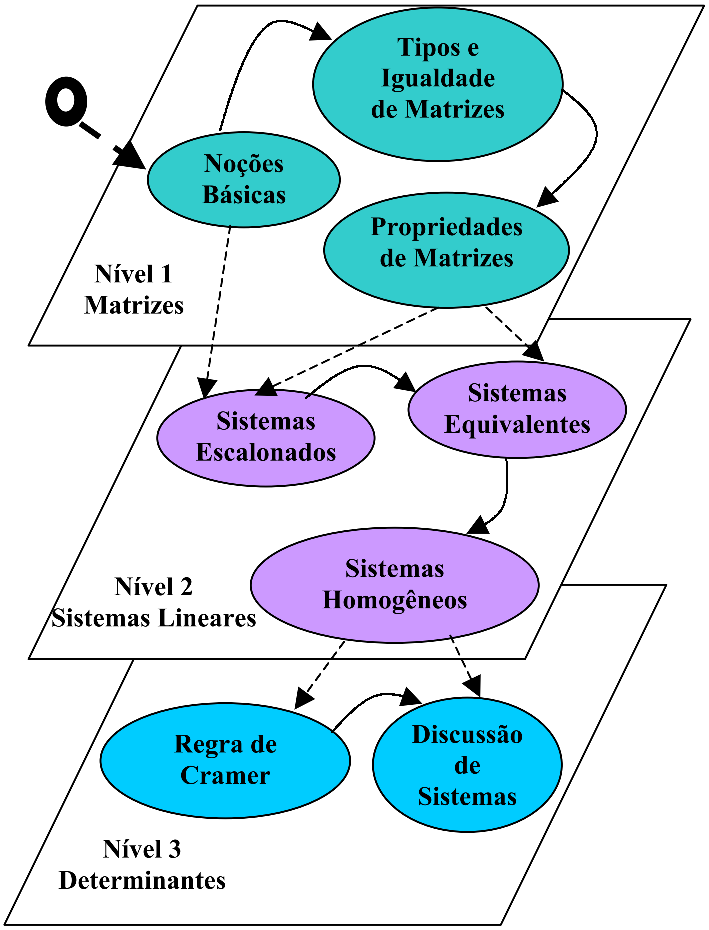

FIGURA 3
MODELAGEM DO CONHECIMENTO EM NÍVEIS

Pode-se notar na Figura 3 que há certas prioridades nos tópicos mostrados. Por exemplo, para o aprendiz aprender sobre *sistemas equivalentes* que está no nível 2, ele precisa ter conhecimento sobre *sistemas escalonados*, que por sua vez, tem como pré-requisito as *propriedades de matrizes* que está no nível 1, que por sua vez, necessita de *tipos e igualdade de matrizes*, que por sua vez requer o conhecimento de *noções básicas* . Assim, para o aprendiz estudar o tópico de sistemas equivalentes, ele precisa ter conhecimento de *sistemas escalonados*, *propriedades de matrizes, tipos e igualdades de matrizes* e *noções básicas*.

5. ARQUITETURA DO SISTEMA

Do ponto de vista da arquitetura, esse sistema está dividido em três camadas[7]:

- a primeira camada é a de apresentação. Esta contém toda a implementação relacionada com o *lay-out* do sistema, como ele é apresentado ao usuário aprendiz;
- a segunda camada é a de negócio. Esta camada é o local onde são feitos todos os processamentos e funções do programa, guardando toda a implementação relacionada a estas funções. É a interação entre a primeira camada e a terceira camada; e
- a terceira camada é a de dados. Nesta camada são guardadas as implementações relacionadas com o armazenamento de dados e acesso a esses dados, além de demais informações do sistema.

Uma demonstração dessa estrutura de camadas é dada na Figura 4.

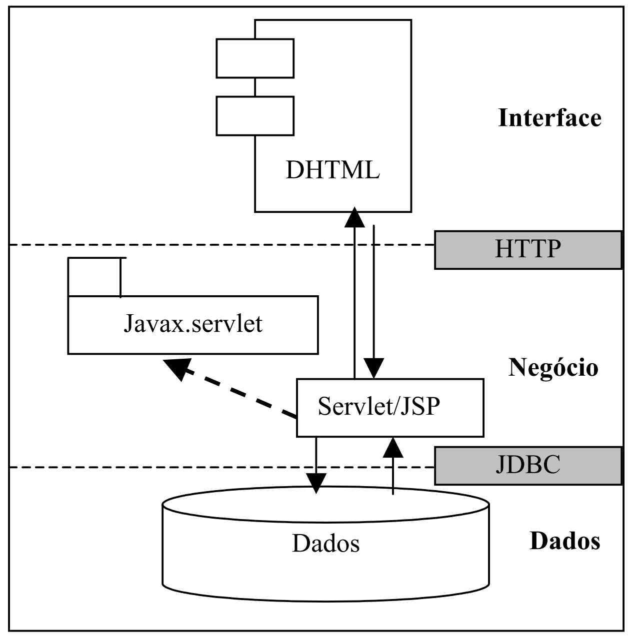

FIGURA 4
ARQUITETURA DE CAMADAS

Pode-se analisar uma ligação entre esta arquitetura de camadas e a divisão dos módulos de um Sistema Tutor Inteligente, explicados na seção 3 .

A camada de dados representa o módulo aprendiz e o módulo domínio, haja visto que o módulo aprendiz armazena os dados sobre o aprendiz e o seu nível de conhecimento, já o módulo de domínio armazena todo o conteúdo a ser ensinado.

A camada de negócio representa o módulo tutor, pois busca os dados do aluno e cruza essas informações com o conteúdo do conhecimento e o mostra através da interface ao aprendiz. Já a camada de interface representa o módulo de comunicação, sendo implementada através da página DHTML em si.

6. FUNCIONAMENTO DO SISTEMA

Ao entrar no sistema pela primeira vez, o aprendiz precisa realizar seu cadastro. Em seguida, lhe é exibido um menu com todos os tópicos disponíveis no sistema, de forma a que o mesmo possa escolher o tópico que mais lhe interessa.

É a partir dessa escolha, que depende unica e exclusivamente do arbítrio do aprendiz, que o LIA gera exercícios de acordo com os pré-requisitos do tópico escolhido, analisando os mapas conceituais relativo ao domínio do conhecimento mapeado. Tais exercícios têm caráter avaliativo, pois pretendem verificar se o aprendiz possui as competências necessárias para estudar o tópico desejado.

Caso o aprendiz demonstre tais competências, o LIA permite a entrada deste no tópico desejado. O aprendiz pode, inclusive, visitar o tópico desejado mesmo que não demonstre as competências requeridas para tal. Porém, o LIA gera mensagens de avisos, indicando quais tópicos seriam mais proveitosos ou até quais tópicos o aprendiz deveria revisar, deixando assim o aprendiz com o direito de escolha , mas consciente de suas necessidades. Tal estratégia é adotada, entre outras razões, de forma a não frustrar as expectativas do aprendiz em relação ao aprendizado.

As avaliações eletrônicas são o cerne do processo de modelagem heurística do aprendiz no LIA, sendo que durante todo o processo o aprendiz passa por diversos testes que qualificam o nível de seu conhecimento dentro do mapa conceitual sob o qual está organizado o currículo da área de conhecimento sendo estudada..

Todas as informações do aprendiz são armazenadas em um banco de dados, para um acompanhamento continuado do mesmo, de modo a poder informar quais competências já foram adquiridas, quais ainda necessitam ser, além de fornecer uma avaliação de até como foi seu desempenho nas avaliações realizadas. A adaptabilidade do LIA depende grandemente da manutenção e recuperação de tais as informações, assim como o acompanhamento de todas as ações por ele efetuadas.

7. Tecnologias Utilizadas

Nos sistemas adaptativos é necessário usar técnicas de inteligência artificial para se obter um resultado como visto anteriormente. Dentro deste ramo, tem-se por base as técnicas de modelagem do aprendiz, que usualmente são utilizadas em Sistemas Tutores Inteligentes. No LIA, o modelo do aprendiz é construído a partir de Mapas Conceituais implementados como grafos, onde cada nós do mesmo representa uma competência dentro de um dado currículo.

Em termos de implementação, conforme já demonstrado anteriormente na Figura 4, a interface da ferramenta é feita utilizando-se DHTML e Javascript. A camada de negócio é implementada em Servlets/JSP. A ligação da camada de negócio e a camada de dados é feito através do padrão JDBC.

Os tópicos a seguir irão explanar brevemente sobre cada uma dessas tecnologias.

DHTML

DHTML, ou HTML Dinâmico, é uma tecnologia da *Web* que torna os elementos de uma página muito mais dinâmicos que em HTML padrão[2]. Algumas das características principais de DHTML são:

Performance: O processamento é realizado localmente, ou seja, no *browser* do usuário, o que garante boa performance já que não exige o tráfego de informações pela rede durante a interação. Dado que o DHTML funciona no *browser* do lado cliente, uma vantagem pode ser imediatamente apontada: a redução drástica dos tempos de resposta. Utilizando o DHTML para deslocar a maior parte do trabalho para o lado cliente, torna-se possível proporcionar ao utilizador novos graus de interatividade. Por exemplo, a utilização de "*pre-caching*", que faz o carregamento em *background* de conteúdo, permite ao utilizador navegar entre páginas com um tempo de espera mínimo. Finalmente, não sendo menos importante, esta tecnologia abre novas perspectivas no que se refere ao desenvolvimento de conteúdo para operar do lado do cliente. Utilizando *scripts* (Em Javascript, por exemplo) combinados com DHTML é perfeitamente viável desenvolver aplicações *Internet* completas.

Compatibilidade: O DHTML não apresenta boa compatibilidade entre os *browsers*. Na verdade não existe um padrão para o DOM (*Document Object Model)*, que é o centro dessa tecnologia. Tanto a *Microsoft* como a *Netscape* já suportam esse padrão a partir das versões 4.0 de seus *browsers*, mas cada uma com seu modelo de objetos. Logo, o código *client scripting* deve ser escrito de acordo com o *browser* destino, a menos que se faça uso das propriedades protegidas, que são um subconjunto das funcionalidades comuns a ambos os *browsers*.

Baseado em objetos: Cada elemento de uma página HTML é visto como um objeto, que pode ser acessado e ter suas propriedades, como cor e posicionamento, alteradas dinamicamente.

SERVLETS/JSP

Servlets são módulos escritos em Java que estendem as funcionalidades de servidores orientados a requisição/ resposta [4]. São usadas basicamente para tratar dados de formulários HTML, sendo uma alternativa viável aos *scripts* CGI.

Virtualmente qualquer aplicação sob o paradigma cliente-servidor pode ser escrita em Servlets. Por exemplo, Servlets podem suportar videoconferência, pois uma servlet pode manipular múltiplas conexões e tratá-las concorrentemente através de *threads*, além de reenviar requisições para outros servidores.

As servlets são fáceis de programar, são mais rápidas de serem executadas e adicionam grande nível de portabilidade do lado servidor.

Toda servlet tem o mesmo ciclo de vida: o servidor carrega e inicializa a servlet; a servlet manipula zero ou mais requisições de clientes; e o servidor remove a servlet. Cada um destes estados é governado por um método específico da servlet.

Já JSP é uma tecnologia que oferece uma maneira simples para se trabalhar com uma arquitetura similar à de Servlets, consistindo em código Java *server-side* incorporado em páginas HTML [5].

A arquitetura do LIA conta com implementações do lado do servidor utilizando Servlets e JSPs, notadamente para fazer a montagem dinâmica das páginas.

JDBC

O padrão JDBC (*Java DataBase Connectivity*) permite aos programadores se conectarem com um banco de dados, consultá-lo ou atualizá-lo, usando SQL *standard*[4]. A grande vantagem de adotar um padrão como o JDBC é a total independência de plataforma e modelo de BDs.

JDBC consiste em duas camadas: a camada superior é a API (interface de programação) do JDBC. Essa API se comunica com a API do driver gerenciador JDBC enviando para ela as diversas instruções SQL. O gerenciador deve se comunicar com os vários *drivers* de terceiros que efetivamente se conectam com o banco de dados, e retornam as informações da consulta ou executam a ação especificada pela interface.

Pode-se usar o JDBC em aplicativos e *applets*. Em uma *applet*, todas as restrições de segurança se aplicam. Em particular, uma *applet* que usa JDBC só pode abrir uma conexão de banco de dados ao servidor a partir da qual foi descarregada. Isto significa que o servidor *web* e o servidor de banco de dados devem estar na mesma máquina, o que não é uma configuração recomendável. Os aplicativos, por outro lado, têm completa liberdade para acessar servidores de banco de dados remotos. Para programas cliente-servidor fará mais sentido usar um aplicativo para acesso ao banco de dados.

No LIA, tais restrições não se aplicam, uma vez que não se utilizam applets em sua interface. Contudo, por se tratar de uma interface baseada em DHTML, futuras versões do sistema que porventura incorporem o uso de *applets* deverão tratar da questão de segurança.

O uso de tais tecnologias traz diversas vantagens para a implementação do modelo de arquitetura em três camadas:

- Separa-se a camada de interfaces (no cliente) da lógica de negócios e dos dados. Portanto torna-se possível acessar os mesmos dados e as mesmas regras de negócio de multiplos clientes.
- Caso se queira substituir a comunicação via HTTP entre o cliente e a camada de negócio, pode-se implementá-la através de RMI (*Remote Method Invocation*) ou algum outro mecanismo, uma vez que se trata de camadas desacopladas e independentes. Da mesma maneira, como se utilizou a ponte JDBC para fazer a conexão com o repositório de dados, o mesmo pode ser trocado, se necessário, bastando uma alteração de *driver*.

8. CONCLUSÃO

Com o crescimento do interesse pelo ensino a distâ ncia, o aumento da necessidade de criação de sistemas que se adaptem às habilidades e competências de cada aprendiz tem sido muito grande, pois cada vez mais é necessário a criação de sistemas que não só cativem a atenção do aprendiz, como também sejam eficientes no que diz respeito à eficácia do aprendizado obtido através da indicação de conteúdo individualizado, adequado às necessidades de cada aprendiz. Espera-se que o uso da ferramenta apresentada neste trabalho produza bons resultados no sentido de obter um melhor aprendizado, graças à adpatabilidade individualizada.

AGRADECIMENTO

As autoras agradecem o apoio emocional de seus familiares, o apoio didático de seu orientador, Prof. Ismar Frango Silveira, e o apoio financeiro da Universidade Presbiteriana Mackenzie .

DA IMPORTÂNCIA DO USO DE SIMULADORES EM PESQUISA E ENSINO UNIVERSITÁRIOS NA ÁREA DE COMUNICAÇÕES ÓPTICAS

Tarcísio Cordaro[1] e Luiz Sergio Zasnicoff[2].

Abstract *— O alto desempenho dos programas simuladores no setor de comunicações ópticas, e a grande capacidade de processamento dos computadores pessoais, têm viabilizado a reprodução de complexos sistemas ópticos com ótima fidelidade. Este fato tem permitido que os estudantes vivenciem situações virtuais muito próximas da realidade, contribuindo na sedimentação de conceitos recém adquiridos, bem como que pesquisadores realizem suas pesquisas com a precisão necessária. Tal fato era até então impraticável, quer pelos altíssimos custos da instrumentação necessária, quer pelas circunstâncias, como exemplo cito a reprodução de sistemas ópticos transoceânicos, ficando tais pesquisas restritas á poucas empresas ou laboratórios no mundo. Este artigo relata, de modo resumido, o trabalho que está sendo realizado na Universidade Presbiteriana Mackenzie na área de comunicações ópticas, mais especificamente na transmissão de solitons com taxa de transmissão de 40 Gbits/s e longa distância (10.000 Km). A Amplificação Raman Distribuída (DRA) é utilizada. Será dada ênfase na importância do uso de simuladores na condução de ensino e da pesquisa.*

Index Terms *— Fotônica, Fibras Ópticas, Amplificação Raman, Soliton.*

INTRODUÇÃO

O aplicativo utilizado como simulador é um PTDA, - *Photonic Transmission Design Suite* – que leva em consideração em seus cálculos:

- Não-Linearidades na Fibra
- Ruído
- Dispersão de segunda e terceira ordem
- Efeito Raman
- Polarização

A interface com o usuário reproduz um ambiente de laboratório de medidas. Alguns de seus instrumentos virtuais são mencionados a seguir:

- Osciloscópio
- Analisador de Espectro
- Freqüencímetros
- Medidor de Potência
- Fontes com diodos Laser
- Medidor de taxa de erro de bit

Internamente, a equação não-linear de Schroedinger generalizada é resolvida numericamente.

$$\frac{\partial A}{\partial z}+\frac{i}{2}\beta_2\frac{\partial^2 A}{\partial T^2}+\frac{\alpha}{2}A-\frac{1}{6}\beta_3\frac{\partial^3 A}{\partial T^3}=i\gamma\left[|A|^2 A+\frac{i}{w_0}\frac{\partial}{\partial T}(|A|^2 A)-T_R A\frac{\partial |A|^2}{\partial t}\right] \qquad (1)$$

Eq. (1) rege a propagação dos sinais na fibra.[1], [2]

A figura 1 mostra a implementação do circuito básico utilizado no trabalho e consiste de um gerador de pulso soliton, um circuito em anel composto dos lasers de bombeamento Raman direto e reverso, uma fibra óptica e um filtro óptico ideal, e a cada volta percorrida pelo soliton neste circuito analisamos seu formato e sua potência através de um osciloscópio e um medidor de potência.

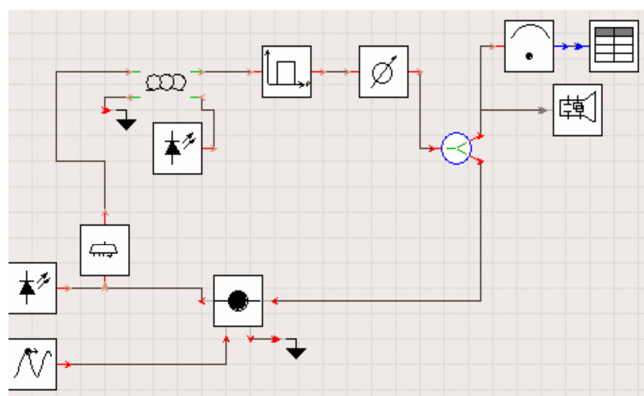

FIGURA 1
EXEMPLO DE CIRCUITO DE SIMULAÇÃO DE UM SISTEMA ÓPTICO DE TRANSMISSÃO

DESCRIÇÃO DE SOLITONS

Aproximadamente 170 anos atrás (1834), enquanto conduzindo experimentos para determinar o modo mais eficiente de projetar canais para barcos, um jovem engenheiro escocês de nome John Scott Russel (1808-1882) fez uma impressionante descoberta científica. Como ele mesmo as chamou *Report on Waves* (relata do 14° Encontro da Associação Britânica para o Avanço da Ciência, N. York, setembro de 1844, pp 311-390, plates XLII-LVII).

[1] Tarcísio Cordaro, Universidade Presbiteriana Mackenzie, Rua da Consolação, 930, São Paulo, SP, Brasil, cordaro@ig.com.br
[2] Luiz Sergio Zasnicoff, Universidade Presbiteriana Mackenzie, Rua da Consolação, 930, São Paulo, SP, Brasil, lszasnicoff@mackenzie.com.br

Durante toda sua vida Russel permaneceu convencido de que sua descoberta, denominada Onda Solitária ou *Wave of Translation* era de importância fundamental. Entretanto, até o começo do século 20, poucos cientistas concordaram com ele. Sua fama originou-se de outras realizações.

Nos anos 60, quando os cientistas iniciaram o uso de computadores digitais para estudar fenômenos não-lineares, tais como a propagação de ondas, que as idéias de Russel começaram a ser apreciadas. Ele entendia sua onda solitária como uma entidade dinâmica auto-suficiente, algo com propriedades típicas de partículas. Do ponto de vista moderno, ela tem sido usada como um elemento construtivo na formulação de complexos comportamentos de sistemas ondulatórios através da ciência, indo da hidrodinâmica à óptica não-linear, dos plasmas às ondas de Shock, dos tornados à grande mancha vermelha em Júpiter e, sobretudo, nas partículas elementares da matéria.

BREVE HISTÓRICO DE SOLITONS EM ÓPTICA

Alguns aspectos sobre solitons e algumas curiosidades históricas são mencionadas:

- Em 1964, dois pesquisadores da universidade de Princeton, Zabuski e Kruskal, observaram ondas cujo comportamento era similar a de partículas (Russel, *Soliton Propagation in Optical Fibers*). Também notaram que uma solução numérica das equações Kdv satisfazia tal fenômeno.
- Em 1969, San MacCall e Erwin Hahn descobriram um importante caso na propagação de solitons em óptica.
- Em 1973, A. Hasegawa e F. Tappert propuseram a aplicação de solitons em fibras ópticas. Neste artigo, cálculos teóricos e simulações numéricas foram apresentados mostrando que, utilizando a dependência não-linear do índice de refração com a intensidade do campo aplicado, era possível transmitir pulsos da ordem de picosegundos de duração em fibras, sem que ocorressem distorções. Mostrou ainda que, acima de certo limiar de potência, tais pulsos tornavam-se estáveis, mesmo sob a influencia de perturbações do meio. [3].
- Em 1980, Linn F. Mollenauer, R. H. Stolen e J. P. Gordon fizeram a primeira demonstração da propagação de solitons em fibras ópticas com comprimento de 700 m. [4].

Desde então, diversos trabalhos têm sido apresentados sobre a propagação de solitons em fibra óptica, sempre se procurando aumentar as taxas de transmissão e as distâncias percorridas. [5]-[13].

UTILIZAÇÃO DE SOLITONS EM TRANSMISSÃO POR FIBRAS ÓPTICAS

As fibras ópticas atingiram um nível baixo de perdas, entretanto os pulsos tendem a se espalhar ou alongar-se devido á dispersão das fibras prejudicando a performance do sistema. Tal fenômeno é mais intenso para pulsos estreitos. Ora, à medida que as taxas de transmissão se elevam, impulsionadas pela crescente demanda de serviços de transmissão de dados, os pulsos tendem a se estreitar. Por outro lado os sistemas de transmissão de longa distância necessitam de regeneradores elétricos periodicamente ao longo do percurso da fibra. Estes Regeneradores são mais tanto mais complexos e caros quanto maiores são as taxas de transmissão.

Os solitons lidam bem com a dispersão, mantendo o formato do pulso ao longo a fibra, permitindo eliminar tais regeneradores elétricos. Contudo é necessário compensar a atenuação da fibra, pois à medida que evoluem na fibra vão tendo sua amplitude atenuada, até um ponto onde entram em colapso, por deixam de atender o requisito fundamental para sua existência, ou seja, o equilíbrio entre a dispersão e as não-linearidades.

Neste caso citado, a dispersão prevalece sobre a não-linearidade, fazendo o pulso se alargar mais rapidamente.

Os amplificadores ópticos têm sido estudados exaustivamente nos últimos anos e demonstraram ser viáveis tecnicamente e bem mais baratos que os sistemas com regeneradores.

Este conjunto Soliton mais amplificador óptico torna-se uma alternativa bastante atraente para sistemas de transmissão de longa distância, pois teria em tese seus preços bem mais baixos que os atuais sistemas com uma performance bastante boa.

Um recente estudo mostra a viabilidade de se transmitir Solitons em taxas de 40 Gbits/seg e longas distâncias, utilizando-se uma fibra levemente dopada com érbio, de modo a conseguir uma amplificação distribuída [11].

Este trabalho mostrará a possibilidade de se transmitir solitons em distâncias superiores a 10.000 km, utilizando-se de Amplificação Ramam Distribuída, com bombeamento a cada 50 Km para minimizar a variação da potência do soliton ao longo da fibra. Posteriormente será demonstrada a possibilidade de aumentar esta distância para 75 Km, utilizando duas fibras diferentes.

CONCEITO DO SOLITON

Em sua forma ideal, (2) representa o comportamento do soliton, e é definida por uma função do tipo secante hiperbólica, segundo mostra a figura 2. [1],[2].

$$\Phi(z,t) = \Phi_0 \operatorname{sec} h(\frac{t - v_g}{\tau_0}).e^{-i\frac{z}{2z0}} \quad (2)$$

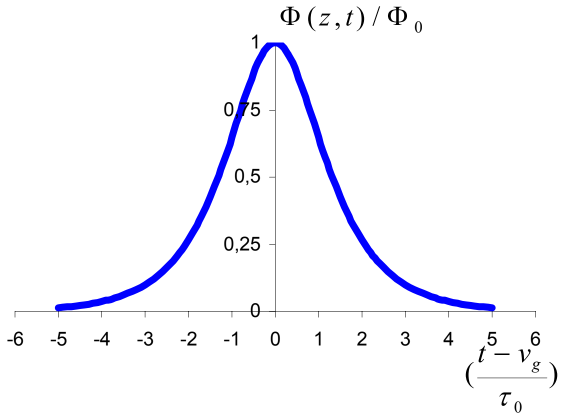

FIGURA 2
SOLUÇÃO DA EQUAÇÃO DE SCHROEDINGER SIMPLIFICADA

Usualmente, (2) é a solução da equação não-linear de Schrodinger para o caso onde N=1, sendo N definido como:

$$N^2 = \frac{\gamma P_0 T_0^2}{\beta_2} = \left(\frac{4\pi^2 c}{\lambda^3}\right)\cdot\left(\frac{n_2}{A_{aff}|D|}\right)\cdot\left(P_0.T_0^{\ 2}\right) = \frac{L_D}{L_{NL}} \quad (3)$$

Onde:

- $D = -\frac{\beta_2 \pi c}{\lambda^2}$ (4)

é a Dispersão Cromática;

- $L_D = \frac{T_0^2}{|\beta_2|}$ (5)

é o Comprimento de Dispersão, e indica a partir de que distância de propagação na fibra, a dispersão é relevante,

- $L_{NL} = \frac{1}{\gamma P_0}$ (6)

é o Comprimento Não-Linear, e indica a partir de que distância de propagação na fibra as não-linearidades são relevantes, e

- $T_0 = \frac{1}{q_0 B}$ (7)

é a Largura do Pulso, conforme mostrado na fig.2, B é a Taxa de Transmissão e q_o é um fator de ocupação.

Se N=1, vem:

$$P_0 = \frac{\beta_2}{\gamma T_0^2} = \left(\frac{\lambda^3}{4\pi^2 c}\right)\cdot\left(\frac{A_{aff}|D|}{n_2}\right)\cdot\left(\frac{1}{T_0^{\ 2}}\right) \quad (8)$$

De um modo simplificado a pesquisa consiste em encontrar os parâmetros do soliton, ou seja, conseguir um equilíbrio entre dois fenômenos que isoladamente são grandes ofensores na propagação em fibra óptica, mas que para este caso particular eles se compensam. A Dispersão e as Não-Linearidades.

Entretanto, conseguir com que este balanceamento permaneça ao longo da fibra, para longas distâncias é o maior desafio, pois como sabemos toda fibra tem atenuação.

Aqui, os simuladores são fundamentais, pois permitiram:

- Verificar a teoria ideal de solitons,
- Dimensionar a melhor condição da DRA,
- Verificar, em condições com perdas e amplificação, a propagação do soliton.

RESULTADOS PRELIMINARES

Os valores utilizados na simulação são:

D = 0.5 ps/(nm.km), T_0= 3 ps e P_0=31 mW.

Assim, obtemos $L_D = L_{NL}$ = 15 km, ou seja, caso as não-linearidades não compensem a dispersão, a partir de 15 km o pulso sofrerá distorções.

Na fig.3, verificamos a propagação do soliton em 10.000 km de fibras, sem perdas. Entretanto, todos os fenômenos não-lineares e a dispersão estão presentes. Verifica-se o perfeito casamento entre estes dois mecanismos, de modo a se compensarem.

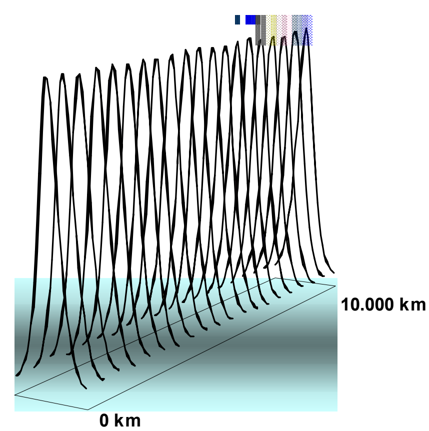

FIGURA 3
PROPAGAÇÃO DE SOLITON EM FIBRA SEM PERDAS

A fig.4 representa a simulação da propagação em fibra com dispersão nula (D=0). Verificamos, então, que as não-linearidades deformam o pulso antes de alcançar 30 km. Neste caso, também a atenuação é nula.

Na fig.5, a simulação considera ativos todos os fenômenos na fibra. Para compensar a atenuação, é utilizada a Amplificação Raman Distribuída (DRA), com bombeamento direto e reverso a cada 50 km.

A fig.6 mostra a propagação quando aumentamos a distância de bombeamento para 75 km. Para conseguir a equalização necessária e suficiente para a propagação, e manutenção do soliton, utilizamos dois trechos de fibras dimensionados para dois regimes de transmissão.

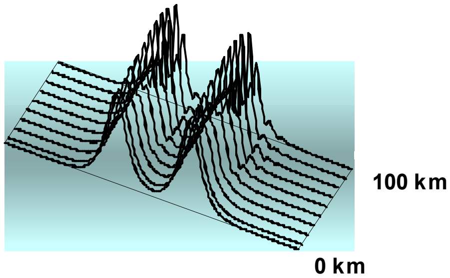

FIGURA 4
SOLITON EM FIBRA SEM PERDAS E DISPERSÃO NULA

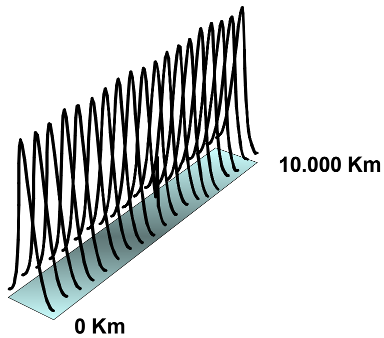

FIGURA 5
PROPAGAÇÃO DE SOLITON COM DRA.

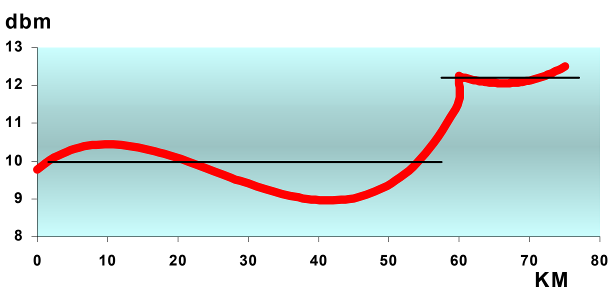

FIGURA 6
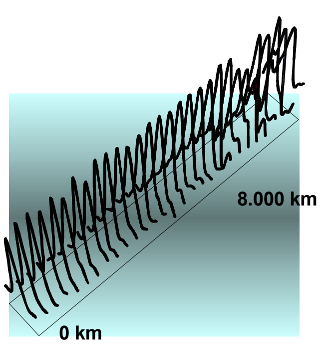
ATENUAÇÃO X COMPRIMENTO PARA DUAS FIBRAS E DRA.



Na fig.7 são apresentados os resultados nesse regime misto de transmissão.

FIGURA 7
SOLITON COM DRA E 75 KM DE BOMBEAMENTO

Percebe-se que o sinal sofre degeneração somente a partir dos 8.000 km. Tal pesquisa ainda está em curso, de modo que acreditamos ser perfeitamente possível atingir uma distância maior que 10.000 km de propagação, sem deformações substanciais no soliton, mantidos os 75 km de distância de bombeamento.

CONCLUSÕES

Foram mostrados alguns resultados que validam a Tese proposta. Acreditamos que as distâncias de bombeamento podem ser aumentadas para 100 km ou mais, caso utilizemos três regimes de transmissão solitônico.

Este e outros trabalhos que vêm sendo elaborados em ambientes virtuais evidenciam o quão importante é a utilização de simuladores em Pesquisa e Ensino.

Mais que apenas importante, acredita-se que, sem tais ferramentas, o ensino e pesquisas estariam incompletos, pois permitem uma vivência, que de outro modo seria muito difícil ao aluno ou pesquisador aprimorar-se.

MELHORAMENTO NO PROCESSO DE UM PRODUTO UTILIZANDO AS FERRAMENTAS DE ENGENHARIA SIMULTÂNEA NUMA INDÚSTRIA ELETRÔNICA

Cassandra R. dos Santos[1] *e R. Radharamanan*[2]

Resumo *— Diante de vários fatores como evolução tecnológica e concorrência entre as indústrias, empresas com melhores produtos fabricados em tempo cada vez menores levam vantagem, já que assim introduzem com maior freqüência seus produtos no mercado. Baseados nesse desafio este projeto de pesquisa foi desenvolvido afim de orientar as indústrias de pequeno e médio porte da região sul do Brasil a desenvolverem produtos e processos que atendam as necessidades do mercado consumidor através da metodologia e de algumas ferramentas de engenharia simultânea. Foram utilizados as ferramentas como projeto para montagem manual, padrão de qualidade internacional (ISO 9002) e desdobramento de função de qualidade com o intuito de melhorar os problemas relacionados ao produto e processo de uma indústria de equipamentos eletrônicos que fabrica alarmes e sirenes para carros. Os resultados obtidos como melhoria no processo e mais qualidade no produto foram discutidos, e finalmente foram apresentados as recomendações feitas baseadas no estudo.*

Palavras Chaves — Engenharia simultânea, indústria eletrônica, melhoramento no processo e produto, projeto para montagem, desdobramento de função de qualidade, e padrão de qualidade internacional.

INTRODUÇÃO

O conceito básico de engenharia simultânea consiste numa abordagem sistemática para o desenvolvimento integrado e simultâneo do projeto de um produto e processos relacionados, incluindo fabricação e atividades de apoio [2]. Esta abordagem faz com que as pessoas envolvidas no desenvolvimento do projeto considerem, desde o início, todos os elementos do ciclo de vida do produto, da concepção ao descarte, incluindo qualidade, custo, prazos e exigências (requisitos) dos consumidores [Figura 1]. Porém, o conceito de engenharia simultânea tornou-se mais abrangente, podendo incluir a cooperação e o consenso entre os envolvidos no processo, o emprego de recursos computacionais e a utilização de outras metodologias [3]. Para implementar com sucesso este conceito, os integrantes da administração, operários e assessoria técnica, devem desenvolver uma percepção profundamente diferente, chamada "percepção do processo", dentro da natureza da atividade industrial.

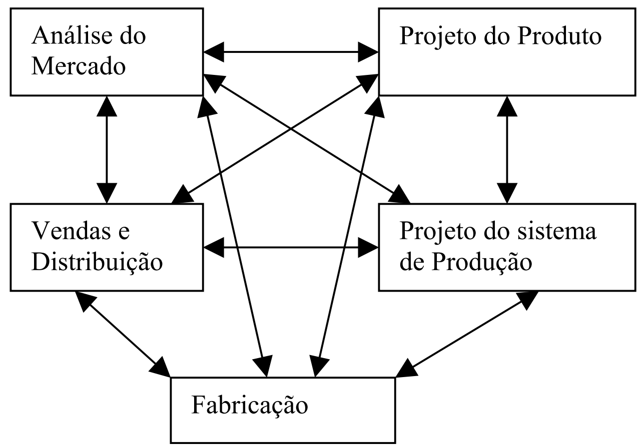

FIGURA. 1
O MODELO DE ENGENHARIA SIMULTÂNEA

Os critérios conceituais para o desenvolvimento da engenharia simultânea são: Identificação das exigências do mercado; Definição e cronograma do projeto para satisfazer as necessidades do mercado; Seleção de tecnologia/ arquitetura satisfatória; Preço/desempenho/confiabilidade satisfatórios; Viabilização das técnicas comprovadas; e Retorno sobre o investimento do projeto adequado [2, 19].

Os benefícios da engenharia simultânea são instantâneos para volumes maduros, aumentando a complexidade do projeto, reduzindo suas interações e aumentando a sua qualidade [10, 12]. Um ciclo típico do projeto de um produto é mostrado na Figura 2.

As empresas brasileiras empenham-se na adaptação à nova realidade da competição internacional. Trata-se de uma questão de sobrevivência para a empresa, seja qual for seu ramo, lançar seus produtos em tempo para atender as demandas do mercado e, ainda, garantir o atendimento das metas do custo e da qualidade para os mesmos. Na busca por maior competitividade, muitas empresas têm investido

[1] Cassandra R. dos Santos, Centro de Ciências Naturais e Exatas, Universidade Federal de Santa Maria, Santa Maria (RS), 97119-900, Brasil, cassandrarodrigues@bol.com.br

fortemente em ferramentas computacionais e em treinamentos para seus engenheiros na utilização das mesmas. Entretanto, a utilização de modernas ferramentas não é suficiente para atingir os objetivos de redução do tempo de desenvolvimento e melhoria da qualidade que o mercado exige. É necessária a prática da engenharia simultânea, pois ela pressupõe que várias atividades sejam desenvolvidas em paralelo, em oposição ao método tradicional de seqüenciamento de etapas. Dessa forma, é possível a realimentação de uma atividade pela outra. Isso é vantajoso por evitar os desperdícios de tempo e recursos, causados pelo não envolvimento completo dos vários setores nas etapas iniciais do ciclo. O tempo e os recursos gastos para executar tarefas que posteirormente precisarão ser refeitas jamais serão recuperados. Foi baseando-se neste contexto, que se decidiu aplicar a abordagem da engenharia simultânea em indústrias de pequeno e médio porte da região sul, a fim de orientá-las a produzirem produtos/processos que atendam as exigências do mercado consumidor.

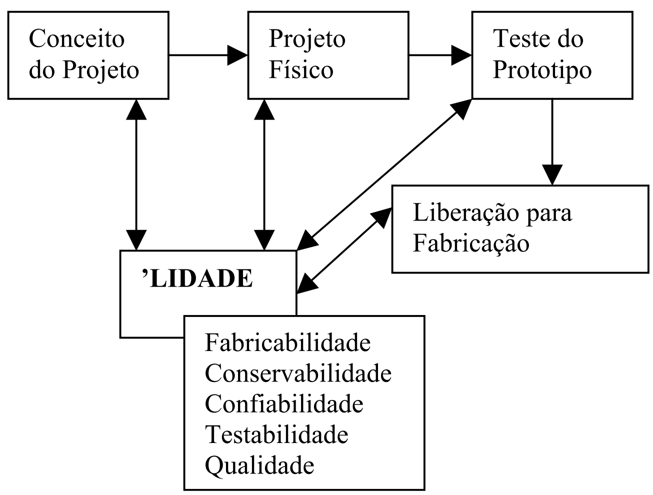

FIGURA. 2
CICLO DO PROJETO DE UM PRODUTO

METODOLOGIA

O processo de desenvolvimento de produtos envolve diferentes áreas da empresa. O departamento de marketing é importante na captação das necessidades dos consumidores (entrada) e no repasse dessas necessidades aos projetistas. A função dos projetistas é processar ou transformar essas necessidades dos consumidores, informações, e materiais em produtos e/ou serviços (saída) – Figura 3. Um fator importante para redução no tempo do desenvolvimento das atividades envolvidas será a velocidade com que estas são elaboradas pelas equipes que participam no projeto.

As ferramentas do Projeto Para Fabricação (PPF) e de Engenharia Simultânea utilizadas neste trabalho são discutidos em seguintes seções.

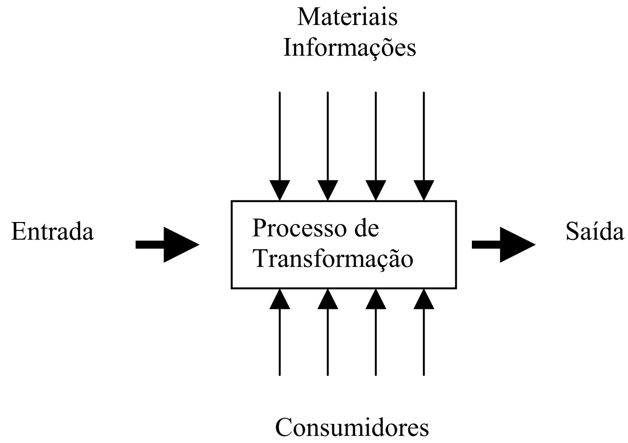

FIGURA. 3
PROCESSO/SISTEMA DE TRANSFORMAÇÃO

Projeto Axiomático

Esta abordagem baseia-se na condição de que: a) existem princípios ou axiomas do bom projeto; b) o emprego de axiomas para guiar e avaliar decisões dos projetos conduz a bons projetos. Os axiomas devem ser aplicáveis a toda o conjunto de decisões do projeto e a todos os estágios, fases e níveis do processo do projeto [6, 7, 16]. Os conceitos de axiomas hipotéticos são:

- **Axioma 1:** no bom projeto é mantida a independência de requisitos funcionais.
- **Axioma 2:** entre os projetos que satisfazem o axioma 1, o melhor projeto é aquele que tem o mínimo conteúdo de informações.

As etapas do projeto de axiomas são: 1. Identificar os requisitos e restrições funcionais; 2. Prosseguir com o projeto, aplicando os axiomas a cada uma das decisões do projeto.

Diretrizes do PPF

Afirmações sistemáticas e codificadas da prática de bons projetos que tenham sido derivadas, empiricamente, anos de experiência em projeto e fabricação. São diretrizes, atuando tanto para estimular a criatividade quanto para mostrar o caminho para o desenvolvimento de um bom projeto, que resultam em um produto que é inerente, mais fácil de fabricar [17, 18]. Algumas das diretrizes do PPF são: Projetar para um número mínimo de peças; Desenvolver um projeto modular; Minimizar as variações das peças; Projetar peças para serem multifuncionais; Projetar peças de uso múltiplo; Projetar peças fáceis de fabricar; Evitar separar os prendedores; Minimizar as instruções de montagem (projeto para montagem de alto a baixo); Maximizar a conformidade (projeto para facilidade de montagem); Minimizar o manuseio (projeto para o manejo e a apresentação); Avaliar os métodos de montagem; Eliminar ou simplificar regulagens; e Evitar componentes flexíveis.

Projeto para Montagem (PPM)

Desenvolvido por Boothroyd e Dewhurst, no MIT, este método baseia-se, nas técnicas de estudo dos tempos e movimentos da Engenharia Industrial. Procura minimizar os custos de montagem dentro das restrições impostas por outros requisitos do projeto [5, 14]. O método PPM é dividido em três seções:

- **Escolha do Método de Montagem :** é um procedimento de escolha entre a montagem manual, a montagem automática com finalidade especial e a montagem automática programável. As informações básicas necessárias são: volume de produção por turno, número de peças na montagem, produto único ou variedade de produtos, número de peças necessárias a diferentes estilos, número das principais modificações esperadas no projeto ao longo da vida do produto e política de investimento da empresa com relação ao emprego de máquinas em substituição à mão-de-obra.
- **Projeto para Montagem Manual:** consiste em comparar o tempo ideal calculado de montagem requisitado pelo projeto de um produto em particular e o tempo atual. O tempo ideal é calculado pelo número teórico de peças em relação ao movimento relativo, diferentes materiais e a necessidade de manufatura e concerto. O tempo atual é calculado para cada peça, dividido entre operações de manuseio e encaixe. Para cada dificuldade associada a cada operação, penalidades, em segundos, são acrescentadas ao valor básico.
- **Projeto para Montagem Automática:** consiste em: Estimar o custo do manuseio automatizado do volume e de sua entrega orientada; Estimar o custo do encaixe automático de peças; Decidir se a peça deve ser separada de todas as outras na montagem; Combinar os três resultados acima para calcular o custo total da montagem.

Após estimar a eficiência do PPM, o quociente de contagem de peças é calculado do seguinte modo: Quociente de Contagem de Peças

$$= \frac{\text{Número Teórico Mínimo de Peças}}{\text{Número Atual de Peças}}$$

Se estas duas medidas estiverem de acordo, valores para elas são fixados como meta. Esta abordagem fornece um alvo quantitativo para a equipe e se torna a base para a aceitação de um projeto particular.

Padrão de Qualidade Internacional (ISO 9000)

Qualidade é uma vantagem competitiva no mercado, isto significa que as indústrias devem ter a mesma ou melhor qualidade do que os seus competidores, observando que a qualidade dos competidores vêm melhorando contínuamente. Para ser competitivo, um programa viável de melhoramento contínuo deve ser desenvolvido e implementado na prática [20].

Os padrões ISO-9000 existem principalmente para facilitar os comércios internacionais. As mudanças devido a globalização são: novas tecnologias em todos os setores das indústrias ; redes de comunicações eletrônicas mundias; viagens mundias; aumento dramático na papulação mundial; redução nas reservas de recursos naturais; uso intensivo de terra, água, energia, e ar (problemas de ambiente comuns); redução de mão-de-obra em empresas grandes; número e complexidade entre as línguas, cultura, jurídica, e social encontrado na economia global com diversidade como fator principal permanente; e países em desenvolvimento tornando uma maior proporção da economia global com novos tipos de competidores e novos mercados. Essas mudanças necessitam melhor qualidade nos seus produtos [13]. Visão 2000 tem quatro metas que relaciona para manter os padrões ISO-9000 para atender contínuamente as necessidades do mercado: aceitação universal, compatibilidade atual, compatibilidade no futuro, e flexibilidade [8, 13]. Um fornecedor certificado pelo padrão ISO-9000 (ISO-9001 ou ISO-9002 ou ISO-9003) é considerado como um fornecedor confiável mundialmente para fornecer produtos e serviços com qualidade; os consumidores podem reduzir ou eliminar as inspeções de componentes comprados resultando um sistema eficiente para comércio global [9, 20]. As 20 cláusulas de padrão ISO 9001, mais compreensivas de três padrões, são encontradas em [9, 13].

Desdobramento de Função de Qualidade

Medida e avaliação da qualidade de um produto não é difícil, então podemos estabelecer padrões de conformidade, inspecionar e testar os produtos, idenficar as taxas de defeitos, corrigir erros, e impor nível de desempenho. O desdobramento da função de qualidade (DFQ) permite reunir uma quantidade de informações em uma forma concisa, em um pequeno número de documentos – os diagramas de DFQ. Sendo a forma gráfica a mais efetiva na simplificação de informações complexos [1, 4].

O DFQ é dirigido ao consumidor, basicamente para ouvir a "voz do consumidor" durante o desenvolvimento de produtos e processos, identificar e enfocar os detalhes e decidir o que é importante. Essa ferramenta simplifica um conjunto de informações através do uso de gráficos baseados em matrizes. O DFQ é um sistema que traduz os requerimentos dos consumidores e identifica as modificações necessárias antes da ocorrência de desperdícios, reduzindo os riscos durante a fase de desenvolvimento, criando um conhecimento básico dos produtos, introduzindo a "voz do consumidor" no processo de desenvolvimento [4, 14].

Esse método permite reunir uma quantidade de informção maiorsendo que é em forma de gráficos. Como cada consumidor é diferente em suas expectativas e necessidades, consequentemente, em requerimentos, identifica consumidores em vários estágios do cíclo de vida do desenvolvimento, e emprega técnicas para compilar os requerimentos dos consumidores. O DFQ exige uma lista de "QUES" e "COMOS", onde os ítens "QUES" são as necessidades e os "COMOS" são os requisitos mensuráveis dos consumidores [1, 4].

O desdobramento de função de qualidade – especificamente, a casa de qualidade – é uma ferramenta efetiva de administração no qual as expectativas dos consumidores são utilizados para dirigir o processo em consideração. Algumas vantagens e benefícios da implementação de DFQ são: uma maneira ordenada de obter e apresentar informações; cíclo de desenvolvimento reduzido; redução considerável em custo; mudanças mínimas no processo; redução nos descuidos durante execução de processo; um ambiante de trabalho em grupo; decisões consensos; e preservação de tudo em forma escrita, ou seja, a implantação de DFQ resulta em consumidores satisfeitos [1, 15].

RESULTADOS

Um estudo foi feito para a implantação de algumas ferramentas de engenharia simultânea e projeto para manufatura numa indústria eletrônica localizado no Rio Grande do sul. Foi utilizada a metodologia de montagem manual de engenharia simultânea durante a fabricação dos produtos "alarme/sirene" de carros com componentes eletrônicos. O estudo inicial com a administração e com os grupos do projeto e manufatura indicaram o seguinte:

- **Tipos de Problemas com Respeito ao Produto:** componentes plásticos defeituosos recebidos de fornecedores, acabamento externo visual, materia prima e placa eletrônica defeituosa, e uso não próprio do produto.
- **Fatores que Influenciam o Custo do Produto:** materil prima, treinamento de mão-de-obra, transporte, programa de qualidade, re-trabalho, tempo ocioso na linha de montagem, marketing, impostos, e garantia do produto.
- **Problemas Relacionados ao Processo de Produção:** resistores queimados, máquinas e equipamentos obsoletos, falta de manutenção preventiva, e falta de ferramentas.
- **Tipos de Reclamações dos Consumidores:** Atraso na entrega do produto, alta custo do produto, concorrência com melhor produto, e produtos defeituosos.

Algumas ferramentas de engenharia simultânea foram adotadas e aplicadas na indústria eletrônica selecionada. Diretrizes do projeto para fabricação foram utilizados inicialmente para re-projetar os produtos existentes. Todas as pessoas da industria, incluindo mão-de-obra até administradores da empresa foram treinados através de um programa de treinamento intensivo. A linha de montagem foi re-projetada incluindo novas ferramentas e equipamentos. Os procedimentos para testar o produto final foram modificados. A qualidade do produto foi melhorada através da certificação ISO 9002. Finalmente, os conceitos de desdobramento de função de qualidade (DFQ) foram implantados para satisfação das necessidades dos consumidores.

Antes da implantação do conceito de engenharia simultânea entre 35-40% de itens fabricados e vendidos voltavam para reparo e re-trabalho dentro de três meses de venda hoje este valor foi reduzido significativamente, com a implantação dos padrões de qualidade, do re-projeto de linhas de montagem, e uso dos conceitos de DFQ.

As reclamações dos consumidores foram reduzidos significativamente, e os reparos e retrabalhos diminuidos entre 5-10%. Atualmente, a empresa esta exportando seus produtos para outros países da America Latina.

CONCLUSÕES

Neste projeto, vários conceitos foram discutidos sobre engenharia simultânea. Estes conceitos quando aplicados adequadamente a indústrias de pequeno porte ajudam ao grupo de projetistas a elaborar um projeto ótimo para cada produto. Os conceitos e métodos aqui abordados tem mostrado alta eficiência quando aplicados em situações práticas. Os benefícios são obtidos aplicando-se e implementando-se corretamente a engenharia simultânea. Somente pela integração do projeto, manufatura, e marketing uma indústria pode, hoje, sobreviver neste mercado altamente competitivo onde custo, tempo de entrega e qualidade são indispensáveis á sobrevivência de qualquer indústria.

AVALIAÇÃO INSTITUCIONAL EM UM CURSO DE MESTRADO EM ENGENHARIA DE PRODUÇÃO – METODOLOGIA E RESULTADOS

Paulo Augusto Cauchick Miguel[1], *Clayton Ap. Cardoso de Moraes*[2]

Resumo *– Este ensaio se fundamenta na descrição de um processo de avaliação institucional realizado no Programa de Pós-graduação em Engenharia de Produção da UNIMEP, campus Santa Bárbara d´Oeste. O processo envolve a avaliação do curso de mestrado em Engenharia de Produção em cinco eixos principais propostos pela instituição, tendo como base a Política Acadêmica da Universidade e o Projeto Pedagógico do curso, por meio de um questionário respondido pelos discentes e outro pelos docentes. Dado o caráter transformador da avaliação, o que se pretende, por meio dos resultados obtidos, é enfatizar o uso de métodos e processos de gestão da qualidade, no intuito de alinhar e direcionar o curso de forma a contribuir com a missão da universidade em prestar serviços que atendam os requisitos da sociedade, no sentido da construção da cidadania.*

Palavras-chave – Avaliação Institucional, Engenharia de Produção, Mestrado, Qualidade.

1. Introdução

O desenvolvimento da avaliação institucional tem proporcionado um desafio extremamente complexo na maneira como tem sido conduzido o processo administrativo-pedagógico das instituições de ensino superior. Desta forma, deve-se promover a articulação dos elementos centrais da vida universitária como o ensino, pesquisa e extensão, sendo destacado também a sua gestão.

A necessidade da Avaliação Institucional, segundo Sobrinho & Balzan (1995) passou a ser discutida na década de 80, mas foi a partir da década de 90 que vem se acumulando e ganhando consistência a temática da avaliação institucional em relação a questões de autonomia e de qualidade.

Na verdade, segundo Graeff (2001), o sucesso e a melhoria de uma instituição associa-se a sua capacidade de auto-percepção, de ver-se em sua extrema realidade, sendo a qualidade largamente condicionada ao investimento que faz na avaliação de si mesma, em seus processos e resultados e, a partir disso, no realismo dos objetivos a que se propõe.

A própria avaliação, praticada por iniciativa da instituição, conforme destaca Graeff (2001) evidencia a importância do auto-conhecimento institucional, além de ser uma exigência do Ministério da Educação, relacionando-se a um processo mais amplo que envolve a renovação do reconhecimento de cursos e o recredenciamento das universidades.

Por esse motivo, o objetivo deste estudo, é descrever o processo de avaliação institucional realizado no programa de Pós-graduação em Engenharia de Produção da Universidade Metodista de Piracicaba (UNIMEP), *campus* Santa Bárbara d'Oeste, desenvolvido em cinco eixos principais: currículo, ações do processo de ensino-aprendizagem, projetos e atividades, operacionalização da gestão do curso e estrutura e apoio, tendo como base a Política Acadêmica da Universidade e o Projeto Pedagógico do curso.

O processo de avaliação utiliza como instrumento de coleta de dados um questionário respondido pelos discentes e outro pelos docentes, a partir desses cinco eixos. O desenvolvimento do questionário é apresentado, bem como a realização de um pré-teste, além dos resultados finais de sua aplicação. Dado o caráter transformador da avaliação, o que se pretende, é enfatizar o uso de métodos e processos de gestão da qualidade, no intuito de alinhar e direcionar o curso de forma a contribuir com a missão da universidade.

2. Procedimentos básicos sobre a sistemática da avaliação institucional

Todos os sistemas de avaliações até então empregados visam a construção de uma cultura Institucional participativa, tendo por objetivo o permanente aperfeiçoamento das Instituições através da identificação e resolução de problemas. Deste modo, o sucesso deste sistema de avaliação depende do estabelecimento e a efetivação de metas podendo defini-las em etapas, descritas a seguir (UNIMEP, 2000):

- Momento preparatório – efetivação de um Comitê de Avaliação Institucional (estruturação);
- Sensibilização – momento de busca da participação da comunidade envolvida;
- Avaliação interna – ou auto-avaliação, que consiste na análise do contexto e dos resultados das ações até então tomadas;
- Avaliação externa – consiste na avaliação por profissionais externos;
- Análise dos resultados da Avaliação e tomadas de decisão – consiste na análise da avaliação seguida pelo rearranjo e tomada de decisões.

A obediência às etapas favorecem o desenvolvimento da Avaliação, porém previamente é necessário reconhecer que os parâmetros de qualidade são definidos pelos clientes ou usuários (aqui sendo discentes, empresas e comunidade em geral) de modo a valorizar e/ou permitir suas participações, se possível em todos os níveis do desenvolvimento da avaliação (UNIMEP, 2000).

Segundo dados do INEP (2002), do ano de 1996 (ano em que instituiu o Provão) até o ano de 2000, observou-se

[1] Programa de Pós-Graduação em Engenharia de Produção - FEMP – UNIMEP, pamiguel@unimep.br.
[2] Programa de Pós-Graduação em Engenharia de Produção - FEMP – UNIMEP, clayton@melfinet.com.br.

um grande crescimento quanto à titulação dos professores envolvidos no ensino superior, Porém, conforme destaca Costa & Júnior (2000) é importante salientar que a qualificação por si só não garante a qualidade do ensino, ou seja, somados a esta são requisitos fundamentais o investimento em infra-estrutura física e tecnológica (laboratórios, bibliotecas etc.) e a capacitação metodológica no processo ensino-aprendizagem.

Entretanto, avaliar não é apenas observar e coletar dados. Conforme afirma Ximenes (2000), a partir das interpretações ou explicações dos fatos, tendo por base parâmetros de referência, a avaliação aproxima-se de seu principal desafio que é o de propor alternativas, permitindo a retroalimentação dos processos de tomada de decisão.

Por extensão, a implementação e manutenção de procedimentos adequados de avaliação, revestidos de seriedade, correção e eficácia, seriam a única forma efetiva de levar ao conhecimento da coletividade, de maneira clara, os resultados alcançados pelo desempenho das instituições de ensino.

3. O processo de avaliação institucional aplicado a um curso de mestrado em Engenharia de Produção

A metodologia descrita a seguir, é o resultado do processo de Avaliação Institucional realizado por meio da auto-avaliação do curso de mestrado em Engenharia de Produção da Universidade Metodista de Piracicaba (UNIMEP), *campus* Santa Bárbara d'Oeste.

3.1. Historicidade do Curso de Mestrado em Engenharia de Produção da UNIMEP

O Curso de Mestrado em Engenharia de Produção da UNIMEP foi criado a partir de março de 1994 e, em dezembro de 1997 ocorreu o seu credenciamento, com vistas a melhoria da qualidade dos profissionais formados e ao desenvolvimento de pesquisas.

O corpo docente é formado basicamente por 13 professores doutores, em regime de dedicação de 40 horas (tempo integral) à universidade. O curso é oferecido na área de concentração de Gerência da Produção, Estratégia e Organizações, Gestão Ambiental e Qualidade e possui cadastradas 48 disciplinas, todas de 03 créditos, sendo exigidos 24 créditos para o mestrado.

O quadro discente do mestrado apresenta 93 alunos. O tempo médio de titulação é de 40 meses para não bolsistas e 33 meses para bolsistas. Estima-se que cerca de 70% estão atuando junto às empresas da região, e o restante em outras áreas. Até agosto de 2002, foram defendidas 58 dissertações.

O tópico seguinte apresenta a metodologia utilizada na condução do processo de avaliação pelo curso de mestrado em Engenharia de Produção.

3.2. Metodologia de Condução do Processo de Avaliação pelo Curso

O processo de Avaliação Institucional deve ser realizado através da auto-avaliação do Curso, conforme documentação do Comitê de Avaliação Institucional (UNIMEP, 2001). A seguir, destaca-se os documentos referenciais para o Processo de Avaliação Institucional do Curso de Mestrado em Engenharia de Produção:

- Política Acadêmica da UNIMEP;
- Programa de Avaliação Institucional (UNIMEP, 2000);
- Projeto Pedagógico do curso, (UNIMEP, 1998);
- Resolução do Conselho Universitário 28/01 (CONSUN - UNIMEP, 2001);
- Minutas de reuniões e correspondências da Coordenação e do Comitê de Avaliação Institucional.

O instrumento escolhido para coleta dos dados foi um questionário, considerando questões abertas, de múltipla escolha, dicotômicas ou tricotômicas, com mais de uma resposta, questões quantitativas e qualitativas, tendo como ponto de partida o seu desenvolvimento os eixos propostos pela instituição, anteriormente citados. Para que fosse elaborado um instrumento de fácil entendimento e com informações necessárias, foi aplicado um pré-teste, para que posteriormente fosse construído o instrumento final.

Cabe ressaltar que o Curso de Mestrado em Engenharia de Produção esteve sempre alinhado com a Política Acadêmica Institucional, e que o Programa de Avaliação Institucional, é um programa essencialmente interno, mas que vem do encontro com as avaliações realizadas pela CAPES.

3.3. Apresentação e Análise dos Resultados

Esse tópico é dividido em duas partes: resultados referentes à avaliação feita pelos discentes e outro pelos docentes, subdivididos de acordo com os eixos de avaliação propostos pela instituição.

3.3.1. Resultados Referentes a Avaliação feita pelos Discentes

Esse tópico evidencia inicialmente o perfil dos discentes, demonstrado na Tabela I. Para essa amostra, o retorno dos questionários foi da ordem de 42,8%.

TABELA I
PERFIL DOS DISCENTES ABRANGIDOS PELA PESQUISA

Perfil dos discentes	**Amostra**
Sexo	80% do sexo masculino
Faixa Etária	27,3% - de 36 a 40 anos; 24,2% - mais de 41 anos; 24,2% - 26 a 30 anos; 21,2% - 31 a 35 anos; 3% - menos de 25 anos.
Áreas de Concentração	36,4% - Estratégias e Organizações; 30,3% - Qualidade; 21,2% - Gerência da Produção; 12,1% - Gestão Ambiental.

TABELA I
PERFIL DOS DISCENTES ABRANGIDOS PELA PESQUISA

Formação	33% - Engenharias (Mecânica, Produção, Elétrica...); 24% - Administração de Empresas; 43% - outras áreas.
Origem da formação na IES	85% - IES particular; 12% - IES pública.
Bolsa de Estudos	30% - Bolsistas.
Atividade Profissional	31% - trabalham na área de formação; 28% - trabalham no ensino superior; 18% - trabalham, mas não em sua área de formação; 18% - não trabalham.

A seguir, os resultados serão apresentados referente a avaliação frente aos cinco eixos de análise, sendo que a tabulação dos resultados apresenta, sempre que se achar necessário, uma discussão em relação ao cruzamento de dados, neste caso, por área de concentração do curso.

3.3.1.1. Operacionalidade da Gestão do Curso

Com relação ao Conselho do Curso, pode-se considerar desfavorável, pois a maior parte dos alunos "não tem clareza do papel desse conselho" (pouco mais de 57%), além de aproximadamente um quarto dos alunos desconhecerem a existência do conselho (por áreas de concentração, as mais acentuadas são Gestão Ambiental - 100% dos alunos e 71,4% dos alunos de Estratégias e Organizações).

Na questão da participação dos alunos no Conselho do Curso, foi apontado que os discentes não procuram tomar conhecimento das decisões das reuniões (57% na área de Gerência da Produção e 50% em Gestão Ambiental).

Vale a pena ressaltar que, na visão dos alunos, a Secretaria e a Coordenação foram bem avaliados, resultando num bom percentual na somatória de "ótimo" e "bom".

3.3.1.2. Projetos e Atividades

As questões que mais contribuíram negativamente nesse eixo foram:

- *Participação em projetos de extensão*, onde 75% responderam que não participam desse tipo de projeto, havendo uma maior concentração na área de Gerência da Produção (aproximadamente 85%); sendo que 60% declararam que o curso tem incentivado esse tipo de participação;
- *Desenvolvimento em projetos de pesquisa com alunos da graduação*, sendo que quase 80% dos alunos declaram que não participam. As áreas que mais e menos respectivamente demonstraram esse pronunciado foram a de Estratégia e Organizações (92%) e a de Gestão Ambiental (50%).

Uma questão relativamente positiva foi a contribuição que o EME (Encontro de Mestrandos em Engenharia) proporciona ao trabalho de pesquisa dos alunos, sendo relevante para 91% desses alunos.

3.3.1.3. Estrutura e Apoio

Neste quesito, pode-se destacar os seguintes pontos negativos apontados pelos discentes:

- o item que mais contribuiu negativamente está relacionado a Livraria e Papelaria, sendo que de 70% dos usuários, 40% consideraram "preço" e "opções de oferta" de regulares a ruim;
- com relação ao uso do laboratório de informática, dos 50% de alunos que o utilizam, a maior parte o considera no mínimo regular;
- em relação a biblioteca, onde 100% da amostra a utiliza, quase a metade a consideraram regular frente aos itens avaliados, tais como quantidade de títulos, periódicos na área e estrangeiras etc.

3.3.1.4. Currículo

Esse foi o eixo de maior impacto positivo na avaliação discente, embora seja evidenciado também pontos críticos, demonstrados a seguir:

- mais de 75% dos discentes indicaram que o Curso de Mestrado em Engenharia de Produção atende um de seus principais objetivos, que é o de "formar recursos humanos com competência em pesquisa científica e tecnológica e ensino em Engenharia de Produção e áreas correlatas";
- no entanto, ficou claro que um terço dos discentes desconhecem os cincos objetivos do curso, principalmente na área de concentração em Gestão Ambiental (75%). Conseqüentemente, um percentual de discente também não souberam avaliar se esses objetivos estão sendo atingidos, enquanto que para uma parte (50%) o curso atinge satisfatoriamente. O mesmo, para um pouco mais de 42% consideraram que as disciplinas oferecidas atendem "parcialmente" aos objetivos do Projeto Pedagógico.

3.3.1.5. Ações do Processo de Ensino e Aprendizagem

Esse foi outro eixo que teve um impacto positivo segundo a visão dos alunos, nos seguintes pontos:

- os alunos dedicam, em média, 8,6 horas por semana para o estudo das disciplinas do curso;
- Os alunos dedicam, em média, 10,8 horas por semana para a condução de seu projeto de pesquisa;
- Com relação as práticas discentes (como tempo para estudo, iniciativa como pesquisador, integração nos trabalho de equipe etc.) mais de 50% avaliaram como "regular".

3.3.2. Resultados Referentes a Avaliação feita pelos Docentes

Esse tópico evidencia inicialmente o perfil dos docentes, demonstrado na Tabela II. Para essa amostra, o retorno dos questionários foi da ordem de 92,3%.

TABELA II
PERFIL DOS DOCENTES ABRANGIDOS PELA PESQUISA

Perfil dos docentes	**Amostra**
Regime de dedicação	100% - dedicação em tempo integral
Titulação	100% - titulação de doutor 25% - pós-doutorado
Sexo	92% - sexo masculino
Faixa etária	75% - de 41 a 55 anos
Tempo de docência acadêmica na UNIMEP	58% - 11 a 20 anos
Experiência não acadêmica	42% - de 01 a 05 anos 33% - de 06 a 10 anos

Igualmente, como foi feito com a avaliação realizada com os discentes, a seguir, os resultados sobre a avaliação feita pelos docentes, serão apresentados frente aos cinco eixos de análise. Onde for considerado pertinente, a discussão considera o cruzamento por tempo de docência na universidade.

3.3.2.1. Operacionalidade da Gestão do Curso

Inicialmente, foi considerado o nível de participação dos professores nos diversos Colegiados da Instituição, apresentado os seguintes resultados:

- para todos os tipos de colegiados da instituição, o nível de participação é considerado, para mais de 50% dos docentes, como "parcial". Isso pode ser constatado, pois 16% dos respondentes tem um tempo de docência de 04 a 10 anos na instituição.

Por outro lado, ao se avaliar o trabalho realizado pela coordenação do curso, pode se constatar que praticamente mais de dois terços dos professores aprovaram o seu trabalho.

3.3.2.2. Estrutura e Apoio

No que se refere a organização e disponibilização do acervo bibliotecário, verificou-se o seguinte:

- dentre os itens avaliados (acervo de livros, periódicos, disponibilidade de livros, quantidade, atualização etc.) todos tiveram indicação "regular" a "ruim", apontados por mais de 50% dos docentes em praticamente todas as faixas de tempo de docência;
- um aspecto positivo refere-se a recente permissão de acesso para a UNIMEP na base de dados da CAPES, o que resolve parte dos problemas relacionados aos periódicos.

Outra questão analisada neste eixo refere-se a adequação da estrutura e organização da sala de aula, observados pela insatisfação dos seguintes pontos a seguir:

- 83% com a ventilação (direcionados apenas para os alunos);
- 75% com o nível de ruído externo;
- 67% para a acústica;
- 58% com relação ao espaço das salas de aula (menores que as outras);
- 58% para a disposição e *lay out* das carteiras;
- 58% sobre as condições de uso dos recursos audiovisuais.

Como fator positivo, pode-se destacar a avaliação feita pela estrutura e organização dos laboratórios pelas áreas de concentração que os utilizam, sendo relativamente bem estruturados, pois têm recebido investimentos institucionais e dos próprios pesquisadores via projeto de pesquisa.

3.3.2.3. Projetos e Atividades

Neste eixo de análise, primeiramente verificou-se as razões que dificultam o envolvimento dos docentes em Projetos de Pesquisa e Extensão, verificando as seguintes razões:

- a universidade/curso não dispõe de docentes em regime de dedicação em número suficiente para propor projetos (possivelmente os docentes estariam se referenciando ao corpo docente da instituição, pois todos os professores do curso trabalham em regime integral);
- para 58% dos docentes, faltam condições de apoio aos projetos (seria necessário entender melhor quais seriam essas condições, pois algumas solicitações de apoio podem ser feitas);
- para 67% as ações do processo burocrático administrativo acontecem com urgência maior que a acadêmica, dificultando o trabalho acadêmicos dos docentes.

Outro item analisado, refere-se ao interesse pela extensão e disponibilidade dos docentes para realizá-la, verificando as seguintes respostas:

- para 42% dos docentes há poucas condições para a realização das atividades de extensão;
- 25% admitem não se identificarem com essa prática (observado em todas as faixas de tempo de experiência docente).

Outra questão pertinente a este eixo, é relativa a percepção da indissociabilidade entre ensino, pesquisa e extensão no curso, apontada nas seguintes atividades:

- para 58% dos docentes ocorre em sala de aula;
- para 67% no projeto pedagógico.

Com relação ao interesse dos docentes pela pesquisa e sua disponibilidade para realizá-la, observou-se o seguinte:

- 83% disserem ter grande disponibilidade e que vem realizando essa prática;
- 42% indicaram ter grande disponibilidade, mas a universidade oferece poucas condições para realizá-la.

Diante desta última questão, as respostas foram apontadas por todas as faixas de tempo de docência na Universidade.

3.3.2.4. Ações do Processo de Ensino e Aprendizagem

Neste eixo, primeiramente foi averiguado a questão da utilização de conceitos na avaliação dos alunos, o que resultou em:

- 68% indicaram que há um predomínio de conversão de notas para conceitos, por parte dos docentes (uma situação que deve ser melhor investigada, porque as avaliações da pós graduação em outros cursos são realizadas por meio de conceitos);

- 60% disseram que há incompatibilidade entre o número de alunos existentes em sala de aula e a proposta de avaliação de conceitos (em princípio, uma avaliação inadequada, pois as turmas da pós-graduação são, em geral, pequenas);
- 35% ressaltaram que o conceito possibilita uma melhor avaliação do processo ensino/aprendizagem.

As práticas relacionadas ao plano de ensino, determinou-se o seguinte:

- 91,7% afirmaram que o plano de ensino é apresentado aos alunos com discussão, no início da disciplina;
- 67% disseram que as alterações no plano ocorrem durante o desenvolvimento da disciplina;
- 33% que as alterações ocorrem frente a sugestões apresentadas pelos alunos.

Na relação entre professores e alunos, constatou-se que:

- 100% afirmaram o predomínio de uma relação aberta, menos hierarquizada, com diálogo;
- 33% disseram que há conflitos, mas que o mesmo enrique o processo.

3.3.2.5. Currículo

Correspondendo ao elenco de disciplinas oferecidas, este eixo abordou primeiramente a avaliação da grade curricular, que indicou os seguintes resultados:

- 75% dos docentes avaliaram a grade curricular como coerente com o projeto pedagógico do curso;
- 67% afirmaram que a grade curricular está ajustada às necessidades do mercado profissional;
- 17% assinalaram que a grade curricular é pouco conhecida pelos professores, mas que seria importante conhecê-la.

Por último, foi perguntado sobre a existência de compatibilidade entre os objetivos do curso, a estrutura curricular e o perfil do profissional desejado, onde se verificou que:

- 75% dos docentes responderam que há compatibilidade;
- 25% responderam que a compatibilidade é parcial.

4. Considerações Finais

É necessário destacar que, pela amplitude da amostra e pelo próprio espaço aqui definido, foram apresentados apenas os resultados mais relevantes, não sendo abordado a pesquisa como um todo.

Ao analisar-se os resultados do processo de avaliação conduzido pelo curso, através dos resultados em seus cinco eixos de avaliação, nota-se que o eixo que está mais relacionado com os aspectos do projeto pedagógico é o do Currículo, em ambas as avaliações, discentes e docentes. Entretanto, existiram alguns aspectos onde a relevância social do projeto institucional da Universidade não tem atingido o alcance desejado, tendo em vista que os objetivos do Projeto Pedagógico não são conhecidos (notadamente por uma parcela dos discentes) ou, mesmo quando conhecidos, não são cumpridos na sua plenitude. As recomendações nesse sentido, é uma análise crítica de onde o Projeto Pedagógico pode ser melhorado no sentido de rever algumas das práticas acadêmicas e administrativas, identificadas na avaliação dos eixos pelos docentes e discentes.

Na análise das três vertentes, Ensino, Pesquisa e Extensão, e sua indissociabilidade, nota-se uma grande interação entre duas delas, Ensino e Pesquisa. No caso da avaliação docente, os resultados apresentados com relação as atividades de extensão, pode-se afirmar que parte desse resultado é explicado pelo entendimento do que vem a ser as atividades de extensão para os cursos de engenharia, sejam de graduação ou pós graduação. De qualquer modo, a presença da extensão como atividade cotidiana é uma ação que deve ser intensificada no Curso de Mestrado em Engenharia de Produção, como também, o Projeto Pedagógico do curso também merece ser reavaliado de forma a direcionar, mais claramente, algumas ações voltadas para a extensão, buscando encontrar quais são suas perspectivas de extensão na universidade, a partir dos objetivos identificados.

Portanto, o processo avaliativo denota uma maior compreensão do objeto avaliado, prestando contas a comunidade, contribuindo para que se busque a minimização de suas deficiências e a maximização de sua produtividade. Ao se destacar a continuidade da avaliação institucional como um processo cultural, um favorável desempenho pode ser auferido pela atividade acadêmica, o que condiciona um compromisso social e ético por parte da instituição de ensino.

NOVA CONFIGURAÇÃO DE FIBRAS ÓPTICAS COM AMPLIFICAÇÃO RAMAN, SIMULADA COM O SOFTWARE *VPI*, UTILIZADO NA INDÚSTRIA E NO ENSINO.

Laércio Alves Nogueira [1] e Luiz Sérgio Zasnicoff [2]

Abstract — As p*erdas em fibras ópticas constituem fatores limitantes em transmissões de longa distância. Uma maneira prática de transmitir sinais com perdas reduzidas é a utilização de Amplificação Raman Distribuída. Como forma de se realizar uma transmissão otimizada, uma nova configuração híbrida de fibras ópticas é avaliada para sistemas de longa distância. Uma solução simples, e que apresenta bom resultado, é a configuração híbrida com apenas dois tipos de fibras em cascata, com bombeamento Raman por meio de um diodo laser. O objetivo é uma transmissão com perda desprezível, mantendo-se a variação total da potência do sinal de entrada, ao longo do enlace, menor que 2 dB, numa distância de 50 km. A linha é composta por um trecho de fibra monomodo (SMF – Single-Mode Fiber), e uma fibra com dispersão compensada (DCF-Dispersion-Compensating Fiber), com bombeamento Raman reverso (backward). Este trabalho apresenta as simulações desse experimento, por meio de simulações com o programa VPI.*

Index Terms — *Amplificadores ópticos, bombeamento reverso, fibras ópticas, espalhamento Raman.*

INTRODUÇÃO

Com a popularização da Internet, a tecnologia da camada física, ou de base, para a comunicação entre os usuários tem se tornado motivo de intensa pesquisa, visando à melhoria constante da rede, de forma a se atender cada vez mais um número maior de pessoas, com um aumento do tráfego e prestação de serviço com mais qualidade. Atualmente, IP (*Internet Protocol*) sobre WDM (*Wavelength-Division Multiplexing*) está recebendo muita atenção [1], pois neste esquema de comunicação uma grande capacidade de tráfego está ligada aos serviços IP. Num futuro próximo, a capacidade demandada será ainda maior, e para se conseguir este aumento de capacidade nos sistemas WDM, diminui-se a largura de espaçamento entre os canais.

No entanto, efeitos não-lineares, tais como FWM (*Four-wave mixing*) e XPM (*Cross-Phase Modulation*), entre outros, aumentam com a diminuição do espaçamento entre canais, limitando assim a distância de transmissão. A Amplificação Raman Distribuída (DRA) tem o potencial de aumentar consideravelmente a distância de transmissão. Ela permite diminuir perdas nas fibras pela utilização do próprio meio físico como um amplificador. Como resultado, o sinal necessário na entrada para se conseguir certo valor da relação sinal/ruído óptica, é reduzido, o que diminui o aparecimento dos outros tipos de efeitos não-lineares.

O ruído óptico causado pelo DRA é menor do que o ruído dos EDFAS (*Erbium-Doped Fiber Amplifiers*). Assim, DRA permite não somente que se eliminem outros efeitos não-lineares, mas também melhora a relação sinal/ruído. As simulações forma realizadas por meio do *software VPITransmissonMaker*™, um produto da empresa Virtual Photonics, Inc. A configuração utilizada para o DRA é a de bombeamento reverso (*backward*), porque o bombeamento Raman direto (*forward*) é geralmente menos eficiente em termos da relação sinal/ruído [2]. Costuma-se operar com um ganho do DRA abaixo de 20 dB, para se evitar espalhamento de Rayleigh.

Neste artigo, para se conseguir uma transmissão com perdas praticamente desprezíveis, uma configuração híbrida é utilizada, como esquema principal das simulações. Dois diferentes tipos de fibras são conectados em série, e adiciona-se a elas um DRA para compensar as perdas do enlace total. Utiliza-se uma fibra de sílica tipo monomodo (SMF – *Single Mode Fiber*), que apresenta relativamente alta dispersão cromática no comprimento de onda de 1.5 μm, mas que é efetiva na redução de efeitos não-lineares, em cascata com uma fibra de dispersão deslocada (DCF - Dispersion-Compensating Fiber), que compensa a dispersão acumulada.

O *software* VPI é a ferramenta utilizada para obtenção dos valores práticos. Os resultados da simulação validam os valores experimentais reportados nos artigos de Okuno [3], Tsukitani [4] e Kato [5].

TEORIA

Espalhamento Raman estimulado (SRS, *stimulated Raman scattering*) é um processo não linear importante que pode transformar fibras ópticas em amplificadores Raman de banda larga e lasers Raman sintonizáveis.

Em muitos meios não lineares o espalhamento Raman espontâneo converte uma pequena fração ($\sim 10^{-6}$) da onda incidente para uma outra onda a uma freqüência deslocada de um valor determinado pelos modos vibracionais do meio. Este processo é o denominado efeito Raman e é descrito pela

[1] Laércio Alves Nogueira, Universidade Presbiteriana Mackenzie, R. da Consolação, 896, 01302-907, S .Paulo, SP, Brasil, lanogueira@telespcelular.com.br
[2] Luiz Sérgio Zasnicoff, Universidade Presbiteriana Mackenzie, Rua da Consolação, 896, 01302-907, S .Paulo, SP, Brasil, lszasnicoff@mackenzie.com.br

mecânica quântica como o espalhamento de um fóton incidente por uma molécula para um fóton de freqüência menor enquanto ao mesmo tempo as moléculas fazem uma transição entre seus dois estados vibracionais. A onda incidente atua como bombeio para gerar a radiação com freqüência deslocada chamada onda Stokes.

O crescimento inicial da onda Stokes é descrito por:

$$\frac{dI_s}{dz} = g_R I_p I_s \qquad (1)$$

onde I_s é a intensidade de Stokes, I_p é a intensidade de bombeio e g_R é o coeficiente de ganho Raman. O coeficiente de ganho Raman está relacionado à parte imaginária da susceptibilidade não linear de terceira ordem.

A interação entre as ondas Stokes e a onda de bombeamento é dada pelas seguintes equações:

$$\frac{dI_s}{dz} = g_R I_p I_s - \alpha_s I_s \qquad (2)$$

$$\frac{dI_p}{dz} = -\frac{\omega_p}{\omega_s} g_R I_p I_s - \alpha_p I_p \qquad (3)$$

onde os coeficientes de absorção α_s e α_p representam as perdas nas fibras, nas freqüências do bombeio e Stokes.

Estas equações podem ser derivadas rigorosamente utilizando as equações de Maxwell. A propriedade Raman de uma fibra óptica é representada pelo fator de amplificação Raman G_R (1/W/km). O coeficiente de ganho Raman, g_R (m/W) dividido pela área efetiva, A_{eff}, resulta no fator de Raman. Partindo-se da equação do fator de amplificação de Raman [6], dado pela equação (4), chega-se à equação da intensidade de sinal $I_s(z)$ local a uma distância Z (km):

$$G_A = \frac{I_s(L)}{I_s(0)\exp(-\alpha_s L)} = \exp(g_R P_0 L_{eff} / A_{eff}) \qquad (4)$$

onde: $0 < z \le L'$, na primeira fibra.

$$I_S(z) = I_S(0)\exp[-a'_S + G'_R P_P A e^{-a_P(L-L')} e^{-a'_P L'} \cdot (e^{a'_P z} - 1)/a'_P] \qquad (5)$$

onde: $L' < z \le L$, na segunda fibra.

$$I_S(z) = BI_S(L')\exp[-a'_S(z-L') + G_R P_P A e^{-a_P(L-L')} \cdot (e^{a_P(z-L')} - 1)/a_P] \qquad (6)$$

onde A e B são valores lineares de perda na emenda entre as duas fibras e L_{eff} é conhecido como comprimento efetivo de interação, e é dado por:

$$L_{eff} = \frac{1}{\alpha_p}[1 - \exp(-\alpha_p L)] \qquad (7)$$

O circuito da configuração híbrida é mostrado na figura 1, segundo a montagem utilizada por Okuno em 2001 e Kato, 1999.

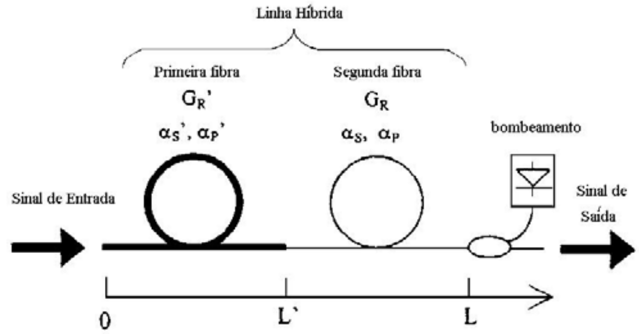

FIGURA 1.
CONFIGURAÇÃO HÍBRIDA COM DRA E BOMBEIO REVERSO.

SIMULAÇÕES

O *software* VPI disponibiliza para simulações modelos de fibras ópticas, dos quais foi utilizado nas simulações um modelo denominado de fibra NLS bidirecional (*Nonlinear Dispersive Fibe*r, NLS). Este modelo de fibra simula a transmissão de um sinal não linear de banda larga em fibras ópticas, levando em consideração o fluxo de sinal bidirecional, espalhamento de Rayleigh múltiplo, espalhamento Raman estimulado e espontâneo, não linearidades de Kerr e efeitos de dispersão. O método de cálculo numérico utilizado é o "*split-step Fourier*".

Com este *software* da VPI, o circuito mostrado na figura 1 foi implementado utilizando-se os blocos operacionais internos ao programa, e simulado com a configuração indicada na figura 2. Esta configuração representa o circuito real experimentado. O diagrama de blocos ilustra os componentes típicos existentes na biblioteca do VPI. Podemos notar os transmissores laser da banda C (1530-1570 nm), os lasers de bombeio DRA reversos, analisadores de espectro, trechos de fibras ópticas, osciloscópios etc.

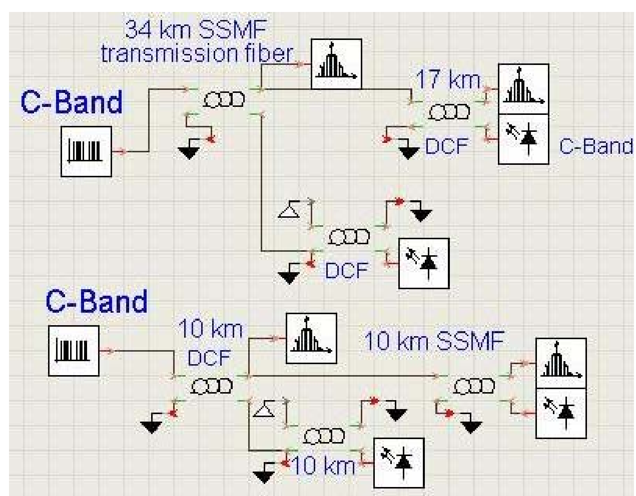

FIGURA 2
CIRCUITO COM CONFIGURAÇÃO HÍBRIDA UTILIZADO PELO VPI.

Os parâmetros estabelecidos foram os mesmos utilizados pelos autores [3,4,5].

O enlace do primeiro trecho-circuito da figura 2 é composto por uma fibra SMF de 34 km acoplada a uma fibra DCF de 17 km. Para o segundo circuito da mesma figura 2, os dois comprimentos das duas fibras possuem 10 km, cada.

A figura 3 mostra a distribuição de potência do sinal observada pelo *Visualizer* do software VPI.

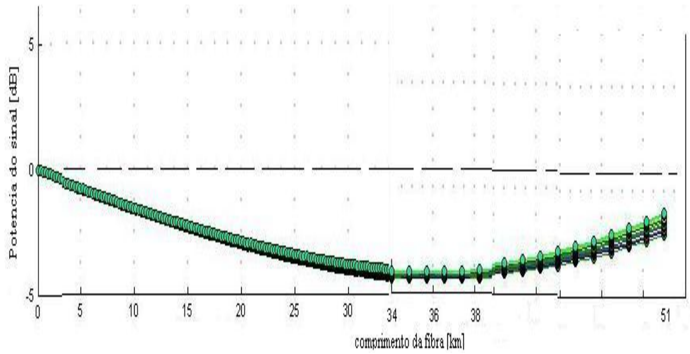

FIGURA 3
VARIAÇÃO DO SINAL DE ENTRADA NA FIBRA AO LONGO DO ENLACE DE 51 KM; ORDEM DA CONFIGURAÇÃO SMF NA FRENTE DA DCF.

Na figura 4, o sinal é observado internamente às duas fibras, no trecho de 10 km cada.

Duas configurações híbridas foram simuladas: a primeira, com 34 km de fibra SMF no primeiro trecho, e outra com 17 km adicionais de fibra DCF no segundo trecho; a segunda configuração utilizando utiliza um trecho de fibra DCF com 10 km de comprimento, à frente de um trecho de fibra SMF, também com 10 km.

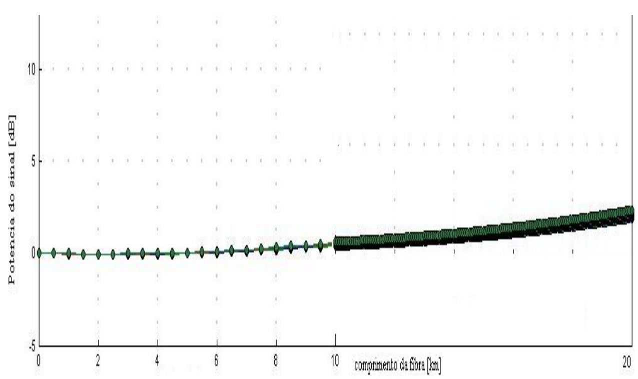

FIGURA 4
VARIAÇÃO DO SINAL DE ENTRADA NA FIBRA AO LONGO DO ENLACE DE 20 KM; ORDEM DA CONFIGURAÇÃO DCF NA FRENTE DA SMF.

Os parâmetros estabelecidos para as simulações são mostrados nas tabelas I e II.

TABELA I
PARÂMETROS UTILIZADOS NA PRIMEIRA CONFIGURAÇÃO

	α_s	L
Primeira fibra SMF	0,2	34 km
Segunda fibra DCF	0,3	17 km

TABELA II
PARÂMETROS UTILIZADOS NA SEGUNDA CONFIGURAÇÃO

	α_s	L
Primeira fibra DCF	0,3	10 km
Segunda fibra SMF	0,2	10 km

Os valores de bombeio utilizados foram de 20,4 dBm para as duas configurações.

O coeficiente α_s adotado para a fibra DCF é de 0,26, e para a fibra SMF, é 0,20.

Os resultados ficaram muito próximos dos obtidos por Okuno em seu trabalho de 2001 [3].

A figura 3 mostra que a variação do sinal, para um enlace híbrido de aproximadamente 50 km, tem variação máxima de cerca de 5 dB.

Na figura 4, com a sugestão dada por Okuno de se utilizar a fibra DCF à frente da SMF, e para um enlace de 20 km, o amplificador Raman praticamente eliminou as perdas do sistema: a variação do sinal ficou abaixo de 2 dB.

Os resultados experimentais simulados com o software VPI mostram concordância com os valores calculados e simulados por Okuno e colaboradores.

CONCLUSÕES

Uma nova configuração híbrida de fibras ópticas foi analisada por meio de simulação utilizando o software VPI. O sistema utilizou um laser de bombeio para originar o DRA, com o esquema de bombeamento reverso. Os valores obtidos indicam que a perda de energia do sinal pode ser confinada para valores menores que 2 dB, em enlaces de até 20 km de extensão, ou para menos que 5 dB, em enlaces de até 51 km.

Os resultados experimentais validam o uso da configuração para compensar perdas nas fibras e uso adequado em sistemas práticos.

Com as ferramentas do software VPI, específicas para comunicações ópticas, foi possível medir todas as variações dos sinais internamente às fibras dos enlaces, e observar o comportamento de suas possíveis interações. A utilização do software tornou o experimento mais rápido e confiável, pois o método de cálculo numérico utilizado por ele, “split-step Fourier” está sendo amplamente usado em implementações similares. Com os resultados obtidos através do VPI temos segurança em propor a configuração para implementação prática para a diminuição das perdas em sistemas de grande capacidade.

O software VPI tem enorme potencial para o ensino, e pesquisa na área de sistemas comunicações ópticas.

A Mídia Eletrônica e as Comunidades Virtuais como Fonte e Manifestação de Conhecimento

Prof.Dr Sidney Ferreira Leite

Resumo: O desenvolvimento das novas tecnologias de informação trouxe novos horizontes e desafios para a educação. Assim, faz-se necessário refletir sobre a melhor forma de incorporá-las ao processo de ensino-aprendizagam. Nesse contexto, parece auspicioso discutir quais as metodologias capazes de levar adiante a alfabetização nas linguagens visuais e prover os cidadãos de novos saberes e competências.

Palavras-chave: educação, computação, revolução tecnológica.

O Olhar Questionador

Como sustenta o jornalista e historiador José Arbex Jr., a Guerra do Golfo (janeiro/ fevereiro de 1991) pode ser tomada como o ponto de partida para compreender, com mais nitidez, o poder da mídia no mundo contemporâneo. De fato, a cobertura jornalística desse conflito consolidou um novo paradigma. Em outras palavras, demonstrou, por um lado, que as novas tecnologias de comunicação permitem o registro de eventos, em qualquer parte do planeta e, concomitantemente, a sua imediata retransmissão em tempo real e, por outro, que as fontes de saber e informação estão passando por um momento de grandes e aceleradas transformações. A utilização das mídias eletrônicas com o objetivo de criar, induzir e manipular fatos coloca uma série de novas questões para os educadores e todos os profissionais, cujas atividades estão, direta ou indiretamente, relacionados a compreensão e operacionallização das complexidades do mundo contemporâneo.

O maior desafio para Douglas Kellner, cujas idéias são fundamentais para discutir as questões relacionadas acima, é estar preparado para a emergência das alfabetizações e das inteligências múltiplas[1]. Os educadores, em geral, necessitam interpretar criticamente as construções e as linguagens elaboradas pela mídia, lançar mão da internet, de filmes e telejornais - que desempenham papel central na forma como as crianças e os jovens concebem e interpretam o mundo. Essas questões são especialmente relevantes, pois os produtos da mídia são empregados cotidianamente nas escolas e, na maioria das vezes, como simples ilustrações, portadoras de verdades inquestionáveis. As manipulações e as distorções são ignoradas ou colocadas num plano secundário. Tal fato se deve, em grande medida, à carência de instrumentais teóricos e práticos para uma leitura critica das mídias.

Esse trabalho visa contribuir para o exercício do olhar questionador e, conseqüentemente, propiciar uma reflexão sobre o papel e o lugar da mídia no processo de conhecimento. Tal reflexão se dará por meio da experiência adquirida pelo seu autor como coordenador do módulo: **Mídia na Escola,** do projeto Educar 2002, levado a cabo pela Cidade do Conhecimento, no Instituto de Estudos Avançados (IEA) da Universidade de São Paulo.

O programa **Educar** na Sociedade da Informação é a principal via de acesso à Cidade do Conhecimento da USP para professores e outros profissionais do ensino médio e fundamental. O programa inclui ciclos de palestras, visitas, trabalhos de campo e atividades *online* em comunidades virtuais. Mais que um curso de atualização com pesquisadores de destaque da USP e de outras organizações, é um espaço para a formação de redes de contatos com profissionais que lideram iniciativas educacionais, projetos de pesquisa e ações sociais fazendo uso inteligente das novas tecnologias de informação e comunicação.

---

[1] As hipóteses do autor em questão podem ser encontradas na seguinte obra: KELLNER, Douglas- **A Cultura da Mídia.** SP: EDUSC, 2001.

A Revolução da Informação

Em **Ética e Poder na Sociedade da Informação**, Gilberto Dupas discute como a autonomia das novas tecnologias obriga a rever o mito do progresso. A hipótese central está formulada nitidamente no primeiro capítulo: "Apesar de ter sido um período de excepcionais conquistas da ciência, o século XX não terminou bem. O mundo capitalista viu-se novamente às voltas com problemas que parecia ter eliminado: desemprego, depressões cíclicas, população indigente em meio a um luxo abundante e o Estado em crise". As luzes não se irradiaram pela sociedade de forma harmoniosa e justa. A humanidade acabou submetida às engrenagens de um darwinismo econômico que hoje se chama "globalização financeira". O progresso se alimenta do atraso e da riqueza do Centro que cresce com a pobreza da Periferia. O autor retrata vários desdobramentos desse contraste e propõe uma saída: a ética da responsabilidade[2]. A questão ética, colocada em relevo por Gilberto Dupas, está diretamente relacionada à necessidade de expandir para milhões de pessoas o acesso às informações e aos conhecimentos que podem ser coletados no ciberespaço.

Como sustenta o cientista político norte-americano Joseph S. Nye Jr., a característica fundamental da revolução da informação não é a velocidade da comunicação entre ricos e poderosos: há mais de 130 anos que a comunicação instantânea entre a Europa e a América do Norte é possível. A mudança decisiva está na enorme redução do custo da transmissão da informação. O atual custo de transmissão da informação tornou-se insignificante para a totalidade dos fins práticos; portanto, a quantidade de informação que se pode transmitir em todo o planeta é de fato infinita[3].

A atual revolução da informação baseia-se nos rápidos avanços tecnológicos do computador, das comunicações e do *software* que, por sua vez conduziram a extraordinárias reduções no custo do processamento e da transmissão da informação. Como demonstra Nye Jr., o preço de um computador novo vem caindo em aproximadamente um quinto por ano desde 1954. Nos Estados Unidos, por exemplo, os novos investimentos em tecnologias de informação elevaram-se de 7% a quase 50%. Nos últimos trinta anos, o poder da rede de computação tem dobrado a cada dezoito meses e ainda mais rapidamente nos últimos anos, e hoje isso custa menos de 1% do que custava no início da década de 1970. Se o preço dos automóveis tivesse baixado tão depressa quanto o dos semicondutores, um carro estaria custando cinco dólares[4].

Há alguns anos que o tráfego na internet dobra de cem em cem dias. Em 1993, havia cerca de cinqüenta *websites* no mundo, no fim do decênio, esse número já ultrapassava os cinco milhões. As larguras das bandas de comunicação estão se expandindo velozmente, e os custos continuam caindo mais depressa que os do poder de computação. Ainda recentemente, em 1980, os telefonemas por fio de cobre transportavam somente uma página de informação por segundo; hoje em dia, um finíssimo cabo de fibra óptica é capaz de transmitir noventa mil volumes por segundo. Em dólares de 1990, o custo de uma chamada transatlântica de três minutos caiu de 250, em 1930, para bem menos que um dólar no fim do século[5].

Nesse cenário, se for levado em consideração tanto o paradigma da velocidade, no qual pode-se detectar que apenas uma pequena parcela da humanidade está a 120km/h e a imensa maioria está a 5 km/h, como a hipótese da redução acelerada dos custos da transmissão da informação, cuja realidade é a constatação de que a redução propalada tem beneficiado a mesma diminuta parte e, simultaneamente, excluído milhões de pessoas.

Essa dupla constatação remete à seguinte questão central: passamos por uma revolução tecnológica que tem no seu centro o computador, a informação, a comunicação e as tecnologias multimídias. Os indicam mais confiáveis sugerem que não estamos suficientemente preparados para aproveitar o rico potencial regenerador que tal revolução propicia,

principalmente quando o campo em questão é o educacional.

De fato, a revolução tecnológica em curso traz novos e instigantes desafios. Cabe destacar, em especial, a necessidade de prover tanto as crianças, como os adultos com as ferramentas e as competências que abram as portas para a participação ativa no século XXI. Pois, as exigências históricas, afloradas principalmente pelo processo de globalização, impõem a existência de cidadãos informados e ativos. A rigor, é mister sublinhar, a revolução me questão, torna indispensável a reestruturação do sistema educacional que predominou nos últimos dois séculos.

Por uma teoria crítica da tecnologia

O filósofo Douglas Kellner, tem razão quando sustenta que nesse tempo de rápidas e profundas mudanças é necessário enfrentar o desafio da experimentação. Em outras palavras, urge questionar as práticas existentes, os sistemas pedagógicos e as filosofias educacionais e de construir novas formas. Nesse cenário, cabe testar o que funciona e o que não funciona no novo milênio. É tempo de refletir sobre metas e, ao mesmo tempo, discernir o que queremos alcançar com a educação. Mas, de forma aparentemente contraditória, é também a época de voltar à filosofia da educação clássica que insere as reflexões sobre a educação nas reflexões sobre a vida e a sociedade e, concomitantemente, refletir sobre como podemos transformar a educação no dispositivo central da sociedade contemporânea.[6]

Nesse contexto, dois grupos estão em litígio: os tecnofóbicos que têm como premissa à oposição às novas tecnologias e os apologistas que, por sua vez, pregam que às novas tecnologias são as caixas de pandora do novo milênio. Nesse cenário bipolarizado, a virtude, tudo indica, está na terceira via, isto é, sustentar que a tarefa prioritária é a investigação sobre as possibilidades e os limites das novas o desenvolvimento das tecnologias. Seguindo tal pressuposto, deve-se rejeitar o exagero e as pretensões das novas tecnologias, pois vê as limitações das propostas pedagógicas e educativas baseadas primeiramente na tecnologia sem ênfase adequada no pedagógico, no professor e no fortalecimento do estudante.

A alfabetização crítica da mídia deve ser um projeto pedagógico que tem como premissas fundamentais a participação e o trabalho em conjunto. Assistir a programas de televisão ou a filmes em grupo, promover discussões produtivas entre professores e alunos, com ênfase no ato de trazer à tona as visões que os estudantes sistematizam, ou seja, permitir variadas interpretações dos textos midiáticos. Assim, como urge formar comunidades virtuais e grupos de discussão. De fato, parece nítido, que tanto as crianças como os jovens conhecem mais a cultura midiática do que seus professores[7]. Dessa forma, as atividades pedagógicas, acima descritas, poderão trazer contribuições significativas para o processo de ensino-aprendizagem e, concomitantemente, iniciar a alfabetização nas linguagens visuais: “Para desenvolver a alfabetização midiática, é preciso desenvolver a sensibilidade à imagística visual, ao som e ao discurso, bem como quanto à estrutura narrativa e aos significados e efeito de texto. Desse modo, recorre-se à estática desenvolvida em literatura, filme, vídeo e em estudos de arte, combinando tal material ao se referir a especificidades do texto particular ou de artefato em questão”.[8]

A partir dessa perspectiva, a alfabetização em informática deve ser orientada e conduzida de forma global e total. Aprender como usar computadores, acessar informações e material educativo, usar correio eletrônico e, até a construção de *websites,* o acesso e o processamento de diversos tipos de informações que, embora, abundantes na “sociedade de informação”, ficam restritos a um número reduzido de privilegiados. Em outras palavras, a alfabetização em questão, inclui a informação de como encontrar fontes de informação desde locais tradicionais, como: as bibliotecas, a mídia impressa, os novos *websites* de internet e os mecanismos de busca. Assim como, envolve aprender onde encontrar a informação, como acessá-la e como organizar, interpretar e avaliar a informação que se procura.

[6] KELLNER, Douglas- “Novas tecnologias: novas alfabetizações. Centro Universitário Sul de Minas, p.05.

[7] Idem, ibidem.
[8] Idem, ibidem.

Mas, não basta o domínio eminentemente técnico. Nessa cultura multimídia computadorizada, a alfabetização visual passa a ocupar posição central na educação. Afinal, como sustenta o autor de **Cultura da Mídia,** as telas dos monitores são mais gráficas, visuais e interativas do que os campos impressos convecionais. Tais fatos confundem os cidadãos, quando esses são confrontados com novos ambientes da *web*, isto é: ícones, janelas, mouses e os vários comandos, conexões e interações presentes na linguagem do hipertexto e mediados pelo computador; fenômenos que ditam novas competências e exigem uma dramática expansão da nova alfabetização. A rigor, postula-se a alfabetização múltipla, ou seja, as alfabetizações necessárias para acessar, interpretar, criticar e participar das novas formas emergentes de cultura e sociedade. As multialfabetizações e as novas pedagogias devem tornar-se reflexivas e críticas e, dessa forma, discuti, a natureza e efeitos das novas tecnologias e sistemas pedagógicos, sem fazer tabula rasa, como foi discutido ao longo desse trabalho, da revolução tecnológica.

O ENGENHEIRO COMO UM "NÓ" NA TEORIA DAS REDES INSERIDO NO MERCADO DE TRABALHO GLOBAL

Carlos Roberto Jóia Hozumi[1] *, Vânia Maria Rocha Gomes Hozumi*[2]
Maria da Glória Faria Leal[3] *, Roberto Peixoto Nogueira*[4]

***Resumo**: A reestruturação produtiva desenha atribuições profissionais diferenciadas para o engenheiro pleno, levando-o a atuar de forma estratégica nas empresas, atendendo às demandas do mercado de trabalho global, com foco na qualidade agregada à produção e em especial ao meio ambiente. Esse profissional atua com uma visão empreendedora e com características e habilidades complementares à sua formação plena acadêmica. Com perspectiva humanista sob ótica sistêmica, apresenta capacidade de relacionamento interpessoal e forte liderança, atuando em todos os segmentos dos processos produtivos e gerenciais das empresas, como um verdadeiro "nó" de uma rede, ratificando a Teoria de Callon. O presente artigo pretende investigar a convergência dessas competências e atribuições, sugerindo metodologias no processo de ensino-aprendizagem desses profissionais de engenharia, de forma aprimorar as discussões em sala de aulas.*

Palavras-chave: Empreendedorismo, Gestão; Metodologia

Introdução

Face às novas diretrizes da economia mundial, as empresas passam pela necessidade de expandir e aprimorar seus negócios e primordialmente seus métodos e processos produtivos, inovando cada vez mais, para que possam garantir seus mercados, priorizando a qualidade de seus produtos e serviços, com desenvolvimento sustentável, isto é, preservando o meio ambiente para gerações futuras. Desta forma, procura criar e adequar novos postos de trabalho, com objetivo de se obter mais qualidade e vantagem competitiva.

Em busca desta modernização e flexibilização de seus pátios de produção, as empresas investem no aperfeiçoamento de sua mão de obra, principalmente aquela responsável pela sistematização de seus processos produtivos, criando e remodelando equipamentos de forma aumentar a produção e os lucros das empresas, alicerçando, cada vez mais, as estruturas de seus negócios. Nesse contexto prima-se pela necessidade de formação de um profissional que atue como um verdadeiro "nó" de uma rede produtiva nas empresas, atento à questões ambientais. Esse profissional além de suas atribuições técnicas, deve ter uma visão empreendedora, ampliando desta forma as competências de sua formação tradicional.

Este profissional com habilidades próprias às demandas de mercado organiza tática e estrategicamente as metas a serem alcançadas pela filosofia da empresa, apóia-se na ciência e na tecnologia conduzindo os trabalhos como um líder eficaz, capaz de motivar seus subordinados, unindo todos os departamentos e setores de trabalho, objetivando melhorias contínuas dos resultados atingidos nos processos produtivos de forma sustentável, preservando as características originais do meio ambiente.

Assim, para formação desse engenheiro, propõe-se aprimorar as discussões em sala de aulas, sugerindo metodologias capazes de integrar seu mundo de trabalho ao ensino-aprendizagem no processo de sua formação acadêmica.

"A Atuação do Engenheiro como um Nó de uma Rede Produtiva"

As empresas buscam obter vantagem competitiva obrigando-se a atender aspectos qualitativos promovendo inovações de seus processos produtivos e formas de trabalho. Para isso exigem velocidade em sua atuação, custos competitivos e ainda a satisfação de seus investidores e clientes, tanto internos como externos, tendo como prioridade a vantagem competitiva aliada à conservação ambiental; até porque, o atendimento à ISO 14000 é priorizada como diferencial entre as empresas.

Cabe ao engenheiro que lida com essas expectativas, atuar de forma sistêmica para atendimento às demandas e necessidades de mercado, administrando recursos materiais e humanos para realização dessas tarefas. Os

movimentos ambientalistas, em contraste, historicamente têm apresentado discussões para participar da administração dos negócios. Estes movimentos procuram soluções para evitar resíduos tóxicos; promovem a utilização racional e eficiente dos recursos naturais, nem sempre maximizando os lucros em curto prazo às empresas, porém de conseqüências fundamentais à qualidade de vida do homem. Segundo Marsh [5] os efeitos negativos não planejados das atividades econômicas humanas no ambiente são sempre maiores que os benefícios. Por exemplo, há ligações entre a derrubada de florestas e a erosão dos solos e entre a drenagem de pântanos e lagos e o declínio da vida animal. Neste contexto apresenta-se o engenheiro como um "nó" de uma rede de trabalho, produzindo sob constante pressão, exercitando suas habilidades em questões de conflitos, que, bem gerenciadas, possibilita o sucesso de sua empresa e conseqüentemente sua progressão profissional.

Bruno [2] ratifica essa pressão emocional em que esses profissionais trabalham em atendimento a cumprimento de prazos de seus projetos, agindo como um condutor de negócios, envolvido em questões próprias de um empreendedor, comprometido com o desenvolvimento e desempenho das atividades das empresas, conflitando muitas vezes com interesses pessoais e sociais.

"Os engenheiros[...]quanto às condições sob as quais trabalham, estas se caracterizam por grande carga de tensão, em cumprimento de prazos cada vez mais curtos para concepção e execução de projetos... "[2].

O engenheiro deve possuir ampla visão técnica e gerencial da produção, envolvido diretamente com a estratégia, qualidade e gestão dos negócios da organização.

Embora esse profissional tenha sua atuação focada em conhecimentos técnicos específicos, como gestor ele atua nas questões ambientais agregadas aos mecanismos de atualização de tecnologia, apropriados à qualidade, pois o uso inadequado dessas tecnologias implica, muitas vezes, em desperdícios às indústrias, à natureza e à própria sociedade.

Sem gestão dos processos produtivos e de controle do meio ambiente, danos irreparáveis à natureza podem ocorrer, em prejuízo aos ecossistemas e à sobrevivência humana. Assim, esses engenheiros trabalham com conhecimentos que envolvem novas tecnologias, conduzindo essas inovações à melhor aplicação na produção, qualificando seus subordinados em seu próprio posto de trabalho, conduzindo-os ao aperfeiçoamento profissional, com objetivo de mantê-los em seus próprios postos de trabalho. Cabe aplicar essas tecnologias, de forma gradual e consciente, de forma reduzir os impactos ambientais a natureza.

Assim, quando de uma nova aquisição tecnológica, a participação desse engenheiro é fundamental, pois com seus conhecimentos técnicos possibilita a adequação de custos e benefícios que esse novo produto de investimento possa proporcionar a curto, médio e longo prazos, tomando assim a melhor decisão para aplicação dos recursos destinados a esses novos projetos de desenvolvimento, para crescimento econômico e competitividade das empresas no mercado de trabalho.

Anderson [1] já apontava que o engenheiro estendia seu campo de atividade, incluindo nele relações humanas e gerenciais em geral, eles se têm inclinado a ampliar o título de engenheiro para cobrir suas atividades, quaisquer que elas possam ser.

Com a reestruturação produtiva, esse engenheiro apresenta-se como um agente de mudanças para a organização, transformando as relações de trabalho puramente técnicas em relações complementares administrativas, assumindo o papel, muitas vezes, central de gestão, com total ampliação de suas funções profissionais, liderando e motivando sua equipe, aproximando as estruturas hierárquicas em seu ambiente de trabalho, comprometendo-se sistematicamente com a produção, objetivando organizar a rede por ele coordenada. Esse profissional tem informações globalizadas, que o coloca integrado ao seu mercado e a sua equipe produtiva, como já citamos, como um verdadeiro "nó" de uma rede, devendo tomar decisões acertadas, para melhor desempenho de seus projetos, sempre buscando a qualidade, a preservação ambiental e, conseqüentemente, a vantagem competitiva.

Callon [3], cientista proeminente do Centro de Estudos da Inovação de Paris, um dos mais renomados pesquisadores da sociologia da ciência e da tecnologia, defende a "teoria das redes", com vistas ao entendimento dos sistemas laboratoriais que conduzem ao desenvolvimento de inovações.

Segundo Callon, o sucesso ou o insucesso das instituições que trabalham com C&T está diretamente ligado à compreensão das chamadas redes. Para ele, os chamados porta-vozes (*porteparoles*) de sistemas que atuam na organização, são elementos fundamentais para funcionamento de um laboratório ou instituição dessa natureza, podendo ser humanos ou não humanos, porém plenamente operantes em sua atuação, para sucesso da pesquisa.

"Na minha visão, de nada adianta se dispor de um grupo de renomados doutores, detentores de Prêmios Nobel, se a rede que opera o laboratório tem um ou mais porta-

vozes inoperantes. Dessa forma, o sucesso das organizações que atuam em C&T está na estrita dependência da adequada coordenação de todos esses elementos da rede".[3]

Portanto, a chamada *Teoria das Redes* que serve para ampliar o entendimento sobre o atual desempenho do pesquisador, clarifica, em certa medida, a figura do engenheiro pleno.

"Muito embora a teoria de Callon tenha sido desenvolvida com vistas ao entendimento dos sistemas laboratoriais que conduzem ao desenvolvimento de inovações, seus princípios têm sido hoje em dia muito usados em analogias a outras atividades que envolvem parceiros em atividades simultâneas em uma mesma organização ou em redes de organizações atuando em parcerias".[6]

O engenheiro faz parte dessa rede, surgindo como agente empreendedor e de mudanças, pois trabalha no limite de suas atribuições técnicas, de gestão ambiental e de negócios, com vistas à qualidade e competitividade estratégica. Atua com propriedade em conflitos sociais e humanos na empresa, conforme ratificado por [4].

"[...] Além do saber técnico-científico necessário à realização industrial, os engenheiros podem intervir com maior propriedade nos conflitos das relações sociais no trabalho, quanto à harmonia dos procedimentos e atitudes do trabalhador" [4]

Este profissional possui raciocínio abstrato, buscando caminhos alternativos não puramente cartesianos ou matemáticos para resolução de suas tarefas, com ótica humanista, não discriminando raças, crenças e valores, podendo assim, organizar e planejar a diversidade de seus clientes. Envolve-se de forma sistêmica em seu trabalho, conhecendo todos os processos de fabricação, possibilitando a dinamização da produção sem prejuízo para a natureza. Por ser criativo, possui uma incrível capacidade de trabalhar equipe, coordenando todos os projetos da empresa.

Robert L. Swiggett, presidente da Kollmorgen Corporation, *apud* [5] diz que *"a função do líder é criar uma visão"*, palavra, até poucos anos, não ouvida entre os gestores. Hoje se sabe que ter uma visão do futuro, sem prejuízos produtivos e também ambientais, é atitude essencial do engenheiro uma postura de liderança agregada aos conhecimentos técnicos adquiridos, além de muita motivação no trabalho, que aliadas ao bom relacionamento interpessoal, constrói-se uma rede produtiva de primordial importância para a empresa.

Visão é sinônimo de negócios, é uma imagem mental de um futuro possível e desejável para uma organização. Atuando como líderes, esses engenheiros imaginam o ideal de futuro para as suas organizações, criando alternativas diferentes do que os outros possam ter considerado como única estratégia ou solução possível. Lutam incessantemente para concretizar realizações importantes que outros não conseguiriam. Procuram olhar à frente e em todas as direções para atingir seus objetivos. Essa visão está centrada na natureza que não deve ser subjugada e sim conservada não apenas para a utilização econômica, mas também por ela própria, isto é, pelo que as pessoas possam aprender com ela.

"Metodologias em Sala de Aulas de Engenharia"

Devido às ampliações nas atribuições profissionais dos engenheiros plenos exigidos pelas empresas no mercado de trabalho globalizado, pode-se constatar a necessidade de aprimorar sua formação acadêmica tradicional, focando o empreendedorismo como condição essencial de sobrevivência em seu mundo de trabalho. Esse aprimoramento envolve dinâmicas em sala de aulas, de forma a criar simulações de situações reais cotidianas vivenciadas em uma empresa; discutindo-se os problemas apresentados e debatendo-os, em busca de soluções ideais ou, muitas vezes, a única possível para sua resolução. Estabelecem-se relações com e entre situações, fenômenos e pessoas, contextualizando *teorias, leis e experiências pessoais*, complementando suas competências e habilidades. Essa simulação mostra a participação do aluno em uma rede produtiva, conduzindo-o a agir de forma construtiva e empreendedora. Essa experiência em sala de aulas induz à reflexão dos problemas e suas alternativas de soluções no processo de trabalho, com ênfase no desenvolvimento sustentável, ligadas a questões ambientais, em conformidade com a ISO 14000, as quais exigem atenções redobradas de seus gestores, pois um erro operacional pode resultar em prejuízos irreparáveis à natureza. Essas dinâmicas devem ser ministradas em disciplinas, tanto técnicas como de ênfase em gestão nos cursos de formação plena, preparando conscientemente o profissional demandado no presente.

Conclusão

O engenheiro atua como um "nó" de uma rede produtiva assumindo os mais abrangentes compromissos em seu mundo do trabalho, agregando-se diretamente à suas tarefas tradicionalmente atribuídas em sua função técnica tradicional, justamente por trabalhar suas habilidades e competências, através de experiências e simulações vivenciadas em sala de aulas. Essas situações, uma vez encontradas em seu mundo de trabalho, tornam-se menos impactativas à sua atuação profissional. Esse profissional direciona suas atividades profissionais como um empreendedor e principalmente como um prestador de serviços às questões ambientais. Atuação esta, que pode diferenciar as lideranças das empresas, promovendo sobrevivência e vantagem competitiva em seus mercados de atuação.

O ENGENHEIRO COMO UM "NÓ" NA TEORIA DAS REDES INSERIDO NO MERCADO DE TRABALHO GLOBAL

Carlos Roberto Jóia Hozumi[1] , Vânia Maria Rocha Gomes Hozumi[2]
Maria da Glória Faria Leal[3] , Roberto Peixoto Nogueira[4]

***Resumo**: A reestruturação produtiva desenha atribuições profissionais diferenciadas para o engenheiro pleno, levando-o a atuar de forma estratégica nas empresas, atendendo às demandas do mercado de trabalho global, com foco na qualidade agregada à produção e em especial ao meio ambiente. Esse profissional atua com uma visão empreendedora e com características e habilidades complementares à sua formação plena acadêmica. Com perspectiva humanista sob ótica sistêmica, apresenta capacidade de relacionamento interpessoal e forte liderança, atuando em todos os segmentos dos processos produtivos e gerenciais das empresas, como um verdadeiro "nó" de uma rede, ratificando a Teoria de Callon. O presente artigo pretende investigar a convergência dessas competências e atribuições, sugerindo metodologias no processo de ensino-aprendizagem desses profissionais de engenharia, de forma aprimorar as discussões em sala de aulas.*

Palavras-chave: Empreendedorismo, Gestão; Metodologia

Introdução

Face às novas diretrizes da economia mundial, as empresas passam pela necessidade de expandir e aprimorar seus negócios e primordialmente seus métodos e processos produtivos, inovando cada vez mais, para que possam garantir seus mercados, priorizando a qualidade de seus produtos e serviços, com desenvolvimento sustentável, isto é, preservando o meio ambiente para gerações futuras. Desta forma, procura criar e adequar novos postos de trabalho, com objetivo de se obter mais qualidade e vantagem competitiva.

Em busca desta modernização e flexibilização de seus pátios de produção, as empresas investem no aperfeiçoamento de sua mão de obra, principalmente aquela responsável pela sistematização de seus processos produtivos, criando e remodelando equipamentos de forma aumentar a produção e os lucros das empresas, alicerçando, cada vez mais, as estruturas de seus negócios. Nesse contexto prima-se pela necessidade de formação de um profissional que atue como um verdadeiro "nó" de uma rede produtiva nas empresas, atento à questões ambientais. Esse profissional além de suas atribuições técnicas, deve ter uma visão empreendedora, ampliando desta forma as competências de sua formação tradicional.

Este profissional com habilidades próprias às demandas de mercado organiza tática e estrategicamente as metas a serem alcançadas pela filosofia da empresa, apóia-se na ciência e na tecnologia conduzindo os trabalhos como um líder eficaz, capaz de motivar seus subordinados, unindo todos os departamentos e setores de trabalho, objetivando melhorias contínuas dos resultados atingidos nos processos produtivos de forma sustentável, preservando as características originais do meio ambiente.

Assim, para formação desse engenheiro, propõe-se aprimorar as discussões em sala de aulas, sugerindo metodologias capazes de integrar seu mundo de trabalho ao ensino-aprendizagem no processo de sua formação acadêmica.

"A Atuação do Engenheiro como um Nó de uma Rede Produtiva"

As empresas buscam obter vantagem competitiva obrigando-se a atender aspectos qualitativos promovendo inovações de seus processos produtivos e formas de trabalho. Para isso exigem velocidade em sua atuação, custos competitivos e ainda a satisfação de seus investidores e clientes, tanto internos como externos, tendo como prioridade a vantagem competitiva aliada à conservação ambiental; até porque, o atendimento à ISO 14000 é priorizada como diferencial entre as empresas.

Cabe ao engenheiro que lida com essas expectativas, atuar de forma sistêmica para atendimento às demandas e necessidades de mercado, administrando recursos materiais e humanos para realização dessas tarefas. Os

movimentos ambientalistas, em contraste, historicamente têm apresentado discussões para participar da administração dos negócios. Estes movimentos procuram soluções para evitar resíduos tóxicos; promovem a utilização racional e eficiente dos recursos naturais, nem sempre maximizando os lucros em curto prazo às empresas, porém de conseqüências fundamentais à qualidade de vida do homem. Segundo Marsh [5] os efeitos negativos não planejados das atividades econômicas humanas no ambiente são sempre maiores que os benefícios. Por exemplo, há ligações entre a derrubada de florestas e a erosão dos solos e entre a drenagem de pântanos e lagos e o declínio da vida animal. Neste contexto apresenta-se o engenheiro como um "nó" de uma rede de trabalho, produzindo sob constante pressão, exercitando suas habilidades em questões de conflitos, que, bem gerenciadas, possibilita o sucesso de sua empresa e conseqüentemente sua progressão profissional.

Bruno [2] ratifica essa pressão emocional em que esses profissionais trabalham em atendimento a cumprimento de prazos de seus projetos, agindo como um condutor de negócios, envolvido em questões próprias de um empreendedor, comprometido com o desenvolvimento e desempenho das atividades das empresas, conflitando muitas vezes com interesses pessoais e sociais.

"Os engenheiros[...]quanto às condições sob as quais trabalham, estas se caracterizam por grande carga de tensão, em cumprimento de prazos cada vez mais curtos para concepção e execução de projetos... "[2].

O engenheiro deve possuir ampla visão técnica e gerencial da produção, envolvido diretamente com a estratégia, qualidade e gestão dos negócios da organização.

Embora esse profissional tenha sua atuação focada em conhecimentos técnicos específicos, como gestor ele atua nas questões ambientais agregadas aos mecanismos de atualização de tecnologia, apropriados à qualidade, pois o uso inadequado dessas tecnologias implica, muitas vezes, em desperdícios às indústrias, à natureza e à própria sociedade.

Sem gestão dos processos produtivos e de controle do meio ambiente, danos irreparáveis à natureza podem ocorrer, em prejuízo aos ecossistemas e à sobrevivência humana. Assim, esses engenheiros trabalham com conhecimentos que envolvem novas tecnologias, conduzindo essas inovações à melhor aplicação na produção, qualificando seus subordinados em seu próprio posto de trabalho, conduzindo-os ao aperfeiçoamento profissional, com objetivo de mantê-los em seus próprios postos de trabalho. Cabe aplicar essas tecnologias, de forma gradual e consciente, de forma reduzir os impactos ambientais a natureza.

Assim, quando de uma nova aquisição tecnológica, a participação desse engenheiro é fundamental, pois com seus conhecimentos técnicos possibilita a adequação de custos e benefícios que esse novo produto de investimento possa proporcionar a curto, médio e longo prazos, tomando assim a melhor decisão para aplicação dos recursos destinados a esses novos projetos de desenvolvimento, para crescimento econômico e competitividade das empresas no mercado de trabalho.

Anderson [1] já apontava que o engenheiro estendia seu campo de atividade, incluindo nele relações humanas e gerenciais em geral, eles se têm inclinado a ampliar o título de engenheiro para cobrir suas atividades, quaisquer que elas possam ser.

Com a reestruturação produtiva, esse engenheiro apresenta-se como um agente de mudanças para a organização, transformando as relações de trabalho puramente técnicas em relações complementares administrativas, assumindo o papel, muitas vezes, central de gestão, com total ampliação de suas funções profissionais, liderando e motivando sua equipe, aproximando as estruturas hierárquicas em seu ambiente de trabalho, comprometendo-se sistematicamente com a produção, objetivando organizar a rede por ele coordenada. Esse profissional tem informações globalizadas, que o coloca integrado ao seu mercado e a sua equipe produtiva, como já citamos, como um verdadeiro "nó" de uma rede, devendo tomar decisões acertadas, para melhor desempenho de seus projetos, sempre buscando a qualidade, a preservação ambiental e, conseqüentemente, a vantagem competitiva.

Callon [3], cientista proeminente do Centro de Estudos da Inovação de Paris, um dos mais renomados pesquisadores da sociologia da ciência e da tecnologia, defende a "teoria das redes", com vistas ao entendimento dos sistemas laboratoriais que conduzem ao desenvolvimento de inovações.

Segundo Callon, o sucesso ou o insucesso das instituições que trabalham com C&T está diretamente ligado à compreensão das chamadas redes. Para ele, os chamados porta-vozes (*porteparoles*) de sistemas que atuam na organização, são elementos fundamentais para funcionamento de um laboratório ou instituição dessa natureza, podendo ser humanos ou não humanos, porém plenamente operantes em sua atuação, para sucesso da pesquisa.

"Na minha visão, de nada adianta se dispor de um grupo de renomados doutores, detentores de Prêmios Nobel, se a rede que opera o laboratório tem um ou mais porta-

vozes inoperantes. Dessa forma, o sucesso das organizações que atuam em C&T está na estrita dependência da adequada coordenação de todos esses elementos da rede".[3]

Portanto, a chamada *Teoria das Redes* que serve para ampliar o entendimento sobre o atual desempenho do pesquisador, clarifica, em certa medida, a figura do engenheiro pleno.

"Muito embora a teoria de Callon tenha sido desenvolvida com vistas ao entendimento dos sistemas laboratoriais que conduzem ao desenvolvimento de inovações, seus princípios têm sido hoje em dia muito usados em analogias a outras atividades que envolvem parceiros em atividades simultâneas em uma mesma organização ou em redes de organizações atuando em parcerias".[6]

O engenheiro faz parte dessa rede, surgindo como agente empreendedor e de mudanças, pois trabalha no limite de suas atribuições técnicas, de gestão ambiental e de negócios, com vistas à qualidade e competitividade estratégica. Atua com propriedade em conflitos sociais e humanos na empresa, conforme ratificado por [4].

"[...] Além do saber técnico-científico necessário à realização industrial, os engenheiros podem intervir com maior propriedade nos conflitos das relações sociais no trabalho, quanto à harmonia dos procedimentos e atitudes do trabalhador" [4]

Este profissional possui raciocínio abstrato, buscando caminhos alternativos não puramente cartesianos ou matemáticos para resolução de suas tarefas, com ótica humanista, não discriminando raças, crenças e valores, podendo assim, organizar e planejar a diversidade de seus clientes. Envolve-se de forma sistêmica em seu trabalho, conhecendo todos os processos de fabricação, possibilitando a dinamização da produção sem prejuízo para a natureza. Por ser criativo, possui uma incrível capacidade de trabalhar equipe, coordenando todos os projetos da empresa.

Robert L. Swiggett, presidente da Kollmorgen Corporation, *apud* [5] diz que *"a função do líder é criar uma visão"*, palavra, até poucos anos, não ouvida entre os gestores. Hoje se sabe que ter uma visão do futuro, sem prejuízos produtivos e também ambientais, é atitude essencial do engenheiro uma postura de liderança agregada aos conhecimentos técnicos adquiridos, além de muita motivação no trabalho, que aliadas ao bom relacionamento interpessoal, constrói-se uma rede produtiva de primordial importância para a empresa.

Visão é sinônimo de negócios, é uma imagem mental de um futuro possível e desejável para uma organização. Atuando como líderes, esses engenheiros imaginam o ideal de futuro para as suas organizações, criando alternativas diferentes do que os outros possam ter considerado como única estratégia ou solução possível. Lutam incessantemente para concretizar realizações importantes que outros não conseguiriam. Procuram olhar à frente e em todas as direções para atingir seus objetivos. Essa visão está centrada na natureza que não deve ser subjugada e sim conservada não apenas para a utilização econômica, mas também por ela própria, isto é, pelo que as pessoas possam aprender com ela.

"Metodologias em Sala de Aulas de Engenharia"

Devido às ampliações nas atribuições profissionais dos engenheiros plenos exigidos pelas empresas no mercado de trabalho globalizado, pode-se constatar a necessidade de aprimorar sua formação acadêmica tradicional, focando o empreendedorismo como condição essencial de sobrevivência em seu mundo de trabalho. Esse aprimoramento envolve dinâmicas em sala de aulas, de forma a criar simulações de situações reais cotidianas vivenciadas em uma empresa; discutindo-se os problemas apresentados e debatendo-os, em busca de soluções ideais ou, muitas vezes, a única possível para sua resolução. Estabelecem-se relações com e entre situações, fenômenos e pessoas, contextualizando *teorias, leis e experiências pessoais*, complementando suas competências e habilidades. Essa simulação mostra a participação do aluno em uma rede produtiva, conduzindo-o a agir de forma construtiva e empreendedora. Essa experiência em sala de aulas induz à reflexão dos problemas e suas alternativas de soluções no processo de trabalho, com ênfase no desenvolvimento sustentável, ligadas a questões ambientais, em conformidade com a ISO 14000, as quais exigem atenções redobradas de seus gestores, pois um erro operacional pode resultar em prejuízos irreparáveis à natureza. Essas dinâmicas devem ser ministradas em disciplinas, tanto técnicas como de ênfase em gestão nos cursos de formação plena, preparando conscientemente o profissional demandado no presente.

Conclusão

O engenheiro atua como um "nó" de uma rede produtiva assumindo os mais abrangentes compromissos em seu mundo do trabalho, agregando-se diretamente à suas tarefas tradicionalmente atribuídas em sua função técnica tradicional, justamente por trabalhar suas habilidades e competências, através de experiências e simulações vivenciadas em sala de aulas. Essas situações, uma vez encontradas em seu mundo de trabalho, tornam-se menos impactativas à sua atuação profissional. Esse profissional direciona suas atividades profissionais como um empreendedor e principalmente como um prestador de serviços às questões ambientais. Atuação esta, que pode diferenciar as lideranças das empresas, promovendo sobrevivência e vantagem competitiva em seus mercados de atuação.

TENDÊNCIAS DO ENSINO DO DESENHO NOS CURSOS DE ENGENHARIA: INSERÇÃO DE MÉTODOS COMPUTACIONAIS

Carlos Roberto Jóia Hozumi[1], Vânia Maria Rocha Gomes Hozumi[2]

Resumo: *Com a velocidade das informações no mundo de trabalho dos engenheiros, tornam-se imprescindíveis ao exercício de suas funções profissionais, ferramentas computacionais auxiliando-os à construção técnica de máquinas e equipamentos necessários à cadeia produtiva. Sabido que, em sua formação acadêmica, o estudante de engenharia trabalha com desenho básico, desenho técnico, geometria descritiva e ainda desenho mecânico, faz-se necessário agregar aos seus estudos tradicionais o uso dessas ferramentas. As formas tradicionais de ensino / aprendizagem do desenho não encontram mais espaço em sala de aulas, fazendo com que professores e alunos convirjam para novos métodos e técnicas computacionais no desempenho de suas tarefas com aplicações práticas, dos trabalhos acadêmicos, atendendo ao mercado de trabalho. Esse artigo sugere metodologias para aplicação dessas tendências tecnológicas em sala de aulas, auxiliando professores e alunos no desenvolvimento de seus trabalhos.*

Palavras-chave: Computação, Ensino do Desenho, Metodologia.

Introdução

Participando de forma significativa de vários aspectos do desenvolvimento da sociedade humana, O desenho com suas especificidades próprias, torna-se a base ou até mesmo a matéria-prima para o desenvolvimento do trabalho humano.

Com esse conceito propõe-se contextualizar o Desenho e sua evolução histórica à Teoria do Conhecimento Humano, discutindo-se Desenho Linguagem e Ferramenta de Produção, como pressuposto da caracterização do Conhecimento Desenho.

Esse estudo aborda a aplicabilidade do Desenho em cursos de Engenharia, tornando-se ferramenta operativa e de projeto para condução do processo de transição prancheta/computador. Refletindo acerca do Desenho como desenvolvimento social, propõe-se contribuir para o despertar de uma relação de conhecimento com base na transdisciplinaridade, atentos a condições que favoreçam buscar novos conhecimentos.

Faz-se uma apresentação acadêmica e descontextualizada desses saberes técnico-semiológicos; conectando-os à um trabalho reflexivo e prático nos processos de comunicação geral, nas necessidades informacionais e representacionais particulares em situação de trabalho, propondo ao aluno de engenharia a construção de sua própria formação, mais completa e mais perceptiva em seu mundo do trabalho.

"O Desenho na Teoria do Conhecimento"

O *Desenho* participa de forma significativa de vários aspectos do desenvolvimento da sociedade humana. As especificidades próprias de sua natureza tornaram-se a "base" e até mesmo a "matéria prima" para o desenvolvimento de vários setores do trabalho. O *Desenho* ora se caracteriza como um "conhecimento" inerente à ciência, ora converte-se em uma tecnologia operacional, às vezes referenciado como uma própria manifestação de arte. Em todas as facetas expostas, fica, contudo, patente o forte componente de linguagem presente no *Desenho*. Reside nesta abrangência a face positiva deste ramo do conhecimento humano, porém contraditoriamente a amplitude gerada por esta situação dificulta o estabelecimento concreto do universo teórico - filósofo desta matéria.

As tentativas de analisar o panorama do *Desenho Moderno* dentro da complexidade do mundo das idéias no Século XX esbarram numa concepção difusa e simplista acerca do seu universo, onde predominam idéias antagônicas, advindas das reflexões efetivas através de um método de análise, o qual não se mostra capaz de evidenciar as definições, as delimitações e a compreensão deste universo. A isto, acrescenta-se o fato de o *Desenho Moderno* transitar num vasto campo que vai das ciências às artes, o que certamente dificulta ainda mais esta tarefa, tornando esta leitura fragmentada linear, dificultando, assim, a compreensão acerca da *Linguagem Desenho*, resultando em uma classificação, uma divisão e uma conceituação, as quais não reflete a natureza e a abrangência da matéria *Desenho.*

"O atual sistema de ensino e pesquisa da área da representação gráfica, ainda divide-se em Linguagem Instrumental das Técnicas de Representação Gráfica (Desenho Geométrico , Geometria Descritiva, Perspectiva e Sombra, Homologia) e Técnicas de Representação Gráfica (Desenho Técnico Mecânico, Elétrico e Civil, Desenho Arquitetônico, etc.). Esse sistema foi criado no final do século passado, para atender às necessidades da Era da Indústria, seguindo um procedimento metodológico coerente com os instrumentos e suportes gráficos tradicionais, não acompanhando, portanto, a evolução científica e tecnológica responsável pela reengenharia em todos os sistemas e organizações".[6]

Partindo do pressuposto de que o *Desenho*, no Século XXI, transita pelos universos da Arte, da Ciência e da Tecnologia, fez-se necessário um estudo acerca do *Desenho*, tomando como substrato de análise e Teoria Semiótica Pierciana. Buscando percorrer esta trilha, tenta-se percebê-lo enquanto significação, discutindo as tendências definidas pelos campos da estética, da epistemologia e da produção, evidenciando, desta maneira, o sentido da *Linguagem Desenho* no contexto da Teoria do Conhecimento Humano. Com esse propósito, contextualiza-se o que conota e o que denota o *Desenho* nos vários momentos históricos do Século XX.

[1]Carlos Roberto Jóia Hozumi, Fundação Souza Marques, Rua Ernani Cardoso 335, 21.2431-3273, Rio de Janeiro, RJ, Brasil, hozumi@zipmail.com.br
[2]Vania Maria Rocha Gomes Hozumi, Universidade Federal do Rio de Janeiro, Rua JJ Seabra s/nº, 21-2431-3273, Rio de Janeiro, RJ, Brasil, vaniagh@zipmail.com.br

Desta forma, pode-se caracterizar na ciência, um conhecimento tão antigo quanto o homem, o Desenho, que carrega em si o elo capaz de exteriorizar idéias, que o homem foi sofisticado com o crescimento de seu potencial de pensar, de laborar e de realizar. Começa com a cinza, com um bastão, com um osso, riscando o chão, as paredes das cavernas, evoluindo para as cerâmicas, as tintas, as canetas sofisticadas. Hoje inserindo no processo digital.

A tecnologia do desenho teve grande apelo industrial no século XX que culminou com a imposição de uma cadeia produtiva cuja determinação de natureza funcional e morfológica que fosse capaz de permitir o estabelecimento de parâmetros de controle. Influenciado pela ideologia instituída, entre os séculos XVIII e XIX, pelo pensamento que notabilizou o movimento que chamamos hoje de Revolução Industrial, o *Desenho* enfrenta uma ruptura e passa a ser percebido pelo que pode ou não ser padronizado. Nesse movimento, está demarcada a fronteira entre as constituintes: produção artesanal e produção industrial.

A primeira, precedente à revolução industrial, notabilizou-se pelo domínio indissociável dos dois momentos determinantes de um processo construtivo, ou seja, cabia ao artesão o domínio das etapas de desenho, enquanto caráter de registro das idéias, e produção caracterizada pela manufatura do produto, a segunda, por questões impostas pelo sistema, já não comportava situar-se nas mãos de uma única pessoa o domínio de todo um processo.

Sob esta perspectiva, o desenho tem estado, desde então, por um lado, a reboque do desenvolvimento tecnológico sendo em alguns casos alvo de interpretações reducionistas por parte das várias áreas que se supõem detentoras da capacidade de projetar e conceber idéias. Por outro lado, tem sido sistematicamente desafiado a apresentar respostas satisfatórias às várias questões que emergem desse mesmo contexto sob o qual a tecnologia se encontra inserida atendendo não somente aos reclamos da indústria, mas também, a outros segmentos e movimentos que o século XX tem protagonizado.

Entretanto, tem prevalecido o entendimento do Desenho produzido como uma tecnologia aplicada apropriada pelas Engenharias para atender às suas necessidades no mundo do trabalho.

"CAD como Ferramenta de Projeto"

A invenção de Gutemberg acabou com a profissão dos copistas. Não foi, logicamente, uma coisa de momento, houve sim uma transição suave que culminou com o domínio inconteste da prensa tipográfica. Da mesma forma observa-se na atualidade o declínio da profissão de desenhista técnico. A mudança teve início com o advento da computação gráfica na década de setenta, intensificou-se no início da década de noventa e hoje fica claro o destino desses profissionais.

Ao fazer-se um retrospecto dos últimos dez anos pode-se, generalizando, descrever o que aconteceu na maioria das empresas: num primeiro momento após a implantação de um sistema CAD a empresa treinou metade de seus desenhistas e a outra metade permaneceu na prancheta. Num segundo momento, segura da confiabilidade e eficiência do CAD ela deixou uma única prancheta para situações de emergência, ou saudosismo, e redistribuiu os demais desenhistas para outros setores da empresa ou os dispensou. Nesta fase os desenhistas cadistas trabalhavam de duas a três vezes mais rápido que na prancheta, porém o trabalho era semelhante ao desenho convencional. Eles recebiam um esboço do engenheiro ou projetista e executavam um desenho mais elaborado.

O que se observa na atualidade é a elaboração do desenho em CAD pelo próprio engenheiro ou projetista. De uma maneira tímida a princípio estes foram buscando o auxílio do computador para agilizar o processo de criação. Com ferramentas de visualização e cálculo, os programas de CAD tornaram-se, em pouco tempo o braço direito desses profissionais. Assim, os desenhistas tiveram que se readaptar e fazer, às vezes de projetistas para permanecer nas empresas.

Com a vantagem adicional de não ser necessário chamar um desenhista ou cadista para passar a limpo, pois a apresentação está pronta para ser impressa, em cores e de excelente qualidade. Como ele, todo o dia centenas de engenheiros descobrem a vantagem de projetar diretamente em CAD.

Existem hoje programas que geram automaticamente as vistas isométricas, perspectivas, cortes e dimensionamentos a partir de um desenho em 3D. O engenheiro mecânico - aeronáutico Cláudio Stio Adamatsu [1] diz que além de programas, é necessário que a empresa tenha os profissionais qualificados, que os projetistas, por exemplo, sejam capazes de fazer todo o projeto dentro de um ambiente CAD, gerando assim o modelo tridimensional da peça juntamente com os cálculos. Os últimos desenhistas que sobreviviam do detalhamento de projetos agora têm fortes motivos para se reciclarem e passar a atuar como cabeças pensantes e não como trabalhadores braçais.

Por outro lado o que se vê é o desconhecimento e inércia da maioria dos usuários de CAD que ainda desenham em 2D (desenho bidimensional) e não procuram aprender o desenho em 3D (tridimensional) que tantas propicia. Com certeza estas pessoas serão preteridas quando as empresas exigirem profissionais completos que projetem e expressem suas idéias em forma de desenhos elucidativos e que possam servir de base para a produção.

Para o desenvolvimento das idéias do projeto é necessário, um meio simples e rápido de expressão, o esboço. Este tem o propósito de fixar as idéias abstratas, dar formas, possibilitar seu exame, também testar a teoria pela demonstração.

Uma maneira excelente de "esboçar conceitos" consiste em utilizar programas CAD paramétricos. A parametrização interliga certas características da geometria de uma peça e estabelece restrições geométricas e dimensionais. Ao permitir a entrada de valores arbitrários em determinadas cotas todo o desenho é automaticamente atualizado para se adaptar à nova medida. Isto permite a uma equipe trabalhar conceitos rapidamente em frente à tela do computador e ter um nível de visualização e entendimento não alcançados com simples esboços.

Como o objetivo deste desenho é fazer uma previsão de dimensões, nada mais lógico do que faze-lo diretamente em 3D e em escala de 1:1. Isto dá uma noção de espaço que até pessoas leigas tem compreensão. Também permite avaliar possíveis interferências que no desenho convencional apareceriam somente na fase de protótipo exigindo um re-projeto demorado e oneroso.

Os desenhos de fabricação dependem de uma série de fatores, como, por exemplo, da quantidade de peças a serem fabricadas, do processo de fabricação, do nível de automação na fabricação, dos recursos disponíveis para o desenho, do nível da mão-de-obra, do tipo de controle de qualidade, do uso e do armazenamento dos desenhos, etc. O formato de papel, seu dobramento, representação de cortes, cotagem, legendas, letras e indicação de acabamentos superficiais são encontrados nas normas de desenho técnico da ABNT.

Uma vez executado o desenho em 3D a maioria dos programas de CAD gera automaticamente as vistas e cortes desejados. Geralmente pode-se configurar pela ABNT as opções de dimensionamento. Quando a fabricação se dará por métodos convencionais, isto é, máquinas operadas manualmente pelos operários, o projetista deverá saber qual o processo de fabricação se dará por máquinas de Comando Numérico Computadorizado (CNC) o projetista pode contar com o auxílio de programas de conversão CAD/CAM (Desenho/ Manufatura) que geram automaticamente o código CN (Comando numérico) a partir do desenho feito no computador.

Com a implantação de sistemas de qualidade a maioria das empresas foi obrigada a registrar seus processos, inclusive os de montagem. Neste ponto o uso do CAD permitiu a execução de planos de montagem com extrema facilidade aproveitando os desenhos já existentes com pouquíssimas modificações. Também os clientes passaram a receber manuais muito melhor ilustrados.

Conclusão

De todos os ramos do conhecimento que obtiveram a chancela de disciplina independente na modernidade, o Desenho é um dos poucos que não foi submetido a um estudo sistêmico. Apenas o Desenho ligado à produção industrial foi reflexionado esteticamente ficando todos os outros compartimentos de sua constituição, submersos na condição de disciplina subsidiária.

Assim, no presente momento, procurou-se refletir acerca do Desenho, afim de entendê-lo como linguagem encetada no labor humano, tomando por pressuposto as dimensões da tecnologia, do conhecimento, da expressividade, do símbolo e do visual ali encerrados.

Verificou-se nos últimos tempos, que os engenheiros tiveram uma visão um tanto quanto deturpada das suas atribuições. Atuavam como capatazes, apenas gerenciando os subordinados. É verdade que a ascensão profissional conduz a áreas gerenciais e administrativas, porém muitas pessoas foram impedidas de demonstrar sua sabedoria em questões técnicas para enfronhar-se em pouco produtivas questões burocráticas.

Agora, podemos observar um início de mudança com a preferência pela contratação de profissionais que dominam, além do conhecimento específico à sua área de atuação, desenho 3D e respectiva interação na manufatura. Ao projetar diretamente em 3D pode-se, posteriormente, obter qualquer vista desejada. Pode-se utilizar o desenho para gerar um programa CN para alimentar as máquinas - ferramenta CNC ou obter um modelo através da prototipagem rápida.

Espera-se que este Artigo possa contribuir para o despertar de uma relação de conhecimento com base na transdisciplinaridade, atentos a condições que favoreçam buscar novos conhecimentos, agregando às disciplinas técnicas o uso de meios computacionais para munir os profissionais de engenharia com ferramentas de construção de suas tarefas diárias.

Com este enfoque o engenheiro estará construindo sua própria formação; mais completa e com melhor percepção para o seu mundo do trabalho, consciente de que não pode deter-se a uma visão fragmentada e sim sistêmica em sua atuação profissional.

UM AMBIENTE DE ENSINO PARA COMPUTAÇÃO MÓVEL INTEGRANDO J2ME E COMPONENTES DE SOFTWARE

Ivan João Foschini[1] *e Sérgio Donizetti Zorzo* [2]

Resumo *— Este artigo descreve a implementação de um aplicativo que possibilita a criação de conteúdo didático para ambientes de Computação Móvel, oferecendo mobilidade aos estudantes no processo educacional. Embora parte deste aplicativo tenha sido desenvolvida para ser utilizada em computadores de mesa convencionais, o conteúdo didático gerado pela aplicação é direcionado para ser visualizado em dispositivos que utilizam a Comunicação Sem Fio para acessar a Rede Mundial de Computadores, notadamente os Palmtops. Com isso, deseja-se que os usuários destes dispositivos possam obter material didático em qualquer lugar onde estejam, usufruindo das vantagens inerentes às Redes de Comunicação Sem Fio, tais como independência de uma conexão cabeada convencional e mobilidade. O ambiente descrito foi implementado utilizando-se as técnicas do Desenvolvimento de Software Baseado em Componentes, explorando este método de desenvolvimento em conjunto com a Java 2 Micro Edition, versão da tecnologia Java voltada especificamente para a criação de aplicações para dispositivos móveis.*

Palavras-Chave — Componentes de Software, Computação Móvel, Educação a Distância, Java 2 Micro Edition, Mobilidade dos Estudantes

INTRODUÇÃO

A Educação a Distância (EAD) é uma modalidade de ensino consagrada e consolidada em diversas partes do mundo [1]. Há tempos, educadores e outros profissionais perceberam as vantagens de se oferecer cursos a distância, e sentiram a necessidade de utilizar novas tecnologias no processo educacional. Quanto às vantagens dos cursos a distância, podem-se destacar: os aspectos econômicos, já que os estudantes não precisam ter custos com viagens e hospedagem, a possibilidade de o aluno poder estudar nos momentos que melhor lhe convierem e o fato de cada um poder seguir seu próprio ritmo de aprendizado, entre outros fatores.

As novas tecnologias, principalmente os computadores e as redes de computadores, ampliaram ainda mais as possibilidades e as vantagens da Educação a Distância. As redes de computadores, notadamente a World Wide Web, tornam possível que qualquer pessoa, em qualquer parte do mundo onde seja possível acessar a rede mundial de computadores, tenha fácil acesso a uma grande quantidade de conteúdo didático.

A utilização das tecnologias de comunicação sem fio e de computação móvel ampliam ainda mais os horizontes das aplicações de Educação a Distância, uma vez que, ao se utilizar meios de comunicação sem fio, o único limitante para a distribuição de conteúdo didático passa a ser a área de cobertura de uma Rede Sem Fio, e não mais a existência de uma conexão cabeada convencional com uma rede de computadores.

O objetivo principal deste artigo é apresentar um ambiente, baseado em componentes de software, que possibilita a criação de conteúdo educacional de forma rápida, eficiente e intuitiva. Este material didático, no entanto, não é direcionado para ser utilizado em microcomputadores de mesa ou quaisquer outros dispositivos semelhantes. A preocupação é criar-se conteúdo educacional que possa ser visualizado em pequenos dispositivos dedicados, com tela pequena e características arquiteturais próprias, especificamente os Palmtops.

Dispositivos como este estão capacitados, atualmente, a receber dados da World Wide Web através de um acesso sem fio, o que possibilita a seus usuários receber o material didático onde quer que se encontrem, independentemente de possuírem a sua disposição uma rede de computadores convencional ou não.

O ambiente proposto neste artigo conta com dois módulos: o Módulo do Professor e o Módulo do Aluno. O Módulo do Professor foi desenvolvido para ser utilizado em *desktops*, e permite que os professores criem listas de exercícios com questões de verdadeiro ou falso e de múltipla escolha, e as disponibilizem em Servidores Web. O Módulo do Professor também permite a geração de relatórios de desempenho individuais e coletivos dos alunos na resolução das listas de exercícios geradas, o que oferece subsídios para que o professor possa aprimorar o processo educacional.

O Módulo do Aluno, por sua vez, permite que os alunos acessem as listas de exercícios geradas e as resolvam em seus Palmtops. O ambiente se encarrega de fazer uma correção automática das resoluções dos alunos, bem como de gerar um relatório a respeito do desempenho dos estudantes na resolução destas listas.

Este artigo descreverá brevemente a Java 2 Micro Edition, os Componentes de Software e apresentará uma Descrição Informal, a Arquitetura e a Interface do ambiente

[1] Ivan João Foschini, Universidade Federal de São Carlos, Rodovia Washington Luís (SP-310) – Km 235, 13.565-905, São Carlos, SP, Brasil, ivan@dc.ufscar.br
[2] Sérgio Donizetti Zorzo, Universidade Federal de São Carlos, Rodovia Washington Luís (SP-310) – Km 235, 13.565-905, São Carlos, SP, Brasil, zorzo@dc.ufscar.br

proposto, expondo ainda um exemplo da criação de uma lista de exercícios e da sua resolução por parte dos alunos, bem como da geração dos relatórios de desempenho.

JAVA 2 MICRO EDITION

O ambiente descrito conta com dois módulos: o Módulo do Professor e o Módulo do Aluno. O Módulo do Professor permite ao educador criar listas de exercícios para avaliação dos alunos e, posteriormente, levantar dados estatísticos a respeito do desempenho dos estudantes. Este módulo é executado em computadores de mesa tradicionais (*desktops*). Já o Módulo do Aluno, desenvolvido com o auxílio da tecnologia Java 2 Micro Edition (J2ME), é executado em Palmtops. Esta seção apresenta esta tecnologia, mostrando as suas principais características. A J2ME foi criada para o desenvolvimento de aplicações a serem exibidas em dispositivos pequenos, tais como Palmtops e telefones celulares, que possuem pequenos computadores dedicados e que freqüentemente utilizam baterias como fonte de energia.

A primeira característica que se destaca nesta tecnologia é que as suas aplicações provêem interfaces gráficas de qualidade, com gráficos coloridos e diversos componentes de interface, o que facilita a interação dos usuários com as aplicações [2]. O fato de a J2ME oferecer interfaces gráficas de qualidade pode vir a resolver um dos maiores problemas práticos encontrados por desenvolvedores de aplicações para dispositivos de tela pequena: criar projetos que realmente atraiam a atenção dos usuários, acostumados a aplicativos multimídia em seus *desktops*.

Outra característica importante da J2ME é que suas aplicações podem comunicar-se com *Servlets*, o que permite que estes aplicativos acessem Servidores Web e bancos de dados remotos através da World Wide Web [3]. *Servlets* são classes baseadas em tecnologia Java que são executadas e instanciadas em associação com Servidores Web, atendendo a requisições realizadas por meio do protocolo HyperText Transfer Protocol (HTTP). Com isso, as aplicações móveis passam a ter muito mais alcance e tornam-se tão poderosas quanto aquelas desenvolvidas para computadores convencionais.

COMPONENTES DE SOFTWARE

O desenvolvimento de componentes de software, ou, simplesmente, componentes vem ganhando notoriedade nos estudos de Engenharia de Software, por oferecer, principalmente, grande possibilidade de reuso de código e redução nos custos de implementação. Os componentes são, basicamente, trechos de código previamente testados, que podem ser instalados e executados em diversas aplicações distintas [4]. Esta propriedade, aliada ao fato de que um componente deve ser tão genérico quanto possível, faz com que o desenvolvedor poupe tempo e recursos de implementação. Atualmente, existem desenvolvedores que se dedicam exclusivamente à criação de componentes, que posteriormente podem ser comprados e utilizados pelos mais diversos usuários, de acordo com as necessidades individuais de cada um. Um componente oferece serviços aos usuários através da sua interface. A interface de um componente é composta por um conjunto de operações que determinam quais são os serviços que um determinado componente pode oferecer.

Independentemente da metodologia adotada para o desenvolvimento de componentes de software, os desenvolvedores devem ter em mente alguns princípios gerais que tornam o uso de componentes realmente atrativos:

- um componente deve ser simples de ser compreendido, para que possa ser facilmente implementado;
- um componente deve ser genérico, para que possa ser reutilizado em um grande número de aplicações com propósitos distintos;
- quando se desenvolve um conjunto de componentes independentes, estes devem ser facilmente combináveis, para facilitar a montagem da aplicação;
- embora devam ser facilmente combináveis, diferentes componentes devem ter suas dependências minimizadas ou, se possível, evitadas;
- deve haver uma preocupação em se criar componentes que possam ser facilmente estendidos, para que novos serviços possam ser adicionados a eles, em caso de necessidades futuras;
- os componentes devem ser portáveis para diversas plataformas distintas, o que aumenta ainda mais as possibilidades de reuso.

O ambiente descrito neste artigo foi implementado utilizando componentes de software tanto no desenvolvimento do Módulo do Professor quanto no Módulo do Aluno. Com isso, exploram-se as vantagens deste método de desenvolvimento de aplicações, expostas nesta seção.

DESCRIÇÃO INFORMAL DO AMBIENTE

Os dois atores que interagem com o ambiente descrito neste artigo são o Professor e o Aluno. O Professor é identificado pelo seu nome, pela disciplina que ministra, pelo código desta disciplina e pela turma pela qual é responsável. O ambiente proporciona ao Professor a criação de uma ou mais Listas de Exercícios, que possuem os seguintes atributos: um código para identificação da lista, o seu título, a sua data de criação e a sua data de entrega. As Listas são compostas por uma ou mais Questões.

Cada Questão possui um número único para identificá-la e é de um determinado tipo (Questão de Verdadeiro ou Falso ou Questão de Múltipla Escolha). As Questões de Verdadeiro ou Falso têm como atributos o texto da questão, uma justificativa que explica qual é a razão do texto da questão ser verdadeiro ou falso, e qual é a resposta correta à questão (verdadeiro ou falso). Já as Questões de Múltipla

Escolha, por sua vez, têm como atributos o texto da questão, uma justificativa que explica porque determinada alternativa é considerada correta, os textos das cinco alternativas a serem apresentadas ao Aluno e a resposta correta da Questão (alternativa A, B, C, D ou E).

Os Alunos são identificados pelo seu código de aluno e pelo seu nome. O Aluno resolve uma Lista de Exercícios, gerando, com isso, uma Resolução, que contém o seu índice de acertos e um relatório a respeito do seu desempenho, indicando, por exemplo, quais foram as questões respondidas corretamente, quais foram respondidas incorretamente e uma justificativa para o fato de a resposta dada à questão ter sido considerada incorreta.

O ambiente também fornece ao professor estatísticas relativas ao desempenho individual e coletivo dos alunos na resolução das Listas de Exercícios, o que oferece subsídios que auxiliam o professor na tarefa de aperfeiçoar o processo educacional.

A ARQUITETURA DO AMBIENTE

Baseado na Descrição Informal da aplicação, definiu-se, para o ambiente descrito neste artigo, a arquitetura exibida na Figura 1:

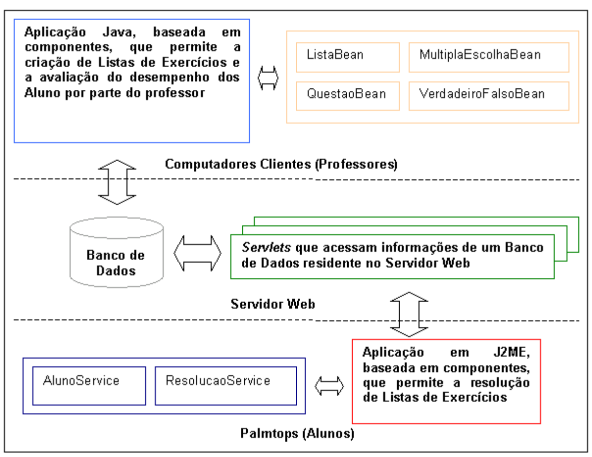

FIGURA. 1
ARQUITETURA DO AMBIENTE DESCRITO, UTILIZANDO COMPONENTES DE SOFTWARE.

O Módulo do Professor previamente mencionado baseia-se em *JavaBeans*, e permite que professores criem listas de exercícios, contendo questões de verdadeiro ou falso e de múltipla escolha. A tecnologia *JavaBeans* foi responsável pela introdução do conceito de componentes em Java. Utilizando-se *JavaBeans*, pode-se criar componentes de software reutilizáveis e independentes de plataforma [5]. Esta aplicação conta com os seguintes *JavaBeans*: ListaBean, QuestaoBean, MultiplaEscolhaBean e VerdadeiroFalsoBean. Cada um destes *JavaBeans* possui alguns atributos específicos e métodos para inserir, alterar, recuperar e excluir informações de um banco de dados que armazena as listas de exercícios criadas pelos professores.

Estas listas de exercícios ficam disponíveis em um banco de dados localizado em um Servidor Web remoto, no qual também residem *Servlets* que podem recuperar, alterar e armazenar informações neste banco de dados.

A arquitetura da Figura 1 exibe ainda o Módulo do Aluno, desenvolvido em J2ME, que faz uso de componentes de software especialmente desenvolvidos para esta tecnologia, o AlunoService e o ResolucaoService. Na tecnologia J2ME, os componentes de software são chamados de *Services* [6]. O Módulo do Aluno permite que os alunos resolvam as listas de exercícios previamente criadas pelos professores. A aplicação J2ME envia os dados da resolução aos *Servlets* residentes no Servidor Web. Os *Servlets*, por sua vez, recebem estas informações e as armazenam no banco de dados do Servidor Web, deixando-as à disposição do professor. Com isso, o professor pode fazer uma avaliação do desempenho individual e coletivo dos alunos na resolução de uma determinada lista de exercícios, utilizando outra funcionalidade do Módulo do Professor.

A INTERFACE DO AMBIENTE

Esta seção apresenta a interface do ambiente descrito neste artigo, exibindo segmentos tanto do Módulo do Professor quanto do Módulo do Aluno. Quando o professor acessa o ambiente, é apresentada a ele a tela exposta na Figura 2:

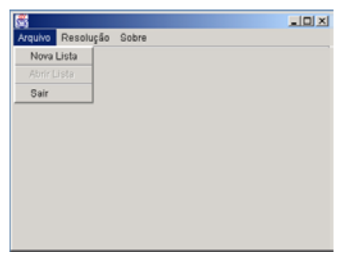

FIGURA. 2
TELA PRINCIPAL DO AMBIENTE.

Conforme pode ser visto na Figura 2, algumas opções são apresentadas ao professor, como, por exemplo, criar uma nova lista (opção "Nova Lista" no Menu "Arquivo" da Figura 2). Quando optar por criar uma nova lista de exercícios, o professor é conduzido à tela apresentada na Figura 3:

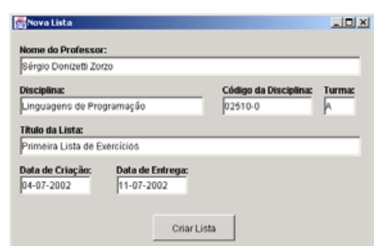

FIGURA. 3
TELA PARA A CRIAÇÃO DE UMA NOVA LISTA DE EXERCÍCIOS.

© 2003 ICECE

Nesta tela o professor fornece os dados relevantes para a criação de uma nova lista de exercícios. Clicando no botão "Criar Lista" uma nova lista de exercícios é criada. A partir daí, o professor pode começar a trabalhar na elaboração das questões que irão compor a lista recém-criada. Se optar por incluir na lista uma questão de verdadeiro ou falso, a tela da Figura 4 será exibida.

O professor deverá escrever o texto da questão e uma justificativa sobre a razão do texto da questão ser verdadeiro ou falso. Esta justificativa será apresentada ao aluno quando este responder de forma incorreta a uma questão. O professor deverá assinalar ainda qual é a resposta correta (verdadeiro ou falso). Clicando no botão "Incluir Questão", esta questão será imediatamente incluída na lista de exercícios. Caso o professor deseje criar uma questão de múltipla escolha, a tela a ser exibida será a da Figura 5, e o procedimento para a criação de uma questão desse tipo será praticamente análogo ao adotado para a criação de uma questão de verdadeiro ou falso.

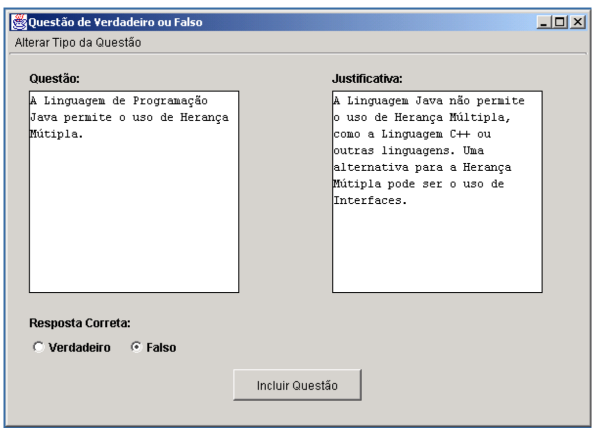

FIGURA. 4
TELA PARA A CRIAÇÃO DE QUESTÕES DE VERDADEIRO OU FALSO.

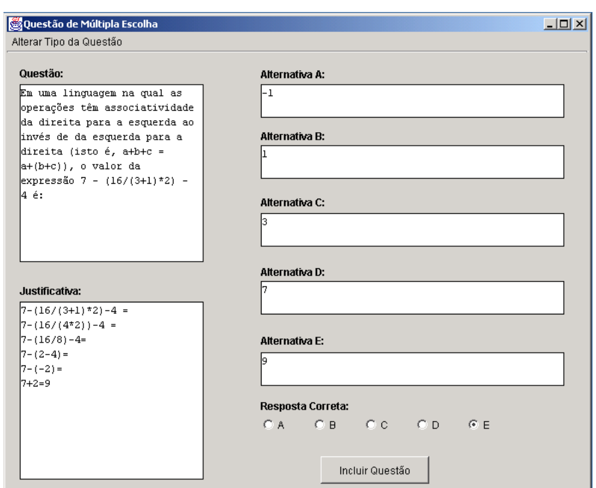

FIGURA. 5
TELA PARA A CRIAÇÃO DE QUESTÕES DE MÚLTIPLA ESCOLHA.

As listas de exercícios criadas com o auxílio deste ambiente ficam armazenadas em um banco de dados residente em um Servidor Web remoto, acessível para os professores que utilizam o ambiente. Todo o processo de armazenamento, consulta, remoção e edição de listas de exercícios é feita com o auxílio do ambiente, que, para isso, utiliza-se de componentes *JavaBeans*. No Servidor Web onde ficam armazenadas as listas de exercícios também residem *Servlets*.

Conforme foi dito anteriormente, aplicações J2ME podem se comunicar com *Servlets*, o que torna possível que essas aplicações acessem bancos de dados remotos na World Wide Web. No caso do ambiente descrito neste artigo, a aplicação J2ME correspondente ao Módulo do Aluno se comunica com *Servlets* que, por sua vez, fazem acesso aos dados das listas de exercícios geradas pelos professores. Estes *Servlets* também são responsáveis por corrigir e por armazenar os dados relativos à resolução dos alunos no Servidor Web, de tal maneira que os professores possam acessar estas resoluções em seus *desktops*, o que lhes permite avaliar o desempenho dos alunos. Dessa forma, o ambiente também permite que os professores possam fazer um acompanhamento e uma avaliação do desempenho dos alunos no processo de resolução dos exercícios. A Figura 6 exibe exemplos de telas dos Palmtops dos alunos acessando uma lista de exercícios:

FIGURA. 6
EXEMPLOS DE TELAS DOS ALUNOS ACESSANDO OS EXERCÍCIOS.

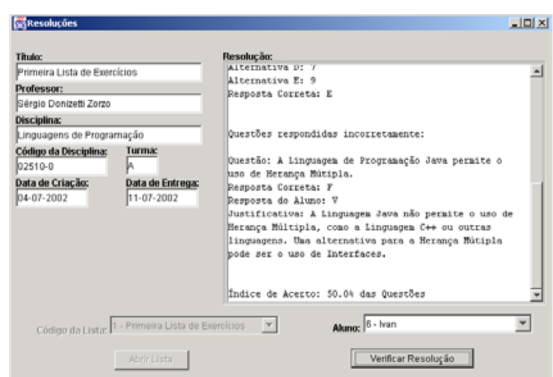

FIGURA. 7
RELATÓRIO DE DESEMPENHO INDIVIDUAL EXIBIDO A UM PROFESSOR.

A Figura 7, por sua vez, mostra a tela que permite ao professor analisar o desempenho individual de um aluno na resolução de uma lista de exercícios, enquanto que a tela exibida na Figura 8 corresponde à interface que possibilita ao professor fazer uma análise coletiva de desempenho.

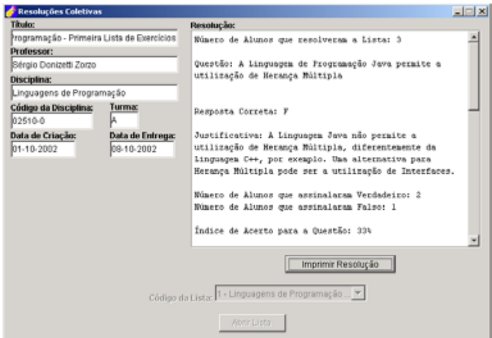

FIGURA. 8
RELATÓRIO DE DESEMPENHO COLETIVO EXIBIDO A UM PROFESSOR.

Conforme mencionado anteriormente, os *Servlets* desenvolvidos para este ambiente também se encarregam de fazer a correção automática das listas de exercícios e de gerar um relatório de desempenho que será visualizado pelos alunos em seus Palmtops. Este relatório traz o índice de acerto de um aluno na resolução de uma determinada lista de exercícios e também todas as questões respondidas correta e incorretamente pelo aluno, bem como as respostas corretas de cada questão e uma justificativa que explica porque uma determinada resposta é considerada correta. A Figura 9 exibe um exemplo de relatório visualizado por um aluno em seu Palmtop.

FIGURA. 9
RELATÓRIO DE DESEMPENHO DE UM ALUNO EXIBIDO EM UM PALMTOP.

Com isso, o ambiente auxilia o aluno no processo de aprendizado, uma vez que os estudantes não apenas respondem às questões, mas também podem verificar quais questões erraram e quais são as razões pelas quais a sua resposta foi considerada incorreta.

CONCLUSÕES

O ambiente descrito neste artigo tem como principal objetivo possibilitar a criação simples e intuitiva de listas de exercícios e é composto por dois módulos distintos: o Módulo do Professor e o Módulo do Aluno. Enquanto o Módulo do Professor é executado em computadores de mesa convencionais, o Módulo do Aluno é direcionado para ser utilizado em Palmtops, e foi desenvolvido com a tecnologia Java 2 Micro Edition (J2ME), também exposta neste artigo. Com isso, expande-se ainda mais a ubiqüidade oferecida pela Educação a Distância (EAD), que tem como uma das suas principais características levar conhecimento para qualquer pessoa, independentemente do lugar onde esta se encontra.

Utilizando-se Palmtops, dispositivos pequenos e capazes de acessar dados da World Wide Web em ambientes sem fio, pessoas interessadas em acessar conteúdo didático poderão fazê-lo facilmente, sem a necessidade de estarem conectadas a redes de computadores convencionais. Com a utilização da tecnologia J2ME, aplicações criadas para dispositivos dedicados adquirem qualidade comparável a aplicativos desenvolvidos para *desktops*.

O processo de criação do ambiente é apoiado pelas técnicas do Desenvolvimento de Software Baseado em Componentes, tanto na aplicação desenvolvida para *desktops* quanto na aplicação para Palmtops. Detalhes relativos a esta técnica também foram expostos neste artigo. Tanto os componentes desenvolvidos para *desktops,* baseados na tecnologia *JavaBeans,* como aqueles desenvolvidos para Palmtops, os chamados *Services*, são facilmente extensíveis e podem ser reutilizados por outras aplicações de EAD.

Foi formulada, ainda, uma descrição informal do ambiente descrito, visando especificá-lo claramente antes de se elaborar uma arquitetura para este ambiente. Esta arquitetura também foi apresentada neste artigo. Por fim, expôs-se a interface dos Módulos do Aluno e do Professor, mostrando-se um exemplo do processo de criação de uma lista de exercícios e da resolução desta lista por parte do aluno. Foram mostradas também as interfaces do ambiente que permitem ao professor avaliar o desempenho individual e coletivo dos alunos na resolução das listas de exercícios criadas.

UM AMBIENTE DE ENSINO PARA COMPUTAÇÃO MÓVEL INTEGRANDO J2ME E COMPONENTES DE SOFTWARE

Ivan João Foschini[1] e Sérgio Donizetti Zorzo [2]

Resumo *— Este artigo descreve a implementação de um aplicativo que possibilita a criação de conteúdo didático para ambientes de Computação Móvel, oferecendo mobilidade aos estudantes no processo educacional. Embora parte deste aplicativo tenha sido desenvolvida para ser utilizada em computadores de mesa convencionais, o conteúdo didático gerado pela aplicação é direcionado para ser visualizado em dispositivos que utilizam a Comunicação Sem Fio para acessar a Rede Mundial de Computadores, notadamente os Palmtops. Com isso, deseja-se que os usuários destes dispositivos possam obter material didático em qualquer lugar onde estejam, usufruindo das vantagens inerentes às Redes de Comunicação Sem Fio, tais como independência de uma conexão cabeada convencional e mobilidade. O ambiente descrito foi implementado utilizando-se as técnicas do Desenvolvimento de Software Baseado em Componentes, explorando este método de desenvolvimento em conjunto com a Java 2 Micro Edition, versão da tecnologia Java voltada especificamente para a criação de aplicações para dispositivos móveis.*

Palavras-Chave — Componentes de Software, Computação Móvel, Educação a Distância, Java 2 Micro Edition, Mobilidade dos Estudantes

INTRODUÇÃO

A Educação a Distância (EAD) é uma modalidade de ensino consagrada e consolidada em diversas partes do mundo [1]. Há tempos, educadores e outros profissionais perceberam as vantagens de se oferecer cursos a distância, e sentiram a necessidade de utilizar novas tecnologias no processo educacional. Quanto às vantagens dos cursos a distância, podem-se destacar: os aspectos econômicos, já que os estudantes não precisam ter custos com viagens e hospedagem, a possibilidade de o aluno poder estudar nos momentos que melhor lhe convierem e o fato de cada um poder seguir seu próprio ritmo de aprendizado, entre outros fatores.

As novas tecnologias, principalmente os computadores e as redes de computadores, ampliaram ainda mais as possibilidades e as vantagens da Educação a Distância. As redes de computadores, notadamente a World Wide Web, tornam possível que qualquer pessoa, em qualquer parte do mundo onde seja possível acessar a rede mundial de computadores, tenha fácil acesso a uma grande quantidade de conteúdo didático.

A utilização das tecnologias de comunicação sem fio e de computação móvel ampliam ainda mais os horizontes das aplicações de Educação a Distância, uma vez que, ao se utilizar meios de comunicação sem fio, o único limitante para a distribuição de conteúdo didático passa a ser a área de cobertura de uma Rede Sem Fio, e não mais a existência de uma conexão cabeada convencional com uma rede de computadores.

O objetivo principal deste artigo é apresentar um ambiente, baseado em componentes de software, que possibilita a criação de conteúdo educacional de forma rápida, eficiente e intuitiva. Este material didático, no entanto, não é direcionado para ser utilizado em microcomputadores de mesa ou quaisquer outros dispositivos semelhantes. A preocupação é criar-se conteúdo educacional que possa ser visualizado em pequenos dispositivos dedicados, com tela pequena e características arquiteturais próprias, especificamente os Palmtops.

Dispositivos como este estão capacitados, atualmente, a receber dados da World Wide Web através de um acesso sem fio, o que possibilita a seus usuários receber o material didático onde quer que se encontrem, independentemente de possuírem a sua disposição uma rede de computadores convencional ou não.

O ambiente proposto neste artigo conta com dois módulos: o Módulo do Professor e o Módulo do Aluno. O Módulo do Professor foi desenvolvido para ser utilizado em *desktops*, e permite que os professores criem listas de exercícios com questões de verdadeiro ou falso e de múltipla escolha, e as disponibilizem em Servidores Web. O Módulo do Professor também permite a geração de relatórios de desempenho individuais e coletivos dos alunos na resolução das listas de exercícios geradas, o que oferece subsídios para que o professor possa aprimorar o processo educacional.

O Módulo do Aluno, por sua vez, permite que os alunos acessem as listas de exercícios geradas e as resolvam em seus Palmtops. O ambiente se encarrega de fazer uma correção automática das resoluções dos alunos, bem como de gerar um relatório a respeito do desempenho dos estudantes na resolução destas listas.

Este artigo descreverá brevemente a Java 2 Micro Edition, os Componentes de Software e apresentará uma Descrição Informal, a Arquitetura e a Interface do ambiente

[1] Ivan João Foschini, Universidade Federal de São Carlos, Rodovia Washington Luís (SP-310) – Km 235, 13.565-905, São Carlos, SP, Brasil, ivan@dc.ufscar.br
[2] Sérgio Donizetti Zorzo, Universidade Federal de São Carlos, Rodovia Washington Luís (SP-310) – Km 235, 13.565-905, São Carlos, SP, Brasil, zorzo@dc.ufscar.br

proposto, expondo ainda um exemplo da criação de uma lista de exercícios e da sua resolução por parte dos alunos, bem como da geração dos relatórios de desempenho.

JAVA 2 MICRO EDITION

O ambiente descrito conta com dois módulos: o Módulo do Professor e o Módulo do Aluno. O Módulo do Professor permite ao educador criar listas de exercícios para avaliação dos alunos e, posteriormente, levantar dados estatísticos a respeito do desempenho dos estudantes. Este módulo é executado em computadores de mesa tradicionais (*desktops*). Já o Módulo do Aluno, desenvolvido com o auxílio da tecnologia Java 2 Micro Edition (J2ME), é executado em Palmtops. Esta seção apresenta esta tecnologia, mostrando as suas principais características. A J2ME foi criada para o desenvolvimento de aplicações a serem exibidas em dispositivos pequenos, tais como Palmtops e telefones celulares, que possuem pequenos computadores dedicados e que freqüentemente utilizam baterias como fonte de energia.

A primeira característica que se destaca nesta tecnologia é que as suas aplicações provêem interfaces gráficas de qualidade, com gráficos coloridos e diversos componentes de interface, o que facilita a interação dos usuários com as aplicações [2]. O fato de a J2ME oferecer interfaces gráficas de qualidade pode vir a resolver um dos maiores problemas práticos encontrados por desenvolvedores de aplicações para dispositivos de tela pequena: criar projetos que realmente atraiam a atenção dos usuários, acostumados a aplicativos multimídia em seus *desktops*.

Outra característica importante da J2ME é que suas aplicações podem comunicar-se com *Servlets*, o que permite que estes aplicativos acessem Servidores Web e bancos de dados remotos através da World Wide Web [3]. *Servlets* são classes baseadas em tecnologia Java que são executadas e instanciadas em associação com Servidores Web, atendendo a requisições realizadas por meio do protocolo HyperText Transfer Protocol (HTTP). Com isso, as aplicações móveis passam a ter muito mais alcance e tornam-se tão poderosas quanto aquelas desenvolvidas para computadores convencionais.

COMPONENTES DE SOFTWARE

O desenvolvimento de componentes de software, ou, simplesmente, componentes vem ganhando notoriedade nos estudos de Engenharia de Software, por oferecer, principalmente, grande possibilidade de reuso de código e redução nos custos de implementação. Os componentes são, basicamente, trechos de código previamente testados, que podem ser instalados e executados em diversas aplicações distintas [4]. Esta propriedade, aliada ao fato de que um componente deve ser tão genérico quanto possível, faz com que o desenvolvedor poupe tempo e recursos de implementação. Atualmente, existem desenvolvedores que se dedicam exclusivamente à criação de componentes, que posteriormente podem ser comprados e utilizados pelos mais diversos usuários, de acordo com as necessidades individuais de cada um. Um componente oferece serviços aos usuários através da sua interface. A interface de um componente é composta por um conjunto de operações que determinam quais são os serviços que um determinado componente pode oferecer.

Independentemente da metodologia adotada para o desenvolvimento de componentes de software, os desenvolvedores devem ter em mente alguns princípios gerais que tornam o uso de componentes realmente atrativos:

- um componente deve ser simples de ser compreendido, para que possa ser facilmente implementado;
- um componente deve ser genérico, para que possa ser reutilizado em um grande número de aplicações com propósitos distintos;
- quando se desenvolve um conjunto de componentes independentes, estes devem ser facilmente combináveis, para facilitar a montagem da aplicação;
- embora devam ser facilmente combináveis, diferentes componentes devem ter suas dependências minimizadas ou, se possível, evitadas;
- deve haver uma preocupação em se criar componentes que possam ser facilmente estendidos, para que novos serviços possam ser adicionados a eles, em caso de necessidades futuras;
- os componentes devem ser portáveis para diversas plataformas distintas, o que aumenta ainda mais as possibilidades de reuso.

O ambiente descrito neste artigo foi implementado utilizando componentes de software tanto no desenvolvimento do Módulo do Professor quanto no Módulo do Aluno. Com isso, exploram-se as vantagens deste método de desenvolvimento de aplicações, expostas nesta seção.

DESCRIÇÃO INFORMAL DO AMBIENTE

Os dois atores que interagem com o ambiente descrito neste artigo são o Professor e o Aluno. O Professor é identificado pelo seu nome, pela disciplina que ministra, pelo código desta disciplina e pela turma pela qual é responsável. O ambiente proporciona ao Professor a criação de uma ou mais Listas de Exercícios, que possuem os seguintes atributos: um código para identificação da lista, o seu título, a sua data de criação e a sua data de entrega. As Listas são compostas por uma ou mais Questões.

Cada Questão possui um número único para identificá-la e é de um determinado tipo (Questão de Verdadeiro ou Falso ou Questão de Múltipla Escolha). As Questões de Verdadeiro ou Falso têm como atributos o texto da questão, uma justificativa que explica qual é a razão do texto da questão ser verdadeiro ou falso, e qual é a resposta correta à questão (verdadeiro ou falso). Já as Questões de Múltipla

Escolha, por sua vez, têm como atributos o texto da questão, uma justificativa que explica porque determinada alternativa é considerada correta, os textos das cinco alternativas a serem apresentadas ao Aluno e a resposta correta da Questão (alternativa A, B, C, D ou E).

Os Alunos são identificados pelo seu código de aluno e pelo seu nome. O Aluno resolve uma Lista de Exercícios, gerando, com isso, uma Resolução, que contém o seu índice de acertos e um relatório a respeito do seu desempenho, indicando, por exemplo, quais foram as questões respondidas corretamente, quais foram respondidas incorretamente e uma justificativa para o fato de a resposta dada à questão ter sido considerada incorreta.

O ambiente também fornece ao professor estatísticas relativas ao desempenho individual e coletivo dos alunos na resolução das Listas de Exercícios, o que oferece subsídios que auxiliam o professor na tarefa de aperfeiçoar o processo educacional.

A ARQUITETURA DO AMBIENTE

Baseado na Descrição Informal da aplicação, definiu-se, para o ambiente descrito neste artigo, a arquitetura exibida na Figura 1:

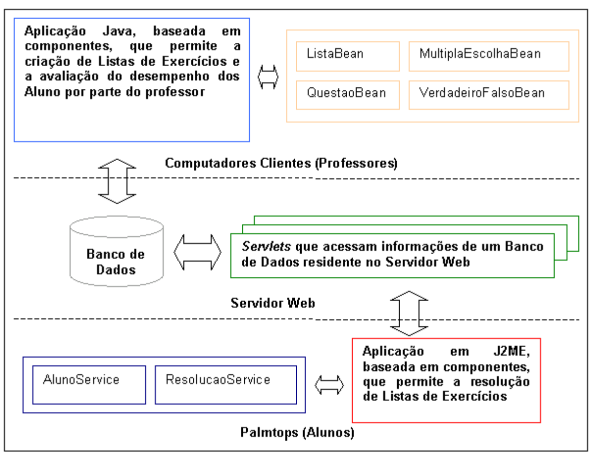

FIGURA. 1
ARQUITETURA DO AMBIENTE DESCRITO, UTILIZANDO COMPONENTES DE SOFTWARE.

O Módulo do Professor previamente mencionado baseia-se em *JavaBeans*, e permite que professores criem listas de exercícios, contendo questões de verdadeiro ou falso e de múltipla escolha. A tecnologia *JavaBeans* foi responsável pela introdução do conceito de componentes em Java. Utilizando-se *JavaBeans*, pode-se criar componentes de software reutilizáveis e independentes de plataforma [5]. Esta aplicação conta com os seguintes *JavaBeans*: ListaBean, QuestaoBean, MultiplaEscolhaBean e VerdadeiroFalsoBean. Cada um destes *JavaBeans* possui alguns atributos específicos e métodos para inserir, alterar, recuperar e excluir informações de um banco de dados que armazena as listas de exercícios criadas pelos professores.

Estas listas de exercícios ficam disponíveis em um banco de dados localizado em um Servidor Web remoto, no qual também residem *Servlets* que podem recuperar, alterar e armazenar informações neste banco de dados.

A arquitetura da Figura 1 exibe ainda o Módulo do Aluno, desenvolvido em J2ME, que faz uso de componentes de software especialmente desenvolvidos para esta tecnologia, o AlunoService e o ResolucaoService. Na tecnologia J2ME, os componentes de software são chamados de *Services* [6]. O Módulo do Aluno permite que os alunos resolvam as listas de exercícios previamente criadas pelos professores. A aplicação J2ME envia os dados da resolução aos *Servlets* residentes no Servidor Web. Os *Servlets*, por sua vez, recebem estas informações e as armazenam no banco de dados do Servidor Web, deixando-as à disposição do professor. Com isso, o professor pode fazer uma avaliação do desempenho individual e coletivo dos alunos na resolução de uma determinada lista de exercícios, utilizando outra funcionalidade do Módulo do Professor.

A INTERFACE DO AMBIENTE

Esta seção apresenta a interface do ambiente descrito neste artigo, exibindo segmentos tanto do Módulo do Professor quanto do Módulo do Aluno. Quando o professor acessa o ambiente, é apresentada a ele a tela exposta na Figura 2:

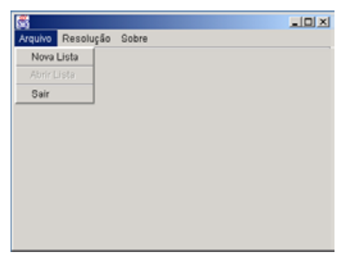

FIGURA. 2
TELA PRINCIPAL DO AMBIENTE.

Conforme pode ser visto na Figura 2, algumas opções são apresentadas ao professor, como, por exemplo, criar uma nova lista (opção "Nova Lista" no Menu "Arquivo" da Figura 2). Quando optar por criar uma nova lista de exercícios, o professor é conduzido à tela apresentada na Figura 3:

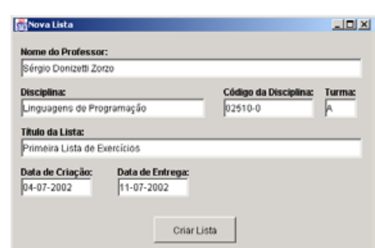

FIGURA. 3
TELA PARA A CRIAÇÃO DE UMA NOVA LISTA DE EXERCÍCIOS.

© 2003 ICECE

Nesta tela o professor fornece os dados relevantes para a criação de uma nova lista de exercícios. Clicando no botão "Criar Lista" uma nova lista de exercícios é criada. A partir daí, o professor pode começar a trabalhar na elaboração das questões que irão compor a lista recém-criada. Se optar por incluir na lista uma questão de verdadeiro ou falso, a tela da Figura 4 será exibida.

O professor deverá escrever o texto da questão e uma justificativa sobre a razão do texto da questão ser verdadeiro ou falso. Esta justificativa será apresentada ao aluno quando este responder de forma incorreta a uma questão. O professor deverá assinalar ainda qual é a resposta correta (verdadeiro ou falso). Clicando no botão "Incluir Questão", esta questão será imediatamente incluída na lista de exercícios. Caso o professor deseje criar uma questão de múltipla escolha, a tela a ser exibida será a da Figura 5, e o procedimento para a criação de uma questão desse tipo será praticamente análogo ao adotado para a criação de uma questão de verdadeiro ou falso.

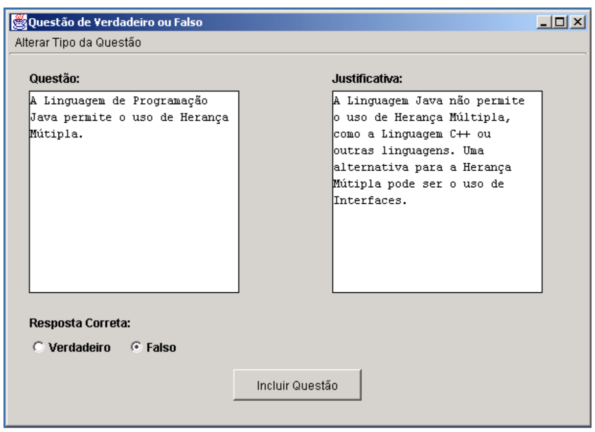

FIGURA. 4
TELA PARA A CRIAÇÃO DE QUESTÕES DE VERDADEIRO OU FALSO.

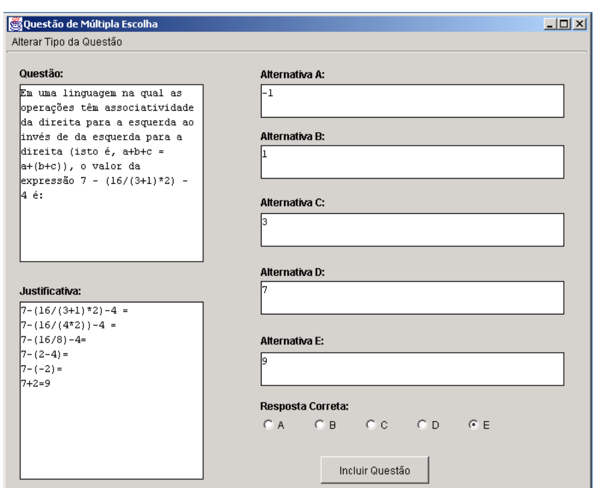

FIGURA. 5
TELA PARA A CRIAÇÃO DE QUESTÕES DE MÚLTIPLA ESCOLHA.

As listas de exercícios criadas com o auxílio deste ambiente ficam armazenadas em um banco de dados residente em um Servidor Web remoto, acessível para os professores que utilizam o ambiente. Todo o processo de armazenamento, consulta, remoção e edição de listas de exercícios é feita com o auxílio do ambiente, que, para isso, utiliza-se de componentes *JavaBeans*. No Servidor Web onde ficam armazenadas as listas de exercícios também residem *Servlets*.

Conforme foi dito anteriormente, aplicações J2ME podem se comunicar com *Servlets*, o que torna possível que essas aplicações acessem bancos de dados remotos na World Wide Web. No caso do ambiente descrito neste artigo, a aplicação J2ME correspondente ao Módulo do Aluno se comunica com *Servlets* que, por sua vez, fazem acesso aos dados das listas de exercícios geradas pelos professores. Estes *Servlets* também são responsáveis por corrigir e por armazenar os dados relativos à resolução dos alunos no Servidor Web, de tal maneira que os professores possam acessar estas resoluções em seus *desktops*, o que lhes permite avaliar o desempenho dos alunos. Dessa forma, o ambiente também permite que os professores possam fazer um acompanhamento e uma avaliação do desempenho dos alunos no processo de resolução dos exercícios. A Figura 6 exibe exemplos de telas dos Palmtops dos alunos acessando uma lista de exercícios:

FIGURA. 6
EXEMPLOS DE TELAS DOS ALUNOS ACESSANDO OS EXERCÍCIOS.

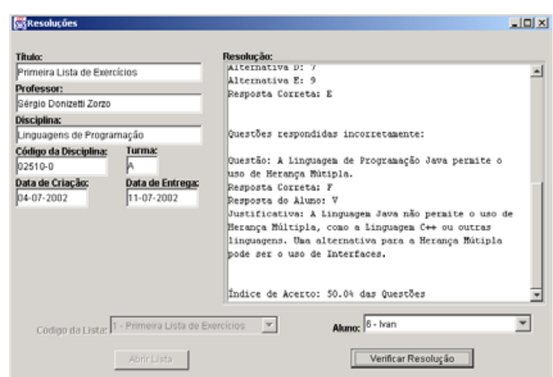

FIGURA. 7
RELATÓRIO DE DESEMPENHO INDIVIDUAL EXIBIDO A UM PROFESSOR.

A Figura 7, por sua vez, mostra a tela que permite ao professor analisar o desempenho individual de um aluno na resolução de uma lista de exercícios, enquanto que a tela exibida na Figura 8 corresponde à interface que possibilita ao professor fazer uma análise coletiva de desempenho.

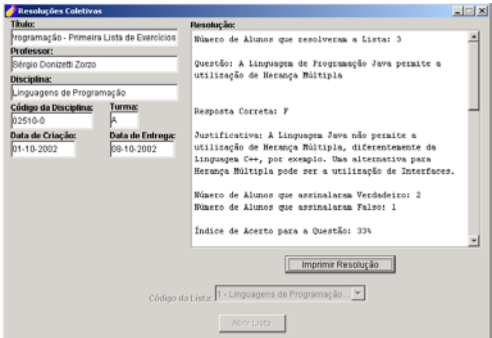

FIGURA. 8
RELATÓRIO DE DESEMPENHO COLETIVO EXIBIDO A UM PROFESSOR.

Conforme mencionado anteriormente, os *Servlets* desenvolvidos para este ambiente também se encarregam de fazer a correção automática das listas de exercícios e de gerar um relatório de desempenho que será visualizado pelos alunos em seus Palmtops. Este relatório traz o índice de acerto de um aluno na resolução de uma determinada lista de exercícios e também todas as questões respondidas correta e incorretamente pelo aluno, bem como as respostas corretas de cada questão e uma justificativa que explica porque uma determinada resposta é considerada correta. A Figura 9 exibe um exemplo de relatório visualizado por um aluno em seu Palmtop.

FIGURA. 9
RELATÓRIO DE DESEMPENHO DE UM ALUNO EXIBIDO EM UM PALMTOP.

Com isso, o ambiente auxilia o aluno no processo de aprendizado, uma vez que os estudantes não apenas respondem às questões, mas também podem verificar quais questões erraram e quais são as razões pelas quais a sua resposta foi considerada incorreta.

CONCLUSÕES

O ambiente descrito neste artigo tem como principal objetivo possibilitar a criação simples e intuitiva de listas de exercícios e é composto por dois módulos distintos: o Módulo do Professor e o Módulo do Aluno. Enquanto o Módulo do Professor é executado em computadores de mesa convencionais, o Módulo do Aluno é direcionado para ser utilizado em Palmtops, e foi desenvolvido com a tecnologia Java 2 Micro Edition (J2ME), também exposta neste artigo. Com isso, expande-se ainda mais a ubiqüidade oferecida pela Educação a Distância (EAD), que tem como uma das suas principais características levar conhecimento para qualquer pessoa, independentemente do lugar onde esta se encontra.

Utilizando-se Palmtops, dispositivos pequenos e capazes de acessar dados da World Wide Web em ambientes sem fio, pessoas interessadas em acessar conteúdo didático poderão fazê-lo facilmente, sem a necessidade de estarem conectadas a redes de computadores convencionais. Com a utilização da tecnologia J2ME, aplicações criadas para dispositivos dedicados adquirem qualidade comparável a aplicativos desenvolvidos para *desktops*.

O processo de criação do ambiente é apoiado pelas técnicas do Desenvolvimento de Software Baseado em Componentes, tanto na aplicação desenvolvida para *desktops* quanto na aplicação para Palmtops. Detalhes relativos a esta técnica também foram expostos neste artigo. Tanto os componentes desenvolvidos para *desktops,* baseados na tecnologia *JavaBeans,* como aqueles desenvolvidos para Palmtops, os chamados *Services*, são facilmente extensíveis e podem ser reutilizados por outras aplicações de EAD.

Foi formulada, ainda, uma descrição informal do ambiente descrito, visando especificá-lo claramente antes de se elaborar uma arquitetura para este ambiente. Esta arquitetura também foi apresentada neste artigo. Por fim, expôs-se a interface dos Módulos do Aluno e do Professor, mostrando-se um exemplo do processo de criação de uma lista de exercícios e da resolução desta lista por parte do aluno. Foram mostradas também as interfaces do ambiente que permitem ao professor avaliar o desempenho individual e coletivo dos alunos na resolução das listas de exercícios criadas.

ELABORAÇÃO E APLICAÇÃO DE UM MODELO FORMAL DE DESCRIÇÃO SINTÁTICA TRANSFRÁSTICA À INTELIGÊNCIA ARTIFICIAL E AO ENSINO DE REDAÇÃO EM CURSOS DE ENGENHARIA E COMPUTAÇÃO

Aldo Bizzocchi[1] e Eloísa Vecchiato[2]

Resumo — *O presente trabalho procura examinar sob que condições uma dada seqüência de frases constitui um texto e, a partir daí, formula algumas hipóteses sobre as relações sintáticas existentes ao nível transfrástico do texto, para, a seguir, propor um pequeno esboço do que seria um modelo formal (lógico-matemático) de análise e descrição de textos lingüísticos com base em tais relações. Esse modelo pode ter larga aplicação na criação de sistemas de Inteligência Artificial, bem como no ensino de redação em língua pátria ou estrangeira a estudantes de cursos de Engenharia e Ciência da Computação.*

Palavras-chave — *Lingüística textual; sintaxe transfrástica; modelos matemáticos de análise lingüística; Inteligência Artificial; ensino de redação.*

INTRODUÇÃO

O interesse de cientistas, filósofos e homens de cultura em geral pelo objeto *texto* não é novo. Entretanto, somente nas últimas décadas tem sido possível empreender um estudo mais sistemático desse objeto na medida em que a própria ciência lingüística evoluiu, fornecendo as chaves fundamentais de uma nova abordagem desse complexo problema. O grande desafio que se impõe hoje é enunciar as regras de uma sintaxe transfrástica com a mesma precisão e rigor formal com que se pode hoje tratar a sintaxe frástica.

Essa "gramática do texto" deve ser capaz de descrever qualquer texto, independentemente de sua natureza, como uma rede de inter-relações funcionais, isto é, como conjunto de elementos que se articulam entre si mediante relações semânticas e lógicas, formando uma estrutura compacta, uma unidade de comunicação. Em outras palavras, tal gramática deverá reduzir o texto a uma expressão "algébrica".

No presente trabalho pretendemos formular algumas hipóteses sobre as relações sintáticas existentes no nível transfrástico, bem como propor um esboço de modelo formal de descrição de textos com base em tais relações, além de sinalizar a possibilidade de utilizar esse modelo no ensino de redação e de criação de sistemas computacionais dotados de Inteligência Artificial.

COESÃO E COERÊNCIA

Os teóricos que pesquisam no campo da lingüística textual têm perseguido um modelo de estruturação do texto ao mesmo tempo sintática e semântica. Buscam regras que permitam não apenas distinguir entre textos gramaticais e agramaticais mas também entre textos semanticamente aceitáveis e inaceitáveis. Os conceitos de gramaticalidade e aceitabilidade semântica estão intimamente ligados aos de coesão e coerência textual, que passamos a discutir.

Dentre as referências que fazem distinção entre *coesão* e *coerência* está [1], que fala em *conectividade seqüencial* (coesão entre os elementos que ocorrem na superfície textual) e *conectividade conceptual* (coerência entre os elementos cognitivos apresentados pelas ocorrências textuais e o nosso conhecimento do mundo).

Segundo a referência [2], a coerência de um texto está ligada à noção de macroestrutura textual, também definível como a estrutura profunda do texto, ao passo que a coesão diz respeito ao encadeamento linear das frases ao nível da estrutura de superfície do texto.

A referência [3] define coerência como "uma certa capacidade de atuar como unidade, enquanto coesão se refere à existência de conexão entre as diferentes partes. A coerência é antes de natureza semântica, nos remete a um certo significado global do texto; a coesão parece dominada por aspectos sintáticos e relacionais entre os componentes. Entretanto, seria imprudente e simplista considerar a coerência como fenômeno exclusivamente semântico, e a coesão como exclusivamente sintático."

De forma geral, podemos entender a coesão textual como o conjunto de relações sintático-semânticas dos elementos constitutivos do texto entre si, enquanto a coerência textual é a relação entre o texto e o contexto extralingüístico, os sujeitos da enunciação, os dados da experiência acerca do mundo disponíveis aos falantes da língua e as condições objetivas e subjetivas de produção do ato lingüístico.

Discussão semelhante se deu, ainda em nível da gramática intrafrástica, quando se constatou que frases agramaticais podem ser perfeitamente aceitáveis semanticamente, assim como uma frase gramaticalmente bem construída pode conduzir à contradição lógica e ao *nonsense*. A coerência, portanto, depende tanto do contexto do enunciado (por vezes chamado de *co-texto*) quanto da situação de enunciação. Já a coesão textual, embora também

[1] Fundação Cásper Líbero e Centro Universitário FIEO, Rua Garcia Lorca, 171, 05519-000 São Paulo SP, Brasil, abizzocc@terra.com.br
[2] Bit Company Franchising, Rua Dr. Jorge Ramos, 95, 03068-030 São Paulo SP, Brasil, elo@ig.com.br

apresente uma dependência semântica, é de natureza essencialmente gramatical. Por isso, sendo impossível enunciar regras de coerência textual independentes do aspecto pragmático, a busca de um modelo formal de descrição sintática de textos deverá recair na questão da enunciação de regras de coesão textual. O problema se reduzirá assim à descrição das relações estritamente lingüísticas existentes entre as frases de um texto dado, não importando a interpretação subjetiva que dele façamos em função dos diferentes contextos em que possa ocorrer.

PROGRESSÃO TEMÁTICA E NÚCLEOS TEMÁTICOS

Todo discurso parte de um consenso em direção a uma especificidade, vale dizer, parte de uma informação já conhecida por ambos os sujeitos da enunciação sobre a qual se faz o aporte de informação nova, inédita. À informação já conhecida dá-se o nome de *tema* ou *tópico*, e à informação nova dá-se o nome de *rema* ou *comentário*. Evidentemente, toda informação nova torna-se de domínio comum dos sujeitos da enunciação no momento de sua veiculação no texto, transformando-se em suporte de uma nova informação. Portanto, todo rema pode tornar-se tema em relação a novos remas. Por essa razão, distinguiremos entre *tema principal* (aquele que não deriva de outro tema dentro do mesmo texto e *tema secundário* ou *subtema* (aquele que é rema de temas anteriores pertencentes ao mesmo texto) [4]. O constante movimento de tema a rema é o que chamamos de *progressão temática*, condição *sine qua non* da existência do texto.

No nível da superfície textual, os sucessivos temas e remas podem ser detectados através de unidades léxicas que sintetizam e concentram a carga semântica do texto: podemos chamá-las de *núcleos temáticos*. A progressão temática poderá então ser entendida como o encadeamento de tais núcleos ao longo do texto.

Para [5], todo discurso resulta da tensão dialética entre o consenso e a especificidade, que, como vimos, articula o não sabido e o já sabido num mecanismo de *suporte/aporte*.

Assim, é natural que todo texto seja parcialmente profluente e parcialmente redundante. A profluência do texto garante sua informatividade, ao passo que a redundância assegura a fixação do tema e a integração dos constituintes textuais no seu desenvolvimento seqüencial.

A esse respeito, [6] propõe a existência de quatro meta-regras básicas de coerência textual, a saber: a *repetição*, a *progressão*, a *não contradição* e a *relação texto/contexto*. Destas, particularmente as meta-regras de repetição e de progressão dizem respeito mais diretamente à construção gramatical do texto, contemplando assim a citada tensão *redundância/profluência*. Essa tensão se reflete no surgimento progressivo de novos núcleos temáticos ao longo do texto, núcleos estes que no entanto tendem, com maior ou menor freqüência, a se repetir à medida que o texto avança. Aliás, quanto maior a freqüência de repetição de um núcleo temático, maior a sua relevância semântica para o texto e maior a sua pertinência ao tema a que está subordinado. Este é inclusive o princípio de conceituação de *palavra-tema* e *palavra-chave*, de que no entanto o núcleo temático cumpre distinguir-se. De modo geral, todos os elementos léxicos de um texto que se repetem de forma significativa constituem núcleos temáticos. Contudo, [6] distingue três tipos diferentes de repetição: a *definitivização* (reiteração da mesma palavra ou expressão), a *pronominalização* (uso de pronomes e proformas em lugar de um termo), e a *substituição* (quer por sinonímia quer por paráfrase). Numa possível representação esquemática do texto, poderíamos convencionar que os núcleos temáticos fossem representados por algarismos romanos, a cada repetição direta de um núcleo correspondendo a repetição do algarismo. Os núcleos substituídos por pronomes e proformas ou por sinônimos e paráfrases seriam indicados por um algarismo romano precedido do prefixo "sub", ao passo que os núcleos substituídos por 0 (fenômeno a que damos o nome de *elipse*) seriam representados por um algarismo romano entre parênteses. No caso de dois núcleos temáticos serem antônimos, ou apresentarem no texto algum tipo de oposição funcional exclusiva, indicaríamos a ambos com o mesmo algarismo, antepondo a um dos dois um sinal de menos (–).

AS UNIDADES SINTÁTICAS DO TEXTO: FRASEMAS E STRINGS

A concepção do texto como uma estrutura implica a existência de unidades constitutivas que mantêm vínculos funcionais entre si. Tal concepção nos conduz à idéia de uma hierarquia entre essas unidades e, conseqüentemente, à possibilidade de explicitá-la na forma de um esquema ou diagrama. Essa hierarquia subjacente aos elementos constitutivos do texto identifica-se bastante bem ao que [2]-[7] denomina *macroestrutura textual*. Todavia, para que possamos estudar as relações funcionais entre as unidades constituintes do texto, é mister primeiramente definirmos quais são essas unidades. Tradicionalmente, costuma-se considerar o texto como um conjunto de frases, e, portanto, seria a frase a unidade textual por excelência. Tal ponto de vista acarreta inúmeros problemas, a começar da própria conceituação de frase [8]. Mesmo que se adote uma definição consistente de frase, ainda resta o problema da possibilidade de reescritura de uma frase em várias ou vice-versa. Por essa razão, alguns teóricos preferem adotar como unidade textual não a frase mas sim a oração. Tal atitude prende-se em parte à expectativa de que a gramática textual contenha a gramática frasal [9]. Entretanto, o estudo sintático dos períodos compostos revela diferentes tipos de relação entre as orações, e o problema da reescritura se recoloca: há orações subordinadas que podem transformar-se em coordenadas e vice-versa; podem por vezes constituir frases autônomas. Há outras no entanto que permanecem sempre subordinadas a uma oração principal, como elemento sintático obrigatório daquela, não podendo ser reescritas sem que o significado geral do período seja drasticamente modificado. Além disso, embora toda oração subordinada desempenhe uma função sintática no seio da oração principal, alguns tipos de subordinadas podem ser suprimidas *sem prejuízo sintático* da oração principal, embora com evidente prejuízo semântico, ao passo que outras, quando suprimidas, simplesmente destroem a oração principal. Isso revela que, mesmo ao nível da subordinação, há diferentes graus de dependência entre as orações, o que nos sugere adotar como unidade de texto todo segmento sintático que se enquadre em uma das situações abaixo:

(i) período simples;
(ii) oração coordenada;
(iii) oração subordinada passível de supressão sem prejuízo sintático da oração principal;
(iv) oração principal cujas subordinadas se enquadrem em (iii);
(v) período composto por subordinação, não decomponível nos termos de (iii) e (iv).

A essa unidade assim definida daremos o nome de *frasema*, e estabeleceremos sua definição em bases mais rigorosas. Para tanto, partiremos da constatação de que há períodos formados por uma única oração, períodos formados por orações coordenadas e períodos formados por uma oração principal e uma ou mais subordinadas (além, é claro, das várias combinações dessas possibilidades). Especificamente no que tange ao período composto por subordinação, observamos a existência de dois diferentes tipos de relação subordinativa, segundo a oração subordinada exerça uma função sintática fundamental dentro da oração principal ou apenas uma função acessória. Ao primeiro tipo de relação daremos o nome de *subordinação forte* e ao segundo chamaremos de *subordinação fraca*. Podemos dizer que a subordinação forte é uma relação indissociável, ao passo que a subordinação fraca e a coordenação são relações dissociáveis. Se explodirmos a frase de modo que se rompam todas as relações dissociáveis, permanecendo apenas as indissociáveis, cada uma das subdivisões resultantes dessa explosão será uma oração simples ou um conjunto formado por uma oração principal e uma ou mais orações subordinadas fortes. São exatamente essas unidades o que chamamos de frasema.

Da definição que demos de subordinação forte e subordinação fraca resulta que são subordinadas fortes basicamente — mas não exclusivamente — as orações substantivas; as demais subordinadas (adjetivas e adverbiais) são, via de regra, subordinadas fracas.

A partir de agora, representaremos o frasema sempre entre barras verticais (| |). Vejamos os exemplos a seguir:

(1) |Comprei um carro novo.|
(2) |Vim,| |vi,| |venci.|
(3) |Despediu-se de todos| |e partiu.|
(4) |Como estivesse doente,| |João não foi à escola.|
(5) |Se for eleito,| |ele será empossado.|
(6) |Quero que você me faça um favor.|
(7) |É importante que eu vá à reunião.|

A frase (1) constitui um período simples, e portanto, um frasema. Em (2) e (3) temos frasemas coordenados sindética ou assindeticamente. Já as frases (4) a (7) representam períodos compostos por subordinação. Em (4), por exemplo, a oração subordinada "Como estivesse doente", ao ser suprimida, produz a oração simples "João não foi à escola", a qual se mantém perfeitamente gramatical e de sentido completo, o mesmo ocorrendo em (5). Em ambos os casos, temos dois frasemas. Em (6) e (7), ao contrário, a supressão da subordinada conduz a orações incompletas como "Quero" ou "É importante". Neste caso, as frases não são decomponíveis em frasemas menores.

Há casos entretanto em que a decomposição de um período composto em frasemas menores, embora possível, não é necessária. É o caso das orações subordinadas adjetivas, que normalmente vêm encaixadas no meio da principal. Por exemplo, o frasema

(8) |O homem que trabalha vence na vida.|

é perfeitamente decomponível em dois frasemas menores, |O homem vence na vida.| e |que trabalha|, contudo a posição tática da oração adjetiva no interior da principal desaconselha por razões meramente práticas sua decomposição. Aliás, cabe ressaltar que a decomposição de um frasema em frasemas menores é em geral facultativa e depende do tipo de relação existente entre os frasemas constituintes e de sua importância dentro da macroestrutura textual em que se encontram.

Enquanto unidades básicas da sintaxe do texto, os frasemas estabelecem entre si relações lógico-funcionais, que chamaremos de *conexões frásticas*, formando assim cadeias de frasemas. Estas por sua vez também apresentam conexões em relação a outros frasemas e/ou cadeias de frasemas, de modo que tais cadeias comportam-se de forma análoga a um frasema simples. Chamá-las-emos de *strings* (inglês *string* = "fio"), por analogia às cadeias lineares de mesmo nome, propostas por Harris (*apud* Borba [10]). Os *strings* podem combinar-se progressivamente, formando unidades cada vez maiores. Por essa razão, todo *string* pode ser chamado de *substring* em relação ao *string* mais extenso que o contém. Da definição de *string* resulta que todo texto é um grande *string*, subdivisível em *substrings*; por outro lado, todo frasema pode também ser considerado como um *string* unitário. Cumpre lembrar ainda que o conceito de *string* não coincide com o de parágrafo, embora em geral todo parágrafo constitua um *string*.

Núcleo temático, frasema, *string* e conexão são portanto os conceitos básicos de nosso modelo. Na representação esquemática, indicaremos o *string* por colchetes ([ ]) envolvendo os frasemas e/ou *substrings* que o compõem. Isso permite uma hierarquização das conexões do texto, de forma análoga ao procedimento da parentetização em álgebra. Com efeito, uma sentença matemática do tipo

$$3 \times 4 + 2 = 12 + 2 = 14$$

é diferente de

$$3 \times (4 + 2) = 3 \times 6 = 18$$

Os parênteses no segundo caso indicam que operação aritmética deve ser efetuada em primeiro lugar. Conseqüentemente, nessa sentença o fator 3 multiplica todo o conteúdo dos parênteses, ou seja, $4 + 2 = 6$, enquanto no primeiro caso multiplica apenas o 4. Esquemas semelhantes são largamente utilizados em lógica matemática e em seus corolários (teoria da informação, computação, lingüística gerativa, etc.). A resolução de esquemas parentetizados parte sempre dos parênteses mais internos da sentença em direção àqueles mais exteriores. A esse procedimento dão os lógicos o nome de *análise centrípeta*. Por exemplo, na sentença

$$((4 + 6) \times (5 - 3)) + 5$$

resolvem-se primeiro os parênteses internos, isto é, $(4 + 6)$ e $(5 - 3)$, obtendo assim a nova expressão

$$(10 \times 2) + 5 = 20 + 5 = 25$$

Em nosso caso específico, a parentetização dos frasemas, criando *strings*, resulta da própria hierarquia funcional dos frasemas entre si, de forma totalmente análoga a uma sentença matemática. Porém, em lugar de números e operações aritméticas, teremos respectivamente frasemas e conexões frásticas. A exemplo da lógica e da aritmética, cabe lembrar que todo colchete aberto deve ser fechado, de sorte que toda sentença completa (em nosso caso, todo diagrama de texto) deve ter tantos sinais "]" quantos forem os sinais "[". Por conseguinte, os colchetes serão sempre em número par.

AS CONEXÕES FRÁSTICAS

Conforme definimos anteriormente, *conexão frástica*, ou simplesmente *conexão*, é a relação lógico-funcional existente entre duas unidades sintáticas transfrásticas (frasemas ou *strings*), constituindo portanto o liame fundamental de todos os elementos integrantes da armação do texto. Sendo uma relação de caráter essencialmente lógico, a conexão pode ser encarada como uma função análoga à relação entre proposições na lógica matemática. Sobretudo, isso permite que representemos graficamente as conexões através de sinais semelhantes aos dos operadores lógicos. É preciso contudo lembrar que nem sempre o tipo de conexão existente entre os frasemas ou *strings* é detectável na superfície textual através de índices sintáticos (advérbios, conjunções, pontuação, etc.). Na verdade, o estatuto das conexões é fundamentalmente de natureza semântica, conforme assinala [2]; por essa razão, nosso modelo, sendo essencialmente descritivo, não discute quais índices, quer sintáticos quer semânticos quer pragmáticos, determinam tal ou qual tipo de conexão, mas procura apenas enunciar uma operatória dessas conexões.

Passamos a seguir a relacionar os principais tipos de conexões frásticas e sua simbologia, ressaltando que a lista de conexões aqui apresentada não é exaustiva: outros tipos de conexão poderão ser detectados à medida que mais e mais textos forem estudados. Também alertamos para o fato de que nossa classificação é bastante sumária e simplista, estando portanto sujeita a revisões e reformulações. De qualquer maneira, nossa intenção aqui é principalmente demonstrar a possibilidade de descrever a sintaxe transfrástica através de um modelo formal.

As conexões frásticas são as seguintes:

Desenvolvimento ($\rightarrow$): é a conexão que liga um frasema temático ou subtemático, representado graficamente entre barras verticais duplas (|| ||), ao seu rema. O desenvolvimento é o elemento básico do processo de textualização dissertativa e também por vezes narrativa, visto que tal tipo de texto consiste fundamentalmente na apresentação do tema ou assunto a ser tratado (*suporte*) seguido da informação que sobre ele o texto traz (*aporte*). Um exemplo típico de desenvolvimento se dá entre o tópico frasal e o restante do parágrafo.

Síntese ($\leftarrow$): trata-se do inverso do desenvolvimento. Neste caso, as diversas informações aportadas pelo texto confluem para um frasema que as sintetiza e lhes serve de suporte. Na síntese, o tema ou tópico frasal vem posposto ao rema. Por vezes, encontramos na superfície textual índices de síntese que poderíamos chamar de *conectores sintéticos* (expressões tais como *em suma*, *em resumo*, *trata-se portanto de*, etc.).

Conjunção (+): articula seqüencialmente frasemas cujos conteúdos proposicionais se verificam de forma compatível entre si, simultânea ou sucessivamente, na realidade proposta pelo texto. A conjunção é uma das formas mais freqüentes de conexão frástica. Dentre os diversos conectores conjuntivos estão *e*, *a seguir*, *também*, *assim como*, *ao mesmo tempo*, *da mesma forma*, etc.

Disjunção (/): articula seqüencialmente frasemas cujos conteúdos proposicionais estão em relação alternativa, o que equivale a dizer que a ocorrência de um deles pode (e eventualmente deve) excluir a ocorrência de outro. Temos disjunção nas proposições alternativas do tipo *ou... ou*, por exemplo.

Contrajunção (//): conecta frasemas cujos conteúdos proposicionais apresentam oposição contrastiva ou adversativa, sendo entretanto, e à diferença do que acontece na disjunção, co-ocorrentes na mesma realidade dada. Índices freqüentes de contrajunção são os conectivos *mas*, *porém*, *entretanto*, *todavia*, etc.

Implicação (⇒): estabelece entre dois frasemas uma relação de causa e efeito. Verifica-se quando o conteúdo proposicional do frasema antecedente é condição necessária, suficiente ou possível para a ocorrência do conseqüente. Sua definição é portanto semelhante à da implicação lógica e seus conectores principais são *portanto, conseqüentemente, se… então, por isso*, etc.

Contra-implicação (⇐): é o inverso da implicação. Neste caso, o frasema antecedente vem posposto ao conseqüente. O segundo membro da conexão é portanto a causa ou justificativa do primeiro. Seus índices mais comuns são *porque, dado que, visto que*, etc.

Explicação (:): introduz um frasema ou *string* cuja função é a de explicar, detalhar, ampliar a informação contida no frasema precedente. A essa função podemos chamar de *expansão semântica*. Por vezes a explicação desempenha papel redundante, parafraseando metalingüisticamente o conteúdo do frasema antecessor ou introduzindo uma exemplificação do mesmo. Cumpre não confundir a explicação com a implicação ou o desenvolvimento: a explicação não encerra uma relação determinística de causa e efeito nem introduz comentário acerca do tópico. Nem sempre a explicação apresenta conectores sintáticos explícitos, entretanto poderíamos citar os dois pontos (:), além de expressões como *isto é, ou seja, com efeito*, etc.

Pressuposição (➔): mais comum entre *strings,* a pressuposição serve para apresentar um argumento ou raciocínio que dá sustentação ideológica ao tema a ser desenvolvido. Poderíamos dizer que a pressuposição é a "justificativa do texto", ao passo que a implicação introduz a justificativa de um frasema ou *string*. As famosas fórmulas jurídicas do tipo *considerando que… o Presidente resolve…* são exemplos característicos de conexão pressupositiva. Embora em geral não haja nexo semântico de causalidade (ao menos em nível explícito) na pressuposição, esta também expressa uma forma de motivação, porém trata-se aí de uma motivação lógico-psicológica por parte do locutor em relação ao seu texto. A pressuposição é portanto a mais pragmática das conexões frásticas.

Aplicação do Modelo à Inteligência Artificial e ao Ensino de Redação em Cursos de Engenharia e Ciência da Computação

O modelo aqui proposto permite o desenvolvimento de tecnologias que podem apresentar diversas aplicações práticas, dentre as quais destacamos duas que estão diretamente ligadas à nossa prática como professores: *a)* a criação de *softwares* de Inteligência Artificial, em que o computador deve ser capaz de processar (isto é, captar, compreender e responder de forma lógica) enunciados formulados em língua natural, e *b)* o ensino de técnicas de redação que explicitem o caráter lógico da estruturação textual. Estamos realizando ambas as experiências simultaneamente ao utilizarmos este modelo (e outros modelos matemáticos fornecidos pela lingüística) no ensino de gramática e redação dentro da disciplina *Língua Portuguesa* dos cursos de Engenharia de Computação e de Ciência da Computação do Centro Universitário FIEO.

A formação dos alunos se inicia pela gramática da frase, em que utilizamos a sintaxe estrutural-funcional de Tesnière [11], o que ocorre no primeiro semestre da disciplina, para a seguir transpor o conceito de sintaxe ao elemento texto. Isso permite que os alunos adquiram competência redacional em termos de gramaticalidade, coesão e coerência por meio da compreensão das relações lógicas entre as divisões e subdivisões do texto (frases, parágrafos, seqüências, capítulos, etc.) e ainda antevejam a possibilidade de desenvolver algoritmos que permitam, ainda que de forma rudimentar, o processamento automático da linguagem humana. Os resultados que temos obtido, ao menos em termos teóricos, parecem até o momento bastante animadores.

ENGENHARIA E EMPREENDEDORISMO

João Cirilo da Silva Neto [1]

Universidade Federal de Uberlândia, Faculdade de Engenharia Mecânica, Av. João Naves de Ávila, 2160, Campus Santa Mônica, Bloco M, 38400-902, Uberlândia, MG, Brasil. (34) 32394376.

Resumo. *Este trabalho apresenta a importância do empreendedorismo nos cursos de engenharia, tendo em vista que a competitividade atual desencadeou um processo de desemprego também para os engenheiros. Neste contexto, o empreendedorismo pode diminuir o número de engenheiros desempregados no país, porque eles podem montar seus próprios negócios. É comentado ainda que a Universidade deve difundir os estudos do empreendedorismo em sala de aula para despertar nos engenheiros o interesse pelo assunto. Este estudo mostra também que maioria das empresas brasileiras são pequenas ou médias; e que nos Estados Unidos os pequenos empreendimentos desenvolvem altas tecnologias, além de serem muito apoiados pelo governo e pelas Universidades.*

Palavras-chave*: Empreendedorismo, Ensino, Engenharia.*

1. INTRODUÇÃO

Com a competitividade fortemente instalada em todos campos da economia, o emprego tornou-se cada vez mais frágil e mais difícil de ser conseguido. Hoje, mais do que nunca, é preciso ter iniciativa para se conseguir um emprego ou gerar o seu próprio negócio e com isso conseguir uma renda que possa restituir os investimentos aplicados na formação profissional.

No caso dos engenheiros, os desafios não são diferentes. Dos milhares de engenheiros que terminam o curso de graduação, a maioria não tem garantia de emprego. Uma alternativa que pode diminuir o desemprego na área de engenharia é o empreendedorismo, tendo em vista que os engenheiros, devido a sua formação técnica e administrativa, têm condições de aplicar bem os conhecimentos adquiridos no próprio negócio.

Apesar da importância da opção pelo empreendedorismo, nesse momento crítico das economias brasileira e mundial, muitos pesquisadores criticam essa opção porque pensam que ela desvaloriza o engenheiro e a sua profissão. Mas diante da situação atual, ou seja, globalização da economia, vale a pena fazer a seguinte reflexão: É melhor guardar o diploma na gaveta e esperar que as mudanças aconteçam ou montar seu próprio negócio?

No caso de optar pela montagem de seu próprio negócio, o engenheiro precisa conhecer bem os caminhos a serem percorridos para não cair nas terríveis estatísticas de falências de empresas amplamente divulgadas pelo SEBRAE. Segundo este órgão, quem opta por um negócio próprio enfrenta muitas dificuldades e constatou essa realidade em pesquisa sobre o índice de mortalidade dos pequenos negócios. Como as pessoas não estão preparadas para abrir a própria empresa – porque faltam condições financeiras, administrativas e, principalmente, de conhecimento sobre o negócio –, sabe-se que, de cada 100 empresas que são abertas, 95 não resistem aos primeiros cinco anos de vida e fecham, deixando um rombo na conta do proprietário falido e desmotivado, e quase sempre pendências jurídicas e financeiras.

Portanto, é importante que o engenheiro seja orientado sobre esses riscos mesmo antes de concluir seu curso e uma espécie de simulações de negócios e pesquisas de tendências de mercado devem ser desenvolvidas nas rotinas das aulas.

O objetivo desse trabalho é mostrar a importância do empreendedorismo para os engenheiros, caso eles optam em montar seu próprio negócio, tendo em vista que muita coisa pode dar errada caso não sejam devidamente orientados.

Será mostrado ainda que a universidade deve difundir os estudos do empreendedorismo em sala de aula para despertar nos engenheiros o interesse pelo assunto. Este trabalho mostra ainda que a maioria das empresas brasileiras são pequenas ou médias e que nos Estados Unidos os pequenos empreendimentos desenvolvem altas tecnologias.

2. PANORAMA ATUAL

Até os anos 50, a economia do mundo tinha sustentação pelo desempenho das grandes empresas multinacionais ou das empresas estatais. Essas duas grandes forças econômicas ofereciam muitas oportunidades de trabalho, sendo responsáveis pela maioria dos bons empregos. Essas grandes corporações determinavam a organização e os rumos de toda a economia, inclusive no Brasil.

Os tempos, no entanto, mudaram. Hoje existe uma nova ordem mundial, que coloca a responsabilidade pela saúde econômica de um país nas pequenas e médias empresas. Também houve drástica redução no número de empregados nas grandes empresas, tanto privadas quanto estatais, configurando processos tão falados como desregulamentação, reengenharia, entre outros. Como ganharam agilidade e produtividade no processo de conquistar a competitividade, as empresas passaram a trabalhar com menos pessoas, o que representou um

[1] João Cirilo da Silva Neto, Universidade Federal de Uberlândia, Faculdade de Engenharia Mecânica, Av. João Naves de Ávila, 2121, Campus Santa Mônica, Bloco M, 38400-902, Uberlândia, MG, Brasil. (34) 32394376, ramal 27. jcirilos@mecanica.ufu.br

enorme número de desempregados em todos os países, MEC e SEBRAE (1999) [1].

O que a engenharia tem a ver com essa situação? No contexto geral, a engenharia e os engenheiros sofrem também com essa mudança no panorama atual. Grandes desafios estão surgindo a cada momento. É exatamente nesse contexto de concentração macroeconômica que são geradas as condições para o surgimento e a expansão das pequenas e médias empresas, que podem ser criadas pelos engenheiros. E as faculdades e universidades de engenharia podem atuar como mola propulsora para garantir maior desenvolvimento das atividades dessas empresas, principalmente quando os engenheiros optam em montar seu próprio negócio, orientando e instruindo os estudantes desde o início de sua formação acadêmica.

Para tanto, é preciso adotar mecanismos técnicos e tecnológicos que permitam ampliar o aspecto a que se destina a educação profissional, possibilitando, assim ao engenheiro, a incorporação das noções de mercado, empresa e de conceitos relacionados com aspectos administrativos, buscando sempre a aplicabilidade desses conceitos, de modo a garantir sucessos na obtenção de resultados.

Diante do contexto econômico mundial e nacional em que vivemos, fica confirmada a necessidade de reafirmar a responsabilidade que está sendo direcionada aos pequenos negócios. As empresas de pequeno porte já são responsáveis por 43,4% dos empregos gerados no país, sendo 80,2% dos empregos no comércio e 63,5% da mão-de-obra do setor de serviços, produzindo 48% dos bens de consumo e 42% dos salários de todo o país, Ref. [1].

Os negócios de pequeno porte compõem 98,2% do total das empresas do Brasil. E mais: 57% das indústrias têm menos de quatro empregados registrados. No setor de serviços essa parcela sobe para 74,2% e no comércio, para 82,9%. Ou seja, os pequenos negócios constituem a parcela mais significativa na economia da nação.

Uma relação com essa realidade é mostrada em um artigo de Avancini (2002) [2], em que o medo de não conseguir um emprego após terminar a faculdade é a grande preocupação dos jovens, cujos dados foram retirados de uma pesquisa realizada pelo Centro de Integração Empresa-Escola (CIEE). Segundo o levantamento, 42% dos entrevistados afirmaram estar preocupados com o futuro profissional em curto prazo. Foram ouvidos 500 estudantes de 16 a 25 anos que procuraram a entidade em busca de um estágio.

O desemprego é uma realidade muito próxima de todo mundo hoje em dia e o jovem sabe que um diploma não é mais garantia de emprego. Outros dados do Instituto de Brasileiro de Geografia e Estatística (IBGE) indicam que a preocupação dos jovens tem fundamento. De 1992 a 1999 a taxa de desemprego na faixa dos 18 a 24 anos: saltou de 9,6% para 14,6%.

Para a referida autora [2], a criança é ensinada, desde pequena, que seu futuro reside em conseguir um emprego. Só que o mundo não é mais assim, o que cria um descompasso entre expectativas e realidade. Emprego é como um animal em extinção e praticamente não existem políticas públicas para preservá-lo. Conseguir um emprego continua sendo a meta de boa parte dos estudantes e supera em muito o desejo de realização profissional: apenas 4% disseram se preocupar com isso na pesquisa do CIEE.

As estatísticas, acima mencionadas, são uma preocupação que se traduz em demanda pelo emprego. Apesar do artigo não relacionar as áreas pesquisadas, pode-se deduzir que no caso da engenharia essa preocupação também existe. Portanto, a opção pelo empreendedorismo pode ser uma saída para diminuir o desemprego nesta área tão importante para o desenvolvimento tecnológico do Brasil. Mas para consolidar esse processo é preciso criar condições estruturais para o desenvolvimento das atividades e buscar o envolvimento do engenheiro com conceitos e ambientes relativos ao empreendedorismo.

Nesse sentido, é preciso ainda que se crie um novo conceito para trabalho em engenharia, ao contrário do que se faz hoje, é possível orientar os estudantes para que sejam os futuros empresários do país. Ao contrário do que acontece hoje, é preciso que a criança, que será o engenheiro do futuro, seja orientada no sentido de ser empresária. Mas para isso é preciso ter bases sólidas sobre conhecimentos de administração de seus próprios empreendimentos.

Apesar do engenheiro necessitar de conhecimentos de administração de empresas, Silva Neto (2002) [3] mostra que muitas universidades não têm dado muita importância à disciplina de administração, especificamente nos cursos de engenharia mecânica, em função da baixa carga horária dedicada a esta disciplina.

Só para ter uma idéia inicial dessa realidade, durante a execução da pesquisa foram encontradas universidades que não tinham a administração como disciplina obrigatória e outras que dedicavam apenas 30 (trinta) horas em seu curso de engenharia mecânica.

Mesmo que outras disciplinas enfoquem aspectos de administração em seus conteúdos, tal carga horária dispensada diretamente à administração é muito baixa, visto que em muitas empresas os engenheiros são os gerentes responsáveis pela administração das mesmas.

3. DEFINIÇÕES DE EMPREENDEDORISMO

Embora empreendedorismo seja um tema amplamente discutido nos dias atuais, seu conteúdo, ou seja, o que ele representa, varia muito de um lugar para outro, de país para país, de autor para autor. Isso porque, embora tenha se originado a partir de pesquisas em economia, o empreendedorismo recebeu fortes contribuições da psicologia e da sociologia, o que provocou diferentes definições para o termo. Algumas são: 1.Empreendedor: que empreende; ativo, arrojado. 2. Aquele que empreende. Chefe de uma empresa. Chefe de uma empresa especializada na construção, nos trabalhos públicos, nos trabalhos de habitação. Pessoa que, perante contrato de uma empresa, recebe remuneração para executar determinado trabalho ou aufere lucros de uma outra pessoa, chamada mestre-de-obras, SEBRAE (2002)[4].

Para Dolabela (2002) [5]**,** o empreendedor é essencial ao processo de desenvolvimento das comunidades e países. Essa é uma conclusão que se espalhou pelo mundo e chegou até aos últimos recantos comunistas, onde as empresas estatais dominam o cenário, como em Cuba por exemplo.

O empreendedor é motivado pela auto-realização, desejo de assumir responsabilidades e independência. Considera irresistível assumir novos desafios, estando sempre propondo novas idéias, seguidas pela ação.

De forma genérica, empreendedorismo costuma ser definido como o processo pelo qual indivíduos iniciam e desenvolvem novos negócios. Por isso, o empreendedorismo relaciona-se tanto com a criação de novos negócios quanto com a inovação promovida dentro de empresas já estabelecidas.

4. O PAPEL DA UNIVERSIDADE NA DIFUSÃO DO EMPREENDEDORISMO

Como é do conhecimento geral, a sociedade contemporânea vive momentos de intensas transformações decorrentes da necessidade de se compatibilizar, adequar ou mesmo mudar valores de uma ordem mundial em transição. Nesse contexto, a Universidade não é exceção. Portanto, ela deve encontrar meios de lidar com tais contradições, reais ou aparentes. Se por um lado há consenso sobre importância da Universidade para o desenvolvimento de nosso país de maneira a assegurar-lhe inserção na economia global, por outro questionam-se os meios advindos em especial das atividades relacionadas diretamente da produção do saber inovador.

A visão de Universidade secular, estruturada a partir do princípio de que cabe a ela proteger todo o conhecimento e ciências, dos fatos e princípios, de pesquisa e descobertas, de experimentos e especulações, tem sido confrontada com outro que entende a Universidade como instituição criada para atender às demandas de uma sociedade que hoje deseja consumir produtos que agregam informações de conteúdo tecnológico e é impulsionada cada vez mais pelas necessidades da economia de mercado.

Neste contexto, outro aspecto relevante a ser considerado para avaliar o adequado desempenho da Universidade está relacionado às suas potencialidades em oferecer um conhecimento diversificado. Se, no passado, a Universidade era a principal instituição detentora do conhecimento, hoje o conhecimento se encontra disseminado em toda a sociedade, nas mais variadas formas e disponibilizado através dos meios de comunicação de massa, e dos sistemas e redes de informação.

Essa perda de hegemonia recoloca a questão da missão institucional da Universidade e a maneira de se buscar formas de assegurar um ensino que contemple a diversidade do conhecimento e que, simultaneamente, em nível da individualidade e subjetividade do aluno, forme profissionais com competência em áreas específicas e capazes de incorporar valores que propiciem o pleno exercício de sua cidadania, UFMG (2002) [6].

Além disso, faz-se necessária a adoção de práticas pedagógicas que privilegiem o ensino em forma e ritmo compatíveis com a realidade econômica social e cultural do aluno, e que lhe permitam acompanhar a evolução dos conhecimentos produzidos que mudam numa velocidade sem precedentes na sociedade contemporânea.

No caso da engenharia as necessidades de mudanças também existem, pois é preciso reconhecer que a reformulação de currículos deve acompanhar os processos sociais, políticos e econômicos.

Conforme citado que houve mudanças consideráveis no oferecimento de postos de trabalho, ou seja, diminuição do número de empregados com carteira assinada, é necessário que os cursos de engenharia valorizem o empreendedorismo como alternativa de absorção de maior número de engenheiros graduados no Brasil.

Em um artigo, Behnken (2002) [7] comenta que a falta de perspectivas de emprego para os jovens brasileiros vem dando a chance de pensarmos em alternativas que se caracterizam pela simplicidade e eficácia. Uma dessas opções vem crescendo no meio universitário e tem se destacado por conseguir unir a teoria com a prática: a empresa júnior.

Criadas na década de 60, na França, as empresas juniores passaram a oferecer aos alunos aquilo que eles mais necessitam: oportunidade de exercer a prática de suas carreiras e adquirir vivência na gerência de uma empresa.

Essa experiência se tornou o embrião para desenvolver o potencial empreendedor e motivar a abertura do próprio negócio. Com isso, aquela idéia antiga de estudar para conseguir um bom emprego vai sendo trocada pela visão ser o gestor da própria vida profissional.

O ideal é plantar essa semente desde os primeiros períodos da faculdade, para que a mudança da cultura da dependência seja feita de forma gradativa. Parece fácil, mas não é. Ainda encontram-se muitos alunos que chegam à universidade sonhando com aquele emprego seguro e estável, em que se entra pela manhã para bater o cartão e se sai no final da tarde, só voltando a pensar no trabalho na manhã seguinte.

Por isso, a empresa júnior se apresenta ao estudante universitário como o grande laboratório propício para desenvolver sua autonomia, além de estimular a responsabilidade pelo sucesso de sua vida e pelo sucesso de sua carreira.

Nesse sentido, o papel preponderante da Universidade deve ser o de habilitar os futuros engenheiros de acordo com as necessidades do mercado, ou seja, promover a articulação entre currículo e as transformações deste mercado.

Portanto, no caso específico da engenharia, os currículos mínimos da disciplina de empreendedorismo devem oferecer condições necessárias para envolver o aluno com o assunto. Um conteúdo que pode ser utilizado, apesar de pertencer a um curso de administração, é colocado da seguinte maneira: Introdução às Micros e Pequenas Empresas- Definições: Pequenas empresas. O empreendedor. O papel da pequena empresa na sociedade. Teorias de empreendedorismo. Pequenas empresas na estrutura econômica. Contribuição da pequena empresa para os objetivos econômicos e sociais. Empreendedorismo: Introdução. Empreendedores: Características, competências. Negociação. Imaginação. Criatividade. Cultura empreendedora. Campo do empreendedorismo. Inovação. Detecção de oportunidades. Apoio para empreendedorismo. Alternativas empreendedoras. Planejamento empreendedorial, EFEI (2002) [8].

Outro ponto importante que se refere ao papel da universidade é o estágio curricular. Entende-se por estágio curricular qualquer atividade que propicie ao aluno adquirir experiência profissional específica e que contribua, de forma eficaz, para a sua absorção pelo mercado de trabalho. Enquadram-se nesse tipo de atividade as experiências de convivência em um ambiente de trabalho, cumprimento de tarefas com prazos estabelecidos, trabalho em um ambiente hierarquizado e com componentes cooperativistas ou corporativistas, etc.

O objetivo é proporcionar ao aluno a oportunidade de aplicar seus conhecimentos acadêmicos em situações da prática profissional clássica, criando a possibilidade do exercício de suas habilidades. Espera-se que, com isso, que o aluno tenha a opção de incorporar atitudes práticas e adquirir uma visão crítica de sua área de atuação profissional.

Mas de forma geral, é uma tradição no Brasil os estudantes de engenharia procurarem as grandes empresas para realizar estágio, mas muitas vezes ficam em determinado setor da empresa a maior parte do tempo. Este estágio pode não ser produtivo porque limita a capacidade de envolvimento do estagiário com a maioria dos problemas que ele irá encontrar na profissão. Caso opte em estagiar em uma empresa de pequeno ou médio porte, poderá conviver diretamente com maioria dos problemas enfrentados no dia-a-dia destas empresas.

Nesse sentido, as Universidades podem incentivar essa mudança, selecionado as empresas que possuem condições de oferecer estágios a estudantes e engenheiros. Este procedimento poderia contribuir para melhorar a integração entre empresa e escola. Além disso, seria uma grande oportunidade para faculdades de engenharia incentivarem o desenvolvimento dessas empresas, a partir do conhecimento de sua realidade.

5. EMPREENDEDORISMO NOS ESTADOS UNIDOS

De acordo com Brockhaus (1999) [9], os Estados Unidos são famosos por suas atividades em empreendedorismo. Seus empreendedores são conhecidos mundialmente, desde Henry Ford e Thomas Edison até Seven Jobs e Bill Gates. Além desses gigantes, existem milhões de outros empreendedores americanos fundadores de vários pequenos negócios. Todos os empreendedores têm inicialmente uma idéia de um produto ou serviço e a visão de como transformar essa idéia em um negócio viável. Este processo é orquestrado pelos fundadores, que são freqüentemente a força motora mais importante por trás da criação. Os fundadores não são os únicos participantes desse processo, e a rede de relacionamentos que eles estabelecem é fundamental para a abertura da firma e o início das operações.

O papel da Universidade na difusão do empreendedorismo nos Estados Unidos é um dos fatores mais importantes. O conteúdo do curso ou do programa inclui conhecimentos gerais em negócios ou seja, contabilidade, finanças, marketing, direito empresarial, recursos humanos, operações e administração ou gerenciamento geral. Estes cursos também contêm informações sobre como começar um negócio, como e onde encontrar oportunidades e idéias, como é a vida do empreendedor, o que é um plano de negócios, como obter financiamento inicial, quem são os prováveis primeiros clientes, como desenvolver uma equipe de administração, direitos de propriedade intelectual, e crescimento e metas.

Geralmente, não são ensinadas as oportunidades de mercados específicos nos cursos de administração e empreendedorismo. Os estudantes podem ser encorajados a descobrir essas oportunidades e adquirir uma compreensão de como tirar proveito delas através de pesquisas ou projetos.

Especular com o conhecimento técnico específico também não é matéria lecionada em cursos de administração ou empreendedorismo. Segundo o referido autor, é mais provável que, tanto o reconhecimento da oportunidade quanto o conhecimento técnico, sejam incluídos em um curso de empreendedorismo na área de engenharia.

As Universidades são importantes também para as empresas de tecnologia avançada na medida em que elas se envolvem em atividades de pesquisa e desenvolvimento (P&D) que são transferidas para a aplicação comercial e elas treinam técnicos e funcionários. No que diz respeito à P&D, as Universidades são importantes sob dois aspectos: em primeiro lugar, as empresas precisam ter acesso ao corpo docente para receber consultoria, elaborar projetos conjuntos, e assim por diante; em segundo lugar, as empresas precisam ter acesso aos equipamentos e instalações universitárias, como os laboratórios, sistemas de informação e bibliotecas.

Empresas de tecnologia avançada também valorizam as Universidades, porque elas precisam de funcionários altamente qualificados. Os estudantes universitários e os já formados são potenciais funcionários para trabalhar em tempo integral ou meio período. O acesso a um trabalhador qualificado e que receba um salário relativamente baixo já é uma preciosidade. Além disso, as empresas podem obter informações de primeira mão sobre as características dos potenciais empregados. Para formar um grupo de novos funcionários, as Universidades oferecem treinamento para aqueles já empregados através de estágios e cursos de extensão.

As Universidades também ajudam as empresas de tecnologia avançada a encontrar o funcionário ideal, atraindo profissionais altamente qualificados para uma determinada área. Para profissionais que receberam treinamento avançado, a oportunidade de garantir uma atividade complementar ou ensinar por meio-período na Universidade, pode ser um fator importante na hora de escolher o empregador, Ref [9].

Além disso, metade dos alunos de MBA da Escola de Negócios de Harvard, nos Estados Unidos, opta por tocar seu negócio próprio. Os cursos de caráter empreendedor são febre nos Estados Unidos: 1 100 faculdades oferecem cursos desse tipo, e em 30 dos 50 estados americanos já existem cursos para crianças e adolescentes, Ref. [5]

6. PRINCIPAIS ORIENTAÇÕES AOS ENGENHEIROS EMPREENDEDORES

Em função do que foi exposto até agora, pode-se observar que existem muitas dificuldades para abertura e manutenção de um negócio. Nesse sentido, o engenheiro precisa ficar atento às necessidades do mercado e oferecer, justamente, aquilo que o consumidor realmente necessita. Uma boa idéia não garante o sucesso do empreendimento. É preciso conhecer todos os pontos positivos e negativos do negócio.

Portanto, nota-se que este assunto é muito complexo para ser abordado somente em um trabalho como este. Por isso, o engenheiro deve procurar outros manuais, livros, realizar cursos, participar de palestras e seminários, entre outros, para consolidar seus conhecimentos sobre este tema, que conforme citado, é de grande importância para desenvolvimento tecnológico do país.

Mesmo assim, algumas orientações podem ser colocadas, com o objetivo de esclarecer os engenheiros na abertura e administração de seu empreendimento. Inicialmente, para qualificar-se como uma boa oportunidade de investimento, o produto ou serviço deve atender a uma necessidade real com respeito à funcionalidade, à qualidade, à durabilidade e ao preço.

A oportunidade, em última instância, depende da habilidade para convencer os consumidores (o mercado) dos benefícios do produto ou serviço. É o mercado quem determina se uma idéia tem potencial para tornar-se uma oportunidade de investimento, ou seja, apenas o mercado dirá se a idéia gera valor para o usuário final do produto ou serviço.

À primeira vista, uma oportunidade pode parecer inviável, mas, graças ao esforço nela concentrado, suas possibilidades de sucesso tendem a aumentar. Portanto, a receptividade é a habilidade para identificar oportunidades. Ela é fundamental para quem deseja ser empresário. É com ela que se aproveita todo e qualquer momento para observar e conhecer negócios, seja no caminho de casa, no trabalho, nas compras, nas férias, lendo revistas, jornais ou assistindo televisão.

Outros pontos também importantes que devem ser observados pelos engenheiros empreendedores são:

-Permitir que os funcionários tomem decisões de acordo com o nível de seus cargos. Confiar na capacidade dos profissionais contratados ou então rever o processo seletivo.

-Utilizar a informação para dar mais acertividade à experiência ou "*feeling*".

-Perceber que outros fatores também podem atrair os consumidores além do preço, tais como: produtos diferenciados, atendimento, *lay-out* de loja, etc.

-Contratar ou manter os funcionários por sua competência técnica.

-Não pensar apenas no hoje. Dedicar parte do seu tempo útil para elaborar planos para o futuro do negócio.

-Perceber que o consumidor é o maior aliado, pois se ele estiver satisfeito e se sentindo bem atendido ele irá voltar inúmeras outras vezes.

-Praticar o jogo do ganha-ganha. Em uma negociação ambas as partes devem sair satisfeitas para que os bons negócios se repitam, César (2002) [10].

7. CONCLUSÕES E SUGESTÕES

- É preciso valorizar o ensino de empreendedorismo nos cursos de engenharia;
- As universidades devem oferecer consultorias às pequenas e médias empresas criadas, principalmente, pelos engenheiros empreendedores;
- A criação de disciplinas eletivas/obrigatórias relativas ao empreendedorismo deve fazer parte da reestruturação dos currículos das Universidades;
- As Empresas Juniores devem ser valorizadas;
- As Universidades devem incentivar o estágio dos estudantes de engenharia nas pequenas e médias empresas.

UM AMBIENTE DE ENSINO PARA COMPUTAÇÃO MÓVEL INTEGRANDO J2ME E COMPONENTES DE SOFTWARE

Ivan João Foschini[1] *e Sérgio Donizetti Zorzo* [2]

Resumo *— Este artigo descreve a implementação de um aplicativo que possibilita a criação de conteúdo didático para ambientes de Computação Móvel, oferecendo mobilidade aos estudantes no processo educacional. Embora parte deste aplicativo tenha sido desenvolvida para ser utilizada em computadores de mesa convencionais, o conteúdo didático gerado pela aplicação é direcionado para ser visualizado em dispositivos que utilizam a Comunicação Sem Fio para acessar a Rede Mundial de Computadores, notadamente os Palmtops. Com isso, deseja-se que os usuários destes dispositivos possam obter material didático em qualquer lugar onde estejam, usufruindo das vantagens inerentes às Redes de Comunicação Sem Fio, tais como independência de uma conexão cabeada convencional e mobilidade. O ambiente descrito foi implementado utilizando-se as técnicas do Desenvolvimento de Software Baseado em Componentes, explorando este método de desenvolvimento em conjunto com a Java 2 Micro Edition, versão da tecnologia Java voltada especificamente para a criação de aplicações para dispositivos móveis.*

Palavras-Chave — Componentes de Software, Computação Móvel, Educação a Distância, Java 2 Micro Edition, Mobilidade dos Estudantes

INTRODUÇÃO

A Educação a Distância (EAD) é uma modalidade de ensino consagrada e consolidada em diversas partes do mundo [1]. Há tempos, educadores e outros profissionais perceberam as vantagens de se oferecer cursos a distância, e sentiram a necessidade de utilizar novas tecnologias no processo educacional. Quanto às vantagens dos cursos a distância, podem-se destacar: os aspectos econômicos, já que os estudantes não precisam ter custos com viagens e hospedagem, a possibilidade de o aluno poder estudar nos momentos que melhor lhe convierem e o fato de cada um poder seguir seu próprio ritmo de aprendizado, entre outros fatores.

As novas tecnologias, principalmente os computadores e as redes de computadores, ampliaram ainda mais as possibilidades e as vantagens da Educação a Distância. As redes de computadores, notadamente a World Wide Web, tornam possível que qualquer pessoa, em qualquer parte do mundo onde seja possível acessar a rede mundial de computadores, tenha fácil acesso a uma grande quantidade de conteúdo didático.

A utilização das tecnologias de comunicação sem fio e de computação móvel ampliam ainda mais os horizontes das aplicações de Educação a Distância, uma vez que, ao se utilizar meios de comunicação sem fio, o único limitante para a distribuição de conteúdo didático passa a ser a área de cobertura de uma Rede Sem Fio, e não mais a existência de uma conexão cabeada convencional com uma rede de computadores.

O objetivo principal deste artigo é apresentar um ambiente, baseado em componentes de software, que possibilita a criação de conteúdo educacional de forma rápida, eficiente e intuitiva. Este material didático, no entanto, não é direcionado para ser utilizado em microcomputadores de mesa ou quaisquer outros dispositivos semelhantes. A preocupação é criar-se conteúdo educacional que possa ser visualizado em pequenos dispositivos dedicados, com tela pequena e características arquiteturais próprias, especificamente os Palmtops.

Dispositivos como este estão capacitados, atualmente, a receber dados da World Wide Web através de um acesso sem fio, o que possibilita a seus usuários receber o material didático onde quer que se encontrem, independentemente de possuírem a sua disposição uma rede de computadores convencional ou não.

O ambiente proposto neste artigo conta com dois módulos: o Módulo do Professor e o Módulo do Aluno. O Módulo do Professor foi desenvolvido para ser utilizado em *desktops*, e permite que os professores criem listas de exercícios com questões de verdadeiro ou falso e de múltipla escolha, e as disponibilizem em Servidores Web. O Módulo do Professor também permite a geração de relatórios de desempenho individuais e coletivos dos alunos na resolução das listas de exercícios geradas, o que oferece subsídios para que o professor possa aprimorar o processo educacional.

O Módulo do Aluno, por sua vez, permite que os alunos acessem as listas de exercícios geradas e as resolvam em seus Palmtops. O ambiente se encarrega de fazer uma correção automática das resoluções dos alunos, bem como de gerar um relatório a respeito do desempenho dos estudantes na resolução destas listas.

Este artigo descreverá brevemente a Java 2 Micro Edition, os Componentes de Software e apresentará uma Descrição Informal, a Arquitetura e a Interface do ambiente

[1] Ivan João Foschini, Universidade Federal de São Carlos, Rodovia Washington Luís (SP-310) – Km 235, 13.565-905, São Carlos, SP, Brasil, ivan@dc.ufscar.br
[2] Sérgio Donizetti Zorzo, Universidade Federal de São Carlos, Rodovia Washington Luís (SP-310) – Km 235, 13.565-905, São Carlos, SP, Brasil, zorzo@dc.ufscar.br

proposto, expondo ainda um exemplo da criação de uma lista de exercícios e da sua resolução por parte dos alunos, bem como da geração dos relatórios de desempenho.

JAVA 2 MICRO EDITION

O ambiente descrito conta com dois módulos: o Módulo do Professor e o Módulo do Aluno. O Módulo do Professor permite ao educador criar listas de exercícios para avaliação dos alunos e, posteriormente, levantar dados estatísticos a respeito do desempenho dos estudantes. Este módulo é executado em computadores de mesa tradicionais (*desktops*). Já o Módulo do Aluno, desenvolvido com o auxílio da tecnologia Java 2 Micro Edition (J2ME), é executado em Palmtops. Esta seção apresenta esta tecnologia, mostrando as suas principais características. A J2ME foi criada para o desenvolvimento de aplicações a serem exibidas em dispositivos pequenos, tais como Palmtops e telefones celulares, que possuem pequenos computadores dedicados e que freqüentemente utilizam baterias como fonte de energia.

A primeira característica que se destaca nesta tecnologia é que as suas aplicações provêem interfaces gráficas de qualidade, com gráficos coloridos e diversos componentes de interface, o que facilita a interação dos usuários com as aplicações [2]. O fato de a J2ME oferecer interfaces gráficas de qualidade pode vir a resolver um dos maiores problemas práticos encontrados por desenvolvedores de aplicações para dispositivos de tela pequena: criar projetos que realmente atraiam a atenção dos usuários, acostumados a aplicativos multimídia em seus *desktops*.

Outra característica importante da J2ME é que suas aplicações podem comunicar-se com *Servlets*, o que permite que estes aplicativos acessem Servidores Web e bancos de dados remotos através da World Wide Web [3]. *Servlets* são classes baseadas em tecnologia Java que são executadas e instanciadas em associação com Servidores Web, atendendo a requisições realizadas por meio do protocolo HyperText Transfer Protocol (HTTP). Com isso, as aplicações móveis passam a ter muito mais alcance e tornam-se tão poderosas quanto aquelas desenvolvidas para computadores convencionais.

COMPONENTES DE SOFTWARE

O desenvolvimento de componentes de software, ou, simplesmente, componentes vem ganhando notoriedade nos estudos de Engenharia de Software, por oferecer, principalmente, grande possibilidade de reuso de código e redução nos custos de implementação. Os componentes são, basicamente, trechos de código previamente testados, que podem ser instalados e executados em diversas aplicações distintas [4]. Esta propriedade, aliada ao fato de que um componente deve ser tão genérico quanto possível, faz com que o desenvolvedor poupe tempo e recursos de implementação. Atualmente, existem desenvolvedores que se dedicam exclusivamente à criação de componentes, que posteriormente podem ser comprados e utilizados pelos mais diversos usuários, de acordo com as necessidades individuais de cada um. Um componente oferece serviços aos usuários através da sua interface. A interface de um componente é composta por um conjunto de operações que determinam quais são os serviços que um determinado componente pode oferecer.

Independentemente da metodologia adotada para o desenvolvimento de componentes de software, os desenvolvedores devem ter em mente alguns princípios gerais que tornam o uso de componentes realmente atrativos:

- um componente deve ser simples de ser compreendido, para que possa ser facilmente implementado;
- um componente deve ser genérico, para que possa ser reutilizado em um grande número de aplicações com propósitos distintos;
- quando se desenvolve um conjunto de componentes independentes, estes devem ser facilmente combináveis, para facilitar a montagem da aplicação;
- embora devam ser facilmente combináveis, diferentes componentes devem ter suas dependências minimizadas ou, se possível, evitadas;
- deve haver uma preocupação em se criar componentes que possam ser facilmente estendidos, para que novos serviços possam ser adicionados a eles, em caso de necessidades futuras;
- os componentes devem ser portáveis para diversas plataformas distintas, o que aumenta ainda mais as possibilidades de reuso.

O ambiente descrito neste artigo foi implementado utilizando componentes de software tanto no desenvolvimento do Módulo do Professor quanto no Módulo do Aluno. Com isso, exploram-se as vantagens deste método de desenvolvimento de aplicações, expostas nesta seção.

DESCRIÇÃO INFORMAL DO AMBIENTE

Os dois atores que interagem com o ambiente descrito neste artigo são o Professor e o Aluno. O Professor é identificado pelo seu nome, pela disciplina que ministra, pelo código desta disciplina e pela turma pela qual é responsável. O ambiente proporciona ao Professor a criação de uma ou mais Listas de Exercícios, que possuem os seguintes atributos: um código para identificação da lista, o seu título, a sua data de criação e a sua data de entrega. As Listas são compostas por uma ou mais Questões.

Cada Questão possui um número único para identificá-la e é de um determinado tipo (Questão de Verdadeiro ou Falso ou Questão de Múltipla Escolha). As Questões de Verdadeiro ou Falso têm como atributos o texto da questão, uma justificativa que explica qual é a razão do texto da questão ser verdadeiro ou falso, e qual é a resposta correta à questão (verdadeiro ou falso). Já as Questões de Múltipla

Escolha, por sua vez, têm como atributos o texto da questão, uma justificativa que explica porque determinada alternativa é considerada correta, os textos das cinco alternativas a serem apresentadas ao Aluno e a resposta correta da Questão (alternativa A, B, C, D ou E).

Os Alunos são identificados pelo seu código de aluno e pelo seu nome. O Aluno resolve uma Lista de Exercícios, gerando, com isso, uma Resolução, que contém o seu índice de acertos e um relatório a respeito do seu desempenho, indicando, por exemplo, quais foram as questões respondidas corretamente, quais foram respondidas incorretamente e uma justificativa para o fato de a resposta dada à questão ter sido considerada incorreta.

O ambiente também fornece ao professor estatísticas relativas ao desempenho individual e coletivo dos alunos na resolução das Listas de Exercícios, o que oferece subsídios que auxiliam o professor na tarefa de aperfeiçoar o processo educacional.

A ARQUITETURA DO AMBIENTE

Baseado na Descrição Informal da aplicação, definiu-se, para o ambiente descrito neste artigo, a arquitetura exibida na Figura 1:

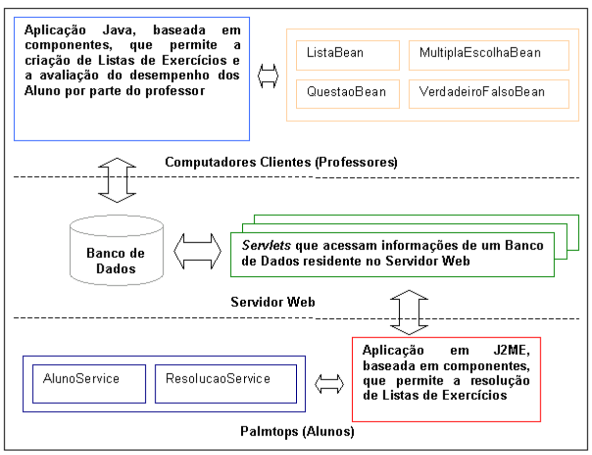

FIGURA. 1
ARQUITETURA DO AMBIENTE DESCRITO, UTILIZANDO COMPONENTES DE SOFTWARE.

O Módulo do Professor previamente mencionado baseia-se em *JavaBeans*, e permite que professores criem listas de exercícios, contendo questões de verdadeiro ou falso e de múltipla escolha. A tecnologia *JavaBeans* foi responsável pela introdução do conceito de componentes em Java. Utilizando-se *JavaBeans*, pode-se criar componentes de software reutilizáveis e independentes de plataforma [5]. Esta aplicação conta com os seguintes *JavaBeans*: ListaBean, QuestaoBean, MultiplaEscolhaBean e VerdadeiroFalsoBean. Cada um destes *JavaBeans* possui alguns atributos específicos e métodos para inserir, alterar, recuperar e excluir informações de um banco de dados que armazena as listas de exercícios criadas pelos professores.

Estas listas de exercícios ficam disponíveis em um banco de dados localizado em um Servidor Web remoto, no qual também residem *Servlets* que podem recuperar, alterar e armazenar informações neste banco de dados.

A arquitetura da Figura 1 exibe ainda o Módulo do Aluno, desenvolvido em J2ME, que faz uso de componentes de software especialmente desenvolvidos para esta tecnologia, o AlunoService e o ResolucaoService. Na tecnologia J2ME, os componentes de software são chamados de *Services* [6]. O Módulo do Aluno permite que os alunos resolvam as listas de exercícios previamente criadas pelos professores. A aplicação J2ME envia os dados da resolução aos *Servlets* residentes no Servidor Web. Os *Servlets*, por sua vez, recebem estas informações e as armazenam no banco de dados do Servidor Web, deixando-as à disposição do professor. Com isso, o professor pode fazer uma avaliação do desempenho individual e coletivo dos alunos na resolução de uma determinada lista de exercícios, utilizando outra funcionalidade do Módulo do Professor.

A INTERFACE DO AMBIENTE

Esta seção apresenta a interface do ambiente descrito neste artigo, exibindo segmentos tanto do Módulo do Professor quanto do Módulo do Aluno. Quando o professor acessa o ambiente, é apresentada a ele a tela exposta na Figura 2:

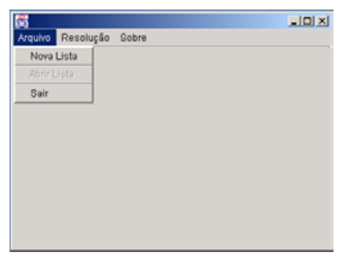

FIGURA. 2
TELA PRINCIPAL DO AMBIENTE.

Conforme pode ser visto na Figura 2, algumas opções são apresentadas ao professor, como, por exemplo, criar uma nova lista (opção "Nova Lista" no Menu "Arquivo" da Figura 2). Quando optar por criar uma nova lista de exercícios, o professor é conduzido à tela apresentada na Figura 3:

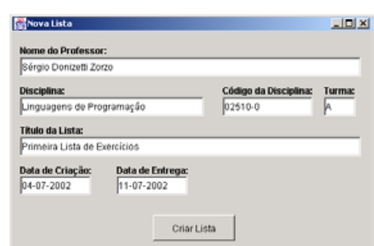

FIGURA. 3
TELA PARA A CRIAÇÃO DE UMA NOVA LISTA DE EXERCÍCIOS.

Nesta tela o professor fornece os dados relevantes para a criação de uma nova lista de exercícios. Clicando no botão “Criar Lista” uma nova lista de exercícios é criada. A partir daí, o professor pode começar a trabalhar na elaboração das questões que irão compor a lista recém-criada. Se optar por incluir na lista uma questão de verdadeiro ou falso, a tela da Figura 4 será exibida.

O professor deverá escrever o texto da questão e uma justificativa sobre a razão do texto da questão ser verdadeiro ou falso. Esta justificativa será apresentada ao aluno quando este responder de forma incorreta a uma questão. O professor deverá assinalar ainda qual é a resposta correta (verdadeiro ou falso). Clicando no botão “Incluir Questão”, esta questão será imediatamente incluída na lista de exercícios. Caso o professor deseje criar uma questão de múltipla escolha, a tela a ser exibida será a da Figura 5, e o procedimento para a criação de uma questão desse tipo será praticamente análogo ao adotado para a criação de uma questão de verdadeiro ou falso.

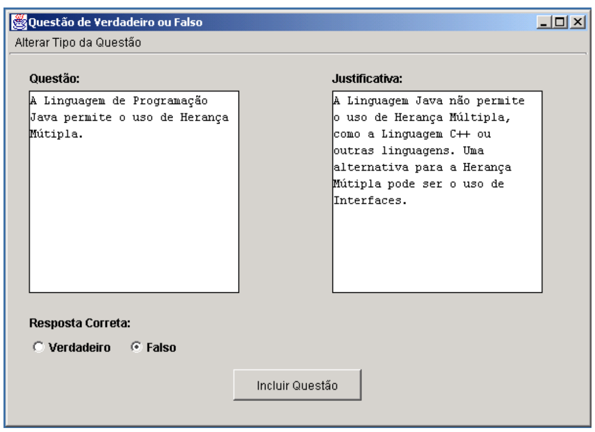

FIGURA. 4
TELA PARA A CRIAÇÃO DE QUESTÕES DE VERDADEIRO OU FALSO.

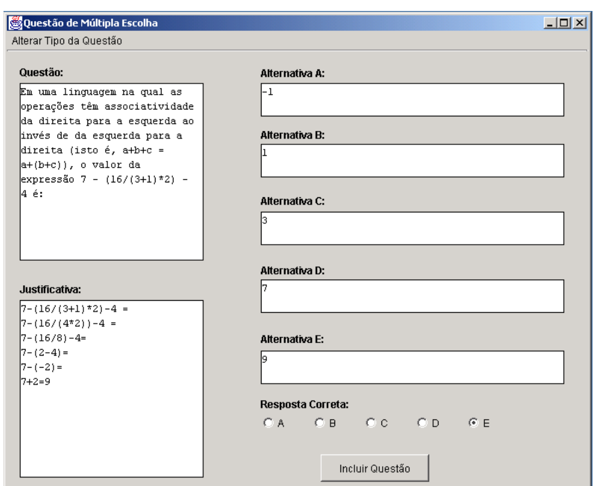

FIGURA. 5
TELA PARA A CRIAÇÃO DE QUESTÕES DE MÚLTIPLA ESCOLHA.

As listas de exercícios criadas com o auxílio deste ambiente ficam armazenadas em um banco de dados residente em um Servidor Web remoto, acessível para os professores que utilizam o ambiente. Todo o processo de armazenamento, consulta, remoção e edição de listas de exercícios é feita com o auxílio do ambiente, que, para isso, utiliza-se de componentes *JavaBeans*. No Servidor Web onde ficam armazenadas as listas de exercícios também residem *Servlets*.

Conforme foi dito anteriormente, aplicações J2ME podem se comunicar com *Servlets*, o que torna possível que essas aplicações acessem bancos de dados remotos na World Wide Web. No caso do ambiente descrito neste artigo, a aplicação J2ME correspondente ao Módulo do Aluno se comunica com *Servlets* que, por sua vez, fazem acesso aos dados das listas de exercícios geradas pelos professores. Estes *Servlets* também são responsáveis por corrigir e por armazenar os dados relativos à resolução dos alunos no Servidor Web, de tal maneira que os professores possam acessar estas resoluções em seus *desktops*, o que lhes permite avaliar o desempenho dos alunos. Dessa forma, o ambiente também permite que os professores possam fazer um acompanhamento e uma avaliação do desempenho dos alunos no processo de resolução dos exercícios. A Figura 6 exibe exemplos de telas dos Palmtops dos alunos acessando uma lista de exercícios:

FIGURA. 6
EXEMPLOS DE TELAS DOS ALUNOS ACESSANDO OS EXERCÍCIOS.

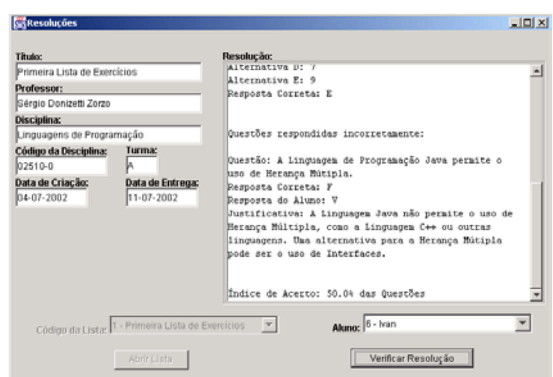

FIGURA. 7
RELATÓRIO DE DESEMPENHO INDIVIDUAL EXIBIDO A UM PROFESSOR.

A Figura 7, por sua vez, mostra a tela que permite ao professor analisar o desempenho individual de um aluno na resolução de uma lista de exercícios, enquanto que a tela exibida na Figura 8 corresponde à interface que possibilita ao professor fazer uma análise coletiva de desempenho.

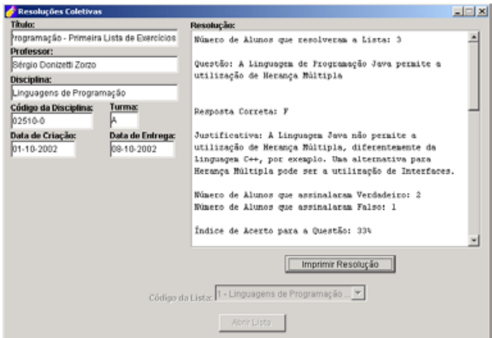

FIGURA. 8
RELATÓRIO DE DESEMPENHO COLETIVO EXIBIDO A UM PROFESSOR.

Conforme mencionado anteriormente, os *Servlets* desenvolvidos para este ambiente também se encarregam de fazer a correção automática das listas de exercícios e de gerar um relatório de desempenho que será visualizado pelos alunos em seus Palmtops. Este relatório traz o índice de acerto de um aluno na resolução de uma determinada lista de exercícios e também todas as questões respondidas correta e incorretamente pelo aluno, bem como as respostas corretas de cada questão e uma justificativa que explica porque uma determinada resposta é considerada correta. A Figura 9 exibe um exemplo de relatório visualizado por um aluno em seu Palmtop.

FIGURA. 9
RELATÓRIO DE DESEMPENHO DE UM ALUNO EXIBIDO EM UM PALMTOP.

Com isso, o ambiente auxilia o aluno no processo de aprendizado, uma vez que os estudantes não apenas respondem às questões, mas também podem verificar quais questões erraram e quais são as razões pelas quais a sua resposta foi considerada incorreta.

CONCLUSÕES

O ambiente descrito neste artigo tem como principal objetivo possibilitar a criação simples e intuitiva de listas de exercícios e é composto por dois módulos distintos: o Módulo do Professor e o Módulo do Aluno. Enquanto o Módulo do Professor é executado em computadores de mesa convencionais, o Módulo do Aluno é direcionado para ser utilizado em Palmtops, e foi desenvolvido com a tecnologia Java 2 Micro Edition (J2ME), também exposta neste artigo. Com isso, expande-se ainda mais a ubiqüidade oferecida pela Educação a Distância (EAD), que tem como uma das suas principais características levar conhecimento para qualquer pessoa, independentemente do lugar onde esta se encontra.

Utilizando-se Palmtops, dispositivos pequenos e capazes de acessar dados da World Wide Web em ambientes sem fio, pessoas interessadas em acessar conteúdo didático poderão fazê-lo facilmente, sem a necessidade de estarem conectadas a redes de computadores convencionais. Com a utilização da tecnologia J2ME, aplicações criadas para dispositivos dedicados adquirem qualidade comparável a aplicativos desenvolvidos para *desktops*.

O processo de criação do ambiente é apoiado pelas técnicas do Desenvolvimento de Software Baseado em Componentes, tanto na aplicação desenvolvida para *desktops* quanto na aplicação para Palmtops. Detalhes relativos a esta técnica também foram expostos neste artigo. Tanto os componentes desenvolvidos para *desktops,* baseados na tecnologia *JavaBeans,* como aqueles desenvolvidos para Palmtops, os chamados *Services*, são facilmente extensíveis e podem ser reutilizados por outras aplicações de EAD.

Foi formulada, ainda, uma descrição informal do ambiente descrito, visando especificá-lo claramente antes de se elaborar uma arquitetura para este ambiente. Esta arquitetura também foi apresentada neste artigo. Por fim, expôs-se a interface dos Módulos do Aluno e do Professor, mostrando-se um exemplo do processo de criação de uma lista de exercícios e da resolução desta lista por parte do aluno. Foram mostradas também as interfaces do ambiente que permitem ao professor avaliar o desempenho individual e coletivo dos alunos na resolução das listas de exercícios criadas.

OBJETOS DE APRENDIZAGEM PARA O ENSINO DE PROGRAMAÇÃO EM ENGENHARIA E COMPUTAÇÃO

Ivan Carlos Alcântara de Oliveira[1], *Carlos Fernando de Araújo Jr.* [2] *e Manuel Fernández Paradela Ledón* [3]

Resumo — *Este trabalho descreve um framework para ambientes de aprendizagem baseado na Web que integra um objeto de interface para inserção de conteúdos digitais, a modelagem deste conteúdo e um interpretador de algoritmos com recursos para o aluno exercitar a solução de problemas representados em pseudocódigo. O objeto de interface foi desenvolvido com HTML (Hypertext Markup Language), JavaScript e CSS (Cascading Styles Sheets) permitindo a criação de arquivos pequenos e interfaces interativas seguindo critérios de design com o objetivo de facilitar a procura de partes do conteúdo modelado. O interpretador de algoritmos foi desenvolvido com a tecnologia Java, possibilitando a análise léxica e sintática de um programa escrito em uma linguagem algorítmica estruturada denominada PoStWEL (Português Estruturado do Projeto WEL). Sua interface simples e robusta possibilita ao aluno escrever e compilar facilmente seus exercícios.*

Palavras Chaves — conteúdo digital, ensino de programação, interpretador, objetos de aprendizagem.

1. INTRODUÇÃO

Nos últimos anos, o constante crescimento do número de cursos que se utilizam das tecnologias baseadas na *web*, vêm provocando uma verdadeira revolução nas mais diversas áreas da educação [1]. A crescente popularização de tecnologias hipermídia vem provocando uma demanda cada vez maior por cursos a distância, cuja qualidade é medida não somente pelo conteúdo, mas também por seu *design*, navegabilidade, organização e clareza das informações [2].

Um fator relevante é que uma vasta gama de recursos computacionais podem ser utilizados na preparação de materiais e em geral não o são. Exemplos disso são: simulações em tempo real, modelos tridimensionais, avaliações eletrônicas, animações e gráficos, recursos de grande importância no processo de aprendizagem e que dificilmente são reproduzidos em sala de aula no ensino tradicional [3]. Isto Posto, o Núcleo de Pesquisa em Computação e Tecnologia da Informação (NCTI) da UNICSUL (Universidade Cruzeiro do Sul) propôs um projeto temático, chamado Projeto WEL (*Web Engineering for Learning*) que engloba basicamente a produção de conteúdo digital para algumas disciplinas dos cursos de graduação em Engenharia e Computação e a construção de alguns componentes de software, denominados objetos de aprendizagem, com o intuito de facilitar o entendimento dos alunos em algumas disciplinas científicas e técnicas [4][5][6]. Os objetos de aprendizagem desenvolvidos neste trabalho são:

- Um objeto de interface para disponibilizar conteúdo digital. Para este objeto também foi modelado o conteúdo de uma disciplina básica relacionada a programação dos cursos de Computação e Informática chamada Estruturas de Dados [7].
- Um objeto de simulação que envolve um interpretador de algoritmos baseado na *Web* onde o aluno pode testar os algoritmos descritos no material das disciplinas e/ou desenvolvê-los na linguagem algorítmica PoStWEL (*Português Estruturado do Projeto Wel*) [8].

Este artigo está organizado em seções conforme segue:

- Na seção 2 são fornecidos detalhes sobre o projeto temático WEL e onde os objetos de aprendizagem descritos estão inseridos.
- Os conceitos relacionados a objetos de aprendizagem e as tecnologias que foram utilizadas na criação destes objetos são introduzidos na seção 3.
- A proposta e os resultados obtidos com a implementação são descritos na seção 4.
- A conclusão obtida com o desenvolvimento e a respectiva continuidade em trabalhos futuros são especificados na seção 5.

2. PROJETO WEL (*WEB ENGINNERING FOR LEARNING*)

O projeto WEL (*Web Engineering for Learning*) é um projeto temático financiado pela UNICSUL (Universidade Cruzeiro do Sul) que propõe o desenvolvimento de software baseado na Web, com uso das metodologias, técnicas e métricas de qualidade da área de *Web Engineering*, para disponibilizar material "instrucional" direcionado ao aprendizado e apoio às disciplinas técnicas e científicas nas áreas de Computação e Engenharia [2]. Este projeto foi

subdividido em quatro projetos de pesquisa conforme Fig. 1. Da figura observa-se o item "Engenharia da Informação e Modelagem de conteúdos" onde se encaixa o objeto de interface e a modelagem do conteúdo e o item "Construção de Programa de Simulação para Apoio ao Aprendizado" onde o interpretador está inserido. Neste projeto foram selecionadas disciplinas de graduação relacionadas ao desenvolvimento de algoritmos, programação, física e cálculo numérico. A disciplina, associada a programação, Estruturas de Dados foi a escolhida como objeto inicial para a modelagem de conteúdo.

3. OBJETOS DE APRENDIZAGEM E TECNOLOGIAS PARA A WEB: ESTADO ATUAL

3.1 Objetos de Aprendizagem

Objetos de aprendizagem são elementos de um novo tipo de aprendizagem baseado em computador utilizando conceito de orientação à objetos como, por exemplo, a criação de componentes. Estes objetos são, normalmente, pequenos, específicos e podem ser reutilizados em contextos diferentes. [6]

Objetos de aprendizagem podem ser definidos como entidades digitais com acesso via Web, de forma que inúmeras pessoas possam usufruir dos seus benefícios simultaneamente [6]. Para que um objeto possa ser reusável deve ser flexível, interoperável e possuir facilidade de atualização e busca.

Alguns exemplos de objetos de aprendizagem são:

- Fotos ou imagens digitais, animações e pequenas aplicações.
- Páginas *web* que combinam texto, imagens e outros meios ou aplicações.
- Sistemas de treinamento por computador, ambientes de aprendizagem interativos, sistemas inteligentes de instrução com o auxílio do computador.

Algumas organizações internacionais voltadas a padronização, como o LTSC (*Learning Tecnology Standard Commitee*), estão desenvolvendo padrões abertos para os objetos de aprendizagem, focando a sua reusabilidade, permitindo que ocorra a redução de tempo no desenvolvimento e facilidade na sua distribuição e adaptação [9].

3.2 Tecnologias para Desenvolvimento Web

O desenvolvimento de objetos de aprendizagem para a Internet pode ser realizado utilizando vários tipos de tecnologias. Pode-se gerar poderosas aplicações com CGI (*Common Gateway Interface*) e Servlets (*Dynamic WebPages in Java*) do lado servidor com a inclusão de Applets Java e JavaScript/CSS (*Cascading Styles Sheets*) do lado cliente permitindo a modificação ou adaptação do conteúdo a ser apresentado ao aluno dependendo de suas ações. O foco deste trabalho está no desenvolvimento de dois objetos de aprendizagem utilizando principalmente as tecnologias JavaScript e Java.

JavaScript é uma linguagem interpretada que associada ao CSS possibilita desenvolver páginas dinâmicas com maior interação permitindo a criação de interfaces mais atraentes com recursos de navegação mais simples e interativos que podem motivar o aprendizado e prender a atenção do aluno[10][11].

Java pode ser executado do lado cliente na forma de um *applet,* inserido em páginas *web*, ser carregado e processado em browsers a partir da solicitação do usuário[12]. O uso de *applets* tem como vantagens a criação de interfaces mais complexas, a independência de plataforma, não necessita instalação e atualização pelo aluno além de ser removido depois do término do seu processamento. Há algumas restrições de segurança que impedem ler ou escrever arquivos no disco local e a comunicação fica restrita somente ao servidor de origem do *applet*. Para contornar esta restrição esquemas de autenticação e modificação da política de segurança da JVM (*Java Virtual Machine*) podem ser implementados. Além das classes Java comuns para geração do *applet* foram utilizados duas ferramentas JFlex e Cup que são distribuídos gratuitamente e são escritas em Java [13][14]. A importância destas duas ferramentas auxiliares está ligada ao código em Java que elas geram para os analisadores léxico e sintático. Atualmente estas ferramentas se encontram nas versões CUP 0.10, para gerar o analisador sintático, e JFlex 1.3.5, para gerar o analisador léxico. Na geração dos analisadores é necessária a definição de dois arquivos de configuração, um com extensão ".flex" e outro com a extensão ".cup" onde são especificadas as informações necessárias à criação destes analisadores.

O desenvolvimento do objeto de interface foi baseado em HTML, JavaScript e CSS e o interpretador em *applet* Java com o Jflex e o Cup.

4. PROPOSTAS E RESULTADOS

4.1 Objeto de Interface e o Conteúdo Digital Modelado

O objeto de aprendizagem para inserção de conteúdo digital foi construído para possibilitar a modelagem de conteúdos de cursos e disciplinas, subdivididos em módulos e submódulos pequenos utilizando uma interface padronizada [2]. Esta padronização é uma tentativa de facilitar a navegação e a procura de informação pelo aluno dentro do conteúdo.

A Fig. 2 ilustra um modelo do arquivo CSS utilizado para padronizar determinados itens de interface como menus, títulos, tipos e cores das fontes do conteúdo digital [10][11].

```
<style type="text/css">
<!--
.curso {position:absolute; top:0px; left:334px;
visibility:visible; width:58%;}
.nav1 {position:absolute; top:25px; left:334px;
...
.variavel{position:absolute; top:0px; left:0px;
visibility:hidden;}
li.inside{list-style-position:inside;}
body {background-color:lightblue;}
a,font {color:black; font-family:verdana; font-
size:12pt; text-decoration:none;}
a:hover {color:blue;}
-->
</style>
```

FIGURA. 2
ARQUIVO CSS ANEXADO A UMA PÁGINA WEB PARA PADRONIZAR COMPONENTES DO OBJETO DE INTERFACE.

Como forma de testar este objeto foi modelado o assunto "árvore" da disciplina Estruturas de Dados. Este assunto possui um conteúdo relativamente complexo e um caráter de abstração considerável onde nem sempre o professor consegue que os alunos compreendam de forma clara as operações ocorridas em cada estrutura.

A Fig. 3 ilustra três modelos de interface obtidos com o desenvolvimento deste objeto de aprendizagem. No modelo de interface (1) observa-se: o logo da instituição, título da disciplina, navegação entre módulos (anterior, próximo), título do módulo, quantidade de submódulos com possibilidade de navegação seqüencial ou aleatória pelo aluno, ligações para exemplos e exercícios relacionados a disciplina, possibilidade de retornar ao índice. O modelo de interface (2) demonstra a organização do conteúdo na forma de um índice. No modelo (3) observa-se um exemplo que permite ao aluno interagir com o conteúdo obtendo informações sobre o desenho da árvore como por exemplo, grau de parentesco, grau de um nó, altura da árvore e outros.

A modelagem da interface e do conteúdo seguiu critérios de *design* envolvendo, principalmente, usabilidade, comunicabilidade e navegação, como tentativa de gerar um ambiente com conteúdo capaz de prender a atenção do aluno, possibilitar uma maior interação com o material e deixar a navegação mais intuitiva e simples [2].

4.2 Interpretador de Algoritmos: Um objeto de Simulação

O interpretador é um objeto de aprendizagem que lê um conjunto de símbolos descrito em uma determinada linguagem, analisa e informa se a junção destes símbolos está léxico, sintático e semanticamente corretos. Não gera um programa executável mas deseja-se que ele seja capaz de executar o programa gerando algum tipo de resultado. No estágio atual de desenvolvimento foi implementado somente os analisadores léxico e sintático [15].

Inicialmente foi criada uma gramática para uma linguagem algorítmica, denominada PoStWEL, desenvolvido um *applet* Java constando de um editor de texto e dos analisadores léxico e sintático [12].

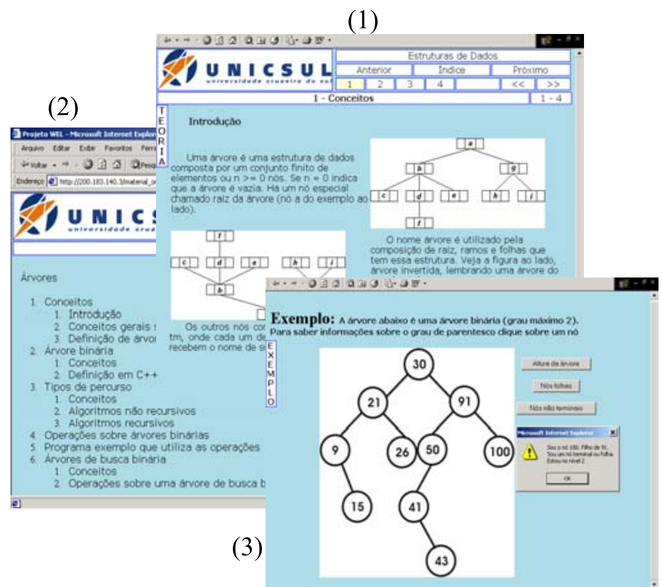

FIGURA. 3
OBJETO DE INTERFACE E A MODELAGEM COM CONTEÚDO E EXEMPLO INTERATIVO.

4.2.1 Gramática da linguagem PoStWEL (Português Estruturado do Projeto WEL)

A gramática da PoStWEL segue a estrutura de uma gramática livre de contexto, como definida pelo lingüista Noam Chomsky [8], onde uma determinada cadeia segue regras para sua formação, como descrito abaixo:

$$A \rightarrow \beta \qquad (1)$$

Em (1) "A" representa um conjunto de símbolos denominados não terminais e "β" uma combinação de símbolos terminais e não terminais. Podemos dizer que um símbolo terminal é qualquer palavra reservada, símbolo especial, operador que pertença a linguagem descrita. E os não terminais são os símbolos utilizados durante o processo de derivação das produções no reconhecimento de uma dada cadeia.

A tabela I ilustra algumas produções desta gramática utilizando a notação BNF (*Backus Normal Form*) onde o símbolo inicial é <postwel>.

TABELA I

ALGUMAS PRODUÇÕES DA POSTWEL

Simbolos não-terminais (A)	Regras de produção (β)
<postwel> ::=	ALGORITMO <nome> ; <bloco>
<bloco> ::=	INICIO <corpo> FIM
<corpo> ::=	<declaraçãoCorpo> | <comds>
<comds> ::=	<atribuição> ; <comds> | <seCondicional> <comds> | ...
<seCondicional> ::=	SE (<expressaoLogica>) ENTAO <acao> | SE (<expressaoLogica>) ENTAO <acao> SENAO <acao>
<acao>::=	<comandoSimples> | <blocoComandos>
<blocoComandos> ::=	INICIO <comds> FIM

Um exemplo de programa escrito em PoStWEL que calcula o fatorial de um número é ilustrado na Fig. 4.

```
algoritmo "Calcula fatorial de um Número" ;
inicio
     inteiro num, fat, i;
     escreva ( "Digite um Numero : " );
     leia ( num );
     fat = 1;
     i = 1;
     enquanto (i <= num) faca
     inicio
        fat = fat * i;
        i = i + 1;
     fim
     escreva ("O Fatorial deste numero é: ", fat);
fim
```

FIGURA. 4

ALGORITMO EXEMPLO NA LINGUAGEM POSTWEL QUE CALCULA O FATORIAL DE UM NÚMERO.

4.2.2 Processo de Interpretação: Análise Léxica e Sintática

O mecanismo de interpretação representado na Fig. 5 segue com o pedido de verificação pela *applet* que envia o arquivo (*reader*) a ser avaliado ao analisador sintático, este segue com a captação dos símbolos ou *tokens* do arquivo de entrada pelo analisador léxico (*scanner*) que envia token a *token* ao analisador sintático (*parser*) que reconhece uma sentença através do conjunto de símbolos definidos pela linguagem algorítmica ao passo que a cada verificação de um conjunto de símbolos (*yybuffer*) interpretados poderá surgir inconsistências com a gramática fazendo com que o analisador sintático gere erros sintáticos mostrando o local através da linha (*yyline*) onde existe a inconsistência [15].

Um manipulador de erros é ativado sempre que for detectado um erro no programa fonte, avisando ao programador da ocorrência do erro e emitindo uma mensagem. O procedimento construído para o tratamento de erros foi interromper a análise léxica e sintática quando um erro é encontrado.

Um trecho do arquivo relativo ao analisador léxico que ilustra algumas definições de *tokens* no formato de expressões regulares são exibidos na Fig. 6 e outro trecho do arquivo para o analisador sintático mostrando as regras para a formação dos elementos sintáticos podem ser visualizados na Fig. 7.

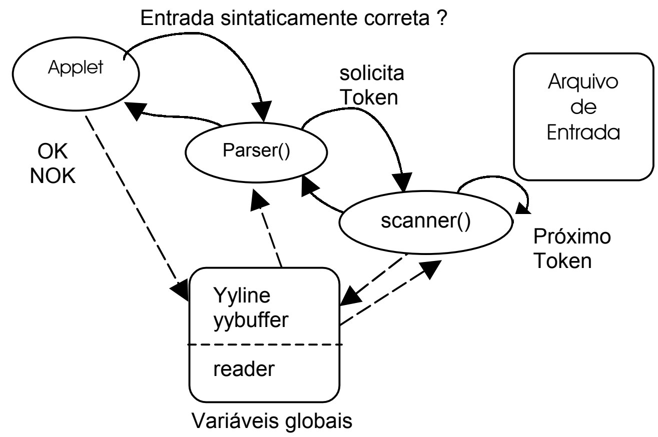

FIGURA. 5

...
```

FIGURA. 7

TRECHO DO ARQUIVO DE CONFIGURAÇÃO ".CUP" (ANALISADOR SINTÁTICO).

4.2.3 Modelagem, desenvolvimento e resultado do Interpretador

O interpretador foi modelado utilizando a linguagem UML (*Unified Modeling Language*). Uma parte do diagrama obtido é descrito na Fig. 8 [16]. O desenvolvimento foi realizado com Java, utilizando Jflex e Cup, a interface gráfica foi implementada utilizando o pacote Swing e um componente do pacote AWT [12][13][14].

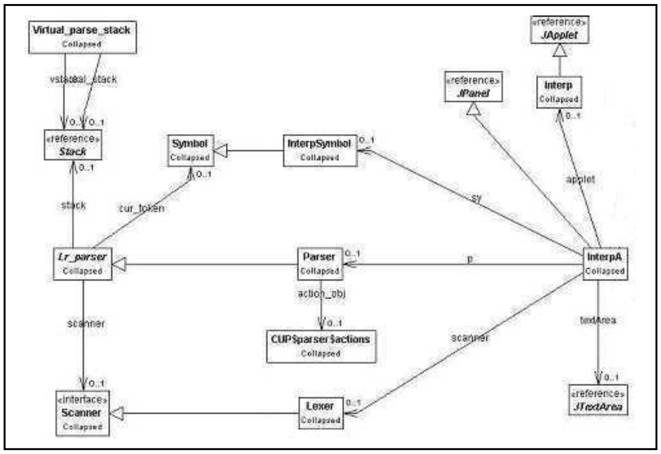

FIGURA. 8

DIAGRAMA DE CLASSES EM UML QUE MODELA O INTERPRETADOR DE ALGORITMOS.

O resultado da interface para o interpretador e a execução de um algoritmo é ilustrada na Fig. 9.

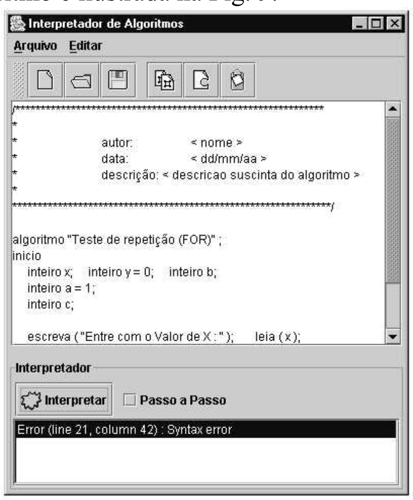

FIGURA. 9

INTERFACE DO INTERPRETADOR , NO FORMATO DE APLICAÇÃO, ILUSTRANDO A COMPILAÇÃO DE UM ALGORITMO.

5. CONCLUSÕES E TRABALHOS FUTUROS

A utilização dos objetos em disciplinas presenciais ou semi-presenciais possibilitará ao professor ilustrar determinadas situações nem sempre tão claras quando a aula é apresentada de maneira tradicional [3].

A possibilidade de maior interação, facilidade de navegação e simplicidade permitirá que o aluno fique mais estimulado a estudar conteúdos de difícil compreensão.

Os objetos construídos poderão ser reusados como um *framework* em disciplinas técnicas e/ou científicas com pouca ou nenhuma alteração interna.

Como trabalhos futuros pretende-se:

- Acrescentar a analise semântica ao interpretador.
- Possibilitar a conversão dos algoritmos criados em PoStWEL para linguagens de programação tipo C/C++ e Java de forma automática.
- Possibilitar a execução passo a passo do algoritmo previamente compilado dentro do interpretador.
- Aplicar o material modelado em disciplinas presenciais avaliando o desempenho dos alunos e comparando ao ensino tradicional.

AGRADECIMENTOS

Os autores agradecem à Coordenadoria de Informática da UNICSUL e o apoio financeiro dado pelo Programa de Qualificação Docente da UNICSUL.

TECNOLOGIA PORTÁTIL E A REOGANIZAÇÃO DO PENSAMENTO

Fernanda Cesar Bonafini[1]

Resumo — *Neste artigo apresenta-se primeiramente os instrumentos denominados no título por tecnologia portátil, que são: a Calculadora Gráfica, o MBL (Microcomputer Based Laboratory), o CBR (Calculator Based Ranger) e o CBL (Calculator Based Laboratory). Destacando em seguida suas possibilidades como: recolher, trabalhar e trocar dados com professores e alunos dentro e fora da sala de aula. Após isso, faz-se uma revisão de literatura empregando o uso desses instrumentos e destacando suas potencialidades propostas por alguns autores, tais como: a utilização como instrumento pedagógico, a alteração da dinâmica da sala de aula, o uso na construção e re-construção de gráficos, sua efetividade na condução de experiências cinestésicas envolvendo o tema movimento, entre outras. Num terceiro momento, apresenta-se as idéias de reorganização do pensamento também presente no título do artigo. Nas considerações finais, elabora-se um entrecorte da revisão de literatura sob a ótica da reorganização do pensamento pontuando algumas analogias e colocando neste bojo a pergunta de pesquisa da autora.*

Index Terms — *tecnologia portátil, calculadoras gráficas, cbl, reorganização do pensamento.*

INTRODUÇÃO

Este artigo é parte de minha pesquisa de mestrado, na qual tenho como objetivo principal analisar, *como estudantes podem trabalhar conceitos matemáticos e físicos ao utilizarem o CBL (Calculator Based Laboratory) e a Calculadora Gráfica em atividades de experimentação*.

Entendo por experimentação "uma prática onde problemas abertos são propostos pelo professor e onde há uma exploração em grupo de temas relacionados com a matemática" (BORBA, 1999, p.26). O objetivo geral dessas atividades de experimentação é encontrar o melhor ajuste de funções para dados experimentais, modelando o fenômeno, validando a teoria e interpretando os valores dos parâmetros dessas funções.

Para que isso ocorra, será necessário que o aluno combine conhecimento de diferentes tipos de funções com conhecimento sobre experimentos físicos. As atividades de experimentação poderão facilitar a interdisciplinaridade, integrando a Matemática à Física, pois ao experimentar, os alunos poderão verificar as aplicações da Matemática na prática para um dado conceito desenvolvido.

A pesquisa será desenvolvida numa perspectiva qualitativa, pois como GOLDENBERG (2000) afirma nesta abordagem "a preocupação do pesquisador não é com a representatividade numérica do grupo pesquisado, mas com o aprofundamento da compreensão de um grupo social, de uma organização, de uma trajetória etc" (p. 14). Sabendo que a abordagem qualitativa em uma pesquisa também *"*consiste em descrições detalhadas de situações com o objetivo de compreender os indivíduos em seus próprios termos*"* (GOLDENBERG, 2000, p. 53), acredito ser esta a metodologia mais indicada para esta investigação.

Neste artigo apresentarei brevemente os instrumentos que denomino no título por tecnologia portátil, uma revisão parcial de literatura, as idéias de reorganização do pensamento também presente no titulo do artigo e finalmente nas conclusões finais faço um entrecorte da revisão de literatura sob a ótica da reorganização do pensamento.

TECNOLOGIA PORTÁTIL

A tecnologia portátil ou tecnologia de mão presente nas calculadoras gráficas, dá ao aluno a possibilidade de recolher, trabalhar e trocar dados com professores e colegas dentro e fora da sala de aula, não só nas atividades de Matemática, mas também em aulas de Física, Química, Biologia e disciplinas afins de cada currículo.

As calculadoras gráficas são superiores às calculadoras científicas, pois possuem além de inúmeras funções adicionais (como por exemplo, as funções estatísticas) a propriedade de confeccionar diversos tipos de gráficos a partir de funções ou tabela de dados, ambos inseridos pelo aluno.

Outro instrumento portátil é o CBR (Calculator Based Ranger). Ele é um detector sônico, sendo geralmente utilizado para estudo das leis de movimento (medição de distância) e suas análises posteriores como velocidade e a aceleração. Com o CBR é possível fazer a coleta de dados e visualizá-la através de uma calculadora gráfica conectada a ele, designando assim, um sistema CBR.

Além do CBR citado acima, destaco o CBL (Calculator Based Laboratory) que é também um dispositivo utilizado para coleta de dados. Este sendo um aparelho portátil, funciona com pilhas, sendo assim um instrumento autônomo na coleta de dados (medição de grandezas).

Possuindo dimensões compactas ele pode ser usado em atividades de Matemática e Ciências, de um modo geral. Esse dispositivo pode ser conectado à vários sensores (ponta de prova), dentre eles: detector de movimento, tensão, luz, pH, pressão, condutividade, temperatura, força, batimentos cardíacos e muitos outros, possibilitando que a sala de aula se transforme em um laboratório.

[1] Fernanda Cesar Bonafini, UNESP – Universidade Estadual Paulista – Rio Claro, Rua 24A, 1515. Rio Claro, São Paulo , SP, Brazil, fbonafini@yahoo.com

É importante elucidar que somente os sensores acima, não são capazes de efetivar um experimento, sendo necessário que eles estejam conectados ao CBL. Para a visualização e armazenamento dos dados coletados poderemos utilizar um microcomputador, o que caracteriza um sistema MBL (Microcomputer Based Laboratory) ou uma calculadora gráfica, caracterizando um sistema CBL.

PESQUISAS REALIZADAS

Inicio esta seção, com a revisão de literatura que emprega o uso das calculadoras gráficas, do MBL, do CBR e finalmente do CBL. Na segunda parte, proponho as idéias de Tikhomirov (1981) que questiona se o computador afeta a atividade intelectual humana, e se sim, de que maneira. Num terceiro momento, evidencio as teorias desse autor enquanto perpasso por pontos principais da literatura. Desta maneira, informo ao leitor que as pesquisas com o uso desses instrumentos (calculadoras gráficas, MBL, CBR e CBL), se misturam ao longo dessa relação.

Calculadoras Gráficas

O uso de tecnologia portátil, como as calculadoras gráficas, vem sendo objeto de estudo de vários pesquisadores. Dentre eles destaco as pesquisas de Kemp, Kissane e Bradley (1996) que procuraram incorporar o uso da calculadora gráfica na estrutura curricular, possibilitando que o aluno a utilizasse inclusive nas provas. Waits (1992), em um de seus trabalhos, enumera dez tópicos que podem ser explorados com a calculadora gráfica em sala de aula, dentre eles a modelagem, simulação, condução de experiências matemáticas, onde o aluno pode formular e testar suas próprias conjecturas.

Sustentam Dunham e Dick (1994), que as calculadoras gráficas podem facilitar a mudança do papel do professor e do aluno na sala de aula, resultando em um ambiente de maior interação e exploração. Relata, que observações feitas em sala de aula, mostram que a calculadora gráfica tem mudado significativamente o relacionamento dos alunos em sala.

Do mesmo modo, Watanabe (1996) enfatiza a importância da presença das calculadoras gráficas como elemento transformador na educação matemática japonesa, que tem como característica um ensino formal e fortemente centrado na resolução de exercícios. Salienta, com exemplos, o uso da calculadora gráfica em aulas de pré-calculo, cálculo diferencial e resolução de problemas, criando um ambiente que pôde despertar a criatividade dos alunos e fazê-los 'perceber', realmente, a Matemática existente nos problemas apresentados.

Sestokas-Filho e Bonafini (2000, 2001 e 2002), destacam o uso de calculadoras gráficas em atividades de sala de aula. Os autores aconselham que, nessas atividades, de 15 a 20 minutos de duração, os alunos trabalhem em pequenos grupos enquanto o professor percorre a sala de aula auxiliando-os. Salientam que, deste modo, os alunos têm a oportunidade de negociar idéias, formular conceitos e construir seu próprio conhecimento em um ambiente favorável à experimentação.

Nota-se, nas pesquisas acima, que o uso da calculadora gráfica, acabou por provocar uma alteração na dinâmica da aula e no relacionamento dos alunos. Assim, procurando utilizar a calculadora gráfica como um instrumento pedagógico em sala de aula, Souza (1996), Souza e Borba (1998) propõem seu uso envolvendo o estudo de funções e de funções quadráticas. Nessas atividades, os alunos analisam famílias de funções, estabelecendo relações entre as representações gráficas e algébricas dessas famílias. Os autores afirmam que a calculadora gráfica, quando utilizada como instrumento pedagógico, permite que os alunos durante a construção dos gráficos, re-avaliem constantemente suas hipóteses e conjecturas possibilitando assim, um método empírico de aprender matemática. O caráter empírico, para esses autores, deve-se a possibilidade de o aluno experimentar a construção de gráficos, funções e tabelas... em sala de aula com o uso da calculadora gráfica.

Sendo a construção de gráficos uma habilidade fundamental tanto no ensino de Física como no ensino de Matemática, Adie (1997, p. 213) postula que "o processo de construção de um gráfico envolve uma série de conhecimentos que não contribuem realmente para um profundo entendimento do conteúdo da Física". As habilidades não Físicas usadas quando desenhamos um gráfico no papel, também descritas em Sestokas-Filho e Bonafini (2002) são: desenho de linhas retas (com régua) para os eixos x e y, trabalho com escalas, desenho dos pontos no gráfico, cálculo da barra de erro, desenho da 'melhor linha' entre os pontos e interpretação da inclinação do gráfico se este for uma reta. Adie (1997) confere a calculadora o poder de cerrar esse ritual, sustentando que o aluno deve conceder mais tempo para concentrar-se na Física presente na atividade.

Uma alternativa para o desenho de gráficos em papel seria utilizar um programa de computador como o excel ou uma calculadora gráfica. Sabendo que geralmente o uso de gráficos em Física e/ou Matemática envolvem a procura de uma função, o cálculo da área sobre uma curva ou a procura da inclinação num ponto particular, Adie (1997) reforça que as calculadoras gráficas fazem todas estas operações facilmente pressionando alguns botões, mas os alunos ainda necessitam um entendimento fundamental do significados dos gradientes, coeficientes, áreas e unidades para interpretar sensivelmente os resultados. Usando uma calculadora gráfica ao invés de lápis e papel, esse autor afirma que a rota pedagógica para a compreensão será diferente, mudando a ênfase do ensino no processo de conseguir resultados para uma solução qualitativa, onde o aluno pode indagar quão bom o resultado significa. Assim, pode-se estabelecer novos tipos de perguntas baseadas na sondagem e na análise de dados.

Para esse autor "os alunos perdem muito tempo nos aspectos matemáticos dos problemas físicos. A calculadora os livra disto permitindo que eles despendam mais tempo entendendo ou explicando Física" (p. 203).

Noto nos trabalhos acima, uma forte recorrência no uso da calculadora gráfica com características de simulação na construção de gráficos, de modo a fazer o estudante entender os processos matemáticos essenciais. No ensino superior, na Física há muitas oportunidades para o uso de cálculos de simulação, exemplos são mostrados no trabalho de Sestokas-Filho e Bonafini (2002).

Simulações com calculadoras gráficas são válidas, pois elas complementam os caminhos de estudo possibilitando que o aluno entenda os fenômenos físicos e os processos matemáticos presente em uma determinada atividade.

MBL/CBR

Além da simulação, possível com o uso de uma calculadora gráfica, nota-se em um curso de Física tradicional que um dos primeiros tópicos ensinados tanto em nível universitário quanto em nível médio é o tema movimento, incluindo os conceitos de posição, velocidade e aceleração. Sabendo que o gráfico é a melhor sintetização da relação funcional entre duas variáveis, muitos professores consideram o uso de gráficos num cenário de laboratório sendo de alta importância para reforçar e desenvolver um entendimento de muitos tópicos da Física, especialmente o movimento.

Se a construção de gráficos é uma capacidade valiosa nos estudantes, cabe saber qual é o nível dessas habilidades. Estudos têm identificado dificuldades nos alunos com tais habilidades gráficas. A dificuldade do estudante em fazer conexões entre gráficos de diferentes variáveis, conceitos físicos e mudo real faz com que eles percebam os gráficos como uma figura. (Linn, Layman, e Nachmias, 1987; McDermott, Rosenquist e van Zee, 1987).

Com estudantes do nível médio ou universitário, o MBL tem demonstrado a potencialidade de elevar os conhecimentos dos alunos em Física e habilidades cognitivas tais como a observação e a predição. Esses autores tomam uma efetividade do MBL, que é a de mostrar os dados graficamente, enquanto o movimento é realizado, dessa maneira a atividade torna-se uma experiência cinestésica, elevando assim as habilidades gráficas dos estudantes (Friedler, Nachmias e Linn, 1990; Mokros e Tinker, 1987; Brasell, 1987).

Linn, Layman e Nachmias (1987); Mokros e Tinker (1987); Brasell (1987), apresentam em seus trabalhos resultados das interpretações gráficas produzidas pelo MBL. Os autores realizaram testes de conteúdo de movimento em turmas com e sem o uso do MBL. Deste modo eles indicaram diferenças significativas entre o laboratório tradicional (sem tecnologia) e laboratório baseado em MBL, sendo o último mais efetivo na mudança conceitual dos estudantes.

Observo, nos artigos de Mokros e Tinker (1987), Brasell (1987) e Thornton (1987) que – segundo Elliott (2000) – em cada um foi feita análise estatística limitada pelos pontos de pré e/ou pós testes para aferir as habilidades dos estudantes em conceitos físicos quando estes utilizavam o MBL.

Percebe-se que os autores tiveram a intenção que seus trabalhos fossem lidos por professores, assim à pesquisa de cada um é claramente baseada em sala de aula, sendo ela o ensino médio ou a universidade.

De um outro lado Bassok e Holyoak (1989) utilizaram o MBL para verificar as dificuldades dos estudantes na conexão de gráficos com conceitos físicos e constataram que conceitos isomórficos na sala de aula de Matemática permitiram que os alunos transferissem os conceitos matemáticos da Álgebra para as aulas de Física. Contudo, quando conteúdos físicos isomórficos ao currículo de Matemática foram trabalhados primeiramente na aula de Física, os alunos não conseguiam estabelecer as relações com o conteúdo matemático. Eles acreditam que, se usarmos a Matemática para apoiar os conceitos vindos de outras disciplinas, como a Física, a transferência de conceitos físicos para conceitos matemáticos venha a existir.

Em suas pesquisas, Dykstra, Bolye e Monarch apud Hale (2000) chegaram à conclusão de que atividades com MBL permitem uma abordagem mais efetiva, procurando ajudar os estudantes a ter uma visão diferenciada do comportamento da velocidade e aceleração por exemplo, o que às vezes não é possível somente ao olhar um gráfico pronto. Acreditam que as atividades com MBL são usadas para ajudar os estudantes a confrontar conflitos que surgem quando eles vêem gráficos similares representando grandezas distintas.

Ainda no veio do conceito de movimento e da construção de gráficos, tomo o trabalho de doutorado de Scheffer (2001) que pesquisou a relação entre os movimentos corporais e as representações gráficas cartesianas desses movimentos, quando produzidos com o uso do CBR. Seu estudo mostra o fato de os estudantes, às vezes, associarem o movimento com a figura de sua trajetória quando utilizam o sensor, fato que vem corroborar com as pesquisas de Mokros e Tinker (1987); Linn, Layman e Nachmias (1987); McDermott, Rosenquist e van Zee (1987). A autora declara que isso se justifica, se nesses momentos os alunos estiverem representando o desenho de uma trajetória e não um gráfico, no plano cartesiano, que descreve uma função a partir de uma variável.

Neste ambiente de discussão, criado pelas mídias os estudantes observaram, analisaram e estabeleceram relações, enriquecendo-se suas concepções acerca do tema movimento.

Esses alunos realizaram experiências cinestésicas, como as discutidas com o uso do MBL em Linn, Layman e Nachmias (1987); Mokros e Tinker (1987); Brasell (1987).

CBL

O sistema CBL surge após o desenvolvimento do sistema MBL e com o uso desse novo sistema, encontro algumas pesquisas no ensino de Química e suas aplicações. Pesquisas como a de Cortés-Figueroa e Moore (1999) e Sales, Ragan e

Murphy (2001), enfatizaram com exemplos que o CBL vem facilitar a execução de experimentos em Química, devido ao seu baixo custo quando comparado a um computador ou a instrumentação de coleta de dados específica da área de Química. Sabendo que a instrumentação laboratorial é de extrema importância para o futuro pesquisador químico, esses autores enfatizam o uso do CBL em atividades durante a graduação salientando que com este uso há um aumento no aprendizado analítico dos estudantes.

Além do uso em Química, exponho a pesquisa de Giorgetti (2002), que descreve a estrutura, objetivo e metodologia para uma nova disciplina presente nos cursos de Engenharia, utilizando o CBL e a calculadora gráfica. O propósito desta disciplina é de sintetizar tópicos da matemática e desenvolver a habilidade da formulação de problemas nos alunos, desta maneira a disciplina assume um caráter de facilitadora integrando disciplinas básicas com as disciplinas da Engenharia.

Na condução desta disciplina, relata o autor, que o docente, adota o papel "de um treinador dos estudantes para a arte da formulação de problemas ou modelagem, desenvolvida com forte apelo ao uso de leis de conservação" (p. 01). Neste artigo são feitos três experimentos, que foram "planejados para serem executados facilmente na sala de aula com a participação intensa dos estudantes na seqüência fundamental da observação de fatos ou fenômenos, escolha de parâmetros para a quantificação dos mesmos, medição e aquisição de dados, e finalmente, modelagem (formulação) e simulação" (p. 01).

É enfatizado o processo de obtenção de resultados, o qual o autor nomeia de 'seccionamento' em suas fases, a primeira trabalhando com uma lei fundamental e a segunda adentrando uma lei particular ambas utilizando a calculadora gráfica e o CBL.

Por outro lado na disciplina de Matemática, Caldwell (1996) afirma que com o uso do CBL e da calculadora gráfica os estudantes estão aptos a observar fisicamente a relação funcional entre duas variáveis e, então, observar uma representação gráfica dessa relação, como um gráfico de pontos (*scatter plot)*. Os estudantes também podem observar a representação numérica dessa relação, pelo traço entre os pontos do gráfico e pela observação das listas, nas quais os dados foram armazenados. Dessa maneira, os estudantes podem então usar a calculadora gráfica para determinar uma equação de modo a ajustar os pontos coletados através do CBL e obter então, uma representação simbólica dessa relação.

Corroborando com a pesquisa de Caldwell (1996), Doerr e Zangor (2000) pesquisaram qual o significado da calculadora gráfica como uma ferramenta de coleta e análise de dados experimentais e observaram que nas atividades propostas os estudantes coletaram, armazenaram, compararam e re-coletaram dados até que eles pudessem decidir se tinham adquirido um conjunto satisfatório de dados. Na maioria das atividades, elas perceberam que os estudantes repetiam o mesmo experimento muitas vezes, até que o conjunto de dados por eles coletados combinasse com as expectativas que eles tinham sobre o comportamento do fenômeno. Neste tipo de uso do sistema CBL, os estudantes necessitaram se engajar no entendimento do contexto da atividade e na decisão a ser tomada, embora, o processo de conjecturas, refinamento e negociação tenha se constituído somente para escolher um conjunto satisfatório de dados.

Os resultados desse estudo sugerem que a natureza das atividades matemáticas, o papel, o conhecimento e as crenças do professor influenciaram no uso dos instrumentos. As autoras também perceberam que o uso da calculadora gráfica, como um dispositivo pessoal, pode inibir a comunicação em um pequeno grupo, em contrapartida o uso desta ferramenta como dispositivo coletivo permite o aprendizado matemático e a interação da classe.

Assim, Hale (2000) também ressalta um benefício dos dispositivos de coleta de dados, como sendo, uma maior interação dos estudantes incorporando conceitos gráficos. Para ela, fica evidente, que o sistema CBL com a comunicação dos estudantes favoreceram o desenvolvimento do conhecimento matemático e científico nos alunos que participaram das atividades.

Neste trabalho, ela examina como os estudantes constroem e reconstroem entendimentos conceituais usando o discurso juntamente com o sistema CBL. Hale (2000) encontrou no uso do CBL grupos cooperativos de alunos, porém os discursos de alguns alunos, nas atividades, poderiam levar outros a concepções errôneas e a autora aproveitou esses momentos para esclarecer os conceitos sem esquecer que as concepções erradas fazem parte da construção do conhecimento e que não devem ser eliminadas do processo de aprendizagem.

Tecnologias e a Reorganização do Pensamento

Nesta seção, exibo as idéias de Tikhomirov (1981), que propôs três teorias para questionar se o computador afeta a atividade intelectual humana. Esse autor utiliza o computador em sua teoria, porém amplio essa idéia para qualquer instrumento informático, que neste artigo são as calculadoras gráficas, o MBL/CBR e o CBL, porém continuarei nesta seção a utilizar a nomenclatura computador para ficar mais fiel ao autor.

A primeira teoria é considerada a teoria da substituição. Nesta teoria, como o próprio nome já diz, o computador substituiria o ser humano no âmbito intelectual. Neste caso, Tikhomirov (1981) leva em consideração que computador é capaz de chegar aos mesmos resultados que o ser humano na resolução de certos tipos de problemas, porém, ele rejeita esta teoria argumentando que os processos utilizados pelo ser humano, na busca da solução de um problema, não são os mesmos processos usados pelo computador na resolução de um mesmo problema. Por este motivo a teoria é rejeitada, pois ela não expressa a relação entre o trabalho do computador e o pensamento humano.

Assim, Tikhomirov (1981) apresenta uma segunda teoria, denominada por teoria da suplementação. Nesta teoria o computador complementa o ser humano, onde o primeiro resolve problemas que são de difícil solução para o segundo. Borba (1999) esclarece que nesta teoria algumas partes do processo são realizadas pelo ser humano, enquanto outras são realizadas pelo computador. A união dessas partes equivale ao resultado final que, anteriormente, era realizado somente pelo ser humano.

Nesta visão, há uma justaposição entre o computador e ser humano. O computador vem suplementar o pensamento humano no processamento de informação, com isso aumentando a velocidade e o volume deste processo, permitindo ao ser humano processar informações, cada vez mais rápido e, talvez, com mais precisão. Nota-se aqui, que há somente um aumento quantitativo da atividade humana não considerando os aspectos qualitativos do pensamento, tais como a busca de possíveis soluções de um determinado problema.

Assim, Tikhomirov (1981) argumenta que as duas teorias anteriores - da substituição e a da suplementação – fracassam, pois não consideram o papel essencial da mediação numa atividade humana. Para o autor, não se trata apenas de considerar o computador substituindo processos mentais, ou então permitir um aumento puramente quantitativo nos processos psicológicos já existentes. O foco deve ser enxergar o computador como um novo tipo de mídia que pode mediar a atividade humana.

Tikhomirov (1981) sustenta, então que o computador não apenas expande a capacidade da atividade existente. O computador, atuando como mediador, faz também emergir um novo estágio de pensamento.

Trago agora a terceira teoria de Tikhomirov (1981), que é a teoria da reorganização, onde o computador é visto como uma nova mídia mediando as atividades humanas. Esse caráter mediador – originado pela teoria Vygotskiniana - produz uma reorganização dos processos de criação, armazenamento de informação e nas relações humanas. Neste caso é possível argumentar que o computador provoca uma reorganização da atividade humana, definida por Borba (1999) como "moldagem recíproca" entre computadores e seres humanos, onde o computador é visto como algo que "molda o ser humano e que ao mesmo tempo é moldado por ele" constituindo assim o sistema ser-humano-computador.

Nesse sentido, não assumo as tecnologias apenas como meios, visto que a produção de conhecimento é permeada por elas. No veio de Tikhomirov (1981), Borba e Penteado (2001) propõem a metáfora seres-humanos-com-mídias. Colocando em voga que uma nova tecnologia não somente se justapõe aos seres humanos, mas interagem com eles, os autores propõem que o pensamento é exercido pelo sistema seres-humanos-com-mídias. Este sistema torna-se uma ampliação do sistema ser-humano-computador proposto por Tikhomirov (1981), considerando o pensamento como algo coletivo do qual fazem parte as tecnologias da inteligência disponíveis ao longo da história (BORBA, 1999). É com esse olhar que passo a seção seguinte onde procuro relacionar as pesquisas realizadas com as teorias apontadas por Tikromirov (1981).

CONSIDERAÇÕES FINAIS

Influenciada por Tikhomirov (1981), retomo a terceira seção, pontuando algumas analogias entre pesquisas realizadas e a reorganização do pensamento.

Ao se tratar da teoria da substituição, não evidencio nenhum trabalho nesta categoria, o que evidentemente não contemplaria atividades em sala de aula com o uso desses instrumentos (calculadora gráfica, MBL/CBR e CBL).

Passando para a teoria da suplementação, percebo que o trabalho proposto por Adie (1998), concebe o uso de calculadoras gráficas para os alunos utilizando a concepção fixada nesta teoria, isso fica presente no recorte: "os alunos perdem muito tempo nos aspectos matemáticos dos problemas físicos. A calculadora os livra disto permitindo que eles despendam mais tempo entendendo ou explicando Física" (p. 203).

Ilustrando esta teoria - a da suplementação - vem o artigo de Giorgetti (2002), quando o autor declara que na condução da disciplina, o docente adota o papel "de um treinador dos estudantes para a arte da formulação de problemas ou modelagem, desenvolvida com forte apelo ao uso de leis de conservação" (p. 01). Nota-se então, que neste contexto a calculadora está complementando o aluno, resolvendo tarefas matemáticas.

Neste momento é importante salientar ao leitor que ambos autores (Adie, 1998; Giorgetti, 2002), relatam o uso de calculadoras gráficas e CBL em disciplinas de aplicação. Nestas disciplinas, na maioria dos casos a Matemática assume o caráter de ferramenta para um objetivo maior, no caso entender a Física presente em um determinado experimento, isso também é notado no trabalho de Bassok e Holyoak (1989). Então, sob o viés das teorias de Tikhomirov (1981), creio que não se pode justificar o uso de um instrumento em sala de aula levando em conta somente que esse instrumento possa favorecer o ensino de outra disciplina à alunos deficientes em conhecimentos matemáticos ou somente com o intuito de enfatizar a prática.

Dirigindo-me agora para a terceira teoria de Tikhomirov (1981), percebo no relato de Dunham e Dick (1994), Watanabe (1996), Souza e Borba (1996, 1998) e Sestokas-Filho e Bonafini (2000, 2001 e 2002), que a calculadora não foi um instrumento neutro, ela reorganizou o pensamento dos alunos na execução das tarefas e modificou o relacionamento deles em sala de aula.

Observo em Caldwell (1996); Doerr e Zangor (2000) e Hale (2000) que a calculadora e o CBL, reorganizaram o pensamento dos estudantes e a sua forma de participação e refinamento (construção e reconstrução) de suas conjecturas estabelecendo assim, grupos colaborativos. Enfatizo nestes trabalhos os instrumentos tendo o caráter de mídias, percebendo que a calculadora e o CBL não somente complementam os estudantes, mas interagem com eles, dessa forma o pensamento é exercido pelo sistema seres-humanos-com-mídias[2].

Noto nos trabalhos de Friedler, Nachmias e Linn (1990); Linn, Layman e Nachmias (1987); Mokros e Tinker (1987); Brasell (1987), Scheffer (2001), a influência da mídia, no caso o MBL nas habilidades cognitivas tais como a observação e a predição, além da possibilidade da atividade tornar-se um experimento cinestésico, o que só é possível com o uso de uma determinada mídia.

Sob o olhar da teoria da reorganização, procuro encerrar esse artigo retomando meu objetivo principal de pesquisa que visa compreender *como estudantes podem trabalhar conceitos matemáticos e físicos ao utilizarem o CBL e a Calculadora Gráfica em atividades de experimentação.*

Deste modo, acredito finalmente que essa pesquisa possa acrescentar contribuições importantes, uma vez que, poucos são ainda os trabalhos acadêmicos com o uso de dispositivos de coleta de dados que relacionam a Matemática e a Física no Ensino Superior.

Educação a Distancia para Deficientes Visuais

Vera R. N. Schuhmacher [1], M. Inés Castiñeira [2], Jakson Hüntemann [3] and Rangel Roecker [4]

Abstract *— Apesar dos grandes avanços existentes na informática e de toda a tecnologia disponível, existe um grande grupo de pessoas que possuem um acesso limitado ao uso das mesmas, e muitas vezes nenhum acesso. Parte deste grupo é formado por deficientes visuais, no Brasil este número chega a 750.000 pessoas abruptamente excluídas do processo de inclusão digital em áreas fundamentais como o uso do ensino a distância. Hoje, mais de 80 países, nos cinco continentes, adotam a educação a distância em todos os níveis de ensino, em programas formais e não formais, atendendo a milhões de estudantes. A educação a distância tem sido usada em situações como treinamento até o aperfeiçoamento de profissionais em serviço.*

A partir do estudo serão apresentadas considerações que possam facilitar a utilização dos recursos tecnológicos disponíveis no mercado para pessoas com deficiência visual. Essas considerações possibilitarão um futuro desenvolvimento de ferramentas que melhor se adaptem as necessidades dos deficientes visuais.

Index Terms — deficientes visuais educação a distância, interfaces, recomendações.

INTRODUÇÃO

O olho humano é considerado um órgão sensório fotorreceptor, que percebe a luz, as cores, as formas, os movimentos e o espaço. O olho humano é opticamente equivalente a uma máquina fotográfica comum, sendo constituído basicamente de um sistema de lentes, um sistema de diafragma variável e uma retina que corresponde a um filme a cores.

O olho humano tem características especiais como um sistema automático de focalização que permite ver, por exemplo, objetos a 25 cm e logo a seguir outros a grandes distâncias, a íris, que corresponde ao diafragma controlando automaticamente a quantidade de luz que entra no olho, apresenta eficiência de operação para ver tanto em ambientes com muita luz como em outros pouco iluminados, apresenta visão angular muito grande: horizontal e vertical e a imagem de um objeto formada na retina é invertida [1].

Existem muitas causas que levam um indivíduo a obter cegueira ou visão subnormal entre elas podemos destacar as mais comuns, como: o tracoma, o glaucoma, a catarata, a miopia e o descolamento da retina.

INCLUSÃO DIGITAL

Inclusão Digital é a denominação dada aos esforços de fazer com que a maior parte possível das populações das sociedades contemporâneas – cujas estruturas e funcionamento estão sendo alteradas pelas tecnologias de informática e de comunicação possam [2]:

- Obter os conhecimentos necessários para utilizar com um mínimo de proficiência os recursos de informática e de telecomunicações existentes;
- Dispor de acesso físico regular a esses recursos.

A expressão-chave no conceito de Inclusão Digital é utilizar com um mínimo de proficiência os recursos de informática e de telecomunicações existentes. Dependendo do significado atribuído ao termo "utilizar", emergem duas visões bastante diferentes do alcance do processo de Inclusão Digital: Inclusão digital restrita e Inclusão digital ampliada.

Quando o termo "utilizar" é referido à idéia de consumidor, origina-se uma visão essencialmente passiva do que é utilizar com um mínimo de proficiência os recursos de informática e de telecomunicações existentes. Nesse caso, o conceito de inclusão digital prioriza o treinamento dos cidadãos para operar computadores e softwares aplicativos de uso comum e podemos citá-la como Inclusão digital restrita.

Na definição de inclusão digital, se o termo "utilizar" for referido à idéia de instrumentalização – de uso instrumental por um sujeito que age com objetivos autônomos – é gerada uma visão de inclusão digital que, além, dos objetivos da visão utilitarista, incorpora o fator finalidade. Temos assim uma visão de Inclusão Digital Ampliada onde o alvo estratégico é universalizar entre as populações o uso instrumental dos recursos das tecnologias de informática e de comunicação para alavancar a aprendizagem contínua e autônoma, para fomentar o exercício da cidadania, para dar voz às comunidades e setores que normalmente não têm acesso à grande mídia e para apoiar a organização e o

adensamento da malha de relações comunicativas entre os atores da sociedade civil que constituem a esfera pública [2].
A relevância atual do tema Inclusão Digital deve-se ao quase consenso que já existe, em escala mundial, quanto à importância e a centralidade das tecnologias de informática e de comunicação na estruturação e no funcionamento de grande parte das sociedades contemporâneas.
Tanto na forma restrita quanto na forma mais ampla, a Inclusão Digital tem um papel importante no momento atual.

TIPOS DE SISTEMAS PARA DEFICIENTES VISUAIS

O conceito de sistema de interação deficiente visual-computador tem um sentido bem amplo, envolvendo hardware, software ou outros tipos de equipamentos. Diversos fatores fazem com que exista atualmente uma quantidade grande e diversificada de sistemas. Primeiramente, devido ao caráter muitas vezes particular de cada usuário deficiente visual, freqüentemente são desenvolvidos ou adaptados sistemas de maneira personalizada. Em segundo lugar, as pesquisas nesta área estão em fase praticamente inicial, com abordagens e enfoques muito variados no desenvolvimento de produtos. Somando-se a isto tudo, existe uma total falta de padronização entre os fabricantes de tais sistemas. Esse é um fator importante, uma vez que é necessário um grande esforço por parte dos deficientes visuais para se adaptar a um determinado tipo de sistema.

Pode-se classificar os sistemas de interação deficiente visual-computador em três tipos principais: os sistemas amplificadores de telas, os sistemas de saída de voz e os sistemas de saída em braille. Além destes, existem outras tecnologias, menos importantes no que diz respeito à sua adoção pelos usuários deficiente visual de computadores, que são as tecnologias de reconhecimento de voz, os "scanners" e os amplificadores de imagens [12].
O sistema de ampliação da saída de vídeo, pode ser obtido de duas maneiras. A primeira delas é por meio da conexão de um processador com caracteres maiores do que o normal, baseado em hardware. A segunda maneira é utilizar um pacote de software que irá aumentar o tamanho do que aparecer na tela.
Os sistemas de saída de voz são compostos por um sintetizador de voz, um alto-falante externo e um software para acessar o texto. Estes equipamentos são muito eficientes e pouco onerosos, estando disponíveis em grande variedade no mercado. O sintetizador de voz é um hardware, geralmente uma placa, que pode ser inserido internamente no computador ou então um dispositivo externo, ligado ao computador através da porta serial ou paralela. O software acessa o texto armazenado no computador e o envia ao sintetizador de voz, efetuando um processo padronizado de conversão, denominado TSC (Text-to-Speech Conversion) que significa, conversão de texto para fala.
Os sistemas de saída em Braille são divididos em dois grupos: o de impressoras e o de terminais de acesso em Braille. As impressoras braille seguem o mesmo conceito das impressoras de impacto comuns e podem ser ligadas ao computador através das portas paralelas ou seriais. Os terminais de acesso em braille foram criados para fornecerem uma janela móvel, codificada em braille, que pode ser deslocada sobre o texto na tela do computador. O alfabeto braille é composto de caracteres que possuem 6 pontos de código.
Enquanto os sistemas sintetizadores de voz estão bem desenvolvidos, os sistemas de reconhecimento de voz estão em um estado tecnológico muito mais primitivo. Eles permitem evitar o uso do teclado, e podem ser treinados para reconhecer centenas de comandos de um usuário em particular, mas geralmente falham, se necessitam receber comandos de mais de um usuário [12].
A conversão de textos impressos, para fins de saída em voz ou braille, exige que seja usado um sistema denominado OCR (Optical Character Recognition), que consta de um “scanner” e de um software próprio. Entretanto, a confiabilidade da tradução dos textos impressos para o meio eletrônico é muito variável, devido a fatores como tamanho, estilo, contraste, e espaçamento entre os caracteres impressos na fonte.
Outros dispositivos amplificadores de imagem disponíveis aos usuários com visão subnormal são os sistemas de circuito fechado de televisão (CCTV) que permitem a execução de tarefas guiadas visualmente, que seriam impossíveis ou improdutivas de serem executadas de outra forma. Alguns destes dispositivos podem ser interconectados com um microcomputador para obtenção de imagens da tela do mesmo [12].

CONCLUSÕES SOBRE OS DIFERENTES TIPOS DE SISTEMA E SUA APLICAÇÃO

Os sistemas de saída de voz são os mais difundidos, fato que ocorre devido, em parte, ao seu baixo custo em relação aos outros sistemas e, em parte, por poderem ser acessados por usuários com qualquer tipo de deficiência visual. Uma combinação dos sistemas de saída em braille e reconhecimento de voz aumenta ainda mais a sensação de manipulação direta e domínio sobre o aplicativo.
As características do usuário assim como o ambiente em que será utilizado devem ser observados para que se possa optar pelo sistema mais adequado.

ENSINO A DISTÂNCIA

Ensino a distância pode ser definido como a família de métodos instrucionais onde as ações dos professores são executadas a parte das ações dos alunos, incluindo aquelas situações continuadas que podem ser feitas na presença dos estudantes. Porém, a comunicação entre o professor e o aluno deve ser facilitada por meios impressos, eletrônicos, mecânicos ou outros [14].

Educação/ensino a distância (*Fernunterricht*) é um método racional de partilhar conhecimento, habilidades e atitudes, através da aplicação da divisão do trabalho e de princípios organizacionais, tanto quanto pelo uso extensivo de meios de comunicação, especialmente para o propósito de reproduzir materiais técnicos de alta qualidade, os quais tornam possível instruir um grande número de estudantes ao mesmo tempo, enquanto esses materiais durarem. É uma forma industrializada de ensinar e aprender [16].

Os conceitos acima apresentam elementos centrais que podem ser resumidos da seguinte forma [14]:

- separação física entre professor e aluno, que a distingue do ensino presencial;
- influência da organização educacional (planejamento, sistematização, plano, organização dirigida etc.), que a diferencia da educação individual;
- utilização de meios técnicos de comunicação para unir o professor ao aluno e transmitir os conteúdos educativos;
- previsão de uma comunicação de mão dupla, onde o estudante se beneficia de um diálogo e da possibilidade de iniciativas de dupla via;
- possibilidade de encontros ocasionais com propósitos didáticos e de socialização.

A EaD, no sentido fundamental da expressão, é o ensino que ocorre quando o ensinante e o aprendente estão separados (no tempo ou no espaço). No sentido que a expressão assume hoje, enfatiza-se mais a distância no espaço e se propõe que ela seja contornada através do uso de tecnologias de telecomunicação e de transmissão de dados, voz e imagens (incluindo dinâmicas, isto é, televisão ou vídeo). Não é preciso ressaltar que todas essas tecnologias, hoje, convergem para o computador [17].

DESENVOLVIMENTO DE CURSO A DISTÂNCIA

Em sua grande maioria os cursos desenvolvidos resumem-se em componentes que convertem o material didático em curso a distância. O curso deve ser planejado e estruturado pelo docente seguindo propostas compostas por descrições gerais, objetivos, métodos de ensino, métodos de avaliação do estudante, plano de estudo, período, objetivos específicos, público alvo, conteúdo e programação [18]. Impõe-se no entanto neste ponto o conflito inerente ao direcionamento de um curso para a comunidade de deficientes visuais oferecidos na World Wide Web (www). Devem ser observados requisitos especiais relacionados às interfaces que compõem o curso para que seja possível ao deficiente o acompanhamento de um curso ministrado a distância com um mínimo de frustração e um máximo de conforto.

ACESSIBILIDADE NA INTERNET PARA DEFICIENTES VISUAIS

A Internet tem um papel fundamental a desempenhar na inclusão digital. Ela "quebra" barreiras físicas e espaciais, servindo de suporte a um grande numero de atividades possíveis de serem realizadas por portadores de deficiência visual. Os deficientes visuais, sem uma tecnologia de acesso a Internet adequada, podem ficar gravemente limitados quanto à quantidade das informações que podem acessar. Essa situação inibe, ou até mesmo impossibilita que eles utilizem por inteiro as potencialidades deste meio de comunicação. A maior parte dos softwares para acesso dos deficientes visuais à Internet é feita em outros paises, com idioma e perfil do usuário diferente dos nossos. Isso torna inadequado o aproveitamento dos sistemas estrangeiros. O acesso a Internet para deficientes visuais baseia-se na concepção de equipamentos, softwares e conteúdos com características de acessibilidade [11].

Acessibilidade significa facilidade de interação, aproximação. No contexto computacional, a acessibilidade está associada a ações que tem como objetivo tornar os computadores mais acessíveis a todos os usuários.
Na Internet, a acessibilidade caracteriza-se pela flexibilidade da informação e interação tornando possível sua utilização por pessoas com necessidades especiais, bem como a utilização em diferentes ambientes e situações através de vários equipamentos ou navegadores.
Os principais problemas encontrados pelos deficientes visuais são [11]:

- Dificuldades em obter informações apresentadas visualmente;
- Interagir usando um dispositivo diferente do teclado;
- Distinguir rapidamente os links em um documento;
- Navegar através de conceitos espaciais;
- Distinguir entre outros sons uma voz produzida por síntese.

ORIENTAÇÕES PARA A CONCEPÇÃO DE INTERFACES ACESSÍVEIS AOS DEFICIENTES VISUAIS

Para auxiliar os desenvolvedores de paginas da Web o W3C (World Wide Web Consortium), organismo responsável pela elaboração de padrões mundiais para a Web, publicou em 5 de Maio de 1999 o primeiro documento: "Web Content Accessibility Guidelines". Este documento tem como objetivo auxiliar e encorajar o desenvolvimento de páginas acessíveis a portadores de deficiência, indicando não só regras gerais como formas ideais de implementação.
As principais regras para o desenvolvimento de páginas serão descritos a seguir de forma genérica [11]:
1. Deve-se utilizar padrões para que qualquer indivíduo de qualquer parte do mundo tenha possibilidade de criar páginas que são acessíveis universalmente aos diferentes tipos de usuários, independente do tipo de software, hardware e limitação que possua permitindo a interoperabilidade.

2. As páginas devem sempre prover mecanismos para gerar um texto alternativo quando um elemento não puder ser exibido e devem assegurar que todos os elementos do site são acessíveis via teclado.

3. Deve-se utilizar navegação consistente e clara, além de colocar informação clara no topo dos cabeçalhos, parágrafos, listas, etc.

4. Outras facilidades importantes são mecanismos para "congelar" as informações que aparecem em movimento. De forma ao sintetizador de voz poder transformá-las em áudio.

5. Ao invés de destacar alguma informação importante através de cores ou outra forma de formatação utilizando-se elementos visuais deve-se, indicar através de palavras sua importância no contexto da apresentação.

6. Deve-se criar uma ordem lógica para os links apresentados, facilitando a navegação. Fornecer links para a página inicial em todas as páginas e garantir que os links textuais são formados por palavras ou sentenças compreensíveis fora do texto.

7. Sempre que se usar elementos gráficos como botões, utilizar texto com a mesma função para facilitar a interação por dispositivos não gráficos e via teclado.

8. Deve-se testar a acessibilidade em diversos browsers, incluindo os browsers com capacidade de sintetizar voz e com os leitores de tela e validar com ferramentas de validação.

CONCLUSÕES

Já existe, hoje, uma preocupação por parte dos fabricantes de fazer as modificações necessárias em sistemas de IHC, para aumentar a acessibilidade de produtos a indivíduos que apresentem limitações no sentido da visão. Além de quase não onerar o custo final dos mesmos, estes produtos passariam a ser acessíveis a um número maior de pessoas que em várias situações encontram-se na periferia da utilização de novas tecnologias.

A observação de recomendações e orientações por parte de desenvolvedores de sítios utilizados em um ambiente de aprendizado computacional contribui de forma sensível para que ocorra uma utilização mais eficiente dos recursos oferecidos de forma confortável evitando frustrações e a exclusão digital de portadores de deficiências visuais neste ambiente tão cooperativo oferecido por meio da Internet.

DESENVOLVIMENTO DE SIMULAÇÕES PARA O APRENDIZADO EM CURSOS NA WEB

Juliano Schimiguel[1], Carlos Fernando Araújo Jr[2] e Luiz Henrique Amaral[3]

Resumo — *Nos últimos anos, a aplicação das tecnologias de informação à educação vem crescendo bastante. Nesse contexto, surgiu o grupo WEL (Web Engineering for Learning), cujo objetivo é o desenvolvimento de conteúdos digitais baseados na Web, para algumas disciplinas da área de computação. Vinculado a esse grupo, existem alguns sub-projetos: conteúdo, simulação, simulação 3D, avaliação eletrônica e interpretadores de algoritmos. Este trabalho, em específico, foca a criação de simulações visuais para o acompanhamento no aprendizado dos conteúdos desenvolvidos.*

Palavras-Chave — *Simulação, WEL, Educação a Distância.*

INTRODUÇÃO

Desde a década de 1990, a área de educação vem sendo fortalecida pelo desenvolvimento de outras áreas, uma delas é a Computação. Foi a partir daí que surgiu a informática na educação, um nicho que vem crescendo cada vez mais, seja através do desenvolvimento de novos dispositivos de hardware, seja no desenvolvimento de novos sistemas de software.

Pensar em informática na educação não é simplesmente destacar elementos computacionais. Existe uma série de fatores pedagógicos envolvidos nesse processo, e que precisam ser considerados. Estes últimos são os elementos que irão realmente contribuir com o fator "motivação" embutido em um sistema computacional, além do processo de desenvolvimento do raciocínio, do conhecimento e aprendizagem.

Juntamente com a Informática na Educação, podemos falar da Educação a Distância (EaD). Na Educação a Distância, o objetivo é acompanhar o processo de ensino-aprendizagem entre pessoas dispersas espacialmente. São vários os grupos de pesquisa que vem trabalhando nesta linha, entre eles o Nead [32] e Nied [33].

Em específico, no Nead (Núcleo de Educação a Distância da UNICSUL) existe o grupo WEL (Web Engineering for Learning), que trabalha no desenvolvimento de conteúdos digitais baseados na Web para algumas disciplinas básicas da área de computação, em especial aquelas que se apresentam com maior dificuldade para o aprendizado, entre elas; Algoritmos, Estrutura de Dados, Física Aplicada e Laboratório de Linguagens de Programação.

Para a criação de conteúdos digitais nessas áreas, o desenvolvimento de simulações é importante para o acompanhamento do aprendizado. As simulações podem envolver vídeos, animações e imagens em movimento. Segundo Byrne [9], a animação permite uma visualização concreta de conceitos abstratos. Para ele, os fenômenos conceituais e abstratos são notoriamente difíceis para o entendimento de estudantes e as animações ajudam na concretização desses conceitos.

Educadores constantemente estão buscando novos caminhos para prover instrução, facilitar o aprendizado e prender a atenção de seus estudantes. O poder dos computadores para armazenar grandes quantidades de informação e para simular ambientes e condições que seriam, em outro caso, não disponíveis, faz das animações uma boa possibilidade [9].

Enquanto visualizações estáticas podem prover pessoas com a essência de como alguma coisa ocorre, é colocada, ou constituída; as animações se mostram mais bem habilitadas para explicar um processo dinâmico. Animações devem apoiar estudantes em construir um modelo mental de vários processos, tal como, o movimento de componentes de um sistema mecânico [9]. Vários estudos sugerem que modelos mentais ajudam os estudantes à, mais precisamente, prever o comportamento dos vários processos ou sistemas [22].

É notório o quanto uma representação visual pode trazer de contribuição ao ensino: "uma imagem pode dizer mais que mil palavras". Quem ainda não se deparou com a seguinte situação: precisar ler um texto imenso e ao se deparar com uma imagem, dirigir a visão diretamente para ela. Uma imagem ou animação tem informação "comprimida" ou "embutida", que pode ser de fácil compreensão. Para obter a mesma informação utilizando textos, poderíamos perder mais tempo. Imagens e/ou animações representam recursos importantes, mas devem ser utilizadas de forma correta e moderada [38].

Neste trabalho, estaremos destacando, entre outras coisas, alguns trabalhos desenvolvidos na área em questão, considerações para a construção de simulações em ambientes educacionais, além de ilustrações de estudos de

caso realizados pelo grupo WEL para a disciplina de Algoritmos e Estrutura de Dados.

REFERENCIAL TEÓRICO

A visão tradicional de ensino, em que o professor exerce o papel ativo de possuidor de todo o conhecimento, e o aluno o papel passivo de receptor, está se transformando rapidamente, devido ao surgimento de novas tecnologias. O novo modelo é centrado no aluno, no qual ele passa a ter um papel muito mais ativo e autônomo na busca do aprendizado e do conhecimento.

A educação a distância baseada em computadores é uma das tecnologias educacionais que está envolvida nesta evolução, pois devolve a iniciativa do aprendizado ao aluno, e possibilita o progresso individualizado. Com a internet, tem surgido novos paradigmas de intercâmbio de informação a distância, e suas surpreendentes possibilidades estão resgatando a imaginação e interesse de educadores dispersos pelo mundo, levando-os a repensar a natureza do ensino e da aprendizagem [10].

Como boa parte de professores e/ou pesquisadores precisa realizar uma aula prática, são universais as dificuldades em se conseguir material, equipamentos e pessoal técnico especializado para montagem de laboratórios e de um programa de aulas práticas, seja pelos altos custos de aquisição e manutenção, seja pelo domínio técnico do manejo de equipamentos. Além disso, a dificuldade para locomoção dos alunos para participação de cursos em instituições de ensino distantes de suas casas tem frustrado os seus objetivos com relação ao aprendizado.

Para tentar resolver parte desses problemas e com o intuito de facilitar e aprimorar o aprendizado, vários pesquisadores estão observando a relevância da utilização de simulações [10].

O vídeo *Sorting Out Sorting*, apresentado no SIGGRAPH'81, é geralmente aceito como o início do campo de animação de algoritmos [1]. Ele mostra visões dos dados sendo ordenados por diferentes algoritmos para ajudar estudantes a entender como os algoritmos trabalham. Desde então, muitos sistemas de animação de algoritmos foram desenvolvidos [6, 7, 8, 17, 30, 35, 40] e estão largamente disponíveis.

Vários estudos tem examinado a eficiência da Web como uma ferramenta de estudo em termos das opções que ela oferece, entre elas, as ilustrações animadas e aplicações multimídia em geral [3, 29, 36, 37] e no caso especial em Ciência da Computação [2, 4, 5, 9, 11, 16, 28, 31].

Para a análise da efetividade de ilustrações animadas baseadas em Web, como uma ferramenta para prover aprendizado, muitos estudos tem demonstrado sucesso em tópicos básicos da computação como programação, estrutura de dados e algoritmos [2, 4, 11], além disso, tópicos avançados como algoritmos paralelos [31], protocolos de comunicação, algoritmos distribuídos [28] e compiladores [16].

Byrne et al. [9] focam o uso de animação para ajudar no ensino de programação e para auxiliar estudantes no entendimento de como os algoritmos trabalham. Segundo os autores, esse é o processo chamado de animação de algoritmos [6] e é uma instância particular de visualização de software [34], ao qual é o uso de imagens, gráficos e animação para ilustrar algoritmos de computador, programas e processos.

A tese de doutorado de Lawrence [24] avalia uma variedade de algoritmos de ciência da computação introdutórios, tal como, algoritmos de ordenação e grafos, e examina a adição de animação para auxiliar no ensino. Segundo ele, o aprendizado é beneficiado pela habilidade de entender a execução de algoritmos e responder questões conceituais sobre o algoritmo.

Hansen et al. [19] encontraram significantes benefícios de aprendizado usando sistemas hipermídia que incluem animações para ensinar estudantes sobre algoritmos.

Mayer e Anderson [25, 26] e Mayer e Sims [27] concluíram que as animações ajudaram estudantes a aprender conceitos de mecânica.

Schimiguel et al. [11] ilustram um caso da aplicação de simulações para o aprendizado na disciplina de Sistemas Operacionais, vinculada a cursos de graduação na área de computação. Segundo os autores, fenômenos computacionais podem ser representados através de animações, como por exemplo, a execução de processos, o compartilhamento de recursos, entre outros.

Kobayashi [8] desenvolveu um sistema, denominado Cabri, para o acompanhamento no aprendizado de conceitos de matemática. Para ele, a matemática é muito abstrata, sendo necessário a criação de imagens e/ou animações para o seu entendimento.

Cardoso [1] descreve a aplicação de simulações para ciências biomédicas, permitindo ao estudante observar o comportamento de um determinado sistema orgânico através de um modelo do mesmo, ou seja, de uma representação matemática, gráfico ou simbólica do fenômeno.

O projeto Multiverse [3], desenvolvido no Institute for Computer Based Learning da Heriot-Watt University, fornece um ambiente de software para facilitar e encorajar o uso de simulações em educação e pesquisa. Além deste, vinculado ao mesmo Instituto, existe o projeto Inside, para integrar simulações em educação distribuída.

O grande número de trabalhos mostra a importância que está sendo dada para o desenvolvimento de simulações para conteúdos digitais baseados na Web. Na próxima seção, estaremos focando a efetividade de simulação para o ensino.

Eficiência da Simulação no Ensino

As simulações têm se apresentado como ferramentas de aprendizagem muito efetivas, ainda que os professores tenham sido lentos para explorarem este claro potencial. Segundo Cardoso [1], em estudos comparando programas de simulações com laboratórios tradicionais demonstrou-se que, embora a aquisição de conhecimento por ambos os grupos tenha sido a mesma, os estudantes tiveram uma atitude mais positiva na utilização em programas deste tipo, e que o custo de laboratórios convencionais baseados nesta abordagem foi cinco vez maior.

Gurka e Citrin [18], com base em estudos e experimentos, identificaram sete fatores a serem considerados no estudo de benefícios pedagógicos de animações: (i) flexibilidade no uso do sistema de animação, (ii) disponibilidade do sistema de animação, (iii) treinamento no uso do sistema de animação, (iv) complexidade envolvida, (v) qualidade da animação, incluindo design gráfico, (vi) como, onde e quando a animação é usada e (vii) diferenças individuais entre estudantes.

Entre as vantagens no uso de simulações, podem-se destacar [10]:

- O software de simulação pode permitir a visualização gráfica e a mudança de parâmetros e variáveis que não seriam possíveis em um experimento convencional;
- O professor pode propor experimentos, roteiros, perguntas; que o aluno irá realizar, responder, escrever relatórios experimentais, entre outros;
- A utilização do programa de simulação pelo aluno pode gerar uma autodocumentação, escores de acertos; que são utilizadas localmente ou enviadas pela Internet e possibilitam ao professor avaliar as táticas de aprendizado, além do desempenho do aluno;
- A simulação pode incluir vínculos de hipertexto para o acesso a material didático em forma digital, além de outros sites web e recursos que permitam o aprofundamento do aluno de acordo com seu grau de interesse;
- As simulações podem ser usadas facilmente nas fases de aprendizagem e avaliação da aprendizagem.

Entre algumas desvantagens das simulações, podemos citar [10]:

- Os modelos podem representar apenas uma parte da função de um elemento, conceito ou componente, sendo desconectados dos seus aspectos integrativos;
- O contato com experimentações reais é perdido, podendo dar idéias incompletas ou imprecisas a respeito de um fenômeno.

Essas desvantagens podem ser eliminadas a medida que as simulações progridem para o entendimento e modelagem dos fenômenos que elas descrevem. Outras podem ser resolvidas pelo próprio desenvolvimento da tecnologia. O professor deve ter uma visão clara de quais aulas podem ser efetivamente substituídas por ambientes com simulações e quais não podem, ou ainda, se as duas formas de ensino podem ser aplicadas paralelamente.

Com o advento de simulações na Internet e na WWW (World Wide Web), e com a possibilidade de usar módulos executáveis em páginas web (applets desenvolvidos na linguagem Java), vários grupos passaram a fazer uso de simulações. Em Kobayashi [8], existe um repositório de simulações no formato de applets para o ensino de matemática.

A integração de Web e Java representa um avanço tecnológico que habilita uma nova aproximação para modelagem de simulações, que torna possível o desenvolvimento de ambientes baseados em Web para criação de modelos colaborativos, além de documentação baseada em multimídia, tal como análise investigativa de modelos [20].

Na próxima seção, ilustraremos um estudo de caso para uma animação desenvolvida pelo grupo WEL na disciplina de algoritmos e estrutura de dados.

ESTUDO DE CASO

O estudo de caso que estaremos ilustrando está relacionado a um dos tópicos da disciplina de Algoritmos e Estrutura de Dados: busca em árvores binárias [12, 13, 14, 15]. Essas árvores tem por característica básica a ordenação e, sobre elas, a realização de várias atividades, como, por exemplo, busca (consulta ou caminhamento), inclusão e exclusão de nós. Cada nó possui um item de dado e dois apontamentos, um para seu filho do lado esquerdo e outro para seu filho do lado direito.

No processo de busca em árvoves binárias pode ser realizado de três formas:

- InOrder: primeiro é visitado o nó pai (ou raiz), depois o nó filho esquerdo e por fim o nó filho direito;
- PréOrder: primeiro é visitado o nó filho esquerdo, depois o nó pai e por último o nó filho direito;
- PósOrder: primeiro é visitado o nó filho direito, depois o nó filho esquerdo e por último o nó pai.

Cada um desses três métodos foi implementado nas formas recursiva e não recursiva. No exemplo das figuras 1 e 2, ilustramos uma árvore para um caminhamento PréOrder Recursivo, onde, a cada vez que o aluno pressionar o botão "Executar Passo a Passo" (localizado na parte central inferior de ambas as figuras), será realizado um novo passo no processo.

Quando um nó é visitado, sua cor é modificada de branco para preto. Além disso, nas figuras 1 e 2, observa-se a existência de uma pilha onde cada caminhamento pendente é inserido. Posteriormente, é necessário visitar esse caminho, a partir do momento que o algoritmo começa a "retornar" em sua execução, retirando, dessa forma, os elementos da pilha.

Na parte inferior esquerda de ambas as figuras, existe um campo onde o resultado do caminhamento é constantemente atualizado. Juntamente com a ilustração da árvore, foi representado o algoritmo que realiza o caminhamento e, a cada vez que o aluno pressionar o botão "Executar Passo a Passo", além dele poder estar visualizando o resultado do caminhamento na ilustração da árvore, ainda poderá verificar como seria a execução do algoritmo, simultaneamente. As simulações ilustradas nas figuras foram criadas utilizando-se as linguagens Html e JavaScript.

No início da execução do algoritmo, é verificado se a raiz é nula (NULL). Como isso não acontece, pois a raiz é o nó "A", ela é visitada, passando da cor branca para preto, conforme pode ser verificado na Figura 1.

Depois disso, é realizado um caminhamento para o nó filho esquerdo de "A", e esse caminhamento é inserido na pilha (PréOrder: A→Esquerdo), pois posteriormente será necessário caminhar para o nó filho direito de "A". Na seqüência, é verificado se a nova raiz (nó "B") é nula; e como isso não ocorre, o nó é visitado, modificando sua cor de branco para preto (Figura 2).

A execução continua, e um nó filho direito somente será visitado quando for encontrado nulo (NULL) em algum nó filho esquerdo. Quando isso ocorrer, será retirado um dos elementos da pilha de execução, que indicava um caminhamento PréOrder-Esquerdo para algum nó.

CONTRIBUIÇÕES E CONCLUSÕES

O interesse pela área de educação a distância vêm aumentando de forma significativa, devido as possibilidades trazidas por ela, como é o caso da não obrigatoriedade presencial em um mesmo espaço físico para a realização do curso.

O desenvolvimento de conteúdos digitais baseados na Web envolve vários fatores; além de elementos computacionais, devem ser considerados aspectos pedagógicos relacionados ao aprendizado.

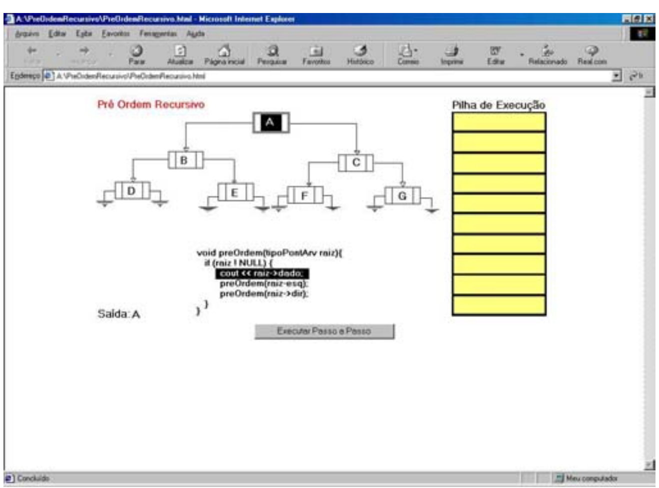

FIGURA. 1
VISITANDO O NÓ RAIZ "A" EM UMA ÁRVORE DE BUSCA BINÁRIA (PRÉORDER RECURSIVO).

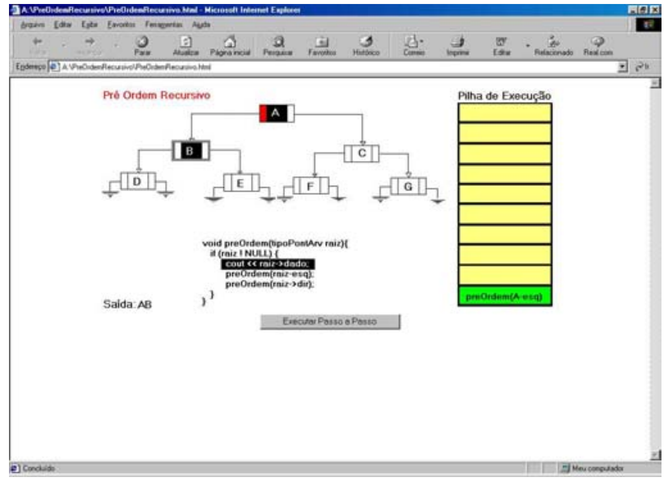

FIGURA. 2
VISITANDO O NÓ FILHO ESQUERDO DE "A" (NÓ "B") EM UMA ÁRVORE DE BUSCA BINÁRIA (PRÉORDER RECURSIVO).

Um dos pontos a serem considerados é a criação de simulações para esses conteúdos pedagógicos. Através deles, temos um ganho significativo no processo de aquisição de conhecimento e formulação do raciocínio lógico. Além de motivar a interatividade com o ambiente, uma simulação pode trazer vantagens com relação ao custo de equipamentos e laboratórios.

Esperamos, com este trabalho, ter focado a contribuição dada por uma simulação ao processo de aprendizagem, influenciando para uma adaptação em sua forma de pensar, raciocinar e interagir com um ambiente computacional.

AGRADECIMENTOS

Os autores agradecem à Coordenadoria de Informática da UNICSUL e o apoio financeiro dado pelo Programa de Qualificação Docente da UNICSUL.

Definição de Premissas para o ReDesign do Website Institucional do Colégio Santa Marcelina São Paulo

Silvana Cristina Alves[1], Juliano Schimiguel[2]

Resumo *– Nos últimos dois anos, o departamento de informática educacional do Colégio Santa Marcelina São Paulo, vem estudando e desenvolvendo um projeto que tem como objetivo principal tornar o Site Institucional uma ferramenta de comunicação efetiva e eficaz para troca de informações entre os usuários que fazem parte da comunidade educativa, bem como, apresentar ao usuário externo a proposta pedagógica e a infra-estrutura do Colégio. Este trabalho tratará, especificamente, do ReDesign do WebSite atual, propondo que a comunidade educativa possa participar das decisões, de forma a interagir na dinâmica das informações que serão apresentadas a todos os usuários.*

Palavras-Chave – ReDesign, WebSite, Ferramenta de Comunicação, Colégio Santa Marcelina São Paulo

Abstract *– In last two years, the educational informatic department of Santa Marcelina São Paulo College, comes studying and developing a project that has as main objective, to become the Institutional Site a communication tool accomplishes and efficient for exchange of information between the users who are part of the educative community, as well as, to present to the external user the pedagogical proposal and the infrastructure of the College. This work will treat specifically, of the ReDesign of the current WebSite, considering that the educative community can participate of the decisions, to interact in the dynamics of the information that will be presented to all the users.*

Index-Terms – ReDesign, WebSite, Tool Communication, Santa Marcelina São Paulo College

INTRODUÇÃO

Desde 1996, quando foi implantado o departamento de informática educacional do Colégio Santa Marcelina São Paulo, observou-se que a Internet poderia ser tratado como um meio de comunicação e interação para apresentação de atividades e projetos desenvolvidos pelos professores, explorando este meio para trocas de informações com toda a comunidade educativa.

No início de 1997, surge a primeira proposta em desenvolver o Site Institucional, onde os alunos da 2ª série do Ensino Médio ficariam responsáveis pela criação e manutenção do Site.

O Site começou a ser construído nas aulas de informática educacional, uma vez por semana, onde os alunos tiveram como ferramenta principal o *Browser Netscape Gold* para a elaboração de toda a estrutura, sendo estes alunos, supervisionados durante as aulas pelos professores de informática.

Surgiu, em agosto de 1997, o primeiro Site do Colégio Santa Marcelina São Paulo. Esta primeira versão ficou no ar durante um ano e meio, onde alguns alunos que haviam participado da sua criação ficaram responsáveis pela manutenção e atualização do Site. Esta versão não teve participação da comunidade, sendo que sua atualização deu-se de modo precário.

O Site tinha como característica principal: "mostrar a história do Colégio", sem possibilitar a interação com a comunidade educativa, não atingindo assim as expectativas da direção.

Em 1999, foi chamado um profissional especializado na construção de WebSites - o "Web Designer" - para reestruturar os aspectos visuais do Site, tornando-o mais atrativo. Este profissional, após algumas reuniões com a direção do Colégio, apresentou a nova estrutura, que foi aprovada.

Verifique, na Figura 1, a página principal atual do WebSite do Colégio, trazendo como referência o logotipo do colégio e uma mensagem bíblica.

Para dar continuidade à navegação ao WebSite, o usuário é convidado a clicar na ilustração das duas meninas (Figura 1), para ter acesso ao menu principal. A segunda página do WebSite esta estruturada conforme a Figura 2.

É através desta segunda página (Figura 2) que o usuário poderá encontrar as informações desejadas, utilizando os subitens do menu principal.

O WebSite atual tem como pontos principais: (i) Estrutura do WebSite, desenvolvida totalmente em Flash, (ii) Manutenção, feita pelo estagiário que precisou estudar o Flash em curto espaço de tempo, (iii) Conteúdo de responsabilidade das coordenações de áreas que, uma vez por mês, passariam estas informações para o estagiário. Este novo design mostrou-se mais eficaz, fazendo que os alunos navegassem mais facilmente pelo WebSite.

[2] Juliano Schimiguel, Universidade Cruzeiro do Sul, Professor Adjunto III (Orientador), Av. Dr. Ussiel Cirilo, 225, 08060-070, São Paulo, SP, Brazil, juliano.schimiguel@ic.unicamp.br

FIGURA. 1
PÁGINA INICIAL (HOME-PAGE) DO SITE INSTITUCIONAL DO COLÉGIO SANTA MARCELINA SÃO PAULO

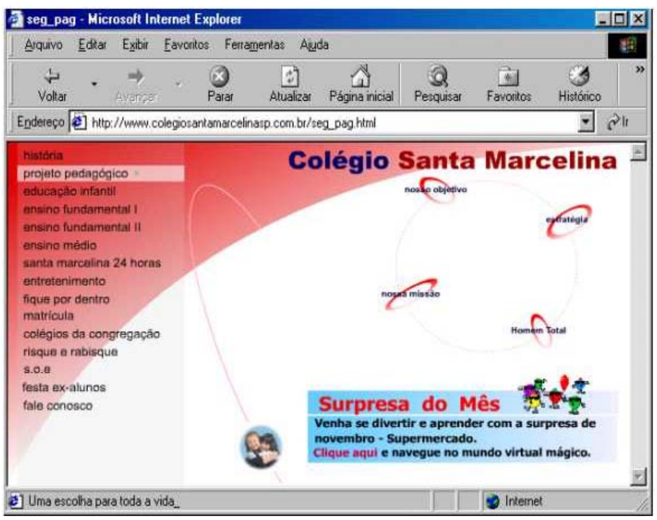

FIGURA. 2
SEGUNDA PÁGINA (COM ITENS DE MENU) DO SITE INSTITUCIONAL DO COLÉGIO SANTA MARCELINA SÃO PAULO

Os coordenadores de áreas decidiram por fixar a data 27 de cada mês para que os professores entregassem as atividades para serem colocadas no ar, sendo que, o departamento de informática educacional tinha até o dia 05 do mês subseqüente para disponibilizar estas informações. As coordenações de áreas são divididas pelos seguintes departamentos: Educação Infantil, Ensino Fundamental Nível I, História, Geografia, Ciências, Matemática, Física, Química, Língua Portuguesa, Língua Inglesa, Educação Física e Biologia.

Muitos desses departamentos não entregavam os seus materiais (atividades, imagens, fotografias, etc) para a coordenação no prazo estabelecido, dificultando assim o andamento do cronograma do departamento de informática educacional, fora às cobranças de alunos, que gostariam de visualizar em casa com seus pais estas atividades.

Atualmente, estamos com o WebSite que foi projetado em 1999, sendo que, nestes últimos dois anos, o mesmo passou por pequenas modificações, perdendo suas características iniciais.

No momento atual, destacamos os seguintes pontos: (i) Proposta Pedagógica do Colégio, (ii) Site elaborado por profissional da área, (iii) Manutenção feita pelos estagiários com orientação da coordenadora de informática, (iv) A comunidade participa na manutenção, fornecendo as atividades, projetos, informativos, comunicados e todas as informações que julgarem necessários para serem disponibilizados, (v) Livro de visitas, (vi) Acesso a outros WebSites da congregação.

Neste ano tivemos entre janeiro a outubro, 43.545 acessos ao WebSite, gerando uma média de 4354 acessos ao mês, para uma população estudantil de 1906 alunos, que dá uma média de dois acessos por aluno.

ATIVIDADES A SEREM DESENVOLVIDAS

Para o ano de 2003, pretendemos reformular o WebSite atual, pois colhemos durante os dois últimos anos muitas observações, críticas dos professores e sugestões dos alunos.

Estamos propondo uma estrutura que trará como benefícios:

1. Facilidade na navegação por parte do usuário, através das seções subdivididas por segmentos, são eles:

a) Educação Infantil – nesta seção iremos incluir os seguintes subitens: (i) Projeto do Ano Letivo, suas características e objetivos principais, (ii) Atividades realizadas, (iii) Passeios, etc;

b) Ensino Fundamental Nível I – nesta seção iremos incluir os seguintes subitens: (i) projetos de cada série (1^a a 4^a séries), (ii) Momento de Descontração, iremos disponibilizar as imagens que serão tiradas diariamente pelas dependências do Colégio, (iii) Atividades realizadas, (iv) Passeios, (v) A palavra é sua; aqui os alunos irão divulgar seus textos, poesias, uma mensagem para toda a comunidade, etc;

c) Ensino Fundamental Nível II – será também subdividido nas séries, tendo como principais itens: (i) Projetos, (ii) Atividades Realizadas, (iii) Passeios, (iv) Texto off-line, aqui os alunos poderão sugerir o texto semanal que será disponibilizado para a comunidade, etc;

d) Ensino Médio – (i) Projetos do Ano Letivo, (ii) Atividades realizadas, (iii) Vestibular, aqui dicas sobre vestibulares, (iv) Nosso Espaço, onde os alunos poderão colocar mensagens, recadinhos e fotografias, (v) Provão, aqui estaremos disponibilizando aos alunos os calendários dos provões e seus gabaritos, etc.

2. Criação de seções solicitadas pela comunidade educativa e que no WebSite atual não foram disponibilizadas, tais como:

a) Pastoral – divulgar os trabalhos realizados pelos alunos, pais, professores e funcionários, voltados para as crianças da creche, doentes do hospital e os idosos em asilos, etc;

b) DAD (Departamento de Apoio Disciplinar) e SOE (Setor de Orientação Educacional);

c) Fale Conosco (por departamentos): aqui deixaremos o coordenador de cada área responsável por abrir os e-mails do seu departamento, tornando assim a comunicação mais fácil para a tomada de decisões;

d) Álbum de Fotografias;

e) Recreio On-Line (tirar fotos no momento do intervalo de cada segmento e disponibilizar no WebSite);

f) Espaço para Ex-Alunos;

g) Eventos do Mês;

h) Mensagem para a comunidade diariamente;

3. Programação diversificada (linguagem HTML [6], DHTML [9], Banco de Dados, Flash [7]) e outros recursos que forem necessários;

4. Imagens tridimensionais (para dar visão da infra-estrutura do Colégio, principalmente aos usuários que entrarem no WebSite pela primeira vez). A visualização 3D permite ao usuário a sensação de imersão, ou seja, é como se o usuário estivesse participando do ambiente [8].

Hoje, com os avanços tecnológicos, podemos dispor de várias ferramentas para a elaboração de um WebSite e vários meios para disponilizá-lo na Internet. Estaremos utilizando recursos conhecidos pela Equipe de Informática Educacional, bem como, recursos que serão apresentados pelos profissionais que farão parte do projeto.

Não podemos deixar de explicitar que, para que este projeto possa dar continuidade, traçamos algumas metas de gerenciamento[1] para o WebSite, são elas:

a) Levantamento de necessidades e expectativas com a Direção e Coordenação (quais serão os objetivos do Site);

b) Elaboração de uma pesquisa com os alunos sobre o que eles gostariam de encontrar no WebSite do Colégio;

c) Qual será o principal *slogan* do WebSite? (neste caso, qual a mensagem que melhor descreverá o nosso Colégio) – vale ressaltar aqui que poderemos trocar este *slogan* de tempos em tempos, com a participação efetiva dos alunos, que ficarão responsáveis pela criação desses *slogans*;

d) Verificação, através de outros WebSites Institucionais, o que o nosso WebSite deverá ter como sendo o diferencial em relação a eles;

e) Levantamento das tecnologias que serão utilizadas, para que a equipe de informática possa estar preparada, por exemplo, para a tarefa de manutenção;

f) Como as informações do WebSite serão atualizadas:

- Diariamente;
- Semanalmente;
- Mensalmente.

g) Quem aprovará o projeto? (Direção, Coordenação, Professores, Alunos, Pais e Funcionários);

h) Qual o tempo que o Colégio dará à equipe para a construção no novo WebSite? (três meses)

i) Qual o provedor que estaremos utilizando para a hospedagem do WebSite? (o provedor que nos fornecer um acesso rápido);

j) Qual o orçamento para a construção do mesmo?

CONTRIBUIÇÕES

Tornar o WebSite mais atrativo para os nossos usuários, onde as informações disponibilizadas no WebSite, estejam vinculadas com a proposta pedagógica do Colégio e, ao mesmo tempo, conectadas à nova visão de comunicação on-line, que é a Internet.

A idéia é que os pais possam comunicar-se com a escola do seu filho quando necessário, sem ter que estar presente fisicamente na mesma; e que possam estar informados quando esta presença é importante.

Pretende-se divulgar os trabalhos realizados em sala de aula, para os alunos e professores, que em muitas ocasiões ficam restritos ao espaço que os mesmos estão inseridos, que é a sala de aula. Neste contexto, também poderemos compartilhar trabalhos nos diversos segmentos: Educação Infantil, Ensino Fundamental Nível I, Ensino Fundamental Nível II e Ensino Médio. Essas informações também poderão ser compartilhadas com a comunidade em geral e permitir a troca de experiências com outros colégios e segmentos de trabalho.

Com estas características, pretendemos fazer com que o WebSite seja um referencial atrativo para o colégio. Nossa pretensão é aumentar em 30% o número de acessos ao WebSite em 2003; sendo que, para a população estudantil, pretende-se chegar a uma média de 50%, passando de dois acessos por aluno ao mês para 4 acessos por aluno ao mês.

Para que se tenha uma idéia de 01 de Janeiro de 2002 a 31 de Outubro de 2002, foram gerados 43.545, sendo que a média por mês durante os dez meses foi de 4354 acessos.

CONCLUSÕES

Esperamos que este trabalho possa mostrar o caminho percorrido pelo colégio até o momento atual, identificando que, durante os seis anos de informática educacional, o WebSite do Colégio foi reestruturado apenas duas vezes e que este dado possa trazer para as pessoas envolvidas no novo projeto, algumas reflexões e discussões sobre qual será a nova postura mediante aos caminhos que serão adotados para a construção do novo WebSite; pois, cada dia mais a comunicação on-line faz-se necessária também dentro do ambiente educacional.

Conforme obtenção de métricas de qualidade para o design de interfaces em WebSites [2, 3, 4, 5], observamos que os colégios estão aprimorando cada vez mais a sua comunicação on-line com os usuários.

Este trabalho terá como principal objetivo propor o ReDesign do WebSite, através da participação efetiva de toda a comunidade educativa, sendo que; sem este trabalho em conjunto, correremos o risco de não atingir os nossos propósitos iniciais, que é "Transformar o WebSite em um instrumento de comunicação para a Comunidade".

É o contexto da escola, a prática dos professores, e a presença dos alunos, pais e funcionários que determinarão o que deverá ser abordado no WebSite; pretendemos assim, desenvolver um processo de formação [10] através de oficinas para que estes usuários possam ter condições de interagir com o WebSite e Comunidade Educativa, enriquecendo a prática pedagógica que a escola se propõe.

Atrelado a isto, temos o desenvolvimento de um Design que traga inovação na forma de apresentação dos conteúdos, onde o mesmo possa contribuir harmoniosamente os conteúdos gráficos (fotografias, imagens, etc) com os conteúdos de texto, além de uma navegação fácil e dinâmica; pois temos observado também em outros WebSites institucionais, a dificuldade em unir dentro de um mesmo espaço visual estes dois conteúdos.

AGRADECIMENTOS

Nossos especiais agradecimentos ao Professor Juliano Schimiguel, pelo incentivo e total apoio dado para o desenvolvimento do trabalho. Gostaríamos também de agradecer as Irmãs da Congregação Santa Marcelina, que sempre acreditaram em nosso trabalho, participando com suas contribuições e gestos de carinho. Não podemos nos esquecer da Coordenadoria de Informática e do Centro de Pós Graduação da UNICSUL. Este último deu apoio financeiro para o desenvolvimento do trabalho.

UM AMBIENTE PARA APRENDIZAGEM COOPERATIVA DE ENGENHARIA DE REQUISITOS ORIENTADO A PROJETOS

Denise Franzotti Togneri[1], Silvana Rossy de Brito[2], Ricardo de Almeida Falbo[3], Orivaldo de Lira Tavares[4] e Crediné Silva de Menezes[5]

***Resumo -** Este artigo discute as principais dificuldades e necessidades enfrentadas no processo de ensino-aprendizagem de Engenharia de Requisitos e propõe uma abordagem baseada na pedagogia de projetos para apoiar esse processo. Apresenta. um ambiente para aprendizagem cooperativa de engenharia de requisitos baseado na abordagem de projetos de aprendizagem.*

Palavras-Chave - Engenharia de software, engenharia de requisitos, pedagogia de projetos, ambiente cooperativo.

I. INTRODUÇÃO

A Engenharia de Software foi criada em resposta a problemas enfrentados no desenvolvimento de software e tem estado em crescente progresso, produzindo novas metodologias, paradigmas e ferramentas. Dentre suas várias atividades, uma das que apresentam maiores problemas quando feita de forma inadequada é a Engenharia de Requisitos [7].

A Engenharia de Requisitos de Software é uma atividade que engloba a descoberta, documentação e manutenção do conjunto de requisitos de um sistema de software [22].

Objetivando produzir software de qualidade e eliminar mitos relativos à forma de atuação do engenheiro de software, a disciplina de Engenharia de Software e, em particular, a Engenharia de Requisitos possui grande destaque no currículo dos cursos de Ciência da Computação.

Dentre as possibilidades pedagógicas utilizadas para auxiliar a aprendizagem de Engenharia de Requisitos, a Pedagogia de Projetos destaca-se por valorizar a cooperação e a colaboração entre os desenvolvedores de um projeto mas, para isso, necessita de apoio automatizado adequado.

Este artigo apresenta um ambiente cooperativo orientado a projetos para apoio à aprendizagem de Engenharia de Requisitos, discutindo suas principais dificuldades e necessidades e apresentando o processo de aprendizagem no contexto da pedagogia de projetos. Está estruturado da seguinte forma: a seção 2 aborda o ensino-aprendizagem da Engenharia de Requisitos; a seção 3 discute a abordagem de projetos na engenharia de requisitos; a seção 4 apresenta um ambiente para aprendizagem cooperativa de Engenharia de Requisitos Orientado a Projetos e finalmente na seção 5 são apresentadas as conclusões deste trabalho.

II. ENSINO-APRENDIZAGEM DA ENGENHARIA DE REQUISITOS

Atualmente, apesar do progresso da tecnologia de informação, produtos de software de baixa qualidade têm sido entregues com freqüência. Tem-se observado que a complexidade dos problemas sendo resolvidos por software tem crescido mais rapidamente que a habilidade de desenvolvê-los e mantê-los [16]. A despeito de várias décadas de esforço, o desenvolvimento dos sistemas de software caracteriza-se mais como uma arte do que uma ciência, sendo dominado por suposições, princípios heurísticos e diretrizes vagas, ao invés de princípios definidos formalmente e técnicas bem definidas [17].

Muitos observadores da indústria de software, já na década de 70, caracterizavam os problemas associados ao desenvolvimento de software como uma "crise" [18]. As investigações determinaram que esses problemas, normalmente, não têm uma causa única, mas as deficiências nos requisitos dos sistemas contribuem fortemente para o problema [5]. Para muitos desenvolvedores de sistemas de software complexos e grandes, os requisitos são o maior problema da Engenharia de Software. Nenhuma outra atividade do processo de desenvolvimento é tão difícil de executar ou tão desastrosa em seus resultados, quando feita de forma inadequada [7].

Com objetivo apoiar a solução desses problemas através de uma melhor formação do Engenheiro de Software, o ensino da Engenharia de Requisitos tem sido cada vez mais valorizado em muitos cursos de graduação e pós-graduação em Computação e em Sistemas de Informação. No entanto, a Engenharia de Requisitos tem sido abordada no contexto

de disciplinas denominadas Engenharia de Software [3], passando, em algumas instituições de ensino, a compor uma disciplina nos programas desses cursos, possibilitando um espaço mais adequado para as discussões pertinentes à área [12].

Segundo Martins [12], apesar de diversos indicativos apontarem que os alunos reconhecem a relevância da Engenharia de Requisitos em suas atividades profissionais, esses indicativos também revelam dificuldades na aplicabilidade da mesma. Além disso, os indicadores relativos à preferência dos aprendizes pelos assuntos abordados na disciplina revelaram uma concentração maior nos temas referentes a elicitação, análise e documentação do que a validação e gerenciamento de requisitos.

Dentre as possíveis causas apontadas para a questão das preferências dos aprendizes nos temas de elicitação, análise e documentação estão [12]:

- há um maior número de pesquisas e artigos publicados sobre elicitação, análise e documentação de requisitos do que validação e gerência de requisitos;
- a validação e a gerência de requisitos são atividades que requerem um considerável esforço dos envolvidos, cujos resultados nem sempre são perceptíveis de forma tão direta como os da elicitação, análise e documentação de requisitos.

As causas apontadas remetem a uma abordagem pedagógica centrada em conteúdos, em detrimento daquelas que valorizam a construção do conhecimento através de construções (artefatos) de discussão, colaboração e cooperação [19].

Adicionalmente, os aprendizes devem compreender que a Engenharia de Requisitos apresenta diversos problemas [4] [9] [29] e é uma tarefa não trivial, iterativa, que envolve intensa comunicação humana e cooperação. Para auxiliar nessa compreensão, é fundamental envolver os aprendizes nas atividades de construção, de forma que, através da experimentação, possam realizar reflexões sobre as falhas que ocorrem no processo de engenharia de requisitos. Essas reflexões podem remeter às seguintes questões:

- essas falhas podem ser atribuídas, em parte, à dificuldade da equipe de desenvolvimento em trabalhar de forma cooperativa, uma vez que, em geral, os engenheiros de software não se preocupam em compartilhar informações e interagir, além de visualizarem a cooperação como um mal necessário [21];
- Os problemas decorrentes da falta de cooperação tendem a se agravar à medida que o número de profissionais envolvidos no processo de software aumenta [11];
- o apoio dos computadores às atividades cooperativas pode auxiliar na solução de alguns desses problemas [27].

Uma abordagem pedagógica que valoriza essas reflexões, as atividades de construção e a experimentação é a Pedagogia de Projetos. Ela pode favorecer o envolvimento do aprendiz no processo de ensino-aprendizagem da Engenharia de Requisitos, através da aprendizagem significativa, promovendo a cooperação e a colaboração entre os participantes desse processo.

III. A ABORDAGEM DE PROJETOS NA ENGENHARIA DE REQUISITOS

Segundo Draves [6], a maior utilidade de um ambiente de aprendizagem cooperativa não é o seu aparato tecnológico e sim o papel de facilitar as interações entre aprendizes e mediadores, e entre os aprendizes. Nesse sentido, estabelecer recursos para que o ambiente melhore o grau de interatividade e envolvimento de seus participantes parece o caminho para aumentar a efetividade dos ambientes de ensino-aprendizagem e promover o crescimento de comunidades de construção de conhecimento [2]. Para alcançar o grau de interatividade e envolvimento necessários, devem ser consideradas tanto as questões relativas ao modelo pedagógico adotado, quanto à necessidade de ferramentas que apóiem o mediador nas suas atividades de acompanhamento.

Na concepção da pedagogia de projetos, os alunos são distribuídos em grupos, cabendo a cada grupo investigar e construir conhecimento sobre um tema. A escolha do tema é norteada pela curiosidade visando com isso tornar a aprendizagem mais significativa possível [24].

Nessa abordagem, os projetos se constituem em planos de trabalho e conjunto de atividades que podem tornar o processo de aprendizagem mais dinâmico, significativo e interessante para o aprendiz, deixando de existir a imposição dos conteúdos de maneira autoritária. A partir da escolha de um tema, o aprendiz realiza pesquisas, investiga, registra dados, formula hipóteses, analisa, aplica e avalia o artefato construído [2]. A aprendizagem é significativa uma vez que a definição de um tema para o projeto pressupõe que o aprendiz possui algum conhecimento prévio sobre o tema proposto, levando em consideração que este se encontra dentro de seu foco de interesse.

Nessa abordagem, não há professor no sentido clássico do termo. Ao invés disso, cada projeto conta com um, ou mais, mediadores. O envolvimento dos aprendizes é fundamental, sendo uma característica chave do trabalho de projetos. Além disso, a responsabilidade e a autonomia dos aprendizes são essenciais: os aprendizes são responsáveis pelo trabalho e pelas escolhas ao longo do desenvolvimento do projeto [24].

Grégoire & Laferrière [8] defendem a idéia de que um projeto será bem sucedido se a participação dos aprendizes e sua contribuição ao tema tiverem sido importantes para o grupo de maneira geral. Isso acontece se os artefatos de um pequeno grupo de aprendizes atraírem o interesse de outros, permitindo que esses outros expandam ou refinem o seu próprio processo de aprendizagem. Os artefatos são produtos produzidos ou consumidos nas diversas atividades durante a construção do projeto [28].

Em um projeto, a responsabilidade e a autonomia dos aprendizes são essenciais. Os aprendizes são co-responsáveis pelo trabalho e pelas escolhas realizadas ao longo do desenvolvimento do projeto. Em geral, essas escolhas são realizadas em equipe, motivo pelo qual a cooperação está também quase sempre associada ao trabalho de projetos. A cooperação é necessária uma vez que o desenvolvimento de um projeto envolve complexidade e resolução de problemas. O objetivo central do projeto constitui um problema que exige o planejamento e a execução de uma ou mais atividades para sua resolução. A execução dessas atividades acontece em fases, conforme sugerem Menezes et al. [13]: identificação do problema, observação e mineração, coleta de dados, análise, síntese, formalização e validação.

No contexto da educação orientada a projetos, as ferramentas de apoio devem prever um meio de comunicação multidirecional eficiente entre seus participantes (mediadores, aprendizes e colaboradores), de forma a substituir a interação pessoal entre eles por uma ação sistemática e conjunta de diversos recursos didáticos, proporcionando um aprendizado independente e flexível aos estudantes. Ao contrário de uma sala de aula, não é necessário que todos os aprendizes estejam realizando as mesmas tarefas, ou em um mesmo ponto em relação ao conteúdo e objetivos do curso. Dessa maneira, seria inadequado insistir na prática de longas aulas de exposição de temas e na hierarquia de papéis de mediadores e aprendizes [24].

No contexto do ensino-aprendizagem da Engenharia de Requisitos, a Pedagogia de Projetos pode auxiliar os aprendizes a compreender a problemática envolvida nas diversas atividades que compõem o processo de Engenharia de Requisitos.

Ainda que diferentes projetos requeiram processos com características específicas para contemplar suas peculiaridades, é possível estabelecer um conjunto de atividades básicas que deve ser considerado em qualquer definição de processo de Engenharia de Requisitos. Existem vários conjuntos de atividades propostos para o processo [1] [9] [10] [15] [22] [25]. Tomando por base a proposta feita por Kotonya & Sommerville [9], de maneira geral, o processo de Engenharia de Requisitos é composto de elicitação de requisitos, análise e negociação de requisitos, documentação, validação e gerência de requisitos.

Não há limites bem definidos entre as atividades propostas; na prática elas são intercaladas e existe um alto grau de iteração e feedback entre elas.

Nos projetos de aprendizagem da Engenharia de Requisitos, o processo de aprendizagem [13] é executado até que um grau de aceitabilidade, definido pelo grupo e pelo mediador, seja alcançado ou que a pressão do cronograma do grupo estabeleça a transição para a próxima fase (Projeto do Software ou apresentação dos resultados da Engenharia de Requisitos para os demais grupos).

No entanto, para suportar a pedagogia de projetos, é imprescindível a utilização adequada de tecnologias que auxiliem o trabalho cooperativo entre os participantes do processo. Sendo assim, um ambiente de aprendizagem orientada a projetos deve fornecer suporte às questões relativas à interatividade, cooperação, colaboração e mediação, além de facilitar a construção dos artefatos do projeto [2].

IV. Um Ambiente para Aprendizagem Cooperativa de Engenharia de Requisitos Orientado a Projetos

Um ambiente de aprendizagem orientada a projeto deve permitir o acesso às ferramentas necessárias para o desenvolvimento de seu trabalho e para suportar as fases do projeto. Além disso, é fundamental que se promova a interação entre os participantes do grupo e entre eles e o mediador.

A necessidade da interação na aprendizagem baseada em projetos também é observada pela estreita relação dessa abordagem pedagógica com a aprendizagem cooperativa. Nos últimos anos, a pesquisa em Aprendizagem Cooperativa Apoiada por Computador (CSCL - *Computer-Supported Cooperative Learning*) deu origem a diversos ambientes que apóiam os processos de aprendizagem promovidos através de esforços colaborativos. A aprendizagem cooperativa é uma técnica com a qual os estudantes se ajudam nos processos de aprendizagem, atuando como parceiros entre si e com o mediador, e visando adquirir conhecimento sobre um dado objeto [20].

No contexto da educação orientada a projetos, as ferramentas de suporte ao processo de aprendizagem devem prever um meio de comunicação multidirecional eficiente entre seus participantes (mediadores, aprendizes e colaboradores), de forma a substituir a interação pessoal entre eles por uma ação sistemática e conjunta de diversos recursos didáticos, proporcionando um aprendizado independente e flexível aos estudantes. Ao contrário de uma sala de aula, não é necessário que todos os aprendizes estejam realizando as mesmas tarefas, ou em um mesmo ponto em relação ao conteúdo e objetivos do curso. Dessa maneira, seria inadequado insistir na prática de longas aulas de exposição de temas e na hierarquia de papéis de mediadores e aprendizes [23].

A CRETA – Uma Ferramenta de apoio à Engenharia de Requisitos Cooperativa pode ser utilizada para apoiar os aprendizes e mediadores, que podem assumir diversos papéis relativos ao desenvolvimento de sistemas, tais como gerentes de conhecimento, engenheiros de requisitos, especialistas de domínio, usuários, gerentes de projeto e patrocinadores [26].

Nesse contexto, CRETA provê mecanismos para compartilhamento e distribuição de informações, facilita a comunicação, a coordenação e cooperação entre os participantes, bem como a percepção e a memória organizacional.

O conhecimento sobre padrões a serem adotados, paradigma, processo, modelos de ciclo de vida, atividades e artefatos, dentre outros, é cadastrado pelo grupo, enquanto exercendo o papel de gerente de conhecimento. O projeto a ser desenvolvido é cadastrado, seu processo é definido pelo grupo, com apoio do mediador e os responsáveis por cada atividade são alocados.

Os participantes fazem uso de ferramentas cooperativas disponíveis, tais como agendas eletrônicas, correio e compromissos eletrônicos, listas de discussão, reuniões virtuais síncronas (chat) e assíncronas (fórum), para promover a comunicação, a cooperação e a interação. Documentos e protótipos para avaliação podem ser disponibilizados, utilizando-se mecanismos da ferramenta. Os diversos artefatos, produzidos pelo grupo, em cada atividade, tais como planos de entrevistas, atas de reuniões diversas e documentos de requisitos podem ser cadastrados, de modo a promover seu registro, compartilhamento, validação e gerência. A arquitetura definida para a ferramenta é composta por cinco componentes [27]: Conhecimento de Processo, Recursos e Padrões, Definição do Processo, Engenharia de Requisitos, Trabalho Cooperativo e Acompanhamento de Projeto. A implementação da arquitetura proposta foi baseada na Web, de forma a possibilitar que os participantes possam estar geograficamente dispersos. Foram utilizadas a tecnologia JSP – *JavaServer Pages* e a linguagem Java 2 da Sun.

A figura 1 apresenta a página principal de CRETA, que exibe os compromissos e correios não lidos, as atividades agendadas para a data corrente e a agenda particular do participante. A partir dessa página tem-se acesso às funcionalidades disponíveis em CRETA.

Na estruturação do projeto de aprendizagem, o planejamento é definido como sendo o momento em que os aprendizes definem o problema (tema) e estabelecem os primeiros procedimentos necessários para desenvolvimento de uma solução.

Ainda que diferentes projetos requeiram processos com características específicas para contemplar suas peculiaridades, é possível estabelecer um conjunto de atividades básicas que deve ser considerado em qualquer definição de processo de Engenharia de Requisitos. Esse processo não deve ser imposto pelo mediador e sim discutido e acordado pelos aprendizes.

Depois de planejado o processo, os aprendizes, na etapa de montagem e execução, iniciam o processo de investigação propriamente dito, realizando entrevistas e reuniões, síncronas e assíncronas, presenciais ou virtuais, pesquisando na Internet, em livros e em outras mídias, coletando informações em sites específicos, participando de listas de discussões, consultando virtualmente especialistas no assunto, elaborando e aplicando questionários, etc.

FIGURA 1
PÁGINA PRINCIPAL DE CRETA

À medida que as informações vão sendo levantadas, elas são formalizadas, compartilhadas, analisadas e negociadas.

A seguir, inicia-se a depuração, que é uma etapa de auto-avaliação e autocrítica, em que os ajustes poderão ocorrer. Nesse momento, o grupo deverá avaliar os artefatos construídos e supostamente acabados para refletir criticamente sobre eles e alterá-los, se julgar necessário. Essa etapa dá oportunidade ao aprendiz de olhar analiticamente seu projeto, buscando a melhoria e a qualidade do resultado final.

Na etapa de apresentação, a criação e depuração do projeto já foram realizadas e os aprendizes podem expor, apresentar e/ou disponibilizar seu produto para a comunidade (mediadores, outros grupos, observadores e colaboradores). Nessa etapa, os mediadores podem também estar realizando a avaliação, não só dos artefatos gerados, mas principalmente, de tudo o que foi aprendido durante o desenvolvimento do projeto.

A etapa de avaliação e crítica tem como finalidade a análise e reflexão sobre o projeto e sobre o processo de desenvolvimento, questionando sua qualidade e apresentando soluções de melhoria para projetos subseqüentes. Segundo Nogueira [14], considerando-se apenas as etapas de utilização dos recursos tecnológicos na elaboração de um produto, o projeto poderia ter sido concluído na etapa anterior (apresentação). Entretanto, o objetivo não é apenas o produto final, mas principalmente, todo o aspecto pedagógico envolvido na metodologia de projetos, justificando a necessidade de mais essa etapa, na qual o aprendiz poderá verificar, analisar e aceitar possíveis "erros".

V. CONCLUSÕES

A ferramenta CRETA, apesar de ter sido desenvolvida, inicialmente, para apoiar a Engenharia de Requisitos Cooperativa [26], pode ser aplicada para auxiliar no processo de aprendizagem, no contexto da Pedagogia de Projetos. Ela favorece a comunicação, as diversas modalidades de interação, a coordenação, a cooperação e a colaboração. Permite o registro e compartilhamento dos diversos artefatos gerados, coletivamente, durante o desenvolvimento de um projeto, que poderão servir como um repositório de conhecimento, a ser utilizado por outros grupos.

A partir da utilização dessa ferramenta, pretende-se aprimorar os requisitos já levantados por Tavares et al. [24], relativos ao acompanhamento dos projetos pelos mediadores, de forma a fornecer registros que permitam potencializar suas atividades de mediação.

CURSO TÉCNICO EM ELETRO-ELETRÔNICA: UMA PROPOSTA INOVADORA EM CURRÍCULO POR COMPETÊNCIAS PARA A EDUCAÇÃO PROFISSIONALIZANTE

Allan Kelvin Mendes de Sales[1], Ailton Façanha Moreira[2],José Roosevelt Marques Nogueira[3], Marcelo Fontenele de Carvalho [4], Viviani de Avelar Cordeiro[5].

Resumo — *As transformações no mundo globalizado pedem um profissional formado em curto espaço de tempo, flexível, crítico e capaz de mobilizar os seus diversos saberes diante de um ambiente de natureza dinâmica e complexa. Em resposta a esta nova demanda social, o Instituto Centro de Ensino Tecnológico (CENTEC) está criando o curso Técnico em Eletro-eletrônica. Este plano de curso busca uma política de ensino de qualidade, visando o desenvolvimento de alunos como pessoas integrais, na ampliação de seus conhecimentos; capacitando para a autonomia, a autocrítica e para uma praxis efetiva de mudança do contexto sociocultural e econômico vivido. Para efetivar estes objetivos partimos para uma proposta inovadora de organização curricular e metodologia de ensino, adequada à democratização do saber: currículo modular e baseado em projetos. O presente trabalho visa apresentar um breviário do curso e realizar algumas considerações teóricas a respeito.*

Palavras-chave — Currículo por Competências, Eletro-eletrônica, Ensino Baseado em Projetos.

INTRODUÇÃO

As transformações no mundo globalizado vêm ocorrendo em ciclos com períodos cada vez menores e envolvendo um número elevado de elementos interdependentes. Este processo propicia o surgimento de um ambiente de natureza dinâmica e complexa, com alto nível de incerteza. Neste contexto, a evolução tecnológica de forma ampla e, mais particularmente, a evolução da informação associada ao desenvolvimento do conhecimento, vem sendo apontada na literatura como elementos fundamentais dessas mudanças.

A escolha por um Curso Técnico em Eletro-eletrônica deve-se, *apriori*, à possibilidade de ampliação do uso dos laboratórios do Curso de Tecnologia em Eletromecânica no período noturno. Desta forma, estaremos otimizando os investimentos realizados pela Instituição. Um outro fator imperante, nesta tomada de decisão, é o reconhecimento que a revolução tecnológica da atualidade é permeada em todos os seus aspectos e nuances pelo uso sistemático da eletricidade e da eletrônica.

O projeto de Curso Técnico em Eletro-eletrônica, a ser desenvolvido pelo Instituto Centro de Ensino Tecnológico – CENTEC, Ceará, busca aproveitar de forma integrada as condições de desenvolvimento e transformações sócio-econômicas e culturais por que passam as regiões do Vale do Jaguaribe, Vale do Acaraú e Vale do Cariri, neste momento, propiciando além da educação profissional de nível técnico, o atendimento à demanda do mercado de trabalho regional.

Em conseqüência, as empresas instaladas nos Pólos Industriais do Ceará, além de transferirem tecnologias, indispensáveis ao desenvolvimento regional, vão colaborar com o CENTEC, na formação de profissionais de nível técnico que atendam às suas necessidades básicas.

Neste contexto, o CENTEC com o presente Curso Técnico de Eletro-eletrônica, primeiro de uma série de outros, se propõe a desenvolver as competências necessárias ao atendimento às empresas instaladas e àquelas que virão a se instalar, contribuindo para o desenvolvimento do potencial humano e profissional da região que se transforma de uma economia fortemente agrícola numa economia significativamente industrial, integrando os recursos humanos locais, no atendimento da demanda do mercado de trabalho.

Pretendemos também, atender as expectativas das empresas implantadas nos Pólos Industriais do Ceará no sentido de gerar oportunidades de melhoria educacional e de condições de profissionalização para os seus funcionários, como conhecimentos e habilidades específicas, propiciando-lhes a qualificação necessária, garantindo-lhe a manutenção no mercado de trabalho bem como o desenvolvimento de habilidades voltadas para o progresso individual e regional.

PRESSUPOSTOS TEÓRICOS

O termo competência tem sua origem no latim competere (cum-com, pete-buscar) que queria dizer correr com alguém,

ter a mesma meta, buscar com. Não é à toa que o lema do Barão de Coubertin, criador das Olimpíadas da era Moderna, era: “o importante não é vencer. O importante é competir”. Em outras palavras, o importante é ter o mesmo objetivo.

Com o passar dos séculos, o termo passou a designar o ponto de partida, e não mais o ponto de chegada de uma corrida, ou seja, o conceito tornou-se o de disputar com, lutar por, rivalizar desde o começo. Mas por que esta reviravolta? Quando se está com um único objeto, ou alguém em vistas e duas pessoas estão desejosas por ele, então o caráter excludente vem à tona: se um consegue o objeto, a pessoa, o outro não o terá. Em um mundo capitalista essa noção de posse é essencial, fundamental, o senso comum: o que se quer é concorrer, competir, disputar com o adversário, para conseguir um lugar ao sol.

Mas como retomar ao conceito original? O saber, o conhecimento, pode ser um retorno ao conceito original. Quando se busca o saber, busca-se o sabor das coisas (ambas tem o mesmo radical latino), e nada dá mais sabor do que buscar com outro.

Mas no contexto escolar, o que vem a ser competências? Segundo o MEC competências são “a capacidade de mobilizar, articular e colocar em ação valores, conhecimentos e habilidades necessários para o desempenho eficiente e eficaz de atividades requeridas para o trabalho” [1].

Nos anos noventa a abordagem por competências resultou em total rearranjo dos sistemas educacionais em países como Bélgica, Canadá e França. Mais recentemente estão sendo implantado currículos sob esta óptica no Brasil (e também na Suíça) desde a instituição das diretrizes curriculares para o ensino técnico (1999), como disposto pela Lei de Diretrizes e Bases da Educação (LDB) de 1996.

A abordagem por competências surgiu da sociologia do trabalho, da pesquisas ergonômicas feitas para um desempenho eficaz e móbil no trabalho realizadas na França [5]. Desta forma, a competência surge como a capacidade de transpor o trabalho prescrito, cotidiano. Diante de uma situação nova e complexa, o trabalhador é obrigado a mobilizar saberes para resolvê-la. É o trabalho real e concreto em contraposição velada ao trabalho prescrito, rígido, normalizado e, portanto, artificial, imposto.

Em um mundo globalizado, em que os avanços tecnológicos são rápidos e efêmeros, não se pode, segundo Perrenoud, “... reduzir o mundo econômico à exploração máxima de uma força de trabalho pouco qualificada já não faz sentido hoje, ainda que o capitalismo descrito por Marx subsista em uma parte do planeta [3]”. Assim, o trabalhador passa a ser visto pela empresa como algo que deve ser flexível, inteligente, perspicaz, imaginativo, tenha entusiasmo, caso se queira uma produtividade eficiente e eficaz. As empresas passam a se interessar por uma pessoa competente no sentido explicitado mais acima. No entanto, elas não fazem isso, é claro, por humanismo, mas por cálculo. Segundo Perrenoud, “o interesse pelas competências insere-se em um contexto de concorrência e de busca de produtividade[3]”. Alem disso, pessoas competentes *a priori*, podem ser descartadas mais facilmente, uma vez que, sendo inteligentes e criativas, podem encontrar mais facilmente novos empregos.

Diante desta necessidade econômica das empresas as escolas não podem mais desenvolver trabalhadores imediatamente adaptados a um posto de trabalho; definidos e com bom desempenho em seu posto. Eles perderiam logo seus postos para outros mais competentes.

No entanto, Perrenoud adverte: “por isso, é importante examinar os currículos muito de perto, para compreender que tipo de seres humanos eles pretendem formar. Seria fácil opor a autonomia ao conformismo, o espírito crítico à obediência cega. As comparações são mais delicadas quando se trata de distinguir uma ‘verdadeira’ autonomia de uma autonomia a serviço da cultura empresarial, um ‘verdadeiro’ espírito crítico de um espírito crítico enquadrado, excluindo de seu campo certos valores e certas práticas [3]”.

Segundo a Proposta do MEC de Metodologia de Planejamento de Currículos por Competências – Cursos Técnicos, o novo paradigma muda o foco do trabalho escolar: de transmissão de conteúdos, para construção de competências. Assim, tem-se em mãos um novo projeto de escola, que pressupõem o aluno como agente do processo: faz perguntas, pesquisa, descobre, cria, aprende; o currículo é considerado como meio para guiar a prática pedagógica; o foco passa a ser a aprendizagem, não mais o ensino.

Nesse sentido deve-se construir competências desde a escola. Aqui, competência significa ações e operações mentais que, associadas a conhecimentos e experiências, geram habilidades (saber-fazer).

Para constituir competências, a estratégia utilizada é a ação desencadeada por desafios, projetos, problemas propostos pelo professor e por este monitorado e assessorado. Esses problemas, projetos são a característica de um currículo dirigido por competências. Podem ser reais ou simulados, formando um conjunto que desencadeia ações resolutivas, tais como as de pesquisa e estudo de conteúdos ou de bases tecnológicas capazes de propiciar ao aluno uma base teórica para a resolução do problema proposto. Neste sentido, a resolução do projeto, do problema passa a ser o foco do aluno, e o saber o meio para isso, tornando-se contextualizado.

A estratégia de solução de problemas, então, capacita os alunos a aprender a aprender, de questionar e ir buscar respostas, de construir autonomia, tornando-os competentes para diante de problemas do cotidiano do processo produtivo de forma rotineira ou inusitada, tomar decisões acertadas.

Organização Curricular

O curso de técnico em eletroeletrônica do CENTEC tem sua organização curricular baseada em uma estrutura por módulos de projetos. A definição dessa estrutura contou com a participação de uma comissão de professores nas áreas afins de cada unidade descentralizada do Instituto CENTEC.

Baseado nessa proposta pode-se assumir, juntamente com a introdução das diretrizes curriculares, *"que* os *currículos não são fins, mas coloca-se* a *serviço do desenvolvimento de competências, sendo ess*as *caracterizadas pela capacidade de, através de esquemas mentais ou de funções operatórias, mobilizar, articular* e *colocar em* ação *valores, conhecimentos e habilidades".* Isto *"significa, necessariamente, adotar uma prática pedagógica que propicie, essencialmente, o exercício contínuo e contextualizado desses processos de mobilização, articulação e aplicação".*

O plano de curso de técnico em eletroeletrônica do CENTEC tem uma organização curricular centrada em projetos, onde são previstos, basicamente, quatro projetos. Cada um deles permite o desenvolvimento de um ou mais produtos a serem entregues no final do módulo correspondente. Os projetos são os responsáveis pelo desenvolvimento das competências mais complexas. Além disso, os projetos articulam Oficinas destinadas ao desenvolvimento de competências mais específicas e nelas focadas, sendo estas competências componentes das mais complexas, atribuídas aos projetos. As oficinas são também instrumentais no desenvolvimento dos projetos e uma mesma Oficina pode estar a serviço de vários deles. O presente plano de curso tem uma organização curricular em espiral e em rede.

Módulo I - Nivelamento

O Módulo I - Nivelamento consiste na identificação do perfil de entrada dos participantes quanto aos conhecimentos básicos no sentido de garantir, de forma igualitária, um ótimo desempenho nos módulos subseqüentes.

Através deste nivelamento busca-se capacitar o participante com conhecimentos básicos indispensáveis para seu desempenho em módulos posteriores em matemática, eletricidade e magnetismo, e informática; possibilitar ao aluno conhecimentos sobre a estrutura, funcionamento e importância do Curso Técnico em Eletro–eletrônica no âmbito do CENTEC, mostrar as perspectivas do curso no contexto regional, áreas de trabalho, necessidades do mercado etc.

Vale ressaltar que o nivelamento não possui terminalidade, nem haverá certificação, posto seu caráter ser meramente de equiparação dos participantes do curso. As disciplinas consideradas necessárias ocorrerão após o processo seletivo, perfazendo 240 horas, e seguirão a seguinte ordem de sequenciamento:

Primeiro momento: Matemática Aplicada (60 horas); Eletricidade e Magnetismo (45 horas) e Introdução a Eletro-eletrônica (15 horas).

Segundo momento: Informática Básica (45 horas) e Análise de Circuitos (75 horas).

Os workshops, descritos em tópico adiante, complementarão as 300 horas do módulo I, serão ministrados ao longo do módulo.

Módulos com Terminalidade (de II a V)

A partir do Módulo I, todos os módulos são terminais e conduzem a uma certificação de nível técnico. As ações educativas compreendidas pelos módulos terminais são articuladas por projetos e estão relacionados diretamente com a formação técnica objetivada pelo módulo correspondente.

Os projetos destinam-se a desafiar o participante e a problematizar o corpo de saberes em construção. Estão no rumo da contextualização do saber, favorecendo o aumento da complexidade do conhecimento e a incorporação das competências pelo aluno. Esses projetos serão relacionados com situações reais.

Cada projeto articula as ações educativas envolvidas em um módulo terminal correspondente. Esses projetos terão um ou mais produtos específicos e estarão destinados ao desenvolvimento das competências necessárias para o desempenho eficaz do profissional a ser qualificado em nível técnico. São as atividades realizadas nas Oficinas, disciplinas, workshops que contribuirão para a realização dos diversos produtos a serem entregues no final de cada módulo.

Neste Plano de Curso estão especificadas, em tópico posterior, as ações educativas (oficinas, ciclo de pesquisas, workshops) que são articuladas pelos projetos, bem como o próprio projeto e os produtos específicos que deverão ser apresentados no final dos módulos correspondentes.

Os quatros módulos com terminalidade perfazem um total de 1200 horas. O Módulo II articula projetos em instalações elétricas prediais, com um total de 300 horas; o Módulo III em instalações elétricas industriais, com 300 horas; o Módulo IV em sistemas eletrônicos analógicos, com 300 horas; o Módulo V em sistemas eletrônicos digitais, com 300 horas;

Após a conclusão de cada módulo, com aproveitamento suficiente, será concedido ao aluno Certificado de Qualificação e Aperfeiçoamento que lhe permitirá integrar-se à força de trabalho no âmbito das atribuições e competências que o referido módulo lhe concede, bem como obter créditos para a conclusão do Curso Técnico em Eletro–eletrônica (Módulos II, III, IV e V). Desse modo, a organização curricular em módulos se consubstanciará num itinerário de níveis cada vez mais elevados de competência para o trabalho possibilitando:

- Um contínuo processo de qualificação, especialização e aperfeiçoamento profissional;
- Atendimento às necessidades do mercado através da formação contínua de mão-de-obra;
- Formação permanente, capaz de oferecer diversas e reiteradas oportunidades de realização individual e coletiva;
- Suprir a carência regional por cursos desta natureza.

Etapas do Curso

Módulo I – Nivelamento:

Ações Educativas	Modalidade	Duração
✓ Matemática Aplicada.	Disciplina	60 horas
✓ Eletricidade e Magnetismo.	Disciplina	45 horas
✓ Informática Aplicada.	Disciplina	45 horas
✓ Análise de Circuitos.	Disciplina	75 horas
✓ Introdução à Eletro-Eletrônica.	Workshop	15 horas
✓ Relações Interpessoais, Ética e Cidadania.	Workshop	30 horas
✓ Segurança, saúde e meio ambiente.	Workshop	30 horas
Duração Total		**300 horas**

Módulo II - Instalações Elétricas Prediais

Projeto	Ações Educativas	Modalidade	Duração
Instalações Elétricas Prediais	✓ Produtos: Projetos residenciais (casa, apartamento, etc).	Projeto	90 horas
	✓ Desenho Técnico e Elétrico.	Oficina	60 horas
	✓ Luminotécnica.	Oficina	30 horas
	✓ Dimensionamento de Materiais Elétricos.	Oficina	45 horas
	✓ Máquinas Elétricas de Baixa Potência.	Oficina	45 horas
	✓ Instrumentação Elétrica.	Oficina	30 horas
Duração Total			**300 horas**

Módulo III - Instalações Elétricas Industriais

Projeto	Ações Educativas	Modalidade	Duração
Instalações E. Industriais.	✓ Produtos específicos: Projeto de uma indústria	Projeto	90 horas
	✓ Motores Elétricos.	Oficina	75 horas
	✓ Transformadores.	Oficina	45 horas
	✓ Acionamentos Elétricos.	Oficina	60 horas
	✓ Manutenção Elétrica.	Oficina	30 horas
Duração Total			**300 horas**

Módulo IV - Sistemas Eletrônicos Analógicos

Projeto	Ações Educativas	Modalidade	Duração
Sistemas E. Analógicos.	✓ Produtos específicos: ▪ Fonte de Alimentação ▪ Amplificador de Sinais ▪ Filtros Ativos ▪ Osciladores ▪ Circuitos de Acionamento ▪ Retificadores Controlados ▪ Conversor D/A	Projeto	90 horas
	✓ Semicondutores.	Oficina	90 horas
	✓ Eletrônica Industrial.	Oficina	60 horas
	✓ Circuitos Integrados.	Oficina	30 horas
	✓ Manutenção Eletrônica.	Oficina	30 horas
Duração Total			**300 horas**

Módulo V - Sistemas Eletrônicos Digitais

Projeto	Ações Educativas	Modalidade	Duração
Sistemas E. Digitais	✓ Produtos específicos: ▪ Semáforo eletrônico ▪ ULA e Memória de 4 bits ▪ Contador de Passagem ▪ Divisor de Freqüência ▪ Relógio Digital ▪ Termômetro Digital ▪ Acionamento de Motor de Passo ▪ Acionamento de LCD ▪ Acionamento de D7S multiplexado ▪ Medidor de Freqüência ▪ PWM para Motor CC ▪ Medidor de RPM	Projeto	90 horas
	✓ Circuitos Combinacionais.	Oficina	60 horas
	✓ Circuitos Seqüenciais.	Oficina	60 horas
	✓ Microcontroladores	Oficina	60 horas
	✓ Manutenção em Eletrônica Digital.	Oficina	30 horas
Duração Total			**300 horas**

Em cada módulo a ordem de desenvolvimento das Ações Educativas ficará a critério de cada unidade, em função das necessidades da clientela e exigências do andamento dos projetos, e da seqüência lógica e psicológica do conhecimento. Os produtos específicos, de cada módulo, terão uma duração de 90 horas ao longo de todo o módulo.

Indicações Metodológicas

O enorme volume de conhecimento científico e as diversas mudanças efêmeras no campo tecnológico criam novas exigências para a educação profissional. Estas devem se basear na formação de um nível de pensamento mais condizente com esta nova realidade. O ensino tradicional, com seus métodos expositivos e com práticas concretas arbitrárias, não satisfaz essas demandas da produção e à constante revolução científica-tecnológica da atualidade.

A educação profissional deve garantir esta formação epistêmica, em que o aluno alcance a realidade, e a interprete de maneira científica e teórica. Desta forma, o aluno será capaz de pensar *independentemente* e de *forma criativa*, modificando ativamente o mundo circundante.

As estratégias pedagógicas adotadas para o desenvolvimento do curso deverão concretizar uma metodologia de contextualização do conhecimento, bidirecional, baseada na troca e no diálogo entre educador e educando, essencial a um processo efetivamente interativo.

As estratégias de aprendizagem deverão abranger a resolução de problemas e o desenvolvimento de projetos. Estes projetos devem conter a(s) essência(s) do saber tecnológico capaz de despertar no estudante novos conhecimentos. Além disso, o professor deve estar a par destas formas gerais e essenciais deste saber. Deve-se garantir a união do abstrato e do concreto: enquanto o professor planeja suas aulas por meio destas “formas gerais essenciais”, os alunos as exploram através da implementação dos projetos, buscando a superação das diversas nuances meramente empíricas e sensoriais, e as dificuldades inerentes na resolução dos problemas propostos. O uso de modelos gerais, e o seu desenrolar, com suas ampliações pelas inclusões das descobertas dos alunos, possibilita a inter-relação e o desenvolvimento do abstrato com o concreto: enquanto o concreto é sintetizado pelas formas abstratas, o abstrato é enriquecido pelo concreto, pois nada se manifesta sem o abstrato [6].

Estas estratégias devem ser flexíveis, propiciando o aproveitamento dos saberes individuais e permitindo o acompanhamento das mudanças e do equilíbrio dinâmico do mundo do trabalho.

Conclusão

A problemática de um trabalhador polivalente não é nova. Embora Perrenoud associe o Capitalismo da era de Marx e o atual, como coisas distintas, vale lembrar o que o próprio Marx dizia sobre o assunto há 150 anos atrás: "o verdadeiro significado que o ensino recebeu entre os economistas filantrópicos é este: treinar cada operário no maior número possível de ramos do trabalho, de modo que, se por introdução de novas máquinas ou por mudanças na divisão do trabalho, ele vier a ser expulso de um ofício, possa mais facilmente achar colocação em outro". Além disso, "a grande industria, com suas próprias catástrofes, faz com que o reconhecimento das variações do trabalho, e daí, da maior versatilidade possível do operário (...) se torne uma questão de vida ou morte [2]". Pode-se concluir daí, que o capitalismo atual nada mais é que uma evolução histórica do da época de Marx, e este previu acertadamente os acontecimentos atuais. A abordagem por competências vai de encontro ao exposto mais acima, surgindo da sociologia do trabalho e da ergonomia francesa.

Perrenoud em suas palestras e artigos tem sido o principal divulgador desta teorização. No entanto, ele mesmo tem notado a ambigüidade, notada por Marx, na implantação de uma escola voltada para as competências. Muitas dúvidas, possíveis desvios são por ele analisados, na tentativa de levar as escolas e professores ao caminho correto pela escolha em se trabalhar por competências.

Deve-se ter em mente, segundo ele, que: as competências não substituem o saber, na verdade ele é a base da competência. No entanto, não se deve confundir um e outro, competência é mobilizar saberes, não um saber a mais. Além disso, também é aprendida. Contudo, não se pode privilegiar o saber em detrimento à competência, o que seria retornar ao método tradicional.

Outro ponto é o perigo dos textos não serem nada mais do que textos... "Pode-se ter um programa magnífico, mas cuja realização plena diz respeito apenas a uma minoria no seio de cada geração. Na maior parte dos sistemas educativos, as finalidades da escola e as intenções subentendidas nos currículos são bastante honrosas. O ponto fraco é a enorme desigualdade em sua realização, em primeiro lugar na interpretação que se faz e que determina o 'currículo real', depois, e, sobretudo, nas aprendizagens efetivas dos alunos [3]". Além disso, ainda em relação aos Currículos, as competências a privilegiar não podem ser "aquelas que mobilizam fortemente os saberes escolares e disciplinares tradicionais", segundo aqueles "que querem que nada mude, salvo as aparências. Se os programas prevêem o estudo da lei de Ohm, eles proporão acrescentar um verbo de ação ('saber servir-se conscientemente da lei de Ohm') para definir uma competência. Para ir além do passe de mágica, é indispensável explorar as relações entre competências e programas escolares atuais [4]".

O CENTEC, sendo uma instituição de ensino recente, não possui certos vícios das instituições mais antigas. Neste aspecto, soube muito bem direcionar as atividades necessárias para a confecção de um currículo por competências de uma forma responsável e dentro do estabelecido, não somente pelos ditames do MEC, mas, sobretudo, pelos olhares atentos de seus colaboradores. Sem esta iniciativa, estaríamos, como adverte Perrenoud, apenas escrevendo textos.

Deve-se ressaltar, ainda mais, que as disposições do MEC são uma coisa, e a filosofia de Perrenoud e seus colaboradores outra. Isso pode ser notado pela tentativa do MEC em prescrever as competências de cada setor produtivo, de considerar as competências como mero saber-fazer eficaz e eficiente. A abordagem por competências é muito mais que saber-fazer, é mobilizar saberes e está além de construir verbos prescritivos para competências e outros para habilidades. Não há em Perrenoud nenhuma alusão a esta distinção. O que ele busca é uso eficaz dos saberes escolares de uma forma transgressiva, para além de prescrições, restrições e do senso comum, voltado para o trabalho real. No entanto, o uso de solução de problemas e uso de projetos é sugerido por Perrenoud como requisitos para se trabalhar com competências.

O Curso Técnico em Eletro-eletrônico está em sintonia com a abordagem original. Espera-se com ele, capacitar os seus alunos para a transgressão do cotidiano, buscando resolver problemas inusitados, enfim, construir competências. O currículo por competências permite isso. Primeiro: sendo modular, se tem terminalidade. Segundo: sendo baseado em projetos, não se tem o saber pelo saber, mas oficinas orientadas ao projeto, o que permitirá ao aluno contextualizar as bases tecnológicas apresentadas. Terceiro: as oficinas podem ser ministradas de acordo com a necessidade dos produtos de cada etapa modular. Assim, não se sobrecarrega o aluno com informações de 4 a 6 disciplinas de uma vez, como ocorre nos currículos tradicionais.

Atenta a estes pormenores, a equipe de elaboradores teve o cuidado para não criar meros arranjos de disciplinas, ensacá-las em um módulo, reescrever unidades em verbos apropriados para agradar ao MEC. Estava-se preocupado com aqueles que ingressarão futuramente no curso. De forma responsável, não se buscou o caminho mais fácil, mas se comprometer, não com um mero cliente em potencial, mas com um futuro cidadão digno de seus direitos e consciente de sua força emancipatória. O CENTEC nos permitiu essa aventura.

AGRADECIMENTO

Agradecemos ao CENTEC pelo apoio logístico dado aos membros da equipe elaboradora, na pessoa da Profa. Elda Tahin Fontelene, Diretora de Pesquisa e Ensino, e nas demais que fazem do CENTEC uma instituição diferenciada. Sem elas este projeto não seria possível.

TRADITIONAL TEACHING METHOD: CRITICISM AND PERSPECTIVE OF A NEW PATTERN FOR THE TEACHING OF ENGINEERING

Allan Kelvin Mendes de Sales[1]

Abstract — *The traditional method of teaching is, no doubt, the most used among university teachers. Practically, the whole educational system of the nation adopts it, except for pre-school institutions and some schools that teach the fundamental level, the so called "constructive" method. Expository classes, explanations of formulae, sequential tests, condensation of knowledge into disciplines, and laboratories in which measurement and observation are overvalued may be considered characteristic of this traditional method. This paper analyzes the possible sources that originated the traditional teaching method, exposes part of the most common criticism about it, and presents a new perspective trying to modify it, based on the scientific theories of Vygotsky, Leontiev, and Davydov.*

Key words: Activity Theory, Teaching of Engineering, and New Pattern.

INTRODUCTION

An overwhelming amount of literature deals with the "crises of education" or with the underlying philosophies about the subject [1].

The specific literature we investigated nevertheless is silent about the scientific treatment of the process that involves teaching-and-learning at the universities.

The traditional method is, no doubt, the most widely used in Brazilian Universities. Almost all the educational system adopts it, except for pre-school and some basic level schools, which adopt the "constructive" method. Expository classes, explanation of formulae, transposition of sequential tests, condensation of knowledge into disciplines, and laboratories in which measurement and observation are overvalued may be considered characteristics of this hegemonic method in Brazilian schools.

In the next segment we analyze the source of origin of the traditional method. Next, we show the commonest criticisms to it and, then, we present a new perspective for change, based on the scientific theories of Vygotsky, Leontiev, and Davydov.

TRADITIONAL TEACHING METHOD SOURCES

In [2], Saviani presents three theses about the teaching process in 1st Degree Schools. One of these theses states that the traditional method has its origins and was studied by means of the Herbatian pedagogic methodology, that is, "in the expository method, which we all know and have been exposed to it, and many are still being exposed, the theoretical matrix is found in Herbart's five formal steps".

Note that in [5] the author, writing about "the traditional approach to the teaching process (not about the traditional method) states that this approach is not implicit or explicitly based in empirically validated theories, but in an educational practice and in its transmission through the years", since it presents in its genesis several theoretical tendencies, both scientific or philosophic about man, the world, the school, etc.

In other texts we may find that the method, not the approach, really comes from generalization or, in other words, from Herbart's steps hegemony and in the so-called formal disciplines [13]. In Brazil, elements from other scientific theories and ideological standpoints were added to this method, especially North-American behaviorism and technicism. This can be inferred by the context in which changes in Brazilian education were carried on at the time of the political dictatorship begun in 1964, as presented in the famous Rudolf Atcon report [4]. From what has been exposed, we may consider the origin of traditional pedagogy as Herbatian.

MOST IMPORTANT CRITICISMS

The traditional teaching is multi-faceted and may be criticized from several standpoints.

Criticisms are always based on its concrete characteristics, and the pre-supposed theoretical and/or philosophical and/or scientific ideas that would justify this didactic attitude.

From the concrete characteristics, we may outline some of the most important: several students seated on desks (depending on the teaching level, we will have a number between 15 and 60!) before a single person who relates the lessons, the contents, and the subject. A moment to clarify doubts and answer questions. Then, homework or some kind of example. A test. The process is now repeated with new contents. These are the main characteristics of the so-called academic school. In some other types of schools (technical, universities) we add a laboratory and several technical experiments to consolidate what has been taught. Tied to this panorama are implicit different viewpoints of the world, the student, the learning process, and we cannot, at this point, homogenize existing ideologies: each teacher will develop them along his school practice.

Once the picture of traditional teaching is characterized we may now look for the presuppositions of this caricature.

[1] Allan Kelvin Mendes de Sales, Instituto Centro de Ensino Tecnológico, Curso de Eletromecânica, Rua Leão Sampaio, s/n, 63.000-020, Juazeiro do Norte, CE, Brazil, nallak@uol.com.br

Johann Friedrich Herbart (1776-1841) was an eminent German philosopher and a skilled teacher. He was the first to develop a learning psychology to justify the "clean slate" theory (derived from Locke's empiricism) by mid XIX century. His psychology was metaphysical and speculative and was based in his own teaching experiences. Therefore it was not an experimental psychology yet. In his view, psychology should be introspective. The four stages of Herbart's method were: clarity, association, system, and method, which his American followers extended to five [9]. These stages were looked upon as a general learning method. The so-called Herbart's formal steps that originated the fundamental teaching are the following: *preparation, presentation, assimilation/comparison, abstraction, generalization, and application [3].*

These steps, if watched attentively, are nothing else than Bacon's scientific method: observation, generalization, confirmation, which are also the reasoning inductive method.

The similarities with traditional teaching do not end here. The renowned class-plans that teachers used to create have their origins in it. Today, not used any more, they were replaced by the emendations.

The practices arising out of this approach required total discipline and attention from the part of the students to the topics presented by the teacher who, on his side, should follow in detail the steps outlined in his lesson-plan, etc. This discipline, focused on total attention, justified the punishment methods so far imposed or, at least, provided subsidies to them. According to Herbart himself the teacher is supposed to disguise any debate from the part of the students by means of an undisturbed disapproval and "wait till fatigue takes care of them" [9]. Needless to say that other disciplinary techniques such as the palmer were considered more efficient to calm down and impose attention from the part of the rowdy and heedless students. The passiveness of the students arises as a result of Herbart's metaphysical philosophic conception in which active are the ideas, not the persons.

Philosophic Presuppositions

The philosophy underlying this method is Locke's sensory empiricism but without a materialist, objective, character. Whereas, according to Locke, learning comes from the interaction of sensory experience with the environment, and this shapes the minds of the persons, who are morally neutral and passive in terms of action, to Herbart everything happens in the heads of the students. It is a world of ideas, perceptions. The ideas, however, have autonomous activity; they live by themselves. Afterwards, Kant, Hegel, and others, being replaced by objective empiricism, criticized these ideas.

Power Structure

Until now, we live a "Herbatian" culture. The palmer was replaced by more subtle tactics of punishment. The established knowledge provides "ex-catedra" supremacy, and this improves discipline, dismissing the use of power. The use of negative points, second-chance tests (generally more difficult), the exclusion/repetition of the "rebel", "problematic" students, permeate the school structure and end up by taming the student, hegemonically producing "docile and submissive bodies" [8].

It is, above all, an excluding and discriminating process: while the "good" students receive the prize of promotion, the "bad" students will repeat, repeat, and repeat... there is no interest in their recovery and reinsertion. If the student does not learn, it is not the teacher's fault! The evaluation is based only on his behavior and on the tests. The student, having no alternatives, memorizes, cheats; what really matters are the grades, to pass easily in all disciplines, knowledge being something secondary in this homeopathic sadism [7].

That is the watch and punish procedure that Foucault and Tragtenberg indict [8]. The school structure, with its roll-calls and ringing of bells, remind us of the of control of the labor forces and the prisoners in jail.

Behaviorism – Technicism

This metaphysics was, little by little, replaced by objectivism and technicism. This happened with the help of behaviorism that proclaimed a programmed instruction, the teacher being a mere extension of the technique and of the teaching instruments. This psychological current admonished the stimuli presented by traditional teaching were presented in a way too slow to provide a reinforcement contingency. The stimuli were based more in negative (punishment) than in positive (prizes) reinforcements. Although behaviorism criticizes traditional teaching methods in some aspects, the ones about reinforcement contingency, it has amalgamated itself so strongly to traditional methods that it is hard to say where is one and where is the other. This is because it has just modified the use of the "stimuli", besides upholding the use of prizes and/or punishments, and the repetition of exercises (memorization) to avoid the *extinction* of an answer. However, behaviorism did not attain itself to other important aspects such as the student's epistemology. Well, for behaviorists only what can be measured and seen matters. Conscience is a black box and so, left to the rats...

The New School

The objective empiricism was readily replaced by pragmatism, forming what was called progressive pedagogy of the New School, its most important exponent being John Dewey. For Dewey, what was important was the learning experience. He criticized Herbart because he took into account everything that was important in education except the essential – "a vital energy searching for an opportunity to effectively exercise" [9]. This way, the central focus is now the student and his actions; not the teacher and the content.

Considering Herbart's teachings, we may find five steps in open contradiction with Dewey [3], very widespread today by what we came to call a learning process based on problems: activity, problem, data, hypothesis, experimentation. Observing this scheme attentively, we will notice a parallelism with the hypothetical-deductive method. While Herbart used the inductive method, the New School and its followers opposed it to the hypothetical-deductive one, being confirmed by contemporary philosophic tendencies such as in the case of the "Viena Circle", and of Karl Popper, among others.

Other Pedagogies

Saviani tries a synthesis of these two educational tendencies, proposing a "content pedagogy", the steps of this synthetic method being: "syncretic" social practice, problematization, instrumentalization, catharsis, and "synthetic" social practice [3].

The scientific method would be the one proposed by Marx in his "Introduction to the Criticism of Political Economy"

In his work he upholds some points of Herbart's method and severely criticizes the progressive pedagogy. However, he sins when he considers progressive pedagogy a pseudo-science because it appeared, as well as traditional pedagogy, from personal experiments of their mentors. And, although both are based in different methods of logical analysis, both of them may be considered scientific, even deserving mutual criticism.

Paulo Freire is another great educator that used to criticize the traditional method on account of its bureaucratization, its insistence in mechanical memorization. He called it "bank teaching" because what mattered was the building up of knowledge, its authoritarianism (the center is the teacher), its micro-reproduction of social dominance. He opposed it with the Pedagogy of the Oppressed, that aimed to produce liberty, not by means of an overwhelming amount of reading, but by reading the world by the oppressed viewpoint, in a horizontal dialogue, consequently democratic, between teacher and student.

There are other pedagogies that could be dealt with: by competence, nowadays a colloquialism in the building up of curricula, Ausubel's meaningful apprenticeship, the ideas of J. Bruner, the field-gestalt theory, etc., but they will not be discussed here.

Piaget's Epistemology

Piaget's epistemology may be one of the most consistent criticisms to the traditional method. Nowadays it is one of the most used in grade school.

Today it is hard to find someone who calls himself traditional in pre-school (even in a worldwide sense). Owing to the lack of space in this paper, we will not consider its details, stressing only its main criticism: the school uses very poorly the spontaneous character (in Piaget's concept) of the children's thoughts, totally forgetting its episteme, and how much it could profit from the lack of equilibrium of the mental schemes already formed in a child's mind. Besides, of course, the over-valorization of the heteronomy and the lack of construction of autonomy by the part of the students [10 e11].

As one may notice, the criticisms to the traditional teaching method are innumerable and even consistent. Nevertheless, we may place a question: why, then, still today, at the very beginning of the XXI century, such an archaic method is used in Engineering courses?

A New Pattern

All the literature presented offers a consistent criticism but fail to provide the teacher with elements that may help him in his daily task. Besides that, all the theories seen so far are unsuccessful in this aspect for they are either pure philosophical speculation (Saviani, Gadotti, Tragtenberg) or emphasize either infantile education (maybe up to 16 years of age) or adult education (Piaget and Paulo Freire). It is not in vain that teachers of technical areas raise comments such as "pedagogy is for children", or "this is something for sissies" We really need an educational theory scientifically based, that may be used by teachers as a didactic guide.

Developmental Education

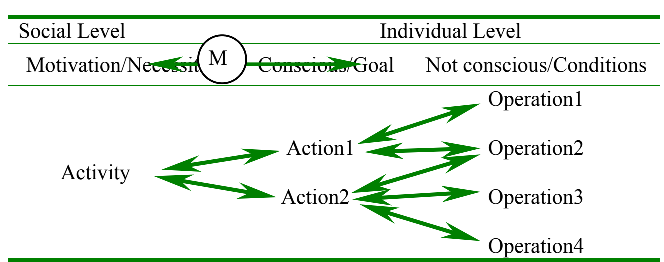
Developmental Education (DE) originated in old USSR, as an outcome of the historic-cultural theory presented by Vygotsky, Leontiev and Luria, later developed in its theoretical aspects by Davydow, Galperin, Elkonin, Lompscher, Chaiklin, Engeström, among others. The philosophic pressupositions of this theory return to Hegel, Marx, and Engels.

The term DE reflects the basic idea presented by Vygotsky that "adequately organized learning turns out into development" [12, 15]. Reference [16] presents briefly some theoretical concepts proposed by Vygotsky and Davydow.

The main concept of this theory comprises learning activity. It arose from the concretion of the general concept of activity made clear by the Activity Theory (TA) (Table I)

TABLE I

STRUCTURE OF ACTIVITY, BASED IN LEONTIEV.



(M): mediation

Still, it is worth taking into account that the concept of Activity has a different meaning for the Russians in relation to the Latin language. It is a lot more than a specific action;

it is a group of actions aimed at the satisfaction of a social necessity and so it may never be looked upon as something individual. It is also a unit in the analysis involving action-emotion-cognition.

The so-called developing education, then, is fundamentally based on the structure of what is known as learning activity. Beyond the relation between activity-motivation, action-purpose, operation-condition, other aspects are taken into account such as the use of psychic instruments of mediation (formation of scientific-theoretical concepts), confining of the action, zone of proximal development (ZPD) and analysis of the discipline [14].

This theory shows itself, then, as something that may be used beyond youth, in spite of the learning activity not being the main activity of the students in this period, and, most probably allowing the teacher to move inside the entangled curricular grid of the engineering course [15].

In this approach, the teaching aim is to give birth to a theoretical thought about reality in the student's minds, expanding a merely empirical thought (to distinguish between the one and the other, see [6] and [16]). If the exposure method is empirical the level of thought of the students will be the same, that is, he will be unable to associate what he learns and the surrounding world.

The main strategy for an educational process to produce development is considered in this theory as an ascending from to abstract to the concrete, typical of Marx's dialectic method; that is, to develop an essential relationship that characterizes an area of knowledge and find out how this relationship appears in several problems. This strategy is oriented towards the conscious and systematic formation of the student's own activity. Besides this and according to Lompscher, "it is important to consider that motivation only arises from activity; it cannot be transferred to the students. This implies the fact that didactics is something that must be oriented towards the actions of the subject that prove necessary to master the contents and the psychic control of the action". In other words, we should pay attention to the unit activity-object-concept and perform a logical and psychological study of the object of the area being studied [14].

Another important point is the analysis of the previous mental conditions of the students. To bear in mind the inter-relationship between internal-external, and ZPD.

Well, if we look upon traditional teaching of Engineering we will see that it tries to transmit something essential by means of concrete examples (i.e. overemphasis measurements of concrete cases without essential inter-relations in the labs). As the student has no psychic tool to adequately manipulate these examples, he remains in the surface, in the outer aspects of the phenomenon (empirical thought). Thus, the students will not be able to make out the differences between the essential characteristics (of content) and the general, or specific ones (formal) [6].

Expository classes and the use of several examples end up, then, overloading the students memory and they do not have a mediating element (psychic tool) to act as a link to the several objects of study and act as an anchor for memorization. This mediating element cannot, however, be formed haphazardly [14]. It is necessary to analyze the discipline, to study the hierarchy of concepts in order to find the one that permeates all the objects of study.

To explain the subject, the teacher must, then, start his work by means of this initial essential relation (ER). This will be gradually enriched and discovered by the students in the handling of the objects/phenomena (O1, F1, etc) being studied, in the transformation of the representative models (Mod.) flowing from this manipulation and by the study of their intrinsic properties (Pro.). The highest point of this activity will be the use of essential abstraction in several problems that will be presented, developing a theoretical thought (Figure 1).

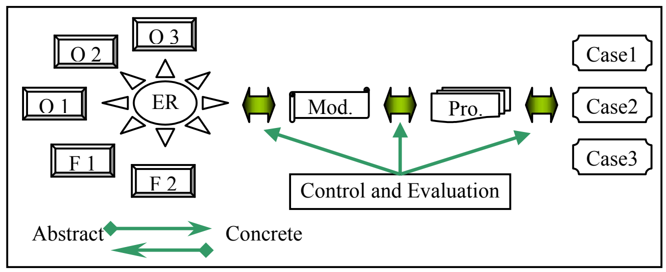


FIGURE. 1
STRUCTURE OF LEARNING ACTIVITIES AND THEIR TYPICAL ACTIONS

Reference [15] shows how to use this analysis of discipline to find the essential generalization (scientific-theoretical concept). This concept many times is something simple and trivial, but fundamental to the organization of the learning activities. It will be the lost link between the sensory aspect and the intrinsic essence among the objects and/or phenomena being studied.

After the previous study of the essential relation, or relations, the teacher should study the necessary actions for the *full* and *independent* development of his students.

We may point out the following as typical actions concerning the learning activity [6]:

- Motivation: the students should learn to evaluate their present way of action, which proves insufficient to solve a new class of problems. This is the moment when the learning activity goals appear.
- Modeling: building up of a model that will settle the essential relation in a material, graphic or literal form, by means of the transformation of the conditions of the proposed material situation.
- Analysis/Synthesis: a study of the intrinsic properties of the relation raised before, which happens by means of the transformation of the models that have been built.
- Expanding: application of the essential relation to the solution of specific problems.
- Auto-regulation: control of the preceding actions, both by the students and by the teacher.

- Evaluation: we confirm the internalization and the independent use of the essential abstraction in new problems.

CONCLUSION

Young teachers, especially those from engineering and technological areas, suffer from being totally unprepared in what concerns the origins and ways of teaching. The way they were taught, they teach. Some head for "alternative methods", try to conform their classes to a context, etc. Somehow, even though these tactics prove necessary, they are insufficient for an effective teaching.

Besides that, the teachers of a technological area, may come in contact with pedagogic theories in didactics courses but these will be presented empirically. Thus, many will feel the necessity to change their teaching techniques but will be unable to do it.

Dewey, Saviani, Gadotti, Tragtenberg and Paulo Freire, all of them educational philosophers, have different opinions about the pedagogical momentum. Even though their personal experiments may have contributed a lot for the development of teaching methods, they lack a scientific-theoretical basis to lay a foundation *specific* for engineering teachers; that is, they say a lot about "what" to change but are of little help in what concerns "how" to perform their daily activities.

Much of what has to be done may be inferred from Piaget, but that applies to pre-school teaching. Piaget, in his theory, was interested much more in developing the individual's cognitive structure performed spontaneously than in his school formation, as he himself stated: "I am a psychologist, not an educator" [11]. In spite of that, many Brazilian educators have wasted time in an inactive and unsuccessful discussion, contraposing or identifying Vigotsky and Piaget, and they would fare a lot better by studying something more up-do-date…

Yet, we may not simply blame the teacher, subdued by the lack of time, by the power structure, as we have shown above. How to remain gentle in overcrowded rooms? How to keep the students' attention? Besides, time is pressing, "time is think", in this crazy run against the clock. School subjects may be planned with excessive or insufficient hour loads, the contents may be crumbled, the knowledge fragmented. What to do if the student lacks a meaningful context: to teach this in spite of it, or step over the student's ignorance? What to do if the matter has already been studied formerly? How to motivate the students?

The structure of the curricula places gaps or superimposes contents. As teachers normally act differently, how to warrant this inter-disciplinary dialogue? When will the teachers be able to discuss such matters? Time passed, the semester is coming to an end. Now the question arises: what to do with the students that were not able to follow the teacher?

DE presents itself as a new pattern for engineering. It points out the necessity to study the school subjects from a new angle, and to analyze curricula from a different standpoint, one that goes beyond formal aggregation of disciplines (pre-requisites).

It is necessary to group similar disciplines and form conceptual modules ("kernel"), We must use the innocuous existence of the school units to formalize groups of side-studies and redefine the teachers' activities as well as the students'. The educator must be educated in order to educate.

Either we dare to relearn how to teach, educate (science of the process teaching/learning and its special activity) or this picture will emphasize the exclusion of the critical knowledge of the world even more.

Paraphrasing Marx, it is necessary not to thing the educational action in different manners; what matters here is to transform it. Paraphrasing Lenin, without a revolutionary theory, we will not have a revolutionary didactics. The DE is a prospective towards that…

ACKNOWLEDGMENTS

I am very grateful to Prof. Joachim Lompscher for his priceless help and his patience in dispelling my doubts about the theory of learning activities. Without them this paper would not have been possible.

POTENCIALIZANDO AS FRONTEIRAS DA DISCIPLINA METODOLOGIA DO ENSINO SUPERIOR COM O APOIO DA TECNOLOGIA – RELATO DE UMA EXPERIÊNCIA PRÁTICA DIFERENTE EM UMA AULA VIRTUAL

Cláudia Batista Mélo [1] e Antônio Berto Machado [2]

Resumo **— Este trabalho apresenta uma experiência prática de uso de novas tecnologias em uma aula à distância da disciplina Metodologia do Ensino Superior, realizada no período letivo 2002.2, com alunos da Pós-graduação em Computação da UFCG. O professor, doutor em Educação, apesar de possuir alguma prática em Informática, não tinha qualquer experiência em EAD e em chats. Embora existam diversos ambientes virtuais de aprendizagem, essa experiência se passou em uma sala de bate-papo comum, com estrutura pedagógica inadequada. Contudo, ficou demonstrado que esta prática pedagógica motiva troca de experiências (alunos conhecedores da tecnologia utilizada e professor com domínio do conteúdo ministrado), funciona como repositório de conteúdo (possibilita o acesso à discussão a alunos ausentes na aula) e favorece um ambiente de aprendizagem colaborativo (construção coletiva de novos conceitos). Dessa forma, comprovamos as potencialidades dessa inovação metodológica, onde professor e alunos interagem no ensino e na aprendizagem, mediados por novas tecnologias de ensino.**

Palavras chave **— Educação a Distância, Internet na Educação, Metodologia do Ensino Superior, Novas Tecnologias Educacionais.**

INTRODUÇÃO

Já não mais convém a discussão da utilização ou não de novas tecnologias no sistema educacional, mais especificamente o computador, nem a questão do custo serve mais como argumento para justificar a sua não utilização, a realidade é que ele está cada vez mais dentro e fora da escola. Isso ocorre devido principalmente ao aparecimento dos microcomputadores, que aliam baixo custo, grande disponibilidade no mercado, simplicidade de operação, manutenção e programação, aos sofisticados recursos para aplicações educacionais, tais como imagens, animações, efeitos sonoros, portfolios eletrônicos de ensino, entre outros [4].

Agora, a questão é saber como ficam melhor distribuídos os papéis d@ educad@r e do computador no processo educacional. O tema precisa ser tratado da forma mais ampla e integrada, não se tratando apenas do uso ou não da máquina, mas também de todo o gerenciamento da informação e do aprendizado.

Este trabalho apresenta um relato de uma experiência prática diferente em uma aula virtual da disciplina Metodologia do Ensino Superior, realizada no período letivo 2002.2, com alunos da Pós-graduação em Engenharias e Computação da Universidade Federal de Campina Grande, na qual os alunos tinham total domínio da tecnologia e o professor do conteúdo.

A EXPERIÊNCIA

A vivência dessa aula virtual teve as seguintes motivações:

a) há algum tempo pensávamos em realizar uma experiência inovadora nas aulas de Metodologia do Ensino Superior – MES, de forma que envolvesse o uso de novas tecnologias;

b) a oportunidade de estar ministrando a referida disciplina para uma turma constituída, em sua maioria, por estudantes do Curso de Pós-graduação em Informática;

c) a provocação desencadeada pelo texto “Da voz à tela, a nova linguagem docente” [1].

Como a disciplina MES destina-se a discentes de Pós-Graduação, os quais, em sua maioria, têm intimidade com o mundo da informática e o acesso facilitado a terminais de micro conectados na rede, acreditamos ser possível ousar inventar e viver uma aula diferente dos modos convencionais, onde @ docente fala e @s alun@s simplesmente escutam, numa atitude de passividade, em relação ao conhecimento apresentado. Com esse intuito, a oportunidade de estar trabalhando com uma turma, cuja maioria era alun@s do Curso de Informática, favoreceu para que avançássemos da intenção à ação.

O fato de contar com um grupo de alun@s que dominava a tecnologia informacional, propiciou a condições necessárias à operacionalização da idéia. O círculo motivacional foi completado com as argumentações

apresentadas por Abreu [1], em defesa da transformação da sala de aula em um espaço de construção do conhecimento, tendo por base a participação interativa dos sujeitos envolvidos no processo de ensino e de aprendizagem, tomando como elemento mediador a linguagem audiovisual, enquanto potencializadora das novas interações entre discentes e docentes.

Planejamento, Execução e Avaliação

Como a Educação a Distância (EAD) deixou de ser inovação e a cada dia surgem novos projetos envolvendo a tecnologia disponível em cada momento, sabemos que atualmente existem diversos ambientes virtuais de aprendizagem disponíveis na Internet e de livre acesso para quem quiser fazer suas experiências de EAD. Entretanto, nossa experiência se passou em uma sala de bate-papo comum, sem a menor estrutura pedagógica.

Coletivamente, docente e discentes, resolvemos concretizar a idéia da aula virtual. Decidimos que aproveitaríamos o espaço de tempo destinado à reposição de uma aula, a qual estava prevista para ser realizada em um sábado, à tarde. Definido a data e o horário, estabelecemos que os participantes da aula deveriam ler, previamente, o texto de "Da voz à tela, a nova linguagem docente". Esse texto foi escolhido por apresentar a necessidade de se transformar a sala de aula em um espaço de construção do conhecimento, tendo como suporte o uso de novas linguagens e tecnologias.

Ficou a cargo do docente todo o planejamento da atividade durante a aula virtual. Para @s alunos ficou a responsabilidade da execução. E em conjunto, professor e alunos fizeram a avaliação da experiência.

O grupo de alun@s da informática ficou encarregado de preparar o ambiente onde seria realizada a aula. Acessando à rede, abriu uma sala de bate-papo, espaço no qual, reuniram-se discentes e docente, na data e horário marcados. O objetivo maior era discutir o conteúdo do texto proposto, a partir dos vários locais físicos onde se encontravam os participantes da aula, tendo como suporte a rede. Isso propiciou a reunião em um espaço virtual (sala de bate-papo) de pessoas distribuídas em diversos espaços geográficos, além de garantir as condições para uma comunicação sincronizada.

Por não dominarmos a tecnologia da informática e sermos inexperientes quanto a esse tipo de ferramenta, enfrentamos algumas dificuldades, entre as quais destacamos:

a) a falta de um ordenamento para apresentação das idéias produzidas pelo grupo envolvido. Isso provocou um acúmulo de textos enviados, simultaneamente, dificultando o processo interacional. À medida que os textos eram remetidos em grande volume, não havia tempo suficiente para construção de posicionamentos individuais dos sujeitos participantes, frente aos textos enviados;

b) a não realização da leitura prévia do texto proposto, por participantes da aula. O fato de não ter lido o texto, contribuiu para que discentes participassem de forma opinativa, cujo posicionamento situou-se no nível do senso comum. Embora reconheçamos a importância do conhecimento de senso comum, esse tipo de posicionamento pouco contribuiu para o aprofundamento do conteúdo sugerido;

c) decorrida a primeira hora de aula, diante da reclamação apresentada por alguns sujeitos envolvidos na experiência, resolvemos propor um ordenamento, de forma que contribuísse minimamente para organização da discussão. Nesse sentido, levantamos aspectos fundamentais tratados no texto estudado e solicitamos que cada participante construísse e expusesse o seu posicionamento. Isso facilitou o processo interacional, contribuindo para o aprofundamento do conhecimento apresentado. À medida que as atenções se voltavam para um aspecto destacado, as pessoas tinham uma fração de tempo maior para pensar e construir um posicionamento através de textos mais elaborados, contribuindo para ressignificar, individual e coletivamente, o conhecimento objeto da discussão, com vistas a uma apropriação mais significativa.

A avaliação foi feita presencialmente sob a forma de um debate na qual professor e alun@s chegaram as seguintes conclusões:

a) a tecnologia utilizada não é o fator mais importante no processo de EAD: com criatividade e responsabilidade, ferramentas diversas podem ser utilizadas e apresentarem bons resultados, mesmo que não tenham sido desenvolvidas com finalidades educacionais;

b) o planejamento é o responsável pelo sucesso da experiência: o processo unido aos objetivos que se deseja alcançar são muito mais importantes do que as ferramentas utilizadas;

c) flexibilidade: apesar da grande importância do planejamento, precisamos destacar que o esforço não é válido se não há interesse por parte da turma, então, cabe ao professor a tarefa de motivar os alun@s;

d) troca de experiência: aulas virtuais podem ser vistas como tendo um grande potencial para troca de experiências, no nosso caso constatamos que além do conteúdo objeto da aula o fato d@s alun@s terem um maior domínio da tecnologia que o professor fez com que @s alun@s tivessem uma grande atuação durante a aula virtual;

e) formação de um ambiente de aprendizagem colaborativo: a medida que o conteúdo era abordado pelo professor, cada alun@ dava o seu ponto de vista e muitas vezes, de acordo com as abordagens dadas pel@s colegas e pelo professor, chega a mudar de opinião em um curto espaço de tempo;

f) inversão de papéis e comportamento entre alun@s: alun@s tímid@s nas aulas presenciais se mostraram totalmente desinibidos durante a aula virtual e alun@s que freqüentemente são bastante atuantes nas aulas presenciais muitas vezes pareciam que estavam apenas acompanhando as discussões e faziam poucas iterações;

g) dependência da tecnologia: alguns alun@s não conseguiram participar da aula pois tiveram problemas como falta de energia, não conseguiam se conectar a Internet naquele momento, etc.;

h) flexibilidade no que diz respeito a localização geográfica dos alunos: muitos dos alunos puderam participar da aula mesmo estando em suas cidades de origem, já que a aula se deu numa tarde de sábado;

i) repositório de conteúdo: para os alunos que por alguma razão não participaram da aula, foi gerado um documento com mais de 80 (oitenta páginas) que ficou disponível para estudos.

RESULTADOS

A realização dessa aula virtual, nos proporcionou algumas indagações:

a) por que no ensino superior, o corpo docente ainda apresenta uma série de resistência com relação a utilização de novas tecnologias no exercício da prática docente, mesmo quando essa nova tecnologia é acessível e encontra-se disponibilizada no âmbito da instituição?

b) essa resistência seria decorrente da falta de domínio dessas novas ferramentas, ou por receio do corpo docente em perder o seu controle sobre os conhecimentos a serem produzidos e apropriados pelos sujeitos envolvidos, minando as relações de poder entre docente e discentes?

Concordamos com a afirmação de que os "indivíduos suportam cada vez menos acompanhar cursos uniformes ou rígidos que não correspondem às suas reais necessidades e à especificidade de seus trajetos de vida" [2]. Isso aponta para a necessidade de uma dinamização do processo de ensinar e de aprender, o que implica ressignificar os próprios conceitos estruturantes da prática docente, tais como: conhecimento, aprendizagem, aula, sala de aula, conteúdo, metodologia, docência, docente, discente, relação docente-discente. Em outras palavras, isso nos remete a uma reflexão do currículo enquanto campo articulador da prática docente, bem como das políticas curriculares enquanto mecanismos de controle do conhecimento, sua produção, disseminação e apropriação, no atual contexto científico, cultural, social e econômico.

Nessa perspectiva, estamos intimados a construir um novo discurso que contribua para estruturação de uma nova prática docente. Para tal, faz-se necessário que tomemos como referência uma pedagogia "que favoreça, ao mesmo tempo, os aprendizados personalizados e o aprendizado cooperativo em rede" [2]. Dessa forma, a docência também tem que ser ressignificada e @ docente "vê-se chamado a tornar-se um animador da inteligência coletiva de seus grupos de alunos, em vez de um dispensador direto de conhecimentos [2].

No entanto, vale ressaltar que, como demonstrei em outro trabalho [3], a construção dessa nova docência e dos novos sujeitos docentes ocorrerá no processo de confronto com os modelos existentes, não para substitui-los, mas para disputarem uma visibilidade hegemônica.

CONCLUSÕES E COMENTÁRIOS FINAIS

Contudo, ficou demonstrado que esta prática pedagógica motiva troca de experiências (alun@s conhecedores da tecnologia utilizada e professor com domínio do conteúdo ministrado), funciona como repositório de conteúdo (possibilita o acesso à discussão a alunos ausentes na aula) e favorece um ambiente de aprendizagem colaborativo (construção coletiva de novos conceitos). Dessa forma, comprovamos as potencialidades dessa inovação metodológica, onde professor e alun@s interagem no ensino e na aprendizagem, mediados por novas tecnologias de ensino.

A INCLUSÃO DE SURDOS NO ENSINO DE ENGENHARIA: UMA PROPOSTA COM APOIO DAS NOVAS TECNOLOGIAS

Sandra L. Oliveira[1], José M. Seixas[2]

Abstract — *O trabalho discute junto aos educadores dos cursos de engenharia a inclusão do aluno surdo, com apoio computacional. Segundo a lei Darcy Ribeiro, o aluno portador de necessidades especiais deve prioritariamente permanecer na rede regular de ensino. A Lei de Diretrizes e Bases também se refere à importância da preparação para o trabalho. Desta forma, discutimos e defendemos a inclusão de surdos na engenharia. Para tanto, é necessário um projeto político pedagógico em que educadores possam discutir, junto aos alunos surdos, sobre as propostas para a educação de surdos. Propomos as novas tecnologias como apoio a essa interação professor-aluno. Num discurso moderno, constata-se que a escola é, por excelência, heterogênea, que deve ser tratada como uma perspectiva de celebração das diferenças, respeitando a heterogeneidade, os direitos de cidadão e preparando-se para esse novo desafio, que é a inclusão dos alunos com deficiência auditiva, no ensino de engenharia.*

Index Terms — *Ensino de surdos, Ensino apoiado computacionalmente, Novas tecnologias de ensino.*

INTRODUÇÃO

A intenção primeira deste trabalho é trazer ao debate algumas questões sobre a inclusão de surdos na universidade, sobretudo, no curso de engenharia. Para que essas questões fiquem bem situadas, dispomos de duas orientações básicas que vêm sendo discutidas por educadores de diferentes níveis escolares, tanto na educação básica quanto na educação superior. Definimos como eixo temático os seguintes pontos: a inclusão de surdos e a visão do educador para enfrentar esse novo desafio no curso superior, na era digital.

Essas duas vertentes têm sido alvo de inúmeras discussões em congressos nacionais e internacionais, seminários, imprensa e demais órgãos integrados à educação. Para entender o porquê dessa chama acesa de discussão, precisamos fazer uma busca sobre a história da educação especial no Brasil e concluir que a polêmica da inclusão se amplia nos últimos anos, respaldada pela lei de Diretrizes e Bases da Educação Nacional [1]. O documento da lei gera polêmica pelo desafio de incluir o aluno com necessidades especiais na rede regular de ensino. Baseados na lei, apoiamos a inclusão de aluno portador de deficiência auditiva no curso de engenharia.

Essa inserção determina um novo caráter da discussão que diz respeito à formação do educador e à adaptação curricular. Neste momento, questionamos: estará o professor preparado para esse novo desafio? É preciso adaptar o currículo aos alunos com necessidades especiais? O processo de avaliação dos cursos de engenharia está adaptado para essa clientela especial?

Por outro lado, o caráter utilitário da educação superior, enfatizado na profissionalização, não pode ser deixado de lado. Contudo, a universidade tem também outras funções que contribuem com o cidadão, no tocante à formação do caráter, à formação ética, à criatividade e ao exercício da capacidade crítica.

Uma proposta feita neste estudo é a alternativa do uso do computador como apoio à educação de surdos. A informática educativa tem sido utilizada por alunos surdos em diferentes níveis. Várias escolas do país já adotaram esse recurso, com êxito na aprendizagem. A contribuição da máquina é visível, visto que a maior dificuldade do surdo é a comunicação.

Para contribuir com a reflexão dos educadores sobre a proposta da inclusão de surdos no curso, foi feita uma pesquisa com educadores do ensino de engenharia, cujo resultado apresentaremos mais adiante.

Diante do exposto, este trabalho vem discutir junto aos educadores do ensino de engenharia a inclusão do surdo com apoio computacional. Na próxima seção, abordamos a política de inclusão do surdo na escola, a formação do currículo e o educador do novo milênio**.** Na seção seguinte, as novas propostas para a inclusão de surdos com apoio computacional são aparesentadas. Na última seção, disctimos os resultados de uma pesquisa feita por nós, com educadores de engenharia, sobre a inclusão de surdos no curso de engenharia e apresentamos as conclusões do trabalho.

A POLÍTICA DE INCLUSÃO DE SURDOS: O PROJETO PEDAGÓGICO E A EDUCAÇÃO SUPERIOR

Ao discutir este tema, visualiza-se como foco principal a instituição de ensino superior em geral. Referimo-nos à escola, a qual há de considerar o fracasso que ela apresenta ao longo de sua história, num processo

[1] Sandra Lúcia de Oliveira, UNESA, Universidade Estácio de Sá, Faculadade de Letras, Rua do Bispo, 83, CEP 20261-060, Campus Nova América, Rio de Janeiro, RJ, Brasil, sandraluciarj@zipmail.com.br
[2] José Manoel de Seixas, UFRJ, Universidade Federal do Rio de Janeiro, COPPE/EE, Laboratório de Processamento de Sinais, Caixa Posta 68504, CEP 21945-970, Rio de Janeiro, RJ, Brasil, seixas@lps.ufrj.br

seletivo, contribuindo com o desenvolvimento das diferenças, na sociedade capitalista. A educação de surdos está dentro deste contexto discriminatório que em nada favorece a clientela. Vislumbrando as teorias da educação, citaremos a distinção entre a concepção crítico-reprodutivista e a crítico não-reprodutivista, apontadas por Saviani [2]: "Segundo a concepção crítico-reprodutivista o aparente fracasso é, na verdade, o êxito da escola; aquilo que se julga ser uma disfunção é, antes, a função própria da escola. Com efeito, sendo um instrumento de reprodução das relações de produção, a escola na sociedade capitalista, necessariamente, reproduz a dominação e exploração. Daí, seu caráter segregador e marginalizador. Daí sua natureza seletiva".(p.34). "(...) uma teoria crítica (que não seja reprodutivista) só poderá ser formulada do ponto de vista dos interesses dominados". (p.35).

Conforme exposto acima, podemos concluir que a teoria reprodutivista serve como estratégia política aos interesses de produção da classe dominante, na sociedade capitalista. Já a crítica não-reprodutivista focaliza uma saída para um funcionamento condizente com os interesses dos dominados.

Neste contexto, são relevantes os questionamentos sobre a educação de surdo feito por Fernandes [3]: "Quando o surdo teve voz? Quando se dispuseram a ouvi-lo, quer seja através do português, quer através de sua língua natural, a (Libras) Língua Brasileira de Sinais?" (p.15). Skliar [4] completa a questão, perguntando: "Quais são os mecanismos de participação da comunidade surda no processo educativo?" (p.18). Desta forma, observamos que é primordial uma reflexão sobre a participação dos envolvidos no processo, educadores e educandos, na construção de uma escola democrática que sirva aos interesses do povo, diminuindo o fracasso e a exclusão social. Para concluir a questão, citaremos dois autores: Weiss [5] quando ressalta: "É fundamental que a escola reflita sobre o papel do sujeito que aprende" (p.18) e Demo [6], ao definir o papel da instituição de ensino: "A escola - que não faz milagres - pode fungir papel estratégico como instrumento público de equalização de oportunidades, à medida que se torna espaço privilegiado popular, universalizante, para concepção e exercício de cidadania". (p.81).

Quanto ao aspecto político-pedagógico, ressaltamos a importância da elaboração de projetos sérios e comprometidos com a educação de surdos, priorizando recursos humanos especializados, bem como recursos materiais para o desenvolvimento integral do educando, respeitando o cotidiano de um sujeito surdo, conforme define Skliar [4]: "A pedagogia para surdos se constrói, implícita ou explicitamente, a partir das oposições normalidade/ anormalidade, saúde/ patologia, ouvinte/ surdo, maioria/ minoria, oralidade/ gestualidade" (p.9).

Desta forma, a viabilidade desta investigação ocorre a partir de um envolvimento com o sujeito-surdo respeitando as oposições e apontando novas perspectivas para o desenvolvimento profissional, num olhar antropológico, cultural e tecnológico.

Ressaltamos que a política educacional deve levar em consideração a importância da educação especial. Esta abordagem é apontada por Skliar [4], quando diz que: "A educação especial é um subproduto da educação, cujos componentes ideológicos, políticos, teóricos são, no geral, discriminatórios, descontínuos e anacrônicos, conduzindo a uma prática permanente de exclusão e inclusão" (p.15).

É evidente que a educação de surdos não deve ser incorporada a essa educação que ora inclui ora exclui. Segundo Skliar [4], para que haja uma proposta significativa de educação de surdos é necessário "Um nível de reflexão acerca das potencialidades educacionais dos surdos que possa gerar a idéia de um consenso pedagógico". (p.15).

Paralelamente, temos também a construção do currículo que não pode ser elaborado numa visão homogênea, sem respeitar a diversidade do sujeito. Um outro aspecto discutível é a integração do currículo ao poder, formando cidadãos subordinados à vontade dos privilegiados do conhecimento gerando o binômio saber/poder.

Sob o aspecto legal, a Lei de Diretrizes e Bases da Educação (LDB) privilegia o aluno portador de necessidades especiais nos artigos 58º, 59º, e 60º. O enfoque principal da lei sobre essa clientela especial é a inclusão social desse grupo em classes regulares. Um outro ponto relevante é a flexibilidade do texto em possibilitar o uso da informática educativa, como apoio ao aluno com necessidades especiais, no processo de aprendizagem, uma vez que o artigo tem o seguinte texto: "currículos, métodos, técnicas, recursos educativos e organização específicos para atender às necessidades especiais". art. 59º. Nestes termos, podemos aproveitar também a idéia de avaliação. Demo [7] diz ser a lei de grande importância para a educação especial, que mesmo não falando diretamente em avaliação, é evidente que está incluída nessa atividade educativa "de extremo esmero qualitativo o processo avaliativo". (p.44)

Ainda citando a LDB, destacamos a flexibilização em nível de processo. Para Bordas [8], "A educação passa a beneficiar-se com o fim da obrigatoriedade da organização departamental e dos currículos mínimos que se constituíam em verdadeiras camisas de força para as instituições de ensino superior". (p.29). Deste modo, podemos constatar a importância de uma política inclusiva, com apoio de especialistas em surdez, integrados aos profissionais do curso de engenharia, a fim de atender a clientela especial.

Podemos observar, portanto, que o processo de inclusão do aluno com necessidades especiais é discussão de muitos especialistas em educação. Entretanto, a escola inclusiva ainda está muita fora do alcance da sonhada escola para todos, pois há divergências entre implicações pedagógicas e escolares no contexto inclusivista. Segundo Mendes [9] "A adoção da filosofia de inclusão vem sendo defendida como um potencial de demanda por políticas educacionais mais afetivas.(p.79), contudo o educador ainda se sente despreparado para esse momento de inclusão.

Quanto à atividade docente, é necessário considerar que a complexidade da sala de aula é um processo contínuo e de múltiplas variáveis em interação. Conforme Mizukami [10], tal complexidade é "caracterizada por sua multidimensionalidade, simultaneidade de eventos, imprevisibilidade, imediaticidade e unicidade." (p.55). O educador vive o momento de exigência progressiva sobre a formação continuada, e está cada vez mais sobrecarregado de trabalho e com menos tempo para se dedicar à atividade docente.

Para finalizar, é importante esclarecer que o surdo pode estar incluído em turmas de alunos ouvintes, desde que o curso de engenharia seja de seu interesse e que haja esforço pessoal e coletivo, para que a integração seja efetivada. Esse processo só será possível se houver uma política educacional de inclusão, bem como um processo de abertura no mercado de trabalho que não limite às possibilidades de ascensão profissional, excluindo o surdo. Para concluir, destacamos Coelho [11], quando diz que "a formação de profissional deve ser aberta, inserida numa formação mais ampla, crítica, rigorosa voltada para o culto do raciocínio, da autonomia, da criatividade, da comunicação e da capacidade de identificar problemas e produzir alternativas para superá-los. (p.9).

NOVAS PROPOSTAS PARA A INCLUSÃO DE SURDOS COM APOIO COMPUTACIONAL

O ser humano vive um momento de grandes transformações. Um novo espaço de comunicação e uma revolução informacional nos despertam para um projeto pedagógico menos individual e mais coletivo. Devemos usufruir o lado positivo desta nova era. Há abertura política, econômica, cultural e humana. Entretanto, é preciso ter discernimento, para perceber que nem tudo que é feito com as redes é bom.

Estar ao lado da cibercultura é, conseqüentemente, visualizar claramente o abismo entre os excluídos e os bem nascidos., quando se avaliam as oportunidades de acesso e de filtragem da informação. Entretanto, mesmo nem sempre absorvida plenamente pelo conjunto da população, a tecnologia vem avançando a cada década. O telefone, por exemplo, gera fortuna, mas é útil à comunicação humana, inclusive a dos surdos.

A cibercultura é um processo globalizador, o qual incomoda aos afortunados que percebem a ameaça que esse avanço pode causar, ou seja, a informação ao alcance de todos, independente de raça, sexo, classe social e necessidades especiais. É evidente o crescimento de viagens espaciais, biologia molecular, telecomunicações, enfim, do dilúvio informacional, que ao que tudo indica, jamais cessará. Só para exemplificar essa questão, podemos citar as mensagens universais que podem ser lidas por qualquer grupo social, que tenha acesso a leitura, via internet. Enfim, as mensagens universais antes restritas, atualmente são abertas a qualquer cidadão. Basta ter discernimento e acesso tecnológico para usufruir dessas tão consagradas mensagens.

Pesquisadores e estudiosos em informática educativa já constataram que a apropriação da máquina como uma ferramenta de apoio à educação, aliada à produção do conhecimento humano, pode gerar grandes resultados. O ideal seria propiciar a democratização social do uso das novas tecnologias, a fim de que todos pudessem ter acesso.

A engenharia, em particular, oferece um palco especial para o desenvolvimento do ensino apoiado computacionalmente. Com o computador sendo, ao mesmo tempo, ferramenta essencial e objetivo de pesquisa e desenvolvimento, o aluno de engenharia integra facilmente a informática educativa no seu processo de aprendizado, potencializando enormemente os seus efeitos. Assim, o aluno surdo que chega a uma faculdade de engenharia pode também se benificiar destas características específicas da área, compartilhando, sem dificuldades maiores, com o aluno ouvinte as perspectivas de aprendizado que as novas metodologias de ensino propiciam.

Recentemente, vários congressos nacionais e internacionais vêm discutindo o uso das novas tecnologias na educação. O Congresso Brasileiro de Educação Superior a Distância [12], organizado pela Cederj e Unirede, discutiu a importância da educação a distância e o novo perfil profissional, diante das novas tecnologias, para a formação profissional no ensino superior. O 1º Congresso Internacional de Tecnologia e Educação [13] apresentou pesquisas desenvolvidas em torno da tecnologia educacional e da importância desses recursos para o ensino-aprendizagem.

Não podemos deixar de citar o V Congresso de Informática Educativa [14], que apresentou vários trabalhos sobre Educação Especial e Informática Educativa, contribuindo com educadores que se deparam com o novo momento de inclusão do aluno com necessidades especiais na rede regular de ensino. Neste contexto, destacamos o trabalho apresentado por Oliveira e Bohadana [15], que reflete sobre o projeto pedagógico, quando aponta que o apoio computacional é importante, uma vez que "o aluno surdo vive mergulhado num mundo tecnológico e a instituição precisa aproveitar essa oportunidade para a produção do conhecimento". O XXIX Congresso Brasileiro do Ensino de Engenharia [16] apresentou trabalhos sobre Ensino de Engenharia com apoio computacional. O congresso discutiu o novo perfil profissional aliado às novas tecnologias. Ressaltamos a comunicação apresentada por Oliveira e Seixas [17], que enfatiza o novo perfil profissional, na seguinte afirmação "O maior desafio pedagógico está na mudança de atitude do educador e das instituições em relação às novas tecnologias".(p. 382). O III Congresso Ibero-americano de Informática Educativa Especial [18] apresentou pesquisas e experiências sobre a utilização das tecnologias da informação e comunicação para contribuir com portadores de necessidades especiais.

Nos tempos atuais, as novas tecnologias são importantes para os portadores de necessidades especiais. Sem dúvida, a informática nos permite conhecer um futuro mais próximo. A hipermídia permite auxílio auditivo, facilitando a vida do surdo. Através da Informática Educativa, observamos vários fatores de auxílio dessa ferramenta na educação especial.

RESULTADO DO ESTUDO E CONSIDERAÇÕES FINAIS

Desenvolveu-se uma pesquisa qualitativa, cujo objetivo primordial era incitar e contribuir com a discussão sobre a inclusão de surdos no curso de engenharia, tendo como ferramenta de apoio a informática educativa. Um curto questionário foi desenvolvido para a pesquisa e aplicado preliminarmente no Departamento de Engenharia Eletrônica e de Computação da Universidade Federal do Rio de Janeiro (UFRJ), como protótipo de uma pesquisa de grande cobertura que se pretende efetuar em diferentes habilitações de engenharia e diferentes universidades públicas e privadas. Os questionários foram respondidos voluntariamente por docentes da instituição. A seguir, descrevemos os resultados preliminares, de uma amostra constituída por 10 professores, os apontam uma reflexão positiva a respeito da inclusão de surdos no curso.

Foram feitas cinco perguntas aos docentes, direcionadas à inclusão de surdos no ensino de engenharia:

- Questão A: tempo de atividade docente no curso de engenharia. Os educadores participantes trabalham na universidade em tempo integral. O mais novo participante tem 1 ano e o mais antigo, 24 anos de tempo acadêmico.
- Questão B: A escola de engenharia e a preparação para inclusão de alunos surdos. A maioria respondeu que a escola não está preparada para esse desafio, mas precisa romper barreiras para desenvolver o processo de inclusão.
- Questão C: O projeto político pedagógico da escola de engenharia e a inclusão de aluno surdo. Os participantes desconhecem qualquer proposta de inclusão feita pela instituição.
- Questão D: O educador e a prática docente com aluno surdo. A totalidade dos participantes nunca trabalhou com surdo em sala de aula, ou, pelo menos, nunca percebeu a presença de alunos surdos.
- Questão E: A informática educativa como auxílio na aprendizagem de surdos no curso de engenharia. Os participantes da pesquisa acreditam ser a informática educativa um recurso de grande importância para auxiliar os alunos surdos no curso de engenharia.

A seguir, destacamos a opinião de dois participantes sobre a seguinte questão:

A escola de engenharia deve fazer um esforço para incluir o surdo tendo como recurso o apoio computacional?

- "A escola deve realizar esforços não somente para deficientes auditivos, como também para outros portadores de deficiências. O computador é uma ferramenta que facilita a troca de experiências, aprendizado e comunicação".
- "A escola deve auxiliar um aluno surdo que entre através de vestibular normal. Não se deve facilitar a entrada de surdos pelo fato de ser deficiente".

As conclusões preliminares da investigação nos estimulam a continuar com a pesquisa, uma vez que percebemos o interesse dos educadores em contribuir com a inclusão de surdos no curso de engenharia. Entretanto, a escola precisa incluir os alunos com necessidades especiais em seu projeto político pedagógico e preparar os educadores, através da educação continuada, para que possam atender a esses alunos, com credibilidade e atitude de cooperação, deixando, para o século passado, o caráter discriminatório, o qual vivemos mergulhados ao longo da história da educação especial.

Para finalizar este estudo, concluímos que o apoio computacional pode contribuir com o rompimento de barreiras físicas e sociais. Entretanto, para romper tais barreiras, é urgente propor mudanças no currículo do curso de engenharia, a fim de aproximar o surdo à tecnologia da informação, orientar o educador para o processo pedagógico, dentro da nova proposta curricular tecnológica e refletir sobre os desafios pedagógicos, que a complexidade da sala de aula moderna gera no cotidiano e na interação professor-aluno. Para que esta proposta tenha êxito, precisamos divulgá-la. Desta forma, estaremos contribuindo com o processo de inclusão do surdo no curso de engenharia.

ORIENTACIÓN NO LINEAL EN CURSOS A DISTANCIA

Manuel Fernández Paradela Ledón[1]

Resumen *— Este trabajo presenta una propuesta de mecanismos de orientación, navegación y evaluación no lineales en cursos a distancia, basados en la definición y las relaciones entre los objetivos del curso, proyectados previamente con una herramienta computacional que funciona utilizando la teoría de las reglas de producción. Se demuestra la utilización de este módulo, que forma parte de un sistema para la organización y administración de cursos Web, con posibilidades para la inscripción, evaluación, cooperación, orientación remota de los alumnos y que estará preparado para, a partir de las definiciones y estrategias establecidas por los profesores orientadores del curso, generar todo el contenido necesario para la manipulación de datos y el código que será ejecutado en el espacio del servidor de páginas Web.*

Índice de términos — Educación a distancia, evaluación remota, Internet, reglas de producción, sistemas expertos.

INTRODUCCIÓN

Son diversas las propuestas y experiencias publicadas sobre la necesidad de construir ambientes realmente interactivos y que faciliten la necesaria colaboración [1,4,5] entre los participantes de un curso, asignatura o cualquier otra forma de enseñanza a distancia.

El tema del presente artículo, está relacionado con las posibilidades de presentación de contenidos, siguiendo otras estrategias no lineales, como complemento de la lectura lineal, tradicional y necesaria, que aparece acompañada, normalmente, por un índice de uno o varios niveles de acceso. Otra experiencia interesante de navegación no lineal, por agrupación conceptual, fue descrita en [2].

El principio utilizado en este trabajo para las sugerencias de presentación de contenidos, estará vinculado con el "aprovechamiento" previo de un alumno en específico y la experiencia descrita por el profesor para acompañar un estudio satisfactorio de la materia. En otras palabras, las evaluaciones interactivas del alumno y las sugerencias que parten del conocimiento del profesor, podrán guiar o sugerir al alumno otras formas de consultar/acceder el curso y concentrar su atención en sus puntos débiles o ausentes.

SISTEMA UNIVRT

El sistema UniVrt es una experiencia que viene siendo desarrollada en la Universidade Cruzeiro do Sul, de São Paulo, desde el año 1999. Dentro de los objetivos propuestos para esta investigación, se destaca el empeño en pesquisar y desarrollar metodologías y herramientas computacionales, orientadas a la enseñanza a distancia que permitan vincular las líneas de pesquisa, la docencia y el trabajo científico estudiantil de la Universidad.

El módulo de profesor del sistema UniVrt, le permite preparar un curso para la Web, con herramientas básicas de proyecto, que generarán, finalmente, todo el material necesario para que ese curso funcione activamente en Internet (Figura 1).

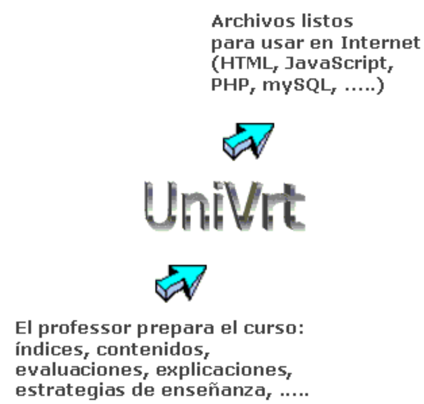

FIGURA 1
EL SISTEMA UNIVRT.

Organización de Contenidos

Un objetivo primario del sistema UniVrt es permitir la organización de los contenidos de un curso, facilitando la creación de un índice de tópicos o epígrafes y todos los vínculos o enlaces necesarios para la navegación por los diferentes niveles de este índice o para la presentación secuencial de la materia.

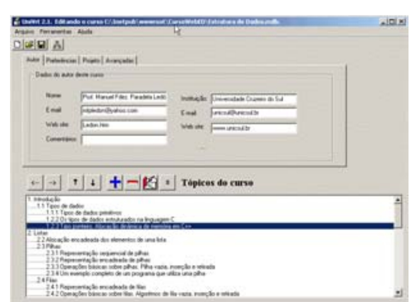

FIGURA 2
ORGANIZACIÓN DE CONTENIDOS.

[1] Manuel Fernández Paradela Ledón, Universidade Cruzeiro do Sul, Ave. Dr. Ussiel Cirilo, 225, Vila Jacui, 08060-070, São Miguel Paulista, SP , Brasil, mfpledon@ajato.com.br.

La Figura 2 muestra un ejemplo de la pantalla de organización de contenidos. Los epígrafes del curso pueden ser organizados en la forma más conveniente y podrá ser atribuido el nivel adecuado para cada tópico. Se trata de un editor general de los tópicos o epígrafes del curso a distancia en proyecto y las posibilidades de edición incluyen la organización, las evaluaciones propuestas, los vínculos con los documentos externos y otros elementos.

Evaluaciones

La interacción del alumno será un elemento básico para poder orientarlo en futuras consultas del curso. En UniVrt, quedará a criterio del profesor cómo utilizar las evaluaciones individuales de los alumnos pero, en principio, deberá ser un elemento activo estimulador de la participación, comunicación y la presencia del alumno, sin objetivos coercitivos o de punición.

Con el clásico mecanismo de identificador y contraseña, el sistema "en ejecución", registrará la presencia del alumno, su participación, sus evaluaciones, su entrada en la sala de colaboración, el número de accesos y otros datos.

Pero el principal objetivo de la evaluación voluntaria, será la orientación futura al alumno, como será comentado en las próximas secciones.

La Figura 3 muestra la ventana de definición de las evaluaciones.

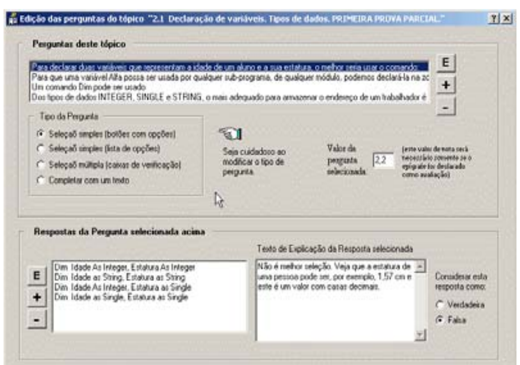

FIGURA 3
EDITOR DE PREGUNTAS O EVALUACIONES.

Observemos, que existen dos clasificaciones de "preguntas":

- Pregunta con retorno y explicación inmediata, sin objetivo de control.
- Pregunta declarada por el profesor como "evaluación" del curso o asignatura.

Las primeras, permiten simular una interacción alumno-profesor en tiempo real, con una explicación adecuada del profesor ante cada respuesta positiva o negativa del estudiante.

El segundo tipo de pregunta será controlada por el sistema, guardando la nota de la evaluación, la fecha, hora y otras informaciones dentro del banco de datos en el servidor Web.

En el cuadro izquierdo superior de selección (vea la Figura 3), el profesor decidirá el formato de la pregunta, que en la versión actual puede ser alguno de los siguientes:

- Selección simple con opciones
- Selección simple con lista de opciones
- Selección múltiple (check-box)
- Completar texto

El resultado de la elaboración de preguntas, será la generación de código HTML/JavaScript/PHP con un formato visual adecuado. Vea los dos ejemplos mostrados en la Figura 4.

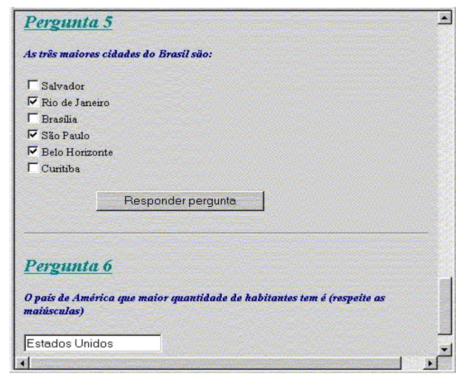

FIGURA 4
DOS EJEMPLOS DE PREGUNTAS EN UNIVRT.

La nota de cada pregunta y la evaluación total de un epígrafe serán decididas por el profesor en esta etapa de proyecto.

Editor de Reglas de Producción

La utilización de reglas de producción [3,6] es el mecanismo de representación de conocimiento utilizado en UniVrt para proyectar la navegación no lineal dentro del curso. Este mecanismo está estrechamente vinculado con las evaluaciones de los epígrafes y la experiencia de los profesores para la presentación y "asimilación" de los contenidos del curso por parte de los alumnos.

La utilización de las reglas de producción en el sistema UniVrt, puede ser dividida en dos etapas. La primera etapa está relacionada con el proyecto de las estrategias de navegación/evaluación, mediante la definición de las estructuras adecuadas de reglas de producción y la segunda etapa será la ejecución de las reglas, utilizando las informaciones específicas del alumno que se encuentra navegando en las páginas del curso.

El sistema permite la construcción de reglas de producción mediante la utilización de operandos (identificadores de epígrafes y objetivos parciales o finales del curso), operadores (conjunción, disyunción, agrupación) y factores de certeza (porcentajes).

La Figura 5 presenta la ventana inicial de manipulación de reglas. Las tablas superiores permiten ver y modificar los identificadores definidos para cada epígrafe y objetivo del curso y la lista inferior muestra las reglas definidas.

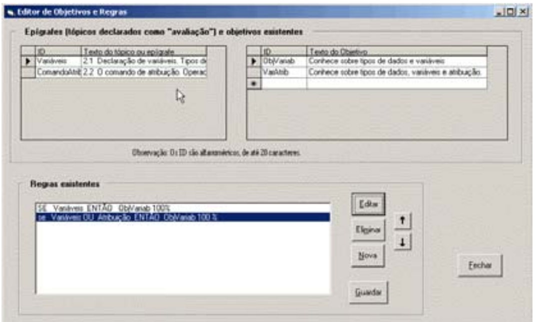

FIGURA 5
MANIPULACIÓN DE OBJETIVOS Y REGLAS.

Como fue mencionado antes, una regla de producción estará compuesta por operandos, operadores y un factor de certeza, con la estructura clásicas de premisas y conclusión. Otro formulario permite la edición individual de cada regla de producción (Figura 6), facilitando la selección de los operadores e identificadores de epígrafes y objetivos posibles.

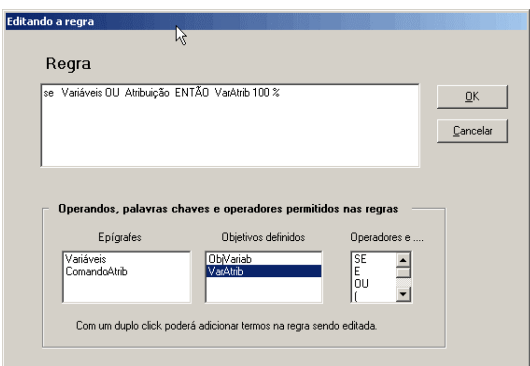

FIGURA 6
EDITOR DE REGLAS DE PRODUCCIÓN.

Las reglas de producción utilizan una sintaxis simple de palabras claves y operadores básicos. Por ejemplo, las reglas que definen el conocimiento de sentencias para ciclos en determinada lenguaje de programación, podrían ser:

SI DoWhile O DoLoopWhile
ENTONCES ConoceCicloWhile (90%)
.....
SI ConoceCicloWhile Y ConoceCicloFor
ENTONCES ConoceCiclos (100%)

Los identificadores DoWhile y DoLoopWhile representarían epígrafes, que tomarán valor dependiendo de las respuestas interactivas del alumno y los identificadores ConoceCicloFor, ConoceCicloWhile, ConoceCiclos, pueden ser objetivos parciales o finales definidos por el profesor.

Para el procesamiento de las reglas de producción, el sistema contiene un pequeño compilador, con las etapas de análisis sintáctico, análisis semántico y generación de código en notación postfija en la etapa de proyecto y un evaluador de expresiones en la etapa de ejecución, en lógica codificada para ser ejecutada en el servidor de páginas Web.

NAVEGACIÓN NO LINEAL ORIENTADA

El complemento de este pequeño sistema experto [3] embutido en el sistema UniVrt, se encuentra dentro del módulo en tiempo de ejecución, un motor de inferencia que permite evaluar las reglas de producción definidas durante la etapa de proyecto, a partir de los valores de los identificadores de entrada, que están relacionados con epígrafes y objetivos del curso, los primeros esperando por las respuestas de un alumno en específico.

Una posibilidad de forma simple de salida del módulo de evaluación/ orientación/explicación, será un reporte que, a partir de un enlace *¿Qué debo estudiar ahora?*, mostrará las informaciones necesarias, con enlaces activos para páginas específicas. Por ejemplo:

Para llegar a la conclusión "Conoce los comandos para ciclos en Visual Basic.NET", usted deberá estudiar y responder satisfactoriamente las preguntas de los epígrafes:

2.1 La sentencia Do-While para ciclos con control en el inicio de la repetición.

O

2.2 La sentencia Do-Loop-While para ciclos con control en el final de la repetición.

Y

2.3 La sentencia For en Visual Basic.NET.

Para la evaluación de los términos de una regla de producción, el sistema permitirá decidir entre dos métodos para operar con los niveles de certeza. Dependiendo del valor final de certeza calculado en la conclusión de una regla, ésta será considerada como verdadera o falsa.

Resulta interesante insistir nuevamente en que este mecanismo propuesto e implementado en el sistema UniVrt, podría ser utilizado como criterio de evaluación individual de los alumnos participantes en el curso, lo que quedaría completamente a criterio del profesor. Las preguntas de un epígrafe (sin límites de cantidades, ni tipos), con los valores de "nota" establecidos por el profesor, conformarían una prueba parcial de la asignatura o curso a distancia.

CONCLUSIONES

En este artículo, fue presentada una propuesta de mecanismos de orientación y navegación no lineales en un curso a distancia, basados en la definición de relaciones entre los epígrafes y objetivos del mismo, proyectadas utilizando reglas de producción que acompañan la participación del alumno en el curso.

Este módulo, forma parte de un sistema para la organización y administración de cursos para Internet, con posibilidades para la inscripción, evaluación, cooperación y orientación remota de los alumnos.

El sistema permite, a partir de las definiciones y estrategias establecidas por los profesores orientadores del curso, generar todo el contenido necesario para la manipulación de datos y la creación del código que será ejecutado en el espacio del servidor de páginas Web.

La investigación de otras formas didácticas de presentación de contenidos en cursos a distancia, de la cual este trabajo es un ejemplo, deberá ser, en nuestra opinión, una línea de pesquisa técnica y pedagógica bastante abordada, por su importancia docente en los tiempos actuales.

INTERAÇÃO UNIVERSIDADE-EMPRESAS MEDIANTE ESTÁGIOS CURRICULARES

Benedito Antonio Luciano[1] *e Talvanes Meneses Oliveira*[2]

Resumo — *Nos últimos anos, tem-se intensificado a aproximação entre as instituições universitárias e os setores industriais e de serviços. Esta aproximação tem ocorrido de diversas formas, dentre outras: oferta de cursos, treinamento para capacitação, educação continuada, serviços de consultoria e extensão universitária. Neste contexto, a interação universidade-empresas mediante a realização de estágios curriculares por parte de alunos dos cursos de graduação se apresenta como uma oportunidade adicional de aproximação, com reflexos positivos para ambas as partes, preservando identidades, propiciando parcerias e superando antigas dicotomias e preconceitos infundados. Neste artigo, em particular, são relatadas as experiências adquiridas com os estágios curriculares desenvolvidos no âmbito do curso de graduação em Engenharia Elétrica da Universidade Federal de Campina Grande, desde a implementação do seu primeiro Programa de Estágio, em 1973.*

Palavras-chaves — Universidade-empresas, Estágio curricular, Ensino de engenharia.

INTRODUÇÃO

Uma das primeiras experiências de programas de Interação Universidade-Empresa ocorreu no *Suderland Tecnical College*, na Inglaterra, em 1903. Naquele programa, as indústrias participavam permitindo aos estudantes a realização de estágios em suas dependências.

Nos Estados Unidos, essa experiência teve início em 1906, no curso de engenharia da Universidade de *Cicinnati*, onde eram alternados períodos de estudos na universidade com períodos de estágios em atividades correlatas nas empresas locais. Essa experiência recebeu o nome de Educação Cooperativa ("*Coperative Education*"), e na Inglaterra foi denominada de Curso Sanduíche ("*Sandwich Course*").

No Brasil, a primeira iniciativa dessa natureza se deu no Instituto Tecnológico da Aeronáutica – ITA, em São José dos Campos, São Paulo, local onde foram realizados os estudos iniciais para o desenvolvimento de um "Plano de Cooperação com a Indústria" na área de engenharia.

Já nas Instituições de Ensino Superior da rede federal, o início do Programa Cooperativo ocorreu a partir do Primeiro Plano Nacional de Desenvolvimento, com o Plano Setorial de Educação e Cultura, incluindo o Projeto 16 – Integração Escola/Empresa/Governo. A execução desse Projeto foi realizada com a participação do Instituto Euvaldo Lodi – IEL, formalizado mediante convênios firmados com o Ministério de Educação e Cultura – MEC.

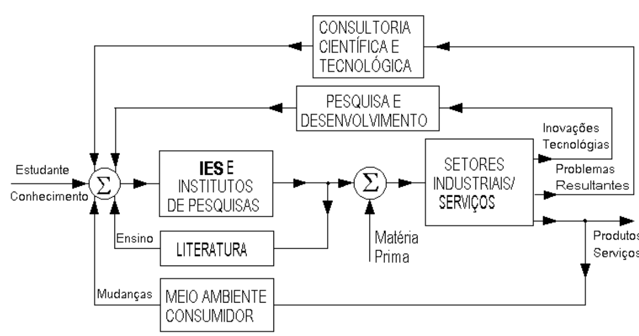
Neste trabalho são apresentadas uma cronologia e as principais ações desenvolvidas no âmbito do Programa Estágio Curricular do Curso de Engenharia Elétrica do CCT da Universidade Federal de Campina Grande - UFCG, a partir do ano de 1973.

A IMPORTÂNCIA DO ESTÁGIO

A aproximação entre ciência e tecnologia é atribuída a Roger Bacon (séc. XIII), segundo o qual essa aproximação se fazia necessária para que a primeira não permanecesse estéril, porque afastada da realidade, e a segunda ineficiente, porque empírica e desprovida de um corpo de doutrina [1].

O conhecimento científico é dominado, armazenado, organizado e gerado, quase que em sua totalidade nas universidades e nos institutos de pesquisas científicas.

A necessidade de interação surge quando os setores industriais e de serviços necessitam absorver uma tecnologia nova para eles, ou quando o setor científico produz inovações tecnológicas com vistas às aplicações práticas. Um diagrama deste fluxo interativo é apresentado na figura 1, com destaque para os elementos de entrada e saída.



A universidade dispõe dos conhecimentos científicos e

tecnológicos necessários, nas diversas áreas de conhecimento, por meio de um corpo docente capaz de orientar as atividades dos centros empresariais de pesquisa e desenvolvimento [2].

As potencialidades universitárias apresentam-se nas mais diversas formas, e dependem, basicamente, do nível de instrução que propiciam, da capacidade do seu corpo docente, do regime de dedicação do seu corpo técnico e de sua capacidade física instalada.

A ação comunitária dessas potencialidades é basicamente associada a convênios firmados com entidades públicas e privadas, os quais abrangem atividades de serviços técnicos, prestação de serviços científicos, serviços de extensão cultural, bem como outras atividades artísticas e culturais. Neste contexto inserem-se os estágios como uma das modalidades de interação universidade-empresa [3].

CRONOLOGIA

Em 1972, três centros universitários foram escolhidos para a experiência-piloto de implantação do Curso Integrado, denominação que foi dada no Brasil à Educação Cooperativa: o Centro de Ciências e Tecnologia da Universidade Federal de São Carlos, no Departamento de Engenharia de Materiais; o Centro de Tecnologia da Universidade Federal de Santa Catarina, no Departamento de Engenharia Mecânica; e o Centro de Ciências e Tecnologia - CCT da Universidade Federal da Paraíba - UFPB, no Departamento de Engenharia Elétrica - DEE. Neste último, o Programa de Estágio foi implantado em 1973 [4].

Em 1992, num trabalho publicado no COBENGE'92 [5], foi apresentado, sob forma de tabela, um levantamento dos estágios realizados por alunos dos cursos de graduação em engenharia elétrica da UFPB (atual UFCG), listando os nomes das empresas, por estado, e o respectivo número de alunos que nelas estagiaram. O período coberto pelo referido levantamento foi de 1973 a 1992, contabilizando um total de 94 empresas, 19 estados e Distrito Federal e 544 estágios realizados. Desse total, 173 (31,8%) alunos realizam estágios no próprio estado da Paraíba e 127 (23,3%) realizaram estágios no estado da Bahia, 70 deles na Companhia Hidrelétrica do São Francisco – CHESF. Com relação ao estado da Paraíba, as empresas que mais ofertaram estágios foram a TELPA (19%), a SAELPA (12,7%) e a CELB (11%).

No ano 2000, a secretaria da coordenação de estágios do curso de graduação em engenharia elétrica (CCT/UFPB) realizou um novo levantamento da oferta de estágios cobrindo o período de 1997 a 2000, verificando a oferta de estágios em dois novos estados: Goiás e Rio Grande do Sul Em relação ao total de estágios realizados no período supra citado, os estados que mais ofertaram estágios foram os seguintes: Paraíba (28,28%), Sergipe (15,15%) e Amazonas (12,62%) [6].

Na figura 2 é apresentado um novo levantamento dos estágios curriculares envolvendo o último decênio (1993 a 2002), com destaque para a distribuição de estágios por ano e por estado da federação, distrito federal e no exterior.

b)

FIGURA. 2

ESTÁGIOS CURRICULARES NO DECÊNIO 1993-2002 NO CURSO DE ENGENHARIA ELÉTRICA DO CCT/UFCG: *a)* DISTRIBUIÇÃO POR ANO; *b)* DISTRIBUIÇÃO POR ESTADO.

De acordo com este levantamento, ocorreu um aumento do número de estagiários no último decênio, contabilizando um total de 312 estágios (média de 31,2 estágios/ano) e 87 empresas, sendo cinco destas localizadas na França (Renault, EDF, Alston, Mastra e BIC). Por outro observa-se que o estado da Paraíba aumentou o número de vagas de estágios ofertados, com índice de 48,08%, seguido por 9,62% da Bahia, 8,97% de Sergipe e de 8,33% do Amazonas.

CENÁRIO ATUAL

Na estrutura curricular do curso de graduação em engenharia elétrica da UFCG o estágio é considerado como uma disciplina obrigatória. Atualmente, o estágio pode ser enquadrado numa das duas categorias: estágio supervisionado ou estágio integrado. O estágio supervisionado pode ser realizado pelo aluno em tempo parcial, cursando simultaneamente outras disciplinas. O estágio integrado, por outro lado, é realizado de modo que o aluno permaneça em tempo integral na empresa. Em ambos os casos, o estagiário dispõe de um supervisor designado pela empresa e professor orientador designado pela instituição de ensino.

Os alunos do curso de graduação em engenharia elétrica têm uma formação com perfil mais generalista do que especialista, entretanto, o aluno pode escolher, como aprofundamento de estudos, pelo menos uma das quatro ênfases do curso: controle e automação; eletrônica; eletrotécnica e telecomunicações.

ASPECTOS OPERACIONAIS

Em termos institucionais a coordenadoria de estágio do curso de graduação em engenharia elétrica está a cargo de um professor designado pela chefia de departamento e de uma secretária.

Ao coordenador de estágio cabem as seguintes atribuições: cadastramento de empresas; regulamentação interna dos estágios; levantamento de vagas; seleção e distribuição de vagas; designar os professores orientadores; operar a estrutura de estágio; realizar reuniões prévias com estagiários e orientadores; encaminhar credenciamento de empresas e realimentar o processo curricular.

Ao professor orientador, no âmbito da universidade, cabe: Apreciar o programa de estágio; orientar o estágio; propor o credenciamento de campos de estágios e avaliar o estágio.

Ao supervisor do estágio na empresa cabe: elaborar a proposta da programação do estágio; supervisionar e treinar o estagiário; controlar a freqüência e avaliar o estágio.

Na atual estrutura curricular os alunos devem estagiar no penúltimo ou último período do curso, em tempo parcial ou integral.

VISÃO DA UNIVERSIDADE VERSUS VISÃO DA EMPRESA

Baseados na experiência, acumulada ao longo desses trinta anos, pode-se afirmar que a interação universidade-empresa, mediante estágio, ainda é cercada de conflitos em termos de entendimento, particularmente no que se refere aos papeis da universidade e das empresas na formação do futuro engenheiro.

Pelo lado da universidade o entendimento é que o estágio deve ser conduzido a partir de um plano de atividades criteriosamente definidas, com vistas à formação sistêmica do futuro engenheiro, o que pressupõe um processo complementar, que supere a equívoca dicotomia entre teoria e prática, estabelecendo a conciliação entre elas.

Por outro lado, o entendimento da empresa é que o estágio é uma oportunidade de adaptação do estudante ao ambiente da empresa, às suas necessidades específicas, ajustando-se, desse modo, ao já existente, de forma passiva. Adicionalmente, em alguns casos, o estágio de estudantes de engenharia pode significar redução de custos com treinamento de profissionais recém-formados, ou a utilização de mão de obra qualificada para realizar tarefas aquém da formação acadêmica desses estudantes.

Entende-se que a interação universidade-empresa, mediante estágios curriculares, deve ser precedida de uma política bem definida, a partir de ampla discussão entre as partes, tendo como mediadores os órgãos representativos dos segmentos acadêmicos e empresariais.

Entende-se também que o processo interativo é dinâmico, sendo a oferta de estágio susceptível às mudanças na política econômica, sobretudo aquelas que implicam em retração ou expansão nos setores industriais ou de serviços.

AGRADECIMENTOS

A Rosilda Maria Costa, secretária da Coordenadoria de Estágios do Curso de Graduação em Engenharia Elétrica – CCT/UFCG, pelo sistemático trabalho de atualização das informações referentes à interação universidade-empresas mediante estágio curricular.

CONCLUSÕES

Neste artigo foram relatadas as experiências adquiridas com os estágios curriculares desenvolvidos no âmbito do curso de graduação em Engenharia Elétrica da Universidade Federal de Campina Grande, desde a implementação do seu primeiro Programa de Estágio, em 1973.

A realização do estágio materializou a interação universidade-empresa, com reflexos positivos para as partes envolvidas, preservando identidades e abrindo novas perspectivas de parcerias para outras iniciativas conjuntas.

CARACTERIZAÇÃO DE CURSOS HIPERMÍDIA ADAPTATIVOS

Raul dos Santos Gonçalves Barbeiro [1], *Clovis Torres Fernandes* [2] *e Luciano Vieira Dutra* [3]

Resumo — *Cursos Hipermídia ou CHs são sistemas que integram características de Sistemas de Treinamento por Computador e Sistemas Hipermídia, enquanto Sistemas Hipermídia Adaptativos ou SHAs são sistemas que integram características de Sistemas Hipermídia e Sistemas de Tutoria Inteligente. Esses novos tipos de sistemas ajudam a promover um alto nível de envolvimento do aprendiz com o conteúdo instrucional. Contudo, eles têm limitações. Por exemplo, um aprendiz estudando através de um CH será exposto ao mesmo material instrucional apresentado a outro aprendiz, enquanto um aprendiz estudando através de um SHA não será usualmente exposto a uma apresentação didática do material instrucional. Este trabalho apresenta uma caracterização e arquitetura dos assim chamados Cursos Hipermídia Adaptativos ou CHAs, que integram características de CHs e SHAs, de forma a apresentar o material instrucional de forma didática, pedagógica e adaptada para cada aprendiz. Um CHA é para ser empregado em atividades de aprendizagem a distância via Internet.*

Palavras-chave — *Cursos, Hipermídia, Adaptativos, Inteligente.*

CONTEXTO DA PESQUISA

A Internet rompeu barreiras que limitavam o acesso ao conhecimento, informação e aprendizagem. As ferramentas e aplicações tradicionais voltadas ao aprendiz, como pesquisa, consulta bibliográfica, apostilas e cópias de transparências de aulas, compartilham, agora, espaço com cursos completos de ensino a distância.

As salas de aulas virtuais passaram a ser empregadas por instituições de ensino como complemento ao ensino tradicional e também como forma de expandir os projetos educacionais. As atividades de aprendizagem realizadas na Internet fazem uso principalmente de aplicações hipermídia. Neste caso, o que se faz normalmente é transpor os cursos tradicionais para essa nova forma tecnológica, usualmente sem o emprego de modelos e metodologias pedagógicas apropriadas [1].

As modificações que aconteceram nos sistemas de aprendizagem assistida por computador, causadas pela evolução dos sistemas de aprendizagem tradicionais, representaram um avanço em direção ao que um aprendiz pode esperar de um sistema computacional para facilitar a aprendizagem. A integração das características dos sistemas de Aprendizagem Baseada em Computador e dos Sistemas Hipermídia nos Cursos Hipermídia e dos Sistemas Hipermídia e Sistemas de Tutoria Inteligente nos Sistemas Hipermídia Adaptativos produziu sistemas com características que facilitam a aprendizagem.

Este trabalho apresenta uma caracterização de Curso Hipermídia Adaptativo ou CHA e uma proposta de arquitetura para um CHA.

O trabalho possui a seguinte organização: primeiro apresentam-se sistemas tradicionais de aprendizagem e sua evolução, que constituem novas formas de aprendizagem; depois se apresenta uma caracterização para CHAs e discorre-se sobre a arquitetura proposta para um CHA.

SISTEMAS DE APRENDIZAGEM TRADICIONAIS

Nesta seção serão apresentados três tipos de sistemas de aprendizagem tradicionais [2]: Sistema de Aprendizagem Baseada em Computador ou CBL (acrônimo do correspondente em inglês: *Computer-Based Learning*), Sistema Hipermídia ou HS (acrônimo para *Hypermedia System*) e Sistema de Tutoria Inteligente ou ITS (acrônimo para *Intelligent Tutoring System*). Tais sistemas são considerados tradicionais porque atualmente dispõe-se de pesquisas em número tal que as suas bases já se encontram definidas.

Sistema de Aprendizagem Baseada em Computador

Sistemas de Aprendizagem Baseada em Computador têm sido a forma de ensino por computador empregada com maior ênfase atualmente [2]. Esses sistemas computacionais de aprendizagem são comumente descritos como CAI, acrônimo para *Computer-Aided Instruction* (Instrução Auxiliada por Computador), ou CBT, acrônimo para *Computer-Based Training* (Treinamento Baseado em Computador).

Independente da distinção que possa ser feita entre um termo ou outro, os sistemas de aprendizagem do tipo CBL são programas que funcionam como receptáculos organizados estaticamente para incorporar tanto o domínio do assunto, quanto o conhecimento pedagógico dos professores especialistas [3].

[3] Luciano Vieira Dutra, Divisão de Processamento de Imagens – Instituto Nacional de Pesquisas Espaciais (DPI-INPE), 12221-027, São José dos Campos, SP, Brasil, dutra@dpi.inpe.br

Os CBLs convencionais são caracterizados por sua estrutura relativamente inflexível e pelo uso de várias formas de apresentação da informação, como vídeo e áudio. Além disso, a estrutura dos CBLs é predeterminada precisamente pelos autores. Um CBL é diferente de um sistema de auxílio online, help em inglês, pois estes são normalmente direcionados para determinada aplicação, ao passo que os CBLs são materiais independentes [4].

Apesar de se encontrar algumas variações quanto à arquitetura dos sistemas de aprendizagem baseada em computador, existem três componentes que podem ser considerados básicos para esses sistemas. São eles o conteúdo, a interface gráfica com o usuário ou GUI (acrônimo para *Graphical User Interface*) e as funcionalidades do sistema [5], conforme ilustra a Figura 1.

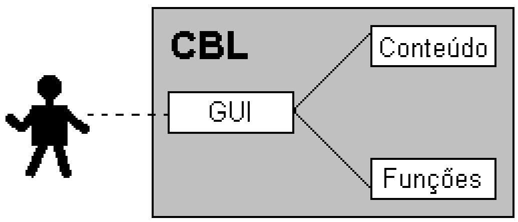

FIGURA 1
ARQUITETURA DE UM CBL.

A interface gráfica com o usuário, ou apenas interface com o usuário, é a responsável pela interação do aprendiz com o sistema. O conteúdo usualmente compreende uma estrutura linear de material instrucional. As funcionalidades são as possibilidades do aprendiz ir para frente ou voltar na estrutura linear, além de receber realimentação sobre respostas a exercícios realizados [6].

Sistema Hipermídia

Os termos hipermídia e hipertexto têm sido freqüentemente utilizados como sinônimos. Embora hipertexto sugira que toda a informação esteja na forma de texto puro, a maioria dos sistemas hipertexto permite o uso de informação em outras formas, como gráficos, som, animação ou vídeo. Pode-se usar a palavra hipertexto hoje em dia com o significado mais completo de hipermídia [7].

Sistema Hipermídia é um ambiente que facilita a criação e manipulação de uma aplicação hipermídia. Uma aplicação hipermídia pressupõe a existência de um sistema hipermídia que forneça os recursos para se realizar a autoria, a apresentação e a navegação. Dessa forma, uma aplicação hipermídia será construída criando-se uma hiperbase, um conjunto de estruturas de acesso e uma interface com o usuário [8]. A Figura 2 apresenta a arquitetura de um Sistema Hipermídia.

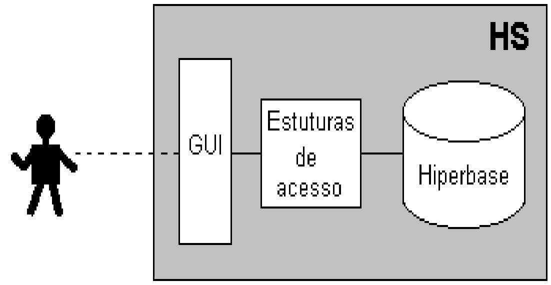

FIGURA 2
ARQUITETURA DE UM HS.

Teoricamente pode-se definir um sistema hipermídia em uma estrutura contendo três níveis [9]:

- Nível de apresentação: interface com o usuário
- Nível Hypertext Abstract Machine (HAM): nós de informação e links
- Nível de banco de dados: armazenamento, compartilhamento dos dados e acesso à rede

O nível de banco de dados está na base do modelo de três níveis, sendo responsável por todos os assuntos tradicionalmente relacionados com armazenagem de informação que não são necessariamente relacionados com hipermídia. Independente da forma como a informação é armazenada, deve ser possível recuperar um bloco específico em um curto espaço de tempo.

Além disso, o nível de banco de dados deve lidar com os assuntos relacionados com acesso múltiplo de usuários, segurança, *backup* etc. Normalmente é responsabilidade desse nível fazer cumprir os controles de acesso definidos nos níveis mais altos da arquitetura.

O nível HAM situa-se entre os níveis de banco de dados e o nível de apresentação. Neste nível central o sistema hipermídia define cada nó de informação, seus links e os respectivos relacionamentos entre eles. O HAM possui conhecimento na forma de nós e links e conhece quais atributos estão associados a cada nó e link. Um exemplo de atributo associado a um nó pode ser o atributo “responsável” que especifica quem é responsável pela criação do nó e possui autorização para atualizá-lo. Outro exemplo de atributo pode ser o “número de versão” do nó.

A interface com o usuário trata da apresentação da informação, incluindo aspectos como quais comandos devem ser disponibilizados para o aprendiz, como exibir nós e links, e apresentação de diagramas. Um exemplo do que pode ser tratado na interface com o usuário em um Sistema Hipermídia é controlar se o aprendiz pode efetuar entrada de valores ou se isso só pode ocorrer no modo de autoria. Os aspectos tratados no nível de apresentação devem refletir a estrutura adotada no HAM.

Para o desenvolvimento de aplicações hipermídia pode-se fazer uso de vários modelos para estruturar a informação. Dentre esses modelos, pode-se citar o Hypermedia Design

Model ou HDM [10], Mapeamento de Informação ou MI [11] e DAPHNE [12].

Sistema de Tutoria Inteligente

Sistemas de Tutoria Inteligente (ITS) utilizam alguma forma de inteligência para a tarefa de instruir com base em computadores. Existem dois lugares chave para inserir inteligência em um ITS. Um é no conhecimento que o sistema tem sobre o domínio do assunto. O outro é nos princípios através dos quais ele efetua a tutoria e nos métodos pelos quais aplica esses princípios [13].

Um ITS é um programa de computador que auxilia de forma inteligente o aprendiz a aprender determinado assunto. Não existe uma definição aceita sobre o que significa favorecer a aprendizagem de forma inteligente. Entretanto, uma característica compartilhada por muitos ITSs é que eles inferem um modelo do entendimento atual do aprendiz sobre o assunto e usam esse modelo individual para adaptar a apresentação didática do conteúdo às necessidades do aprendiz [14].

Com base nos itens descritos acima, pode-se definir os ITSs como sendo programas de computador destinados a auxiliar o processo de aprendizagem, utilizando técnicas e métodos de Inteligência Artificial (AI) para representar o conhecimento e para conduzir a interação com o estudante. Esses sistemas têm por característica possibilitar um maior controle, pelo programa, sobre a forma como está sendo realizado o aprendizado [15].

Os módulos componentes da arquitetura de um ITS, ilustrada pela Figura 3, apresentam as seguintes funções [15]:

- Interface com o usuário - Componente do ITS responsável por realizar a interação com o aprendiz.
- Módulo Tutorial - Responsável por planejar e gerenciar a interação com o aprendiz.
- Modelo do Estudante - Responsável por capacitar o sistema a fornecer uma individualização da aprendizagem.
- Módulo do Especialista ou Domínio - Compreende o conhecimento do especialista.

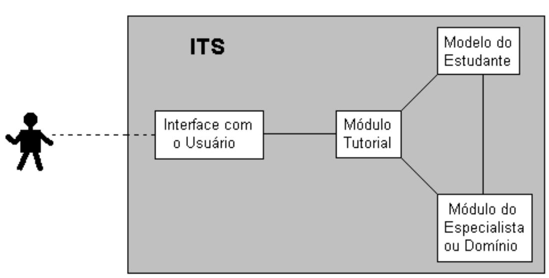

FIGURA 3
ARQUITETURA DE UM ITS.

EVOLUÇÃO DOS SISTEMAS DE APRENDIZAGEM TRADICIONAIS

Os sistemas de aprendizagem tradicionais foram aperfeiçoados, vindo a constituir novas formas de facilitar a aprendizagem. Esses sistemas foram integrados, conforme ilustrado na Figura 4, formando estruturas que apresentam características próprias. Por exemplo, Cursos Hipermídia ou CH são sistemas que integram características de CBLs e HSs, enquanto Sistemas Hipermídia Adaptativos ou SHAs são sistemas que integram características de HSs e ITSs. Esses novos tipos de sistemas, descritos em seguida, ajudam a promover um alto nível de envolvimento do aprendiz com o conteúdo didático [8].

Curso Hipermídia

Um Curso Hipermídia é um curso realizado por computador que utiliza a tecnologia hipermídia, cujo objetivo é facilitar o desenvolvimento de novas estruturas de conhecimento por parte do aprendiz [9].

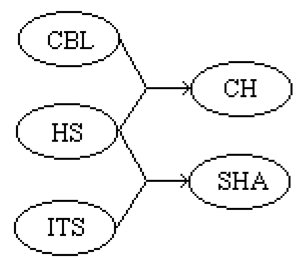

FIGURA 4
EVOLUÇÃO DOS SISTEMAS TRADICIONAIS.

Esse tipo de curso apresenta, assim, a informação de forma didática e pedagógica sobre determinado assunto. O CH fornece orientação ao aprendiz, embutida nas seqüências de informação definidas ou roteiros, e nos mecanismos de navegação empregados [8].

Os roteiros são definidos com base na aplicação hipermídia armazenada num banco de dados, que é chamada de hiperbase. Além da referência aos nós da hiperbase, os roteiros incorporam nós adicionais que ajudam na apresentação didática do material instrucional. Os roteiros não são lineares como nos CBLs por causa dos links hipermídia, embora nem todos os links da hiperbase sejam ativados no nível dos roteiros. Isto constitui o grau de liberdade de navegação, associado a cada nó do roteiro [1]-[15].

Um ambiente de aprendizagem deve prover uma boa orientação para o aprendiz, de modo a facilitar a obtenção dos objetivos pretendidos pelo autor do curso. É importante ter-se um balanço entre o controle do autor e o grau de liberdade oferecido ao aprendiz [1]-[8]-[15].

Enquanto os sistemas inteligentes têm sido criticados pela forma como efetuam a tutoria e o modo como empregam os modelos especialistas do domínio do conhecimento, os cursos hipermídia sofrem pela falta de uma estrutura ou auxílio especialista ao longo da seqüência instrucional [16]. Como decorrência, isto pode ocasionar a sensação de desorientação no aprendiz, ou de "perdido no hiperespaço" [20].

A expressão "perdido no hiperespaço" refere-se a um problema de desorientação que ocorre quando se utilizam até mesmo aplicações hipermídia relativamente pequenas, educacionais ou não. Esse problema consiste na combinação dos dois subproblemas seguintes [21]:

- Uma vez que se encontre algum material instrucional interessante, o leitor acredita ser melhor lê-lo cuidadosamente de imediato, porque pensa na eventualidade de não o encontrar novamente;
- Ao se navegar numa aplicação hipermídia, fica-se confuso sobre o local atual de navegação, não se sabendo, momentaneamente, porque se chegou nesse ponto, nem para onde se deslocar, uma vez que se perdeu o foco que deve nortear uma navegação.

Para reduzir os problemas relacionados à estrutura dos cursos hipermídia, utilizam-se modelos para desenvolver os cursos hipermídia. Encontram-se na literatura vários modelos e metodologias que podem ser empregadas [1]-[8]. Independente do modelo ou metodologia empregada, a construção de cursos hipermídia pode compreender as seguintes etapas, adaptadas de [1]-[8]:

- Pré-autoria: planejamento da hiperbase e dos roteiros
- Autoria: implementação da hiperbase e dos roteiros
- Infra-estrutura de apresentação e navegação

Sistema Hipermídia Adaptativo

Sistemas Hipermídia Adaptativos têm sido projetados e desenvolvidos em reconhecimento à necessidade de fornecer algum grau de apoio aos aprendizes durante a navegação. Um Sistema Hipermídia Adaptativo busca fornecer uma solução para o problema de desorientação causado pela navegação em sistemas hipermídia e a necessidade de acomodar usuários com interesses variados. Isso é conseguido através da capacidade de buscar e filtrar a informação mais relevante para as necessidades do usuário, seus objetivos e interesses [17].

SHAs são todos os sistemas hipermídia que reflitam algumas características do usuário em um modelo de usuário e aplique esse modelo para adaptar vários aspectos visíveis do sistema para o usuário [17].

Em um SHA pode-se adaptar o conteúdo da página hipermídia e os links de uma página, incluindo páginas de índice e mapas, para as páginas relacionadas. Distinguem-se essas duas técnicas de adaptação chamando a primeira de apresentação adaptativa, ou adaptação ao nível do conteúdo, e a segunda de suporte para a navegação adaptativa, ou adaptação ao nível dos links [18].

CARACTERIZAÇÃO DE CURSOS HIPERMÍDIA ADAPTATIVOS

Um aspecto que deve ser observado nos sistemas resultantes da evolução dos sistemas tradicionais, é que a integração resultante se apresenta com características marcantes de um ou outro sistema. Olhando um sistema filho, pode-se dizer de qual sistema pai ele herdou mais fortemente uma característica.

Os Sistemas Hipermídia Adaptativos possuem forte influência dos Sistemas de Tutoria Inteligente, no sentido em que buscam uma solução que está centrada em um modelo de usuário. Esse modelo procura representar o "estado cognitivo" do usuário e através desse modelo o sistema procura se adaptar ao mesmo. Já os Cursos Hipermídia demonstram forte influência dos sistemas de Aprendizagem Baseada em Computador, representada pela incorporação de aspectos pedagógicos no curso [1]-[8]-[19].

Buscando incorporar aos Cursos Hipermídia e aos Sistemas Hipermídia Adaptativos novos mecanismos para facilitar a aprendizagem, esses dois sistemas de aprendizagem foram integrados, gerando os assim chamados Cursos Hipermídia Adaptativos. Esses cursos irão apresentar maior ou menor grau de facilitação da aprendizagem em função das características incorporadas dos sistemas pai.

Curso Hipermídia Adaptativo

Os cursos hipermídia adaptativos ou CHAs incorporam características dos cursos hipermídia e dos sistemas hipermídia adaptativos. Um curso hipermídia adaptativo é um curso hipermídia que utiliza a tecnologia dos sistemas hipermídia adaptativos para fornecer uma informação sobre determinado assunto de forma didática, pedagógica e adaptada para cada aprendiz que realize o curso. A Figura 5 representa a integração dos CHs e SHAs, formando os CHAs.

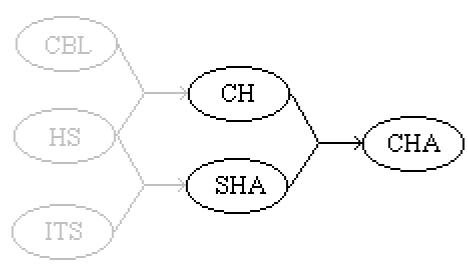

FIGURA 5
EVOLUÇÃO DOS CHS E SHAS.

Um CHA facilita o desenvolvimento de novas estruturas de conhecimento por parte do aprendiz, através da aplicação de um modelo de usuário que reflita no curso características do aprendiz, adaptando vários aspectos do sistema ao usuário.

Com isso, no CHA emprega-se uma característica herdada dos SHAs que pode resolver o problema dos cursos que são realizados por diferentes classes de aprendizes. Os aprendizes podem apresentar grande divergência quanto aos seus objetivos, suas experiências e seus conhecimentos sobre os assuntos abordados num dado curso. Contudo o CHA irá tratar essas diferenças de modo único e voltado para cada aprendiz [20].

Ao se preparar um CHA, estar-se-á fornecendo um curso que deverá atender os objetivos específicos de cada aprendiz, adequando o conteúdo do curso para as necessidades, experiências e conhecimento do mesmo durante todo o transcorrer do curso. Isso é obtido através do uso de modelos de usuário, que fornecem as informações necessárias para que o CHA possa adequar-se ao aprendiz.

Outro aspecto, herdado dos CHs e SHAs, é que um CHA evita a sensação de "perdido no hiperespaço" do aprendiz [20].

Quanto à questão de encontrar material instrucional de interesse, num CHA o aprendiz não precisa se preocupar com isso, pois ele deverá ter acesso, por definição, somente a documentos que sejam de seu interesse.

A questão da navegação em um CHA é realizada como se fosse uma via de mão única e sem retornos. Caso o sistema do CHA detecte, num dado ponto, que o aprendiz requer algum conhecimento prévio, este será apresentado na interação imediatamente a seguir do aprendiz com o sistema. Uma interação é representada pelo ato do aprendiz solicitar ao CHA a apresentação de algum material instrucional. Isso deve ser feito de forma transparente para o aprendiz, de modo que o aprendizado não seja prejudicado.

A Figura 6 representa duas interações do aprendiz com o curso: i e i+1. Antes da interação i, o CHA seleciona qual material instrucional será exibido para o aprendiz e em que ordem, no caso o item 2. Após a interação i, antes de o aprendiz realizar a interação i+1, o CHA recalcula, com base em seu desempenho na interação i, o material instrucional que será apresentado ao aprendiz na interação i+1, no caso o item 3. Percebe-se que não apenas o próximo material instrucional é alterado (item 3 em vez do item 5 da interação i): toda uma possível seqüência é recalculada.

Essa é uma característica que remonta aos ITSs, uma vez que um CHA efetua um maior controle sobre a forma como está sendo realizado o aprendizado. O aprendiz comanda o sistema para prosseguir, mas é o CHA quem diz para onde ele pode ir ou o que ele pode ter acesso.

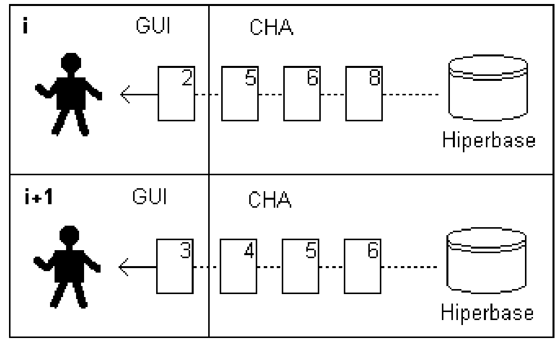

FIGURA 6
INTERAÇÕES DO APRENDIZ.

ARQUITETURA PROPOSTA DE UM CHA

A caracterização dos CHA, nos leva à seguinte proposta para uma arquitetura de um Curso Hipermídia Adaptativo, com os seguintes elementos:

- Servidor CHA – Implementa a lógica do curso, integrando as informações dos demais elementos constituintes do CHA.
- Roteiro-base – Melhor seqüência para percorrer o material instrucional do curso, definida por especialistas.
- Modelo do Aprendiz – Módulo que permite extrair informações do usuário, visando adaptar o curso ao mesmo.
- Módulo Avaliador – Efetua o controle de desempenho do aprendiz.
- Hiperbase – Aplicação hipermídia armazenada em um meio persistente ou banco de dados.
- Interface com o aprendiz – Interface de acesso ao material instrucional do curso.

A Figura 7 apresenta a arquitetura conceitual proposta para um CHA e a Figura 8 seguinte representa a arquitetura para um CHA quando realizado na WWW em um ambiente cliente-servidor.

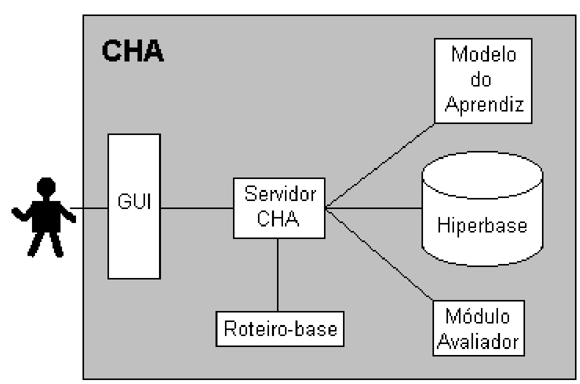

FIGURA 7
ARQUITETURA DE UM CHA.

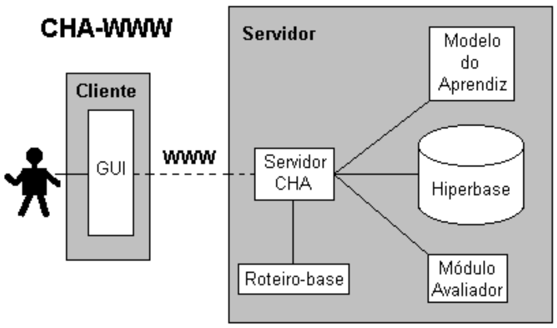

FIGURA 8
ARQUITETURA DE UM CHA PARA A WWW.

Servidor CHA

Este módulo implementa a lógica do curso, integrando as informações dos demais elementos constituintes do CHA. Este módulo é responsável pelo planejamento e gerência da interação com o aprendiz. Neste módulo estão integradas as estratégias de aprendizagem, ou conjunto de ações que serão executadas visando atingir os objetivos de aprendizagem definidos pelo autor do curso.

As informações sobre o aprendiz, obtidas do Modelo do Aprendiz, e o desempenho do aprendiz, obtido do Módulo Avaliador, integradas com o Roteiro-base capacitam o Servidor CHA a selecionar na Hiperbase o material didático adequado que será apresentado ao aprendiz. Este módulo representa o chamado Módulo Tutorial dos ITSs.

Roteiro-base

Neste módulo está presente o roteiro de referência que o CHA irá utilizar para definir o material instrucional a ser apresentado ao aprendiz. Este módulo representa o modelo de roteiro utilizado nos CHs, onde para cada nó é oferecida uma lista de opções alternativas que o aprendiz pode seguir.

O modelo de roteiros dos CHs atua como um roteiro-base, pois para um CHA os roteiros devem ser adaptativos e este tipo de roteiro será alcançado quando as informações do Roteiro-base forem integradas com as informações dos demais módulos.

Hiperbase

O conjunto de material instrucional da hiperbase deve ser projetado de modo que possa atender os diferentes aprendizes que deverão realizar o curso. As informações presentes na hiperbase devem conter material relevante a cada aprendiz, de outra forma ela poderá atender somente uma pequena parcela de aprendizes.

Roteiro-base, Servidor CHA e Hiperbase, em conjunto, representam o Módulo do Especialista dos ITSs, que contém os fatos e regras de um determinado domínio que será apresentado ao aprendiz.

Módulo Avaliador

É responsável por efetuar o controle de desempenho do aprendiz. A avaliação é um aspecto essencial em toda aprendizagem. Ela é utilizada com os seguintes propósitos [21]:

- Determinar o que um aprendiz conhece ou não conhece.
- Ordenar os aprendizes em função de seu desempenho.
- Decidir o que deve ser empregado na apresentação do material instrucional.
- Atribuir notas aos aprendizes.
- Admitir um aprendiz no próximo nível de um curso.

A avaliação pode ser um questionário informal ou um exame formal, monitorado, em grupo ou individual. Na arquitetura do CHA proposto, o Módulo Avaliador assume duas funções principais:

- Determinar o desempenho do aprendiz no curso, visando definir qual o melhor nível de informação para apresentar ao aprendiz, dentre os níveis suportados pela hiperbase.
- Selecionar quais conceitos ele deve ver, e serão apresentados ao aprendiz, e quais conceitos ele não precisa ver, e não serão apresentados ao mesmo.

Modelo do Aprendiz

Módulo que permite extrair informações do usuário, visando adaptar o curso ao mesmo através da representação do estado atual de conhecimento do aprendiz sobre o assunto do curso. Esse módulo realiza a tarefa de reunir informações que sejam consideradas relevantes sobre um aprendiz individual que podem ser utilizadas para adaptar o curso ao aprendiz.

Os módulos Avaliador e Modelo do Aprendiz representam o chamado Modelo do Estudante dos ITSs que é responsável pela capacidade de individualização da aprendizagem nesses sistemas.

Interface com o Aprendiz

Este módulo realiza a apresentação ao aprendiz do material instrucional selecionado pelo Servidor CHA. Este módulo deve possuir suporte aos vários tipos de arquivos presentes na hiperbase, tais como texto, som e vídeo. A interface com o aprendiz deve possuir os seguintes recursos [15]:

- Capacidade de personalização pelo aprendiz
- Apresentação de dados em diversos formatos e meios
- Facilidade de uso, minimizando o número de ações necessárias para uma comunicação efetiva entre aprendiz e sistema.

- Interatividade e apresentação de informações sobre o estado atual do sistema, como no caso de se estar aguardando o resultado de um processamento.
- Reconhecimento de erros involuntários e monitoração contínua das ações do aprendiz
- Respostas rápidas, dentro dos limites impostos pelo meio físico empregado no curso

Comparação Entre CH, SHA E CHA

Através das características dos CHs e SHAs, apresentadas anteriormente, e pela caracterização dos CHAs, pode-se observar que esses sistemas apresentam grande potencial para seu emprego na aprendizagem. Esses sistemas de aprendizagem apresentam características que podem ser contrastantes e devem ser apresentadas para que, quando da realização de um curso, possa escolher-se o sistema que melhor atenda as necessidades do autor.

Para realizar uma comparação entre esses sistemas de aprendizagem, foram adotados os critérios utilizados por Santos, conforme apresentados na Tabela 1 [15].

TABELA 1
COMPARAÇÃO ENTRE SISTEMAS DE APRENDIZAGEM.

Critérios x Tipos de Sistema	CHs	SHAs	CHAs
Grau de liberdade	Alto	Variável	Variável
Estilo de aprendizagem	Informal	Formal	Formal
Modelagem do domínio	Implícita	Explícita	Explícita
Métodos de ensino	Não	Sim	Sim
Modelagem do usuário	Não	Sim	Sim
Iniciativa na interação	Flexível	Mista	Mista
Responsabilidade	Usuário	Sistema	Mista
Sobrecarga cognitiva	Sim	Eventualmente	Eventualmente
Complexidade de criação	Variável	Alta	Variável
Ferramentas	Muitas	Poucas	Poucas

O item "grau de liberdade" indica quanto o aprendiz é livre para determinar o rumo do curso. Esse item serve para medir o grau de controle do sistema sobre o aprendiz. Pode ser baixo, médio, alto ou variável.

O item "estilo de aprendizagem" indica o formato da aprendizagem que é empregado pelo sistema, podendo ser formal, informal ou variado.

O item "modelagem do domínio" indica se o sistema possui um Modelo de Domínio do conhecimento, podendo ser explícito ou implícito.

O item "métodos de ensino" indica se o sistema é capaz ou não de incorporar diferentes métodos de ensino. A característica de poder possuir vários métodos de ensino é muito importante para o aprendizado, possibilitando variar de método em função do desempenho do aprendiz.

O item "modelagem do usuário" indica se o sistema possui uma forma explícita para modelar o aprendiz. Isso indica a possibilidade de adaptar o curso ou não ao aprendiz.

O item "iniciativa na interação" indica qual tipo de iniciativa é utilizada durante a realização do curso pelo aprendiz. Pode ser rígida, mista ou flexível.

O item "responsabilidade" indica se a responsabilidade maior sobre o andamento do curso está a cargo do aprendiz ou do sistema.

O item "sobrecarga cognitiva" indica se o sistema pode, por suas características, causar sobrecarga cognitiva ao aprendiz. Pode ser sim, eventualmente ou não.

O item "complexidade de criação" indica o grau de exigências predefinidas, especificações rígidas e dificuldade de alterações, expansões e manutenção do curso. Pode ser baixa, média, alta ou variável.

O item "ferramentas" indica a disponibilidade de ferramentas auxiliares para a criação de um curso. Nesse item efetuou-se uma análise de modo a englobar todas as fases de criação de um curso. Em especial, no tocante à modelagem conceitual, os sistemas que envolvem modelagem de usuário não dispõem de ferramentas para essa tarefa.

Independente de qualquer análise que possa ser feita entre CHs, SHAs e CHAs, os dois primeiros apresentam uma característica que os distinguem dos CHAs e justifica o desenvolvimento deste trabalho de pesquisa. CHs e SHAs possuem metodologias de desenvolvimento que norteiam os autores para extrair, de cada sistema de aprendizagem, as suas melhores características.

Quanto ao item "responsabilidade", enquanto num SHA a responsabilidade pelo andamento do curso está a cargo do sistema, num CHA está a cargo tanto do sistema quanto do aprendiz, que explicitamente pode influenciar os passos que ele deve seguir.

Quanto ao item "métodos de ensino", embora tanto um SHA quanto um CHA incluam métodos pedagógicos na condução do curso, CHAs adicionam material didático adicional ao proveniente da hiperbase, apresentando-o de forma bastante viva e diversificada. Em contraste, um SHA apresenta apenas e tão somente o material instrucional oriundo da hiperbase.

CONCLUSÕES

Os Cursos Hipermídia Adaptativos representam uma área relativamente nova de pesquisa e um número limitado de modelos ou sistemas foi implementado visando à melhoria do grau de aprendizagem do aprendiz.

O potencial dos Cursos Hipermídia Adaptativos para a aprendizagem a distância é imenso e deve ser explorado de modo a obter todo o potencial disponível nas redes de computadores atuais e, em especial, a Internet. A tecnologia de Cursos Hipermídia Adaptativos está sendo empregada no desenvolvimento de vários cursos via Internet.

MEJORÍA EN CALIDAD DE LA ENSEÑANZA DE INGENIERÍA: TRANSFORMACIÓN DE CONPORTAMIENTO ENTRE DOCENTE Y DISCENTE

Katia Tannous [1]

Resumen—La propuesta de ese trabajo es presentar una nueva visión de la calidad de la enseñanza de ingeniería en lo que corresponde a la relación entre profesor y alumno. La investigación fue realizada en curso de postgrado IQ100-Transferencia de la Cantidad de Movimiento ofrecida en la Facultad de Ingeniería Química de la Unicamp. La transformación del hábito y conportamiento en las actitudes en la clase puede generar una mejoría significativa en la enseñanza-aprendizaje. El abordaje constructivista proporcionó la construcción de un software con interfaz gráfica, subdividido en dos partes: abordaje teórico y abordaje matemático. En el abordaje teórico, fueran elaborados los contenidos discutidos y debatidos en clase, a saber: tensiones en los fluidos, deformaciones y ecuaciones constitutivas, ecuaciones de conservación de la cantidad de movimiento, soluciones de la ecuación de Navier-Stokes, teoría de la capa límite y flujo turbulento. En el abordaje matemático (solución analítica y numérica) fueron elaborados dos ejercícios prácticos, respectivos al flujo en ductos circulares y concéntricos, con objetivo de la determinación del perfil de velocidades en estado estacionario y transiente.

Palabras-clave: enseñanza-aprendizaje, metodología de enseñanza, tecnología orientada a objetos

INTRODUCCIÓN

La civilización dentro de la cual hemos vivido en ese último siglo es fuertemente influenciada por los parámetros de la racionalidad y por lo que se imagina ser lo mejor del rigor científico. Nos orgullamos de ese tipo de cultura objetiva, racional y científica, sin la cual, no había sido posible construir la modernidad, ni tendríamos el extraordinário progreso y tecnológico de que disfrutamos. Pero, si el paradigma de la racionalidad técnica fue útil y necesario para orientar el conocimiento y los caminos de la humanidad hasta hoy, ahora, ciertamente el se choca con las nuevas realidades y con las exigencias de los nuevos tiempos[1].

Parte de la crisis que presenciamos es fruto de una relación no satisfactoria entre una situación vivida y un modelo de respuestas que ya no atiende a esa situación. Por eso, toda crisis es benéfica, pues ella nos obliga a una introspección de la cual resulta una revisión interior y la adopción de nuevos comportamientos.

Percibimos que el mundo alrededor está cambiando de forma bastante acelerada y la educación sigue asentada en el paradigma dominante que refuerza una enseñanza fragmentada y conservadora que tiene como foco central la reproducción del conocimiento por el aprendiz, incluso utilizando avanzados instrumentos tecnológicos. Sabemos que no se cambia un paradigma educacional dominante sólo poniendo un nuevo ropaje, camuflando viejas teorías, poniendo pantallas en las clases, si el alumno continúa en la posición de mero expectador, de simple receptor, presenciador y copiador [2].

La ciencia moderna nos legó un conocimiento funcional del mundo que amplió extraordinariamente nuestras perspectivas de supervivencia. Hoy no se trata tanto de supervivir, sino de saber vivir. En esa perspectiva, el proceso de construcción, de (des)construcción o de (re)construcción del conocimiento – presencial y/o a distancia – apunta para el ultrapasaje de la visión compartimentalizada, disciplinar, aislada, objetiva, científica con base en los princípios defendidos por [1]. Todo conocimiento es local y total; todo conocimiento es autoconocimiento, todo conocimiento científico-natural es científico-social y visa constituirse en senso común.

En las propuestas pedagógicas y opciones metodológicas emergentes, el uso de las nuevas tecnologías de la información y de la comunicación no aseguran la inovación educacional, pues el salto transformador depende de la forma como los instrumentos tecnológicos son utilizados para superar la reproducción del conocimiento y contribuir a la producción de un saber significativo y contextualizado, para el desarollo de competencias, habilidades y actitudes imprescidibles a la construcción de una vida y un mundo mejor para todos [3]-[4].

La mediación pedagógica en la Educación a Distância-EAD, que enfatiza el proceso de producción de conocimiento, involucra los suportes mediadores - tecnológicos o no - los procedimientos interactivos y las relaciones que envuelven profesor/alumno/conocimiento.

Para concretizar la interactividad, [4]-[5]-[6], el profesor propone para sus alumnos el conocimiento, no la transmición. En clase, él es más que instructor, entrenador, compañero, consejero, guía, facilitador, y colaborador. El es formulador de problemas, provocador de situaciones,

[1] Katia Tannous, Unicamp, Facultad de Ingeniería Química, Departamento de Termofluidodinámica, Cidade Universitária Zeferino Vaz, CP6066, 13083-970, Campinas, SP, Brazil, katia@feq.unicamp.br

arquitecto de trayectos, movilizador das inteligencias múltiplas [7] y colectivas en la experiéncia del conocimiento. El disponibiliza estados potenciales del conocimiento de modo que el alumno experimente la creación del conocimiento cuando participa, interfiere, cambia. Por su vez, el alummo deja de la recepción pasiva em la cual oye, mira, copia y presta cuentas para que se envuelva con la proposición del profesor [8]-[9].

Adémas, la interactividad contribuye para sostener, en nuestro tiempo, que educar significa preparar para la participación ciudadana, y que esta puede ser experimentada en la clase (informatizada o no), a distancia o presencial, no más centrada en la separación de emisión y recepción. Por lo demás, la imaginación creadora del profesor está demasiado solictada delante del desafío de educar en la era de las informaciones, en la era digital [5].

Con esa visión, propuestas de técnicas y metodologías de enseñanza de forma interactiva, colaborativa y constructiva fueron presentadas em estos últimos años asociando enseñanza presencial y a distancia en cursos de graduación y postgrado en la Facultad de Ingeniería Química de la Unicamp [10-13].

MOTIVACIÓN Y OBJETIVOS

Ese trabajo forma parte de un proyecto que está siendo desarollado en el Departamento de Termofluidodinámica de la Facultad de Ingeniería Química de la Unicamp, tiendo como objetivo general el desarollo de un ambiente computacional de enseñanza-aprendizaje interactivo.

El alto nivel de multi-disciplinaridad de este proyecto exige la construcción de un prototipo para demonstrar la eficacia de ideas y tecnologías. El ambiente que se quiere desarollar posee de entre otros componientes, interfaces gráficas interactivas, comportamiento en tiempo real y arquitectura distribuida. Para satisfazer esos requisitos se recae en el domínio de la tecnología orientada a objetos.

La disciplina de postgrado elegida para el prototipo es IQ100-Transferencia de la Cantidad de Movimiento. Por tratarse de un contenido complejo para los alumnos de las ingenierías, pues involuera conocimientos fundamentales de matemática, física y fenómenos de transporte, y principalmente por las diferenciadas potencialidades de los alumnos, viniendo de diferentes escuelas nacionales y estranjeras, gran parte del tiempo disponible en clase es gasto con la transmisión de los fundamentos y conceptos del curso.

La dificultad de los aprendices está en, por ejemplo, modelar las condiciones de contorno o reconocer el caracter tridimensional del flujo o aún convalidar los resultados del análisis. Se sabe que la simulación tende a ser más motivadora que las actividades de aprendizaje tradicionales, pues siendo interactiva, estimula al aprendiz a exploración en un gran número de hipótesis. La facilidad de poder variar los parámetros y visualizar inmediatamente las consecuencías de esas variaciones, se convierte en una verdadera ampliación de aprendizaje.

La primera fase de ese trabajo es analisar cualitativamente y cuantitativamente (aplicación de contenido) la interatividad profesor/alumno y alumno/alumno en la construcción del conocimiento. Las herramientas de la Web fueron utilizadas para auxiliar en el desarollo del trabajo.

ORGANIZACIÓN DEL CURSO

Dos ambientes fueron utilizados conjuntamente en la disciplina: *WebCT (Web Course Tools)* y *Delphi.*

Estructura del Curso en Ambiente de Educación a Distancia

La disciplina fue reformulada y adaptada en el software *WebCT* como herramienta didáctica. A pesar del curso ser presencial, la utilización del software *WebCT* permite el acceso previo al contenido ministrado en clase, promoviendo mayor interactividad entre los participantes.

El contenido programático del curso IQ100 aborda la descripción del movimiento, conservación de masa en flujos, tensiones en los fluidos, deformaciones y ecuaciones constitutivas, ecuaciones de la conservación de cuantidade de movimiento, soluciones de ecuación de Navier-Stokes, teoría de la capa límite y flujo turbulento.

La presentación del curso virtualmente tuvo los siguientes accesos (www.ead.unicamp.br:8900):

- Informaciones generales del curso: informaciones del profesor, objetivos, requisitos mínimos, libros-textos
- Calendario de orientación del curso dinámico
- Contenido del curso en forma de textos didácticos y complementares en respuestas a los cuestionamientos de los alumnos
- Trabajos en grupos
- Biblioteca virtual contiendo *links* de busca
- Herramientas de comunicación (e-mail y foro de discusiones)
- Notas de evaluaciones

La utilización del software permitió al profesor el acompañamiento virtual de los alumnos a través de las informaciones estadísticas de la frecuencia de acceso, de la adquisición de las herramientas de comunicación y utilización de los sitios de busca para la realización de los trabajos en grupos, siendo esos disponibles para todos los participantes.

Estructura del Curso en Ambiente Orientado a Objetos

La técnica de aprendizaje adoptada fue apoyada en la realización de proyectos asociados en grupos de trabajo, evidenciando habilidades técnicas/científicas ejercitando habilidades de colaboración y comunicación entre lo profesor y alumno, y principalmente entre los alumnos.

Para el desarollo del ambiente orientado a objetos *(Learning Object)*, los alumnos fueron divididos en três largos grupos de acuerdo con la formación básica de cada uno. A pesar de uniformidad curricular de las escuelas de ingeniería química (nacionales y estranjeras), la potencialidad de los alumnos son distinctas. El modelo adoptado, sucede la sugerencia de [14], como se puede ver en la figura 1.

Esa propuesta de trabajo promovió una dinamización en curso, a través de la definición del proyecto, organización de los grupos, adaptación de los alumnos en cada proyectos inicialmente eligidos, integración de los grupos y los contenidos estructurados, atualización constante del trabajo, entrega del proyecto final y evaluación a través de la defensa del proyecto por un integrante de cada grupo.

<table>
<tr><th>Secuencia</th><th>Descripción</th></tr>
<tr><td></td><td>El profesor específica el proyecto.

El profesor ayuda a los alumnos en la organización de los grupos y designa para cada uno, parte del proyecto. Cada grupo proyecta su parte y integra a las otras, de los demás grupos. Un grupo es responsable por la integración total del proyecto.

El ciclo del proyecto se repite varias veces.

Término final de elaboración del proyecto.

Los alumnos presentan el proyecto final y el profesor evalua.</td></tr>
</table>

FIGURA 1
MODELO DE APRENDIZAJE ADOPTADO

RESULTADOS Y DISCUSIONES

Desarollo del Ambiente Orientado a Objetos

El ambiente orientado a objeto (*software*) fue desarollado en Delphi 6.0, denominado Momentun 1.0, donde fue subdividido en dos partes, un abordaje teórico y otra matemático.

En el abordaje teórico (Figura 2) fueron presentados conceptos de la transferencia de la cuantidade de movimiento en formato de textos sin animación, posibilitando la lectura de la teoría del curso de forma sistemática y concisa.

En el abordaje matemático fue desarollado y presentado la solución analítica (Figura 3) y numérica (Figura 4) de dos problemas envolviendo flujo en ductos circular y ortogonal en espacio anular. El objetivo de los ejercicios es la determinación del perfil de velocidad de un fluido escurriendo en ductos horizontal y vertical, en estado estacionario y transiente. En la solución numérica, el usuario puede introducir las propiedades del fluido (viscosidad, densidad), dados de la tubería (diámetro, comprimiento) y dados de operación (variación de presion y tiempo) y aclarar rapidamente el perfil de velocidad conjuntamente a los dos problemas.

CONSIDERACIONES FINALES

Esa experiencia nos permitió identificar y compreender la eficiencia de una técnica de enseñanza a partir del desarollo de actividades en ambientes virtuales de aprendizaje, siendo estos ambientes de EAD y ambientes orientados a objetos.

La tecnología implementada en el desarollo del ambiente orientado a objetos permitió que se hiciera un mejor control del proceso de aprendizaje desarrollado por los grupos de trabajo. Los resultados obtenidos nos señalan indícios de que el modelo adoptado privilegió la regularidad y consistência de aprendizaje a través de los desempeños demonstrados.

Los aspectos de motivación y interactividad, observados durante el curso, apuntan en la dirección del acceso facilitado al contenido del curso, facilidad en la comunicación entre profesor-alumnos, y alumno-alumno, así como la construcción del conocimiento individual y en grupo.

Entonces, se cree que el aprendizaje colaborativo constructivista es una buena alternativa para crear interacción entre profesor y alumno, transcendiendo la simple transmisión de informaciones.

Con eso, se buscará dar continuidad a ese trabajo, con otras grupos, proyectando nuevas formas de presentación de contenido y formación de nuevos ejemplos prácticos.

AGRADECIMIENTOS

La autora agradece la turma de IQ100 del 1º semestre de 2002 del curso de Postgrado de Ingeniería Química por la aceptación de esa nueva propuesta de trabajo y dedicación para que el resultado fuera totalmente positivo fructificando futuros trabajos.

O “PROFESSOR.COM”: O ALUNO E A MÁQUINA

Eloísa Vecchiato[1] *e Aldo Bizzocchi*[2]

Resumo *— O presente trabalho pretende revelar, à luz dos pressupostos teóricos de Jung, que o processo de ensino-aprendizagem estabelecido entre alunos e professores mediados pela Internet e/ou computador só é possível priorizando-se a compreensão do homem (seja ele professor ou aluno) enquanto ser cognitivo e da máquina enquanto meio no processo de aquisição e fundamentação de novos conhecimentos. Todos os seres humanos percebem e julgam informações, usando para isso quatro funções cognitivas: sensação, intuição (processos de percepção), pensamento e sentimento (processos de julgamento). Partindo desse pressuposto, pretende-se evidenciar quais aspectos humanos devem ser levados em consideração no momento em que um professor de exatas se depara com diferentes perfis de alunos, que se comportam de maneiras diferentes diante de um mesmo conhecimento.*

Palavras-chave — Comunicação interpessoal, intrapessoal e grupal, estilos cognitivos de aprendizagem, ensino da computação.

TRAFEGANDO ENTRE A SOCIOLOGIA, A FILOSOFIA E A PSICOLOGIA PARA EXPLICAR O CONCEITO DE CONHECIMENTO

“O conhecimento mantido sob controle restrito dos especialistas está escapando ao controle e atingindo cidadãos comuns. Da mesma forma, dentro das principais empresas, os empregados estão conseguindo acesso ao conhecimento que antes era monopolizado pela direção. E, à medida que o conhecimento é redistribuído o mesmo acontece, também, como o poder nele baseado”. [1]

Com a Revolução Industrial, camponeses passaram a operar em “chão de fábricas” subordinados a patrões, literais detentores de riqueza. Esse posicionamento gerou mudanças no conceito de família; o patriarca saiu de cena e alguns papéis exercidos pela família transferiram-se para a Educação. Novas elites surgiram e os pilares estruturais da sociedade tornaram-se outros, assumindo novas dimensões; o trabalho braçal deu lugar ao trabalho intelectual, e o poder deslocou-se por meio de três canais: violência, riqueza e conhecimento.

“Tal como máquinas-ferramentas […] a força, a riqueza ou o conhecimento, se usados de forma adequada podem dar ao indivíduo o comando de muitas outras e mais variadas formas de poder.” [2]

“O conhecimento é a mais democrática fonte de poder.” [3] É uma fonte inacabável: quanto mais se usa, mais se gera de forma contínua e ascendente. Pode ser usado simultaneamente por várias pessoas; gera pensamentos novos, riqueza, soluções, conceitos, direcionamentos, estratégias, ciência.

Como se Constrói o Conhecimento?

Apoiando-se na filosofia moderna para introduzir um conceito de construção do conhecimento proposto nesse trabalho, temos em linhas gerais três correntes filosóficas: o Racionalismo, o Empirismo e o Interacionismo.

- Racionalismo: representado por René Descartes, valoriza a razão como fonte de conhecimento. É a versão do idealismo grego de Platão, onde o mundo das idéias era o mundo real e o real não passava de representações do mundo das idéias. O sujeito deposita no objeto um conhecimento prévio que traz consigo.
- Empirismo: segundo John Locke, o conhecimento é resultado da experiência externa produzida pela sensação e a razão é um segundo ato na constituição interna que dá forma ao que foi captado pelos sentidos. Valoriza a experiência e a prática como fontes de conhecimento. O conhecimento parte do objeto que o sujeito recebe passivamente por meio do sistema sensorial.
- Interacionismo: acabando de vez com o reducionismo provocado pelas duas correntes filosóficas citadas anteriormente, o Interacionismo considera de forma equilibrada a participação de sujeito e objeto na constituição do conhecimento.

O conhecimento depende de julgamento (reflexão, entendimento) para se constituir, e juízo é característica inerente ao ser humano, oriundo dos estímulos provocados pelo espaço que ele habita, segundo sua concepção de “bom” ou “mau”. Assim, o ser humano é único em sua capacidade de construir e mudar o conhecimento, por meio da sua interação com o objeto e seu juízo de valor. Máquinas não julgam, portanto não constroem conhecimento.

O homem que interage com a máquina de maneira constante e talvez até desordenada reinventa esta máquina, que por sua vez fornece novos subsídios para que ele julgue/perceba novamente as transformações decorridas das ações diretas dele sobre o objeto em questão. Com isso, a tecnologia vem aos poucos querendo tornar a máquina um “ser” capaz de transmitir informação. Isso ela já é desde sua existência. O professor, como ser pensante, representante do conhecimento e disposto a compartilhá-lo de maneira a gerar

[1] BIT Company Franchising, R. Dr. Jorge Ramos, 95, 03068-030 São Paulo SP, Brasil, elo@ig.com.br

mais, deve fugir do modelo "homem-máquina", beneficiando-se dos seus aspectos de juízo e percepção.

Agora, transformar um sistema computacional em tutor humano é, além de um grande desafio para várias áreas do conhecimento, um esforço louvável. Sob o ponto de vista das aplicações informáticas, os Sistemas de Inteligência Artificial (SIAs) são excelentes meios na transmissão de conhecimento, pela sua capacidade classificatória e de seriação de informações. Do outro lado, há o aluno-aprendiz, que não apresenta condições satisfatórias de ser modelado, seriado e classificado de forma cognitiva presumida para interagir de maneira única com os SIAs. Ao tentar reduzir a construção do conhecimento a um mero processo de transmissão de informações, estamos reduzindo o ser humano ao recipiente proposto pela corrente filosófica do empirismo.

O poder que advém do conhecimento permite um olhar totalizante, o entendimento da diversidade dentro da unidade e vice-versa. O movimento da interação provoca mudanças nas estruturas biológicas, sociais e emocionais dos indivíduos. Ao tentar explicar como um indivíduo conhece e/ou aprende, Jean Piaget não distanciou o "eu" do "meio" no momento em que se adquire um novo conhecimento, sem classificá-los como prioritários, bons ou ruins, mas sim complementares entre si. "A proposta de Piaget consiste em afirmar que o organismo assimila o meio e que existe uma reação do meio sobre a estrutura do organismo." [4] Sendo assim, o homem é o único ser capaz de ser sujeito e objeto ao mesmo tempo. Da mesma forma que modifica o meio, é modificado por ele.

UMA DEFINIÇÃO PARA O HOMEM E O MEIO NA QUESTÃO DA APRENDIZAGEM DAS CIÊNCIAS EXATAS

Numa interação do "eu", representando o homem em sua condição de aluno e/ou professor, e o "meio", representando a máquina e o uso da Internet e da comunicação virtual para se adquirir conhecimento, as ciências exatas que fazem uso contínuo desses meios possibilitam o *aparecimento do "professor.com"*, no sentido de interação das novas tecnologias com o homem que ensina, mas que também aprende, numa proporção interminável.

A tecnologia avança de forma rápida a ponto de não conseguir atingir as etapas da compreensão humana, devido a fatores externos ao homem (economia, religião, política, etc.) que não avançam com a mesma velocidade. Esses fatores externos atravancam a contemporaneidade dos fatos tecnológicos, restringindo-os a poucas pessoas ou atrasando o "relógio" da existência de determinados fatos tecnológicos à maioria da população.

No papel múltiplo de homem, meio e representante da ciência, o "professor.com" precisa deter o maior número possível de informações de maneira rápida e ininterrupta para dar continuidade ao processo de ensino-aprendizagem que mais se aproxime da realidade vivida por seus alunos naquele momento. É uma verdadeira corrida contra o tempo, num meio que se transforma, à medida que o homem se movimenta. Além disso, é importante que ele entenda como ocorre o processo de apreensão do conhecimento na sua totalidade, diminuindo o tempo gasto para transmiti-lo.

Para entrar nessa questão, vale ressaltar que a teoria sugerida é a dos estilos cognitivos frente a quatro enfoques inerentes ao que chamamos de "professor.com", para assim elucidar quais aspectos os professores de exatas devem considerar quando estiverem ensinando seus alunos.

QUATRO ASPECTOS DO "PROFESSOR.COM"

Levando em consideração que o professor como ser humano é capaz de alterar um ambiente e sofrer alterações provocadas por esse mesmo ambiente, elucidamos o "professor.com" sob quatro aspectos que podem influenciar diretamente sua forma de ensinar:

- Professor.COMercial: muitos alunos procuram os cursos de exatas levando em consideração o aspecto mercadológico e financeiro das profissões associadas. O "professor.COMercial" precisa entender que, como profissional, também é responsável pelo funcionamento da engrenagem do mercado, que necessita de mão-de-obra qualificada para o exercício de determinadas funções. Se ele quiser continuar sendo um profissional da área da educação para a tecnologia, precisa doutrinar o aluno para uma prática profissional que requer mudanças. Isso quer dizer que o professor tem papel primordial na escolha de determinados alunos que, apesar de não terem perfil para tal carreira, viram nela uma possibilidade de crescimento. As carreiras mudam conforme a necessidade do mercado e a necessidade atual é voltada para o mercado da informação, da tecnologia, do "@". O mesmo vale para o professor de cursos livres de informática, que representa o saber de uma área que cada vez mais se apropria de um mercado sem fim, abarcando uma grande parcela da população que depende do uso dos computadores para exercitar suas tarefas cotidianas.
- Professor.COMunicação: para ser um bom professor, é preciso ser um bom comunicador. Nas áreas de exatas, além da já conhecida comunicação homem-máquina, existe a comunicação homem-homem e máquina-homem. É preciso estabelecer um diálogo formal com a máquina, por meio de uma linguagem de programação ou um simples clicar do mouse. É preciso dominar várias línguas (a maioria dos programas usa a língua inglesa como padrão, sem falar nas linguagens de programação, que de certa forma estabelecem uma comunicação do homem para com a máquina) e saber relacionar-se de forma a criar um clima de parceria entre educadores e educandos. Ter inteligência emocional e saber o verdadeiro significado de relações inter e intrapessoais.

- Professor.COMplemento: o professor complemento é aquele que vê na ausência de determinados aspectos do processo de aprendizagem uma oportunidade para a compensação, não mudando as formas como a realidade se perfaz, apenas conduzindo-a. Ele é capaz de completar o aluno onde ele apresentar deficiência. Tem a percepção de que não é o todo no que diz respeito ao conhecimento, mas sim parte dele. Soma qualidades ao invés de subtrair. Percebe-se como um indivíduo que somado a outros cresce em sua proporção. A engrenagem que falta para o mecanismo funcionar, mas que tem perfeita noção de que a máquina não funciona sem a engrenagem anterior. Entende a diversidade na unidade.
- Professor.COMpleto: um professor completo é um ser humano completo: aquele a quem nada falta, pois, usando o conceito anterior, consegue perceber que seus alunos o tornam completo. Aquele que faz uso de todas as suas capacidades e potencialidades, comportando-se de várias formas diante de um mesmo conhecimento, de forma que não seja somente um instrutor, mas sim um professor. Instruir é intermediar a transmissão de um conhecimento, ensinar é propor a constituição de um sujeito que constrói seu próprio significado. Ser completo não é necessariamente ser perfeito, mas é sentir-se completo com a presença do outro, com potencialidades, dificuldades, defeitos. Entender a unidade na diversidade.

O "PROFESSOR.COM": SUAS PERCEPÇÕES E SEUS JULGAMENTOS

Como único ser que consegue estabelecer uma posição sincrônica de sujeito e objeto frente ao conhecimento, o homem deve ter em mente de que o processo de aquisição de conhecimento não ocorre de maneira unilateral, ou seja, só recebendo estímulos e não os gerando. O professor de exatas precisa compreender que ele, enquanto sujeito, e seus alunos, também enquanto sujeitos, possuem formas diferentes de receber estímulos e gerá-los. Precisa entender que, por mais lógica que seja uma teoria, há alunos que se perguntam o porquê de aprender aquilo e daquela forma, necessitando de razões diferenciadas. Isso não significa incapacidade de compreender, mas sim a forma natural como esses alunos compreendem um conteúdo.

Teoria dos Estilos Cognitivos

Presentes em qualquer ser humano, os estilos cognitivos se referem aos processos que o homem utiliza para adquirir e processar o conhecimento. Essas formas partem basicamente de dois canais: percepção e julgamento. Esses dois canais participam ativamente da interação sujeito-objeto, dando forma a um tipo psicológico, que une uma função perceptiva e uma função de julgamento.

Carl Gustav Jung descreve tipo psicológico como caracterização de indivíduos conforme interesses, preferências e habilidades. Dentro de cada canal existe aquilo que Jung chamou de função. Existem as funções para perceber e para julgar uma informação. Essas funções estão divididas em:

Funções de percepção:

- *Sensação*: relativa ao sistema sensorial;
- *Intuição*: relativa aos significados não captados pela lógica ou pela sensação.

Funções de juízo:

- *Pensamento*: relativa à lógica;
- *Sentimento*: relativa aos valores pessoais.

Todos os seres humanos possuem as quatro funções, só que, ao longo da vida, existe a predominância de uma delas devida ao seu uso constante, que é influenciado pelo meio. A essa função predominante Jung chamou de f*unção principal*. As outras funções até existem, porém se mantêm inativas, a menos que instigadas com certa freqüência. Foram denominadas de *função auxiliar* (segunda mais usada) e *função inferior*, que corresponde à função oposta à função principal. Exemplo: se a função principal de um indivíduo é o pensamento, a função inferior é o sentimento, pois pertencem ao mesmo canal, que é o julgamento.

Jung afirmou que é impossível desenvolver as quatro funções de maneira simultânea, pois as situações sociais farão com que o sujeito "escolha" aquela que mais lhe traga conforto perante as exigências do meio.

A referência [4] tenta traçar um paralelo entre os tipos psicológicos e a escolha profissional relacionada à Polícia Militar do Estado de São Paulo, chegando à conclusão de que a maioria dos policiais possuía um perfil predominante, no qual a sensação e o pensamento eram as funções mais ativas, criando um estereótipo que influenciava diretamente o relacionamento desses policiais com a comunidade e também exercia influências sobre a escolha profissional de aspirantes à carreira militar que se identificaram de alguma forma com a corporação.

Existem organizações que utilizam testes para identificar e montar uma equipe que trabalhe em prol de um objetivo comum sem muito conflito. Para muitas empresas, conflito entre funcionários causa perda de tempo e conseqüentemente queda na produtividade. Temos como exemplos o teste de MBTI (Myers-Briggs Type Indicator) e o QUATI (Questionário de Avaliação Tipológica).

Na intenção de montar equipes com funções psicológicas equivalentes, podemos deduzir que, se o grupo perdurar, jamais haverá estímulos gerados por possíveis conflitos que façam o grupo desenvolver a capacidade de resolver determinados problemas. Ou seja, todos pensarão e agirão da mesma forma, causando uma diminuição de tempo nos prazos estabelecidos e também uma sincronia nas formas de adquirir e manipular conhecimento, melhorando a produtividade. Por outro lado a produtividade se sobrepõe ao homem.

Numa situação de aula de exatas, espera-se que tanto alunos quanto professores usem muito mais a lógica (função pensamento) para compreender determinados fenômenos e estabelecer um diálogo formal com eles. Espera-se, mas nem sempre é o que ocorre. A grande questão é como aprender ciências exatas sem fazer uso somente da lógica. Alunos de exatas que têm como função principal o sentimento ou a intuição também podem aprender de maneira eficaz, pois essas funções são determinantes na forma como apreendem o conhecimento, independente de ser um conhecimento lógico ou não.

Usar da lógica constantemente no ensino e considerar que ela é a única forma de o indivíduo apreender cálculos, equações, algoritmos é negligenciar o desenvolvimento completo, causando:

- um baixo aproveitamento das múltiplas inteligências do indivíduo; ele só estará preparado para provar, testar e avaliar à luz da razão, deixando de lado valores pessoais e morais em nome do que é racionalmente aceito;
- desequilíbrio das estruturas cognitivas que necessitam de outros estímulos para funcionar adequadamente promovendo a equilibração dos aspectos comportamentais humanos;
- uma valorização extrema do ser pensante e conseqüentemente uma desvalorização do ser como sujeito completo que pensa/age/sente/cria (não necessariamente nessa ordem);
- a eterna dissociação da boa convivência entre *humies* e *techies* [6];
- a incompreensão da *Educação para o Século XXI* proposta pela Unesco.

Se a intenção da educação não deve ser de forma alguma classificatória, como trabalhar com esses aspectos?

- As pessoas recebem diretamente a influência do meio para balizarem suas atitudes. Portanto, se o meio representado pela figura do professor for um meio multidirecional, a possibilidade de essas pessoas trafegarem pelas suas quatro funções cognitivas será bem maior.
- O professor tem um tipo psicológico definido, tendendo a aproximar alunos com tipo psicológico semelhante ao seu e chamar os alunos que mais se afastam dessa predominância de "alunos difíceis". Na prática didática, o "professor.com", deve deixar seu tipo psicológico "camuflado", tentando compreender que seus "alunos difíceis" não passam de pessoas com um tipo psicológico diferente do seu, mas com uma mesma capacidade para aprender.
- Devemos levar em consideração que, numa sala de aula com área de conhecimento definida, a possibilidade de termos tipos psicológicos semelhantes é considerável. Se a maioria predominante for compatível com o tipo psicológico do professor, a minoria não concluirá de forma satisfatória o processo de aprendizagem, pois a forma como o professor se comunica é aceita pela maioria, mas não pela totalidade.

A grande preocupação dos professores enquanto representantes diretos de uma área específica do conhecimento é: como ensinar de maneira equivalente sem que haja deficiências?

Para um grupo específico de professores, o ato de aprender é puramente mecânico; os números fazem o acerto das hipóteses levantadas. Caso fossem indagados sobre como ocorreu a própria aprendizagem, tentariam achar uma resposta lógica para o processo. O difícil é convencer que, apesar de envolverem o aspecto emocional, os estilos cognitivos são extremamente lógicos no sentido de explicar como se dá parte do processo de aprendizagem.

Aplicado à tecnologia, isso fica ainda mais evidente frente às perguntas, respostas e inquisições feitas por alunos de cursos universitários de Computação e também por professores de informática. Por meio de algumas palavras ou colocações usadas com mais freqüência por esses indivíduos, identificamos e criamos uma classificação segundo os tipos psicológicos. Essas expressões ditas com freqüência acabam por caracterizar o professor e/ou o aluno dentro da função psicológica que ele mais usa:

- perguntas e inquisições com expressões como "sinto", "se eu fosse você", "eu acho", "concordo", "não sei como começar" revelam uma maneira de interação com o meio baseada no sentimento do indivíduo. Fala carregada de sentimento em relação às atitudes alheias são características de pessoas-sentimento;
- perguntas e inquisições que contenham "li numa revista"; "segundo o autor…", "as pesquisas mostram…", "vou lhe ser franco", "deixa que eu faço", "mas por que…", "isso está errado" revelam um perfil de pessoa racional, que se baseia em processos anteriores fundamentados de maneira lógica. Fala carregada de tom lógico, impositivo e constante é característica de pessoas racionais;
- perguntas e inquisições com expressões como "vi", "ouvi dizer", "deixa eu ver" (já inclinando-se para pegar o objeto em questão), "passa pra cá", "isso não é pra já", "onde?" revelam uma maneira sensorial de aprender, baseada no que o indivíduo consegue captar através do sistema sensorial. Pessoas mais práticas e de ações rápidas também pertencem a essa categoria;
- perguntas ou inquisições com expressões como "muito tempo atrás", "minha mãe disse", "amanhã…"; "Já sei!", "percebi que…", "não é bem assim" revelam perfis de pessoas que aprendem por intermédio de significados não apreendidos de forma presente, mas que dão significado a atuações futuras; pessoas que planejam muito antes de agir são classificadas nessa categoria.

Com base nessa classificação, observamos o comportamento de 12 instrutores de informática submetidos a treinamento e alcançamos os seguintes resultados:

- dos 12 professores envolvidos, seis possuíam tendências a ter como função principal a intuição, cinco deles o pensamento, um a sensação e nenhum o sentimento (o que caracteriza o estereótipo profissional do uso da lógica nas ciências exatas);
- um dos que apresentaram tendências intuitivas confirmou que tinha sérios problemas de relacionamento com um dos instrutores que apresentaram a tendência a ter como função principal o pensamento (funções opostas);
- os cinco instrutores classificados como "pensamento" tacharam como alunos difíceis pessoas que perguntam demais e fazem questão de estabelecer relação do que estão aprendendo com fatos passados e futuros. Já um instrutor com tendência intuitiva disse que esse aluno era o melhor para ele trabalhar.

Apesar de a amostragem ser pequena, um teste de avaliação tipológica revelou que as tendências classificadas se aplicaram a dez indivíduos envolvidos.

Tornando-se um "Professor.Com"

Tomando como base a crescente necessidade da utilização do computador para o desenvolvimento de várias atividades, como agregar no processo de ensino-aprendizagem diferentes tipos psicológicos frente a uma área de conhecimento na qual todos têm interesse, movidos pelas tendências mercadológicas?

O "professor.com" novamente tem papel primordial. Deve ser capaz de classificar ao menos de forma superficial seus alunos dentro de um tipo psicológico, deixando de lado sua subjetividade. A partir do momento que o "eu" der lugar ao professor, ele conseguirá atrair para si todos os alunos de forma efetiva na aprendizagem e será capaz de criar uma maneira que lhe permita trafegar pelas quatro funções.

Na sociedade da informação, ainda mais na área de exatas, quanto mais formos capazes de exprimir ou mesmo captar um novo conhecimento de maneira ampla e não fragmentada, mais conseguiremos colocar em prática os preceitos da *Educação para o Século XXI* proposta pela UNESCO e que se enquadra perfeitamente na idéia deste trabalho:

- *Aprender a ser*: global, inteiro, desenvolvendo-se em todas as partes;
- *Aprender a fazer*: de nada adianta teoria sem conceitos e sem o "fazer". Usando das sensações podemos trabalhar esse item de forma ampla;
- *Aprender a aprender*: como professor e como aluno aprendemos da mesma forma? Para aprender é preciso haver correlação do item a ser aprendido com a realidade vivida;
- *Aprender a viver juntos*: buscar na diversidade uma forma congruente de troca de informações. Estar juntos apesar da distância. Complementar e completar o outro na busca pelo conhecimento;
- *Aprender a sentir*: humanização. Consciência de que o ser humano é um ser completo e de que, apesar de ter um tipo psicológico predominante, precisa ser trabalhado e compreendido na sua totalidade, para que o ensino de exatas não seja algo puramente mecânico, mas seja a porta de comunicação entre a linguagem humana e a linguagem de máquina, utilizadas pelo professor que, além de ser "pontocom", é completo e complemento de si mesmo.

Não se pode voltar aos tempos remotos de escola, classificando os alunos em A, B ou C, de acordo com a forma como aprendem e com seus estilos cognitivos. A valorização do racional existe, porém por trás do racional existe o humano. Os educadores da área de exatas precisam ter a consciência de que aquele aluno que se sente incompreendido, na realidade, é um aluno com estilo cognitivo diferente do dos demais, que precisa ser tão estimulado quando os outros, e, principalmente, que a realidade de uma sala de aula de exatas revela o meio e, como tal, as profissões a elas relacionadas trazem para si pessoas nem sempre com perfil ideal para tal posicionamento no mercado. De fato, com o grande desenvolvimento das tecnologias da informação, tem havido um crescimento constante da demanda nos cursos técnicos e superiores ligados à informática. Graças a atrativos como expansão crescente do mercado de trabalho, que afasta o risco de desemprego, e a alta remuneração dos profissionais de computação na maioria das empresas, muitos alunos de cursos como Sistemas de Informação, Ciência da Computação, Engenharia de Computação, Engenharia de Telecomunicações e mesmo de cursos livres ou técnico-profissionalizantes de informática não apresentam real vocação ou aptidão para o ramo, tendo escolhido essas carreiras motivados muito mais por fatores extrínsecos do que intrínsecos. A abordagem cognitiva por parte dos professores universitários e instrutores da área pode auxiliar a contornar possíveis dificuldades que tais alunos apresentam quando submetidos a um enfoque didático tradicional. Enfim, usar a psicologia e encontrar razões didáticas e sociais para o ensino de exatas.

Ambiente de aprendizagem adaptável conforme as preferências do aprendiz

Eliane Pozzebon, Jorge Muniz Barreto

Resumo *- Apresentamos um ambiente de aprendizagem dos conceitos básicos de neurofisiologia, adaptável conforme as preferências do aprendiz. Trabalho desenvolvido por membros da equipe do projeto ICEM (Inteligência computacional no ensino com multimídia) da Universidade Federal de Santa Catarina, para que facilite um aprendizado individualizado.*

Palavras Chaves: ensino com computador, hipermídia adaptativa.

INTRODUÇÃO

A utilização do ensino via computador com abordagens da IA (Inteligência Artificial) pode ser uma forma de diversificar os instrumentos de apoio do ambiente atendendo às necessidades pedagógicas e tecnológicas em questão. Um ponto central de sistemas de ensino considerados inteligentes para suporte ao aprendizado é sua adaptação às experiências requisitadas pelos aprendizes.

A hipermídia permite relacionar os assuntos de muitas maneiras, onde os aprendizes também podem visualizar suas experiências. Existem numerosos problemas nestes sistemas, que, todavia, tem sido reduzidos utilizando um modelo teórico de hipermídia baseado na Teoria dos Autômatos, denominado hipertômato [1] [2].

Um percurso desenvolvido pelo aprendiz pode identificar seu comportamento. Dessa maneira, elaboramos um questionário onde o aprendiz responderá questões para identificar suas preferências e adaptar o ambiente de ensino para que facilite um aprendizado individualizado.

Dependendo das características dos softwares estes podem ser classificados como [8] [9]: tutoriais, exercitação, investigação, simulação e jogos.

- Tutoriais: apresentam conceitos e instruções. Geralmente possuem baixa interatividade;
- Exercitação: repete e reforça conceitos já vistos anteriormente;
- Investigação: Através deste tipo de programa o aluno localiza informações a respeito de assuntos diversos. Como exemplo desta classe pode-se citar as enciclopédias;
- Simulação: O aluno é fomentado a tomar decisões a partir de resultados obtidos num modelo artificial que reproduz uma situação real. Estes softwares também são utilizados para antecipar os resultados de determinados experimentos que na vida real inspiram perigo, impossibilidade de execução, inconveniência e alto custo. Como exemplo de sua aplicação de Engenharia Civil, quando os alunos simulam falhas em estruturas. Isto seria impossível no mundo real.
- Jogos : O aluno participa de uma atividade organizada por um sistema de regras que definem a perda ou o ganho.

ADAPTAÇÃO CONFORME AS PREFERÊNCIAS

Os modelos produzidos por IA têm potencial para representarem um grande meio de comunicação de conhecimento, porque apresentam uma capacidade dinâmica de modelagem cognitiva, facilitando as decisões educacionais à medida que o estudante utiliza o sistema [13]. Dentro desta perspectiva, o processo de aprendizagem pode ser concebido como o mapeamento do conhecimento do tema a ser ensinado para a estrutura de conhecimento do estudante.

Neste tutorial o percurso é definido conforme as preferências do aprendiz. Dessa maneira, elaboramos um questionário para identificar e modelar o tutorial através de regras, conforme tela do protótipo apresentada na figura 1.

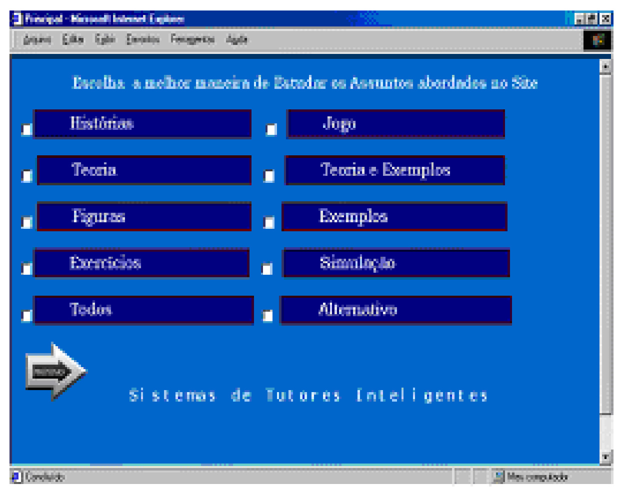

Figura 1. Tela com regras para adaptação do ambiente

Assim conhecendo-se as preferências do aluno pode-se adaptar o sistema para que facilite a aprendizagem e promova um aprendizado individualizado com a construção dos conhecimentos.

Na figura 2, as preferências do aprendiz são classificadas na base de conhecimento, através das perguntas. E a adaptação do ambiente utiliza regras conforme a resposta do questionário, por exemplo : gosta de aprender com simulação.

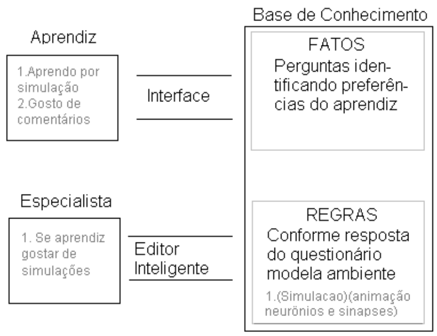

Figura 2. Adaptação do ambiente conforme preferências do aprendiz

MODELAGEM DE HIPERTEXTO COMO AUTÔMATO

Um modelo teórico de hipertexto precisa de três conceitos a serem incorporados: o nó da informação, a ligação entre os nós e os nós de simultaneidade [11] apud [10].

Um autômato pode ser considerado como uma particularização de um sistema dinâmico que varia com o tempo. Em um sistema dinâmico é descrito o mecanismo de como ele trabalha (internamente), especificando como o conjunto dos estados varia com o tempo. Tal descrição é suficiente para gerar uma definição comportamental, conforme proposto por Almeida e Barreto [1].

Um sistema computacional, denominado hipertexto, pode ser convenientemente definido como autômato (ou máquina), que é descrito abstratamente como uma sextupla:

$A_t = \{ U, Y, X, x_0, \lambda, \eta \}$

Onde:

U é um conjunto finito de entradas,

Y é um conjunto finito de saídas,

X é um conjunto de estados,

$X_0 \in X$ é o estado inicial,

$\lambda: U \times X \rightarrow X$ é a função de próximo estado ou função de transição,

$\eta: U \times X \rightarrow Y$ é a função de próxima saída.

Se a cada nó de informação é associado, por exemplo, com uma janela na tela do computador (uma forma possível de entrada), então um conjunto de janelas na tela caracteriza um estado x do hipertexto .

DESCRIÇÃO DO AMBIENTE DE APRENDIZAGEM

O protótipo para ensino consiste de quatro blocos funcionais, que são: Apresentação, Célula Biológica, Neurônio e Sistema Nervoso.

Inicialmente foi definida a estrutura do bloco de apresentação que consiste de duas molduras: uma contendo a tela principal do protótipo e outra um mapa de navegação. Isto permite ao usuário selecionar o assunto de seu interesse.

Um segundo bloco apresenta informações sobre a célula biológica, sua definição, classificação e composição. Faz parte deste bloco a página que aborda os assuntos sobre organelas.

O neurônio é mostrado no terceiro bloco instruindo o aluno sobre sua função e principais partes. Pertencem a este bloco, as páginas do impulso nervoso e da sinapse.

O quarto e último bloco apresenta informações sobre o sistema nervoso distribuídas em quatro páginas: sistema nervoso, sistema nervoso central, sistema nervoso periférico e sistema nervoso autônomo.

Estes blocos podem conter um ou mais nós de informações conectados a outros documentos do mesmo bloco ou a blocos distintos. A figura 3 mostra um modelo hipertômato.

O modelo hipertômato permite a visualização de todos os nós (estados) do sistema e das ligações (transições de estado) que poderão ocorrer quando da navegação do usuário no sistema. A grande vantagem da concepção do sistema através desta modelagem é a garantia de que todos os estados do ambiente sejam alcançáveis, ou seja, muitos dos problemas de navegação (perda do usuário no espaço de informações, páginas não encontradas) e que na maioria das vezes dependem dos aspectos construtivos dos sistemas podem ser evitados.

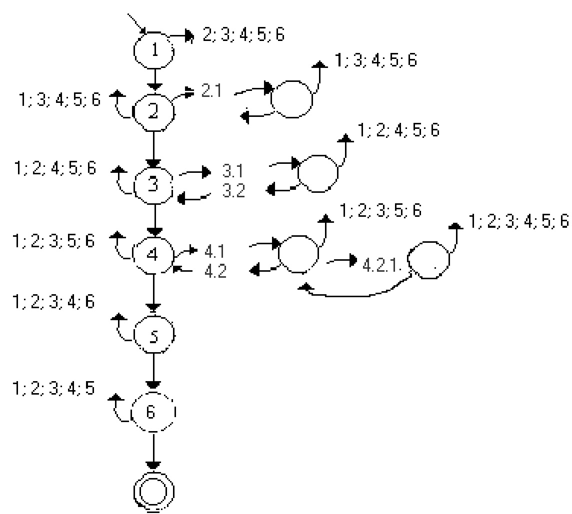

FIGURA 3: Exemplo do grafo de implementação do protótipo como hipertômato [11]

Em relação à Figura acima, tem-se que o usuário inicia a navegação do sistema tipo "espinha dorsal" no nó 1 (estado inicial) onde são realizados a apresentação do mesmo com recursos na Web internos e externos. Em seguida, o mesmo poderá seguir o percurso no nó 2 que contém os tópicos de apresentação da célula biológica. Deste, poderá percorrer o nó 3 que trata o neurônio e a seguir vai para o nó 4 do sistema nervoso.

Nota-se que os nós possuem retorno e conexões para outros nós (nós de detalhamento). A partir do nó quatro ele poderá percorrer o nó 5 que apresenta o mapa do site. Finalmente o usuário atinge o nó 6 (estado final) e sai do sistema.

A esta modelagem segue-se a implementação com a ferramenta de autoria levando em consideração os paradigmas educacionais.

IMPLEMENTAÇÃO

O protótipo implementado exibe a teoria a respeito da anatomia e fisiologia do sistema nervoso, bem como imagens, animações e vídeo que representam os tópicos estudados.

O protótipo foi desenvolvido em linguagem HTML (*Hypertext Markup Language*), JavaScript e enriquecido com algumas animações desenvolvidas em um editor de imagens.

O conteúdo apresentado está dividido em nodos, sendo que cada um deles apresenta de forma bem definida o assunto a ser estudado. Isto possibilita que os mesmos sejam alterados e modificados com facilidade dependendo do estilo e necessidade de cada professor.

FIGURA 4: Tela inicial do protótipo

A tela inicial do documento está representada na figura43 e o ambiente de aprendizagem é apresentado através das seguintes partes:

- Célula Biológica:

Este tópico apresenta ao aluno informações a respeito da constituição, funcionamento e classificação das células (figura 5). Suas principais partes como, citoplasma, organelas e núcleo, são descritas. Também apresenta figura esquemática das estruturas que a compõem e da membrana que a envolve.

Esta parte do sistema possui uma ligação com outro nodo que descreve as organelas que se encontram mergulhadas no citoplasma da célula. Este contém ilustrações e animação representando as estruturas estudadas.

FIGURA 5: Exemplo de aprendizagem com figura e texto da Célula Biológica.

- Neurônio:

Esta seção apresenta as principais partes do neurônio e suas funções.

A próxima ilustração descreve as partes da célula nervosa. Contém ligações bidirecionais para outros dois nodos:

- Impulso Nervoso :

Explica através de textos e ilustrações como um neurônio que se encontra no estado de repouso sofre o potencial de ação.

- Sinapse :

Através de texto, ilustração e animação o leitor poderá entender como os impulsos nervosos são transmitidos de um neurônio ao outro.

- Sistema Nervoso:

Nesta parte do sistema, inicialmente faz-se uma introdução a respeito do sistema nervoso demonstrando através de ilustração a sua estrutura.

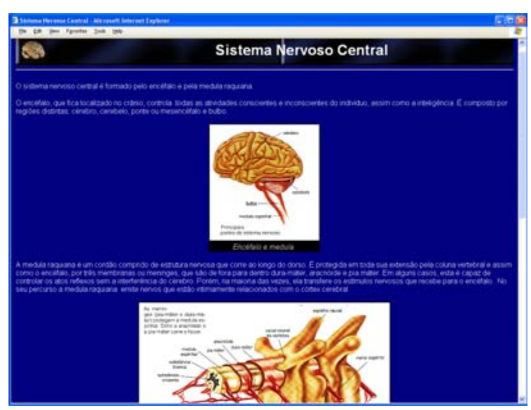

FIGURA 6: Tela do sistema nervoso central

Por motivos didáticos este sistema é dividido em dois tópicos:

a) Sistema nervoso central :

Detalha o funcionamento destacando suas principais partes, figura 5.

b) Sistema nervoso periférico :

Explica como as mensagens são transmitidas de uma parte a outra do indivíduo e quais os elementos que compõem este sistema. Este tópico possui uma ligação bidirecional para outro nodo: sistema nervoso autônomo, que descreve o funcionamento involuntário do sistema nervoso sobre os vários órgãos do corpo.

- Exercícios:

Nesta parte do sistema, inicialmente faz-se o aprendiz interagir com o tutor através de exercícios (figura 7).

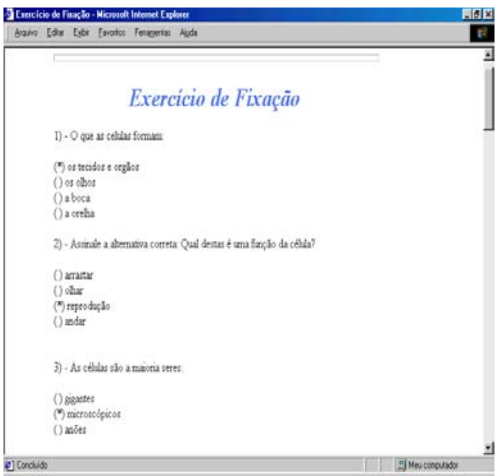

FIGURA 7: Exemplo de Exercício no ambiente

- Mapa:

A partir do mapa o usuário tem a possibilidade do usuário visualizar todos os elementos que compõem o protótipo de forma estruturada.

RESULTADOS

A fase de testes é de suma importância na elaboração de um protótipo por possibilitar a verificação de erros antes que o mesmo seja utilizado pelo usuário final.

Os testes referentes ao protótipo inicial para ensino de neurofisiologia foram efetuados com 20 alunos do curso de Informática e Biologia através da aplicação de um questionário e utilização do ambiente de ensino-aprendizagem.

Os testes revelaram que o protótipo não possui problemas funcionais, já que todas as páginas acessadas foram exibidas corretamente e de forma rápida. Quanto aos aspectos visuais, os resultados também foram favoráveis e demonstraram que a utilização de técnicas multimídia poderá tornar os ambientes de aprendizagem mais interessantes. Com relação aos textos, figuras e animações o teste demonstrou que o protótipo os apresenta de forma clara.

Alguns participantes do teste sugeriram que, para trabalhos futuros, seria interessante a inclusão de exercícios e testes, que tivessem a capacidade de fornecer os resultados do desempenho do aluno.

AGRADECIMENTO

A autora Eliane Pozzebon agradece a bolsa de mestrado da CAPES.

CONCLUSÕES

Através das pesquisas efetuadas no desenvolvimento deste trabalho, pode-se perceber que o computador pode ser utilizado como uma ferramenta no processo de ensino-aprendizagem, propiciando resultados bastante positivos e com qualidade nos ambientes adaptáveis conforme as preferencias do aprendiz.

O aluno toma conhecimento das informações e aprende a aplicá-las. Apresenta, além disso, características essenciais ao processo de aprendizagem, como prender a atenção do aluno, testar o aluno para verificar se ele entendeu os conceitos apresentados, além do aluno poder rever quantas vezes quiser um conceito mal compreendido.

A modelagem, de hipermídia como autômato, utilizada para o protótipo de ensino-aprendizagem de neurofisiologia garante que todos os estados do ambiente sejam alcançáveis [4]. Isto evita problemas como a perda do usuário no espaço de informações ou a ocorrência de páginas que não possam ser encontradas.

Quanto a perspectivas futuras poderão ser incluídas técnicas de Inteligência Artificial que no caso dos testes, por exemplo, o sistema forneça os resultados da avaliação, informações e sugestões sobre as deficiências do aluno caso seu desempenho não tenha atingido um nível desejado. O ambiente ainda poderá incorporar um banco de dados para armazenamento das informações sobre os alunos.

ASPECTOS DA PRODUÇÃO BRASILEIRA DE WEB ARTE

Fábio Oliveira Nunes

Resumo *– Trata-se de um breve relato sobre a produção artística brasileira para a rede Internet que visa contextualizar a produção recente em arte telemática, abordar alguns trabalhos brasileiros – de diferentes tecnologias e conceitos – disponíveis atualmente na rede e propor a discussão da apropriação – estrutural e semântica – do meio em questão.*

Palavras-chave – Arte contemporânea, Arte e novas tecnologias, Internet, Web arte, Net-art.

ANTECEDENTES

As experiências artísticas utilizando-se de redes já datam de algum tempo. Muito antes do advento do computador pessoal, a arte postal – no Brasil, muito em voga nos anos 60 – foi um movimento transnacional, muitas vezes paralelo ao circuito oficial das artes, onde os artistas trocavam imagens por meio do correio tradicional. Estabelecem-se intercâmbios de imagens e delineia-se a produção de trabalhos artísticos coletivos com participantes fisicamente distantes.

Com os avanços tecnológicos no campo dos satélites e das transmissões eletromagnéticas, surge um novo elemento para a produção de experimentações artísticas: o instantâneo. Agora, torna-se possível estabelecer novos vínculos e intercâmbios imagéticos com possibilidades sincrônicas, uso do tempo real como parte inerente ao trabalho artístico e o alcance fisicamente distante. Assim, começam as primeiras experiências artísticas utilizando-se de artefatos eletroeletrônicos como a televisão de varredura lenta (Slow Scan TV), o telefone, o fax, e as redes de computadores que de início eram estabelecidas somente para eventos determinados e logo a seguir, desfeitas. Com o início do uso comercial da Internet, as estruturas – redes físicas e conexão de espaços – para as experimentações artísticas em rede computacionais, antes estabelecidas para eventos pontuais, deixam de ser unicamente efêmeras.

ARTES NA REDE INTERNET E WEB ARTE

Os espaços que levam a insígnia "artes" na Internet, de um modo geral, encontram-se em dois grupos distintos. A rede mundial pode ser utilizada como meio de divulgação de trabalhos que existem independentemente da rede – pinturas, esculturas, vídeos – e que utilizam códigos e técnicas inerentes aos meios a que pertencem, apresentando-se na rede sob a forma de fotografias, espaços em terceira dimensão simulando galerias de arte e vídeos em *streaming*[1].

Porém, o que nos interessa aqui são trabalhos artísticos que existem dentro das especificidades do meio, questionando suas práticas, utilizando suas capacidades de alcance/tempo real, proporcionando mundos virtuais ou desenvolvendo espaços com tecnologias específicas para a Internet, enfim, realizando trabalhos que desde a sua concepção, voltam-se para a sua existência através da rede. Para estes trabalhos, surgiram vários termos como *ciber-art*, *net-art* e web arte. Gilbertto PRADO[2] define:

> *Sites de realização de eventos e trabalhos na rede: (...) nos dois grupos que se seguem elas* (as redes) *intervêm mais como 'obra'. Essa participação pode ser compartilhada diretamente com outros ou ser desencadeada a partir de dispositivos particularmente desenvolvidos e direcionados para esses eventos. Por esta classificação, não queremos dizer que os artistas sejam definidos por uma única forma de trabalhar como sua característica exclusiva. As diferentes aproximações artísticas de produção em rede não se excluem, elas são algumas vezes complementares e geralmente concomitantes.*
> *a) Dispositivo: É uma estrutura em rede estendida em diferentes locais, onde o espectador e/ou artista agem – sem estar em contato com outras pessoas – diretamente sobre o dispositivo, para iniciar uma ação. O trabalho artístico se estabelece com o desencadear da ação que é proposta pelo artista, conceptor da 'obra' e que se inicia com a participação do espectador.*
> *(...)*
> *b) Interface de contato e partilha: Trata-se também de formações efêmeras de redes, mas nas quais os trabalhos existem somente e graças a diferentes participantes em locais diversos. Não é somente a noção de fronteira que é quebrada, mas também o desejo de estar 'em relação' com outros. As redes nesse caso são utilizadas sobretudo com a intenção de um trabalho coletivo e partilhado.*

PARTICULARIDADES DA WEB ARTE

A produção em web arte está necessariamente ligada ao campo de significações que a rede Internet suscita e também as especificidades técnicas e conceituais que nela se inserem. Primeiramente, esta produção é calcada na efemeridade tecnológica – onde há um permanente caráter de atualização – e em determinados casos, no caráter perecível da informação. O fluxo informacional disponível no universo telemático proporciona um envelhecimento muitas vezes precoce.

Enquanto meio de expressão, a web arte apresenta-se com uma linguagem ainda em definição. Muito do que é produzido para a Internet parte de pressupostos oriundos de traduções/transcodificações de outros meios como a pintura, a fotografia, o cinema, o vídeo e o design impresso. Parte de um processo recorrente em diversos momentos da história da arte, onde a linguagem de um novo meio nasce a partir de nuances dos meios existentes até então.

Por outro lado, em vertente avessa, encontram-se trabalhos que entendem "o meio como mensagem" e abordam o universo do usuário em rede: os caminhos bifurcados, a navegação solitária, o receio de contaminação por vírus e as suas expectativas – velocidade de carregamento, legibilidade – diante de cada página ou espaço navegado. Esses trabalhos muitas vezes exigem um repertório extremamente específico, onde conhecer a práxis da rede proporciona outros níveis de leitura. Entre os trabalhos mais conhecidos de auto-referência na rede, está o *Jodi*[3], que originou um "estilo" de sites artísticos, onde elementos de composição de sites da Internet (botões, animações, listas de arquivos) passam a ter uma dimensão estética, compondo um mundo extremamente caótico, repetitivo, desconexo. Sobre este site, DONATI escreve:

> *Na relação homem-máquina, existe a necessidade de interfaces para que se estabeleça a comunicação, para que uma informação reconhecida pela máquina torne-se legível ao homem e transmita assim um significado. Este ir e vir de códigos, como traduções sucessivas que se sobrepõem em níveis, trabalhados pelo repertório do interpretante, é representado neste site por imagens de texto que se transformam em códigos de barra, enquanto o código de cores da linguagem HTML traduz a cor vermelha para um número binário. Este site apresenta esta intertextualidade entre códigos, mas vem reverter esta situação, na medida em que produz ruídos, "chuviscos", interferências e não efetiva a comunicação, por não alcançar o sentido esperado.*

Porém, os ruídos de comunicação não são a única forma de abordagem da metalinguagem em web arte. O site "Willkommen bei Antworten"[4], proporciona um questionamento do visitante diante da espera em frente à tela de seu computador e suas expectativas. É constituído de uma interface que se assemelha a um visor eletrônico de lanchonetes, que indica o número atual e mais abaixo, o seu número. O artista, em alemão, pede: "por favor, espere!". Já o site "Unendlich, fast..."[5] que se constitui em uma única página de fundo azul, com barras de rolagem tanto verticalmente quanto horizontalmente sem texto ou imagem – apenas pequenos traços, não estão associados a nenhum link ou ação. O visitante se depara com um imenso azul, uma página web sem qualquer tipo de informação textual ou link, em que a única ação possível é tentar procurar através das barras de rolagem, a existência de algum elemento de significação. Neste trabalho, o artista questiona o meio e a tão proclamada interatividade intrínseca a Internet.

Há ainda trabalhos que buscam a especificidade do meio através da participação e interação de visitantes entre si e/ou diretamente no trabalho proposto. São espaços (net-instalações), happenings ou eventos que podem fazer referência a algum meio de origem, distante da Internet ou serem auto-referentes e que através de dispositivos de ação em espaços remotos, *webcam*[6], *chats*[7] e ambientes multi-usuário, proporcionam uma interação em tempo real nos espaços e o contato direto entre indivíduos num universo comum.

ARTISTAS BRASILEIROS

No Brasil, podemos observar diversas linhas de trabalho que adotam a rede Internet para a realização de experimentações artísticas, utilizando-a tanto em relação a espaços externos físicos como também, sob a forma de sites artísticos e ambientes virtuais em terceira dimensão. Alguns dos trabalhos aqui citados fazem parte de eventos consagrados como a Bienal de São Paulo[8].

Em relação a espaços físicos distantes conectados – muitas vezes, espaços expositivos de instituições culturais – temos a pesquisa artística de Eduardo Kac[9], que estabeleceu a "telepresence art", utilizando câmeras e outros dispositivos em trabalhos como "Ornitorrinco in Eden" (1994), onde via rede era possível estabelecer uma colaboração compartilhada de controle de um robô por participantes anônimos, mais tarde, o artista passa a se dedicar a arte transgênica desenvolvendo trabalhos como "Gênesis"[10] (2000), apresentada no Instituto Cultural Itaú, em São Paulo. A instalação Gênesis constitui-se em uma sala de paredes escuras com uma projeção de vídeo. Na primeira parede, uma transcrição de um pequeno trecho do antigo testamento onde é possível entender uma possível "autorização" divina para as intervenções da atual engenharia genética: *"Deixe que o homem domine sobre os peixes do mar, sobre as aves do céu e sobre todos os seres vivos que se movem na terra"* (Gênesis 1, 28). Em outra parede, a transcrição do texto em inglês para o código Morse e em uma terceira, a tradução do código Morse para o código genético DNA. Cria-se aqui um gene sintético, advindo do texto bíblico. O crítico de arte Arlindo Machado[11], um dos curadores da exposição, descreve o funcionamento desta instalação:

> *O gene sintético contendo o texto bíblico é, em seguida, transformado em plasmídeo (anel de DNA extracromossômico capaz de auto-replicação) e então introjetado numa bactéria E.*

coli, que o reproduzirá às próximas gerações. As bactérias contendo o gene Genesis apresentam a propriedade de fluorescência ciã (azul esverdeado) quando expostas à radiação ultravioleta e coabitam uma placa de Petri com outra colônia de bactérias, não transformadas pelo gene Genesis e dotadas da propriedade de fluorescência amarela quando submetidas à mesma radiação ultravioleta. À medida que as bactérias vão entrando em contato umas com as outras, um processo de transferência conjugal de plasmídeos pode acontecer, produzindo as seguintes alterações cromáticas: 1) se as bactérias ciãs doarem seu plasmídeo às amarelas (ou vice-versa), teremos o surgimento de bactérias verdes; 2) se nenhuma doação acontecer, as cores individuais serão preservadas; 3) se as bactérias perderem seus respectivos plasmídeos, elas se tornam ocres.

O processo de mutação cromática das bactérias pode se dar naturalmente ou pode ser também ativado por decisão humana, por meio da radiação ultravioleta, que acelera a taxa de mutação. No espaço da galeria onde ocorre a experiência, tanto os visitantes locais como os visitantes remotos (que participam do evento pela Web) podem ativar ou desativar a radiação ultravioleta, interferindo, portanto no processo de mutação e ao mesmo tempo possibilitando visualizar o estágio atual das combinações de ciã, amarelo, verde e ocre.

A instalação Gênesis constitui-se em um evento que se utiliza a Internet para estabelecer ao visitante, um controle remoto para a interação em um espaço físico: ativar a radiação ultravioleta para mutação das bactérias. Por meio do site, o internauta irá observar o status da radiação (ligada ou desligada) e imagens em tempo real, exibindo as bactérias do espaço expositivo e suas alterações cromáticas.

Em "Mediamorphose"[12], do artista franco-brasileiro Roberto Cabot, no interior de uma instalação transmídia na 25ª Bienal de São Paulo, uma câmera de vigilância captura imagens dos visitantes do espaço expositivo – tendo ao fundo uma pintura em anamorfose – e simultaneamente as projeta em um outro ambiente, mostrando ao fundo, o que antes não era inteligível: um batalhão de soldados "em ação" em torno do visitante. As imagens capturadas são também disponibilizadas imediatamente em um site, possibilitando o acesso à imagem de todos os visitantes do espaço, organizados por dia e hora de inclusão no banco de dados. O artista aborda nossa condição como ser observado, diante de um olhar eletrônico onipresente que muitas vezes se dá distante da nossa percepção.

Uma outra utilização da Internet em relação a espaços externos físicos foi realizada por Gilbertto Prado, na net-instalação "Depois do turismo vem o colunismo"[13] (1998), no Paço das Artes em São Paulo, onde a disponibilização de imagens do espaço expositivo em tempo real na rede, mesclada por imagens de banco de dados, pautava o olhar estrangeiro e a antropofagia.

Já a utilização artística da Internet sob a forma de sites é a mais comum e caracteriza-se normalmente por ser menos efêmera quando comparada com os eventos realizados em intercâmbio com espaços físicos remotos. Alguns artistas partem para a estetização e destituição de função de elementos do universo da própria rede. Um bom exemplo disso, é o site "Lands Beyond"[14] (1997), dos artistas Thiago Boud'hors e Celso Reeks, onde elementos da interface computacional encontram-se em meio a nuances literários. No memorável "Netlung"[15] (1997), os artistas Diana Domingues, Gilbertto Prado, Suzete Venturelli e Tânia fraga, a referência ao meio está no ato simbólico de respirar na rede, propondo diversos percursos sensoriais. Em "Perspectiva Clássica"[16] (1999) de Daniel Sêda, uma ciber-colagem enaltece a leitura fragmentada e simultânea.

Uma interessante metáfora ao tempo na Internet é vista no site "Cronofogia"[17] (2002) de Kiko Goifman e Juradir Muller, onde foi criado um "relógio web". O trabalho é constituído de uma única página, com o nome do trabalho e as palavras-chave "violência, tempo, deterioração, morte" que se mantêm em ritmo contínuo de acende-apaga. Logo abaixo, apresenta-se uma imagem de carne em decomposição, que ocupa uma grande parte da janela. Mais abaixo, ainda há o incentivo para a participação do usuário através da frase "clique na imagem para disparar o relógio web". Inicialmente, adentra-se a questão da expectativa do usuário: a busca de respostas claras a suas ações. A própria palavra utilizada na frase convidativa – "disparar" – dá a idéia de algo ressonante que provavelmente se configuraria com significância. Porém, ao clicar sob a imagem, somente uma linha horizontal passa e aparentemente nada acontece. Na verdade, o relógio web foi disparado e a imagem recebeu mais um clique que diminui a sua permanência, sua sobrevivência na web. Os artistas desenvolveram um mecanismo no qual cada imagem tem sua sobrevivência definida por um número – sabido somente pelos próprios artistas – de cliques somados de todos os visitantes. Ao alcançar o número definido, a imagem é automaticamente substituída por outra, igualmente com carne em decomposição. Assim como em outros trabalhos de colaboração coletiva, é o processo coletivo que determina o tempo de existência e o momento de morte e esquecimento da imagem ali exposta. São os cliques coletivos que quando somados, formam um resultado que enquanto processo é invisível para cada elemento da coletividade.

Outros trabalhos distanciam-se da referência direta ao meio e partem para a criação de faturas híbridas como em "Literaterra"[18] (2002), de Artur Matuck, um espaço de recombinação textual e "Econ"[19] (1999) de Silvia Laurentiz, espaço virtual em terceira dimensão, onde o visitante "caminha" por palavras, estabelecendo novas maneiras de ler um poema.

Em criações de terceira dimensão – Realidade Virtual – voltadas para a rede Internet, vale destacar a pesquisa de Suzete Venturelli e Tânia Fraga[20], bem como Gilbertto Prado em "Desertesejo"[21] (2000), ambiente multiusuário onde aborda-se um universo de solidão, contemplação e ritos de passagem.

Assim, da mesma forma que a produção internacional, a multiplicidade de experimentações dos artistas brasileiros reflete paradigmas em formação, idéias que flutuam sob um mar de possibilidades e caminhos possíveis em meio a conceitos que vão emergindo diante do fazer artístico na web.

A LINGUAGEM DA INTERNET E OS DIFERENCIAIS NA TRANSMISSÃO DA MENSAGEM PUBLICITÁRIA

Alessandro Marques de Oliveira[1]

[Este artigo é dedicado ao Prof. Dr. Flávio Mário de Alcântara Calazans, amigo e orientador, pelo incentivo contínuo e "nada virtual"]

RESUMO:

A LINGUAGEM DA INTERNET E OS DIFERENCIAIS NA TRANSMISSÃO DA MENSAGEM PUBLICITÁRIA

Tudo começou com a idéia de um meio seguro de transmissão de mensagens. O processo embrionário do que seria a Internet surge em meio à corrida espacial e guerra fria. Hoje, a guerra fria terminou e a corredores da competição pela conquista do espaço parecem ter cansado. Sem verbas, a NASA adia e retarda projetos, os russos idem, pois se encontram em meio a crises financeiras e novas tentativas de emancipações de alguns de seus territórios. Diante desse quadro parece que a única maneira que se têm encontrado para a sobrevivência de todos é a convênio. O embrião desenvolveu-se e nasceu a Internet. O grande número de usuários e o crescimento constante, atraiu empresas que, através do mercado publicitário, investem milhões de dólares em uma nova forma de Publicidade, a Webvertising, ou a propaganda on-line. A interatividade e a comodidade do internauta são as benefícios da Propaganda na web.

Palavras-Chave: Internet, Publicidade na Internet, Comunicações Digitais, Sociedade de rede.

1- Introdução

A Internet é o mais recente meio de comunicação de massa. Estima-se que, em 2005, o mundo terá mais de 1bilhão de internautas[2]. Este poderoso meio atrai tantas pessoas por ser prático, fácil e, principalmente, pela sua interatividade, o receptor da mensagem possui mecanismos de responder ao emissor. Isso é o que fascina o internauta, pois há um certo diálogo. Mas, além da interatividade, a Internet também possui outra característica: a comodidade, pois não depende de deslocamentos físicos para utilizar-se da web. Na web, basta que o webwriter[3] – redator que escreve textos publicitários para a Internet – receba o briefing, ou seja, a solicitação de serviço que uma uma agência de Propaganda recebe de uma empresa, através de seu departamento de marketing, formate e adapte a linguagem, através de linguagens visuais e textuais de Internet e elabore a Webvertising[4]. Esse confortável cliente on-line, pode conhecer empresas, cadastrar-se como cliente
preferencial, mandar correspondências(e-mails) e, principalmente, comprar os produtos. Mas a Internet perde e ganha com suas características e é isso que esse estudo pretende levantar, utilizando-se como **metodologia**, Levantamento Bibliográfico sobre o tema e Observação Participante de sítios de Internet, pois o pesquisador faz parte do universo pesquisado, enquanto estudioso da Internet, comunicólogo e publicitário.

2- A Internet como meio de comunicação e veículo publicitário

Em 1957, em plena guerra fria, quando os soviéticos lançaram no espaço o satélite artificial Sputnik, o mundo percebeu que o céu não era mais um lugar seguro e exclusivo e algumas nações. Era necessário criar alternativas de envio e recebimento de informação em terra firme. Mas como seria criada essa tecnologia? Na verdade, o embrião dessa tecnologia já havia sido lançada, quando o engenheiro americano Bob Taylor, teve a idéia de ligar os computadores da ARPA (Advanced Research Project Agency), entidade do Pentágono responsável pelas pesquisas espaciais. Em 1969, nasce então a ARPAnet. Em 1973, após a ARPAnet já ter criado conexões em rede entre algumas Universidades norte-americanas, ocorre a primeira conexão internacional com a Universidade de Londres.

---

[1]Alessandro Marques de Oliveira é mestrando em Comunicação e Mercado pela Faculdade de Comunicação Social Cásper Líbero, Professor Universitário e Publicitário.

Da mesma forma como a ARPAnet, instituições privadas começam a investir em meios de transmissão de dados via rede. Através do Engenheiro da Xerox, Americano Bob Metcalfe, que utilizou idéias oriundas da ARPAnet, descobriu-se como conectar Computadores Pessoais em redes empresariais. A empreitada deu tão certo, que Bob criou a 3Com, empresa que desenvolveu o mecanismo Ethernet

Depois, surge a Novell, que desenvolve um sistema novo de conexões em rede que faz os computadores pessoais armazenassem dados em servidores, podendo haver compartilhamento. Depois da 3Com e Novell. Outras empresas surgem e criam-se então, várias redes independentes e fechadas de comunicação via rede.

Na década de 80, dois estudantes da Universidade de Stanford, Califórnia, Sandy Lerner e Len Bosak, conseguem passar 25km² de cabos, interligando todos os 5mil computadores de toda a Universidade que, em seus respectivos prédios, já eram conectados. Depois de saírem da Academia, entram no mercado e fundam a Cisco Systems. Em breve, todas as Universidades americanas também foram cabeadas, criando uma grande rede nacional.

Mas, somente em 1991, quando o inglês Tim Berners-Lee, um técnico em informação do Laboratório Europeu de Física em Genebra cria a *World Wide Web* (Grande Rede Mundial), começa-se a esboçar a Internet. Tim, utilizando-se do *hyper text transfer protocol*, descobre que é possível conectar outros computadores, de outras redes, transportando quaisquer informações. Para isso bastasse que essas informações estivessem armazenadas em servidores e que tivessem, um endereço eletrônico. Daí nasceram as ***http://www***. Com essa facilidade de comunicação global, a Internet ganha força e conquista o mundo.

Entre os setores que mais rapidamente se adequaram à grande rede, estão os veículos de comunicação. Jornais, revistas, emissoras de rádio e televisão rapidamente lançaram seus *sítios* (conjunto com mais de 500 páginas de internet), fazendo ou incrementando a interatividade que nunca tiveram ou que tinham discretamente, através de discretos contatos por telefone ou carta. Grandes conglomerados da Comunicação aumentaram sua força entrando na Internet e outros, de modo inverso, nasceram dela e cresceram "para fora" da grande rede, adquirindo outras empresas. Entende-se como portal, o conjunto de mais de 10mil páginas de internet, onde é possível formar comunidades virtuais, que são grupos afins de usuários da web. Assim sendo, portais como a Ameria on Line, Terra, Universo on Line por exemplo, têm diversos serviços à disposição de usuários, o que os torna grande fonte de consulta e, conseqüentemente, de procura de anunciantes, o que acaba gerando receita a esses portais, fazendo-os investir cada vez mais em novidades para o internauta (outro termo que advém do usuário já familiarizado com o computador e a operacionalização deste e das ferramentas da Internet).

Com essa possibilidade de ganhos, hoje a Internet é opção real na indústria da Propaganda. Em 1997, uma pesquisa feita pelo IAB – Internet Advertising Bureau, apresentou um estudo comparativo entre os investimentos em propaganda nos diversos meios de comunicação. Nesse estudo, o IAB demonstra que a Internet, na época com pouco mais de 5anos de existência, já abocanhava a considerável fatia de US$ 907milhões. Todo esse dinheiro e confiabilidade de retorno aplicada pelas empresas anunciantes à internet deve-se, principalmente, pelo diferencial da interatividade e comodidade. O internauta interage com a empresa, através de mecanismos de Webvertising e acaba consumindo, sem sair de casa, os produtos anunciados no portal. Para atrair a atenção do internauta de maneiras diferenciadas, são sempre criados mecanismos de divulgação das mensagens através do talento e criatividade de webdesigners e webwriters.

Podemos citar entre vários mecanismos de propagandas on-line:

–SITE: CONJUNTO DE PÁGINAS DA WEB. TEM CERCA DE 500 PÁGINAS;

–PORTAL: CONJUNTO DE SÍTIOS QUE POSSUI CERCA DE 10.000 PÁGINAS;

–MINISITE: SITE COM POUCAS MENSAGENS. FORTE APELO VISUAL;

–HOTSITE: MINISITE ESPECÍFICO DESTINADO PARA EVENTOS COM DATA DE INÍCIO E ENCERRAMENTO.

–PUSH ADVERTISING: PERGUNTA-SE AO CLIENTE O QUE ELE DESEJA. É OFERECIDO CONJUNTAMENTE COM UM ANÚNCIO, QUE PAGA O "PUSH".

–BANNER: ATÉ AGORA A "ALMA" DA PROPAGANDA ON-LINE. PEQUENA FIGURA QUE MOSTRA COMO ACESSAR DE MANEIRA RÁPIDA O ANUNCIANTE/PRODUTO.

Somando-se a verba publicitária ao preço pago pelo internauta pelo uso do portal, chega-se à receita final. Portanto, quando mais audiência, mais receita e confiabilidade possui o portal.

Essa confiabilidade é indispensável às empresas e à própria Internet para o seu crescimento enquanto

meio publicitário, principalmente porque os outros meios de comunicação ainda estão bem à frente quando o assunto é verba.
Na mesma pesquisa já citada neste texto, do IAB– Internet Advertising Bureau, demonstra que, o jornal lidera os investimentos com cerca de US$41,2 bilhões. A TV vem em segundo lugar com cerca de US$37,1bilhões seguido de perto pela Mala-direta, com US$36,9 bilhões. Comparando-se aos pouco mais de US$900 milhões, a Internet tem muito a investir, crescer, modificar-se.

3- Considerações Finais

A Publicidade na Internet, ou a Webvertising é uma realidade que progrediu e vem em constante aperfeiçoamento.
Diversas maneiras de divulgação da mensagem publicitária on-line, foram criadas especificamente para esse motivo, além de medidas de conferência e medição de audiência. Isso sinaliza e faz pensar que, os quase 1bilhão de usuários que a Internet, já em 2005 terá, muito provavelmente tornará a Webvertising um dos negócios mais lucrativos do mundo.

ANÁLISE DAS POSSIBILIDADES PARA O USO DAS CALCULADORAS GRÁFICAS NOS CURSOS DE ENGENHARIA

Fernanda Cesar Bonafini[1]*, Bruno Sestokas-Filho*[2]

Resumo *— A sociedade atual requer um profissional que trafegue eficazmente não só em uma área específica, mas também que não se intimide com as incertezas e velocidade das transformações do mercado. Para tanto, as Instituições de Ensino Superior devem formar profissionais habilitados para os novos desafios surgidos com a tecnologia. Os cursos de Engenharia são constituídos por disciplinas básicas, de formação geral e profissionalizantes, as quais devem caracterizar o perfil do aluno que a Instituição deseja formar. As disciplinas básicas são oferecidas no início do curso e constituem o "Núcleo Comum" às Engenharias tendo a finalidade de fornecer as ferramentas matemáticas e teóricas para as disciplinas de formação geral e profissionalizantes. Este trabalho apresenta: 1) a análise dos resultados de uma pesquisa feita com professores e alunos dos cursos de Engenharia sobre o possível uso pedagógico das calculadoras gráficas em sala de aula; 2) um entrecorte do estado atual dos ensinos passivo versus ativo no grupo pesquisado; 3) uma discussão sobre as metodologias de ensino envolvendo a pedagogia e a andragogia, visto que os alunos ingressantes notam as diferentes exigências de seus comportamentos ao passarem do Ensino Médio ao Superior.*

Palavras-chave — Ensino de Engenharia, Calculadoras Graficas, Tecnologias Informáticas.

INTRODUÇÃO

Nos dias de hoje é bastante fácil observar que a tecnologia já faz parte de nossas vidas. Os bancos já disponibilizam operações e transações na internet, as notícias já se encontram on-line, os celulares já podem se conectar e com isso trocar mensagens, nossos filhos já possuem aulas de informática e com nossos alunos não seria diferente.

A sociedade atual requer um profissional de engenharia que trafegue eficazmente não só em uma área específica, mas também que não se intimide com as incertezas e velocidade das transformações do mercado de trabalho. Percebemos que o mundo contemporâneo tornou-se globalizado e altamente dependente das tecnologias, fazendo com que as pessoas necessitem cada vez mais de uma maior qualificação (tanto cultural como escolar) para ocupar uma melhor posição neste mercado. Para tanto, as Instituições de Ensino Superior devem formar profissionais habilitados para os novos desafios surgidos com a tecnologia.

Nesta perspectiva, consideramos que uma das preocupações do ensino atual da Matemática Superior seja o desenvolvimento de competências na resolução de problemas em situações da realidade e a utilização da tecnologia como elemento mediador nessa atividade.

Automaticamente, entendemos que esses alunos devem estar preparados para viver numa sociedade tecnológica racional e matemática, em que viver significa ser um elemento crítico, atuante e preparado para mudanças.

Em contrapartida, os docentes devem também estar abertos para essa realidade, de modo a conceber diferentes caminhos para gerar o conhecimento juntamente com os alunos ou, conseqüentemente, ficarão estagnados à métodos de ensino obsoletos. É neste quadro que a aprendizagem matemática passa a ter um papel relevante na formação dos jovens, se o seu ensino for adequado às exigências da sociedade atual.

Neste trabalho apresentamos, primeiramente, a análise dos resultados de uma pesquisa feita com professores e alunos dos cursos de Engenharia sobre o possível uso pedagógico das calculadoras gráficas em sala de aula; seguido de um entrecorte do estado atual dos ensinos passivo versus ativo no grupo pesquisado e, finalmente, uma discussão sobre as metodologias de ensino envolvendo a pedagogia e a andragogia, visto que os alunos ingressantes notam as diferentes exigências de seus comportamentos ao passarem do Ensino Médio ao Superior.

AS CALCULADORAS GRÁFICAS

Neste artigo utilizamos uma das Tecnologias Informáticas (TI´s) presentes no Ensino Superior, as calculadoras gráficas. Essas são superiores às calculadoras científicas, pois possuem além de inúmeras funções adicionais (como por exemplo, as funções estatísticas) a propriedade de confeccionar diversos tipos de gráficos a partir de funções ou tabela de dados, ambos inseridos pelo aluno.

A calculadora gráfica é um instrumento portátil que pode dar ao aluno a possibilidade de recolher, trabalhar e trocar dados com professores e colegas dentro e fora da sala de aula, não só nas atividades de Matemática, mas também em aulas de Física, Química, Biologia e disciplinas afins de cada currículo.

Aproveitamos para ressaltar que esses instrumentos não são novos, ou seja, as calculadoras gráficas foram lançadas há vários anos e, até hoje, muitos alunos e professores ainda

Este trabalho foi financiado parcialmente (B.S.F.) pelo Instituto Presbiteriano Mackenzie através do processo Mackpesquisa No. 068/ 01.

não resgataram o potencial pedagógico que esses instrumentos podem oferecer.

Neste artigo utilizamos as calculadoras gráficas HP 48 série G pois, durante a observação, percebemos que a maioria dos alunos possuía esse modelo de instrumento.

METODOLOGIA

Como metodologia utilizamos a abordagem qualitativa sabendo que nessa perspectiva o "pesquisador colhe informações, examina cada caso separadamente e tenta construir um quadro geral [de uma dada] situação. É um exercício de ir juntando as peças, como num quebra-cabeça, até o entendimento global do problema" [1]. A seguir, apresentamos os procedimentos metodológicos para a coleta de dados relativos aos professores e alunos, respectivamente.

Com os Professores

Para a coleta de dados com esses participantes, nos valemos do uso de questionários contendo perguntas de múltipla escolha e também perguntas abertas. Essa técnica tem as vantagens de atingir um maior número de pessoas e a facilidade de registro das respostas enviadas [1].

Na análise dos dados procuramos identificar categorias, tendências, padrões, de modo a classificar os dados que havíamos recolhido [2]. Assim, analisando os questionários recebidos, percebemos que muitos eram os argumentos que surgiam em relação ao uso da calculadora gráfica em sala de aula, os quais receberão mais detalhes na seção Uso das Calculadoras Gráficas.

Com os Alunos

Com esses participantes utilizamos como técnica de coleta de dados a observação participante não-estruturada, como afirma Alves-Mazzotti e Gewandsznajder [2], "[é] a qual os comportamentos a serem observados não são predeterminados, eles são observados e relatados da forma que ocorrem, visando descrever e compreender o que está ocorrendo numa dada situação". Esses autores [2] ainda afirmam que "nesta observação, o pesquisador se torna parte da situação observada, interagindo por longos períodos com os sujeitos".

A observação teve um caráter natural, pois os pesquisadores – autores deste artigo – pertenciam à mesma comunidade que o grupo investigado [3], ou seja, durante o ano letivo de 2002, os pesquisadores foram os docentes dos sujeitos observados.

De maneira a aumentar a confiabilidade dos dados coletados, foram também distribuídos questionários aos docentes (de um modo geral) dos sujeitos da pesquisa. Esse segundo procedimento nos ajudou na triangulação que "tem por objetivo abranger a máxima amplitude na descrição, explicação e compreensão do objeto de estudo" [4], no nosso caso o uso da calculadora gráfica pelos alunos.

Na seção Uso das Calculadoras Gráficas serão apresentados mais detalhes sobre as categorias estabelecidas para os alunos.

USO DAS CALCULADORAS GRÁFICAS

Ao longo dos anos ministrando disciplinas de Cálculo Diferencial e Integral e de Física Geral e Experimental nos cursos de Engenharia, pudemos perceber os diferentes usos que os docentes normalmente fazem das TI´s, mais especificamente, das calculadoras gráficas.

Inicialmente tínhamos o foco centrado no aluno, porém, durante o caminhar desta pesquisa, resolvemos observar também os professores. Assim sendo, primeiramente, vamos ressaltar alguns pontos importantes em relação ao comportamento dos professores diante do uso da calculadora gráfica e, posteriormente, nos centraremos no comportamento dos alunos.

Pelos Professores

Após a análise dos dados pudemos agrupar e, em conseqüência, classificar os argumentos em três categorias distintas: 1) os professores que não utilizam a calculadora gráfica em sala de aula; 2) os professores que não as utilizam nas aulas, porém permitem que os alunos as portem nas provas e 3) os professores que aderem ativamente a sua utilização em sala de aula.

Na primeira categoria, o argumento denominado de ordem técnica para o não uso da calculadora gráfica foi uma possível heterogeneidade de modelos e marcas existentes na sala de aula, implicando que o professor dominasse os diferentes equipamentos. As dificuldades listadas a seguir também foram citadas pelos docentes quanto ao uso da calculadora gráfica: a complexidade no modo de operação, as dificuldades na programação, a exigência que o aluno domine alguns tipos de algoritmos característicos de algumas disciplinas, além dos docentes se auto-julgarem com poucas habilidades no uso desse instrumento e a falta de tempo para se dedicarem ao seu uso pedagógico em suas respectivas disciplinas. Um ponto notável dessa categoria foi a preocupação quanto às conseqüências do processo de aprendizagem com o apoio da tecnologia, numa avaliação final decisiva para a vida do estudante. Esse argumento foi rapidamente refutado, uma vez que em 1996 (para os cursos de Engenharia Civil) e 1998 (para os cursos de Engenharia Elétrica) foram instituídos os exames nacionais (ENC) nos quais é permitido ao aluno o uso de calculadoras, inclusive as gráficas.

No segundo grupo, encontramos o argumento que titula essa categoria, justificado quando olhamos a necessidade do docente em modificar os exercícios de modo que os alunos não fiquem dependentes dessa tecnologia, nem sintam impossibilitados de a utilizarem. Com isso advém o sub-uso das calculadoras gráficas, ou seja, elas são empregadas como calculadoras científicas e, por esse motivo, são permitidas em provas. Desse modo, a calculadora toma um forte apelo de instrumento de conferência de cálculos algébricos, inicialmente para o professor e posteriormente para o aluno.

Na terceira categoria, na qual nos incluímos, estão os docentes que aderem ao uso das TI´s em sala de aula. Exemplos deste uso estão apresentados em diversos trabalhos [5, 6, 7, 8, 9 e 10]. Alguns docentes afirmam que a incorporação da calculadora gráfica em sala pode ser feita num período de 20 minutos da aula, deixando que os alunos trabalhem em grupos orientados pelo professor.

Pelos Alunos

Nos dias de hoje, a calculadora gráfica tornou-se um instrumento de trabalho muito útil aos estudantes, porém devido ao quadro que apresentamos na seção anterior, poucos são os professores que estão posicionados na visão proposta pela terceira categoria. Em contrapartida, muitos são ainda os professores que estão na categoria 1 e em menor quantidade na categoria 2.

Assim, analisando as observações feitas e os questionários recebidos, buscamos identificar categorias e tendências de modo a compreender os dados que havíamos recolhido. Como resultado da análise desses dados percebemos que os alunos – embora diferentes uns dos outros – estabeleceram critérios para recorrer ao uso da calculadora.

Dentro desses critérios identificamos quatro categorias, a saber: 1) alunos que utilizam a calculadora gráfica para qualquer cálculo, mesmo que esse cálculo seja elementar; 2) alunos que possuem dificuldades quando necessitam fazer uma confrontação entre o resultado obtido com o lápis e papel e o resultado mostrado na calculadora gráfica; 3) alunos com um conhecimento deficiente na manipulação da calculadora conduzindo, em geral, a erros de interpretação dos resultados gráficos e 4) o uso da calculadora gráfica fora da sala de aula.

Na primeira categoria, observamos o uso imaturo da calculadora gráfica por parte do aluno e uma negligência por parte do professor. Muitas vezes esse aluno sabe que sua calculadora possui funções gráficas, mais é incapaz de as conhecer ou ter interesse por essas possibilidades. Notamos neste tipo de aluno uma grande importância ao tempo dispendido ao estudo gerando uma acomodação para com o ato de pensar.

A principal característica que nomeia a segunda categoria se faz presente nos alunos que possuem algumas dificuldades ao confrontarem os resultados obtidos com o lápis e papel com resultados mostrados na calculadora gráfica. Apoiados na observação percebemos que, nesses casos, a dúvida normalmente permanece, pois faltam aos alunos tanto domínio quanto conhecimento da matemática envolvida numa questão determinada.

Para ilustrar essa categoria, tomemos o exemplo a seguir, quando é necessário o valor da integral:

$$\int_1^x \frac{1}{x}\,dx \qquad (1)$$

que é facilmente resolvida utilizando uma tabela de integração donde temos: ln |x| - ln |1| = ln |x| - 0 = ln |x|.

O aluno que opta em utilizar a calculadora gráfica, primeiramente insere a função a ser integrada, a variável de integração, os limites inferior e superior e o tipo de resultado desejado (simbólico ou numérico) obtendo a resposta, que está apresentada na Figura 1.

FIGURA 1
A) INSERÇÃO DA FUNÇÃO, B) RESULTADO DA INTEGRAÇÃO.

Neste caso em específico, os alunos não sabem interpretar a resposta fornecida pela calculadora, ou seja, não possuem conhecimentos matemáticos para tal confrontação. Note que na pilha 1, a calculadora fornece o resultado e o aluno deverá substituir os limites de integração para obter a resposta final desejada.

Na terceira categoria, classificamos os alunos que possuem um conhecimento deficiente em relação a manipulação da calculadora gráfica conduzindo, em geral, a erros de interpretação dos resultados gráficos apresentados. Novamente através da observação realizada, apresentamos a seguir um exemplo na disciplina que ministramos.

Um exemplo de aplicação é quando solicitamos aos alunos a construção de gráficos oriundos da aplicação da Transformada de Laplace [11] onde em um circuito elétrico são pedidas a carga e a corrente, às quais são calculadas através dessa transformação. Os alunos deverão construir os gráficos da: $q(t) = e^{-2t}.sen16t$ e $i(t) = -2e^{-2t}.sen16t + 16e^{-2t}.cos16t$, respectivamente, de modo a obter, através do gráfico, o valor máximo da carga e da corrente num instante t de tempo.

Primeiramente, os alunos devem inserir a função, nomear a variável independente e pressionar a tecla DRAW para plotar o gráfico, como mostrado na Figura 2.

FIGURA 2
A) INSERÇÃO DA FUNÇÃO, B) GRÁFICO DA CARGA.

Contudo, devemos notar que a janela de visualização acima não é a mais adequada para o gráfico dessa função, pois esta apresenta os valores ‘default’ para H-VIEW e V-VIEW. Dessa forma, para obtermos o valor máximo da carga, precisamos re-ajustar essa janela e re-desenhar o gráfico, como mostrado na Figura 3.

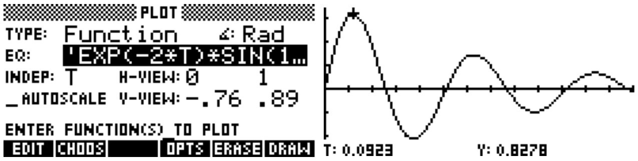

FIGURA 3
A) INSERÇÃO DA FUNÇÃO, DEFINIÇÃO DA JANELA DE VISUALIZAÇÃO, B) GRÁFICO DA CARGA.

Para obter a corrente, o aluno deverá derivar a carga no tempo, cuja resposta gráfica está apresentada na Figura 4.

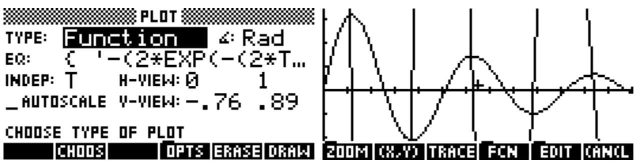

FIGURA 4
A) DEFINIÇÃO DA JANELA DE VISUALIZAÇÃO, B) GRÁFICO DA CARGA E DA CORRENTE.

Neste caso, percebemos que uma conseqüência da má visualização poderá gerar distorções na aquisição de conceitos.

Uma categoria que emergiu da pesquisa realizada, mais precisamente das observações, foi a categoria quatro. Nesta, notamos que os alunos utilizam amplamente a calculadora gráfica fora da sala de aula. Esse instrumento se faz presente nos momentos de monitoria ou estudos em grupo, onde notamos que a aprendizagem ocorre entre os alunos de uma maneira informal, a medida que um aluno ensina o outro uma nova dica de programação e este agora aprende um comando novo para o cálculo de alguma tarefa matemática.

Além disso, nesta categoria, notamos uma organização entre os alunos para realização de cursos (fora do período de aula) para os alunos menos experientes no uso da calculadora gráfica. Observamos também, que há uma troca entre os pares de: programas, jogos e aplicativos para as diversas disciplinas de seus cursos utilizando tais calculadoras [12].

CONSIDERAÇÕES FINAIS

As considerações finais foram divididas primeiramente aos professores e posteriormente aos alunos. Após isso, seqüencializamos apreciações, de um modo geral, em relação à inserção das tecnologias informáticas no ensino tecendo um paralelo entre o ensino passivo versus ativo, nos valendo da pedagogia auxiliada pela andragogia quando lidamos com o ensino universitário.

Para os Professores

Esse trabalho mostra que, mesmo os professores classificados na primeira categoria, acreditam que as Instituições de Ensino Superior devam fornecer um curso ou treinamento para ampliar o uso desses instrumentos dentro e fora da sala de aula.

Os argumentos presentes na segunda categoria são bem próximos da anterior. Contudo, esses docentes se auto-denominam um pouco mais flexíveis ao uso das TI´s, pois apesar de não as incorporá-las nas suas aulas, permitem que os alunos as utilizem nas avaliações.

Na terceira categoria, os docentes enfatizam que as atividades com calculadoras gráficas possuem o potencial de integrar os alunos entre si, bem como alunos e professor. Neste contexto, esses instrumentos, possuem fundamental importância na formulação de hipóteses, verificação de resultados e desenvolvimento do espírito crítico do aluno. Neste caso, o professor deve adaptar suas práticas e suas provas de acordo com a abordagem a ser feita na sala de aula.

Todos esses comportamentos desafiadores decorrentes da integração das TI´s ao ambiente educacional impõem mudanças estruturais à ação docente e às formas de ensinar.

O novo papel do professor será o de validar mais do que anunciar a informação. Em todas as categorias os docentes relatam que a calculadora gráfica poderia ser utilizada, a princípio, em todas as disciplinas do "núcleo comum" do currículo de Engenharia, destacando-se as disciplinas: Cálculo Diferencial e Integral, Geometria Analítica, Cálculo Numérico, Estatística, Física Geral e Experimental, Mecânica Geral, Mecânica dos Fluídos, Circuitos Elétricos e Eletromagnetismo.

Para os Alunos

Com relação aos alunos, os resultados levaram-nos a estabelecer dois grupos: 1) os que recorrem quase sistematicamente à calculadora gráfica, confiando completamente nos resultados que esta fornece, com objetivo de tentarem resolver todos os problemas propostos e 2) os que preferem usar o papel e lápis na resolução dos exercícios, usando raramente a calculadora gráfica, pois manifestaram maior confiança nos seus raciocínios e cálculos.

No primeiro grupo havia alunos que manipulavam bem a calculadora gráfica e outros não, porém esses últimos legitimavam o uso do instrumento, mesmo esse não lhes fornecendo respostas consistentes.

No segundo grupo, notamos que muitos alunos não se interessavam por aprender a trabalhar com as calculadoras gráficas, pois só recorriam a ela para cálculos mais complexos ou para a confirmação de gráficos que foram previamente esboçados a mão. Temos, então, um entrelaçamento dos dados vindos dos alunos e dos professores. Como justificativa, para essa convergência, acreditamos que o comportamento desses alunos seja um reflexo da conduta dos docentes. Neste momento, cabe um alerta que o docente deve ter consciência que a sua opção pela adoção (ou não) das Tecnologias Informáticas poderá influenciar o comportamento e atitude dos alunos no uso de quaisquer tecnologias em sua vida profissional.

Constatamos também, nesta pesquisa, que o emprego das calculadoras gráficas pelos alunos se faz com maior freqüência nas: operações elementares, funções matemáticas e construção de gráficos. A opção pela programação é bastante utilizada por poucos alunos de modo a confeccionar programas que lhes auxiliem durante as aulas ou nas provas.

A Pedagogia auxiliada pela Andragogia

Alguns professores, em sua prática, se apóiam na Pedagogia, que "é a arte e a ciência de ensinar crianças, tendo como preocupação a formação e o desenvolvimento do homem na sua totalidade" [13]. Baseado nessa premissa, percebemos que os professores ensinam aos graduandos, apoiados em métodos da educação para crianças. Em outras palavras, uma educação baseada em disciplinas e regras, enquanto os indivíduos mais maduros desejam uma educação centrada na solução de problemas, de modo a prepará-los para as dificuldades que irão enfrentar ao longo de sua carreira.

É nesse ínterim que a Andragogia "arte e a ciência de ajudar o adulto a aprender baseando-se em pressupostos acerca das diferenças entre crianças e adultos, onde os últimos são considerados aprendizes" [13], tem sua contribuição na formação desses estudantes.

Nos cursos de engenharia temos como aprendizes, indivíduos que estão em transição entre a adolescência e a maturidade. Esses autores [13] afirmam que o estudante universitário é impactado ao ingressar na Universidade, por se deparar com um mundo onde o comportamento adulto é predominante. Então temos o paradigma: se por um lado ele já pode ser considerado adulto, por outro não tem muita experiência acumulada, o que sugere a aplicação dos princípios da Pedagogia e da Andragogia de forma consorciada.

Um outro fato que reforça o elo Pedagogia-Andragogia é que a maioria das turmas em nível universitário são compostas por calouros (que vêm de um ensino médio baseado na pedagogia) e por alunos mais velhos (que tiveram um longo intervalo de tempo entre o ensino médio e o universitário dedicando-se, na maioria dos casos, ao trabalho) que já possuem muitas experiências intelectuais e de vida acumuladas.

Como Bazzo e Pereira [14], alertamos da necessidade em conhecer os alunos com quem vamos trabalhar. Isso deve ser uma premissa básica para empreendermos um ensino que resulte em uma aprendizagem transformadora. Os autores [14] afirmam que, se entendermos um pouco melhor o contexto com o qual estamos trabalhando, é possível lutar por um ensino que privilegie a formação de cidadãos criativos, críticos e esclarecidos.

Além de o docente conhecer o aluno, acreditamos que as Tecnologias Informáticas podem ter um papel fundamental na formação desse indivíduo. Desta forma, as TI´s são vistas como agentes transformadores da dinâmica da sala de aula. Como relatado anteriormente com os docentes que incorporaram as TI´s em sua prática, percebemos uma transformação de um ensino passivo para um ensino ativo, onde neste último as TI´s são as mediadoras das atividades ocorridas em aula.

Alertamos que somente a introdução das TI´s na prática do docente, não garantem essa transformação no ensino. Para que possamos realizar essas mudanças é preciso que o docente saiba lidar crítica e pedagogicamente com as TI´s.

EDLIB: UMA BIBLIOTECA DIGITAL MULTIMÍDIA PARA O APOIO EDUCACIONAL

Cláudio S. Baptista[1], Cláudia B. Mélo [2], Flávio O. Logrado[1], Rodrigo A.V. Miranda[1] e Alex. S. Rego[1]

Resumo *— Atualmente, no desenvolvimento completo de sistemas para o apoio educacional se faz necessário incorporar uma biblioteca digital. Entretanto, um dado assunto deve ser avaliado através de diferentes mídias tais como textos, vídeos, áudios e imagens. Desse modo, é necessário prover uma biblioteca digital que lide com esses diferentes tipos de mídia. Nos últimos anos, a abundância de dados multimídia que têm sido gerados aliado à larga aceitação da Internet como a infraestrutura para publicar esses dados tem motivado pesquisas no campo das bibliotecas digitais multimídia. Esse artigo apresenta uma biblioteca digital multimídia chamada EDLib (Educational Digital Library – Biblioteca Digital Educacional). O projeto EDLib é baseado em uma arquitetura de n camadas e manipula dados multimídia como objetos de primeira classe. Esta arquitetura distribuída provê escalibilidade e otimiza o armazenamento balanceado.*

Palavras-chave — bibliotecas digitais, multimídia, educação, sistemas para web

1. INTRODUÇÃO

Pesquisas em informática na educação vêm evoluindo rapidamente nos últimos anos com modelos e ferramentas para suportar o ensino a distância. No entanto, para se ter uma universidade virtual completa, faz-se necessário não apenas ferramentas de autoria, apresentação e representação de conteúdo educacional, mas também um repositório tal como uma biblioteca digital no qual o aluno pode realizar buscas sobre tais conteúdos educacionais. A área de pesquisa Bibliotecas Digitais vem se consolidando em todo mundo como um elemento indispensável na cadeia de informação que visa implantar a sociedade da informação [1,2]. Destarte, a integração de tais bibliotecas em ambientes de educação a distância constitui-se numa importante área de pesquisa.

Muito já se tem evoluído na área de bibliotecas digitais textuais, inclusive com padrões já amplamente utilizados para representação textual tais como: TEI (http://www.tei-c.org/). Outros domínios específicos tais como aplicações espaciais e museus têm também seus padrões de metadados definidos e largamente usados como por exemplo o ISO/TC11 Geographic Information/Geomatics. Necessita-se, pois, desenvolver tais bibliotecas num contexto mais amplo, envolvendo não apenas os diferentes tipos de mídia como também diferentes domínios. Isto caracteriza uma biblioteca digital de quarta geração que provê acesso a conteúdo digital distribuído na Internet [3].

O principal diferencial desta pesquisa com relação aos trabalhos correlatos deve-se ao fato de integrar numa biblioteca digital dados multimídia como objetos de primeira classe. Isto é, textos, sons, vídeo e imagens serão armazenados e consultados de acordo com a peculiaridade de cada mídia. Por exemplo, full-text retrieval para textos, content-based retrieval para imagens e vídeo [4].

Neste artigo, apresentamos a EDLib – Educational Digital Library, que é uma biblioteca digital multimídia para fins educacionais. EDLib é baseada numa arquitetura distribuída em n camadas e disponibilizada na Web. A EDLib mantém os requisitos básicos de armazenamento, recuperação e visualização de dados multimídia distribuídos na Web.

O restante deste artigo é organizado da seguinte forma: a seção 2 apresenta alguns dos principais requisitos envolvidos na área de bibliotecas digitais; a seção 3 discorre sobre aspectos de projeto da biblioteca EDLib; a seção 4 apresenta exemplos de uso da biblioteca; finalmente, a seção 5 conclui o artigo e aponta futuros trabalhos a serem realizados.

2. BIBLIOTECAS DIGITAIS: REQUISITOS BÁSICOS

As bibliotecas digitais caracterizam-se pelo tipo de recursos armazenados em suas coleções, pelos padrões de metadados utilizados para descrever tais coleções e pelos serviços que são providos tais como cobrança, segurança e recuperação da informação.

Nas primeiras gerações das bibliotecas digitais, o acervo era restrito a documentos do tipo texto. Em uma biblioteca digital de última geração, ao pesquisar, por exemplo, por "staphilococcus aureus" é possível recuperar não apenas artigos ou livros que abordam o assunto, mas também, imagens de microscópio da bactéria e até mesmo vídeos educativos mostrando uma aula sobre o assunto, desde que disponibilizados nas coleções. As bibliotecas digitais desta geração são chamadas bibliotecas digitais multimídia.

Outro aspecto importante das bibliotecas digitais é o uso de metadados para a descrição dos recursos. Os metadados permitem que, através de uma única consulta, diversos tipos

[1] Claudio S. Baptista, Flávio O. Logrado, Rodrigo A.V. Miranda, Alex S. Rego, Universidade Federal de Campina Grande, Departamento de Sistemas e Computação, Av. Aprígio Veloso, 882, Bodocongó, 58109970, Campina Grande, Pb, Brasil, {baptista, flavio, vilar, asrego}@dsc.ufcg.edu.br
[2] Cláudia B. Mélo, Universidade Federal de Pernambuco, Departamento de Patologia, Recife, PE, Brasil e Universidade Federal de Campina Grande/COPELE, Av. Aprígio Veloso, 882, Bodocongó, 58109970, Campina Grande, Pb, Brasil, claudiamelo@dee.ufpb.br

de conteúdos digitais sejam recuperados, uma vez que todos os conteúdos, independente de mídia, são descritos em termos de metadados. Além do que, a utilização de padrões de metadados é peça fundamental para a interoperabilidade entre bibliotecas digitais. Historicamente, os padrões mais usados nas bibliotecas eram os da família MARC[5]. Com o advento da Internet e a necessidade da descrição semântica dos recursos nela disponibilizados foi proposto o padrão Dublin Core[6].

Com relação às técnicas de recuperação da informação utilizadas pelas bibliotecas digitais multimídia destacam-se:

Recuperação baseada em atributos de metadados: aplica-se a qualquer recurso multimídia. As consultas são realizadas em termos dos metadados que descrevem os recursos. Exemplo: o autor de um documento, a data de criação, o título do documento, etc.

Recuperação baseada em conteúdo (content-based retrieval): aplica-se a imagens e vídeos. As consultas são realizadas em termos de determinadas características dos dados tais como histograma de cores, textura e forma dos objetos que compõem uma dada imagem ou videoframe. Exemplo: recupere fotografias de aves semelhantes a uma dada imagem.

Recuperação textual. As palavras dos textos são indexadas. As consultas são realizadas utilizando uma linguagem baseada em palavras ou radicais de palavras com o auxílio de operadores lógicos. Exemplo: recupere os textos que contêm a palavra "diabetes".

.

3. EDLIB

Bibliotecas digitais podem ser usadas para armazenar dados de diversos domínios. Estes dados são agrupados em coleções que contêm os dados em formato digital. No campo da educação, por exemplo, poderemos ter uma biblioteca digital específica para uma determinada área de conhecimento como medicina; ou uma biblioteca mais genérica com coleções sobre diversas áreas de conhecimento. O projeto EDLib incorpora estas duas características e o bibliotecário decide como ele deseja organizar os dados em diversas coleções. A seguir daremos um exemplo de uso da EDLib para apoio ao ensino à medicina, com uma coleção sobre Zoologia.

Coleção de Zoologia

Uma biblioteca digital, como a tradicional, pode ser organizada em coleções. Portanto, vamos ilustrar esta aplicação com a criação de uma coleção sobre a área de Zoologia onde podem ser encontrados aulas em formato de texto e vídeo sobre espécies em extinção; fotografias destas espécies; no caso de aves, poderíamos ter o canto destas aves representadas como áudio. Toda esta informação servirá para apoiar o ensino em aulas de Zoologia em que, por exemplo, aves em extinções seja discutido. Na seção 4 mostraremos algumas consultas com estes tipos de dados.

Projeto da EDlib

A EDLib foi desenvolvida usando um processo iterativo e incremental usando notação UML [7]. A EDLib possui quatro camadas: o software para navegação na web (cliente); páginas de apresentação (HTML e JSP); lógica da aplicação, encapsulada em JavaBeans e Java Servlets; banco de dados objeto-relacional com as extensões para tratar com dados multimídia. A figura 1 mostra o projeto arquitetural da EdLib.

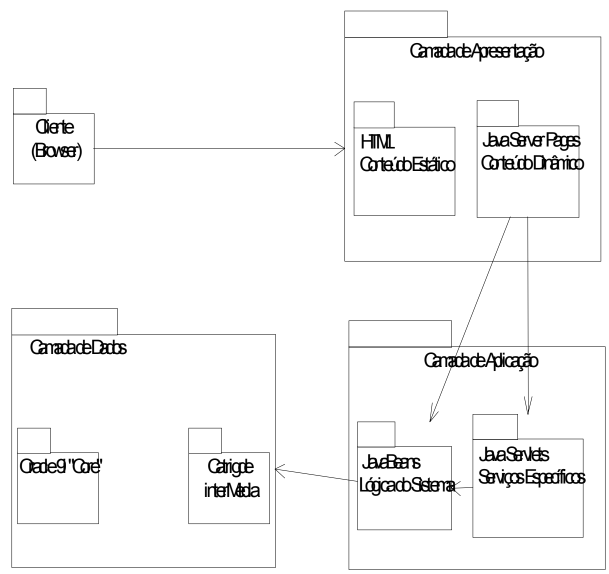

FIGURA 1 ARQUITETURA DA EDLIB

As quatro camadas da arquitetura compreendem:

- Camada do Cliente: Nesta camada, são usados os navegadores para Web, como o Internet Explorer e o Netscape Navigator, que têm a função de apenas exibir as páginas que são geradas pela camada de apresentação.
- Camada de Apresentação: esta camada apresenta a página index.jsp quando o usuário acessa o site da EDLib, contém as páginas de apresentação estática, através de HTML, e dinâmica através de JSP.
- Camada de Aplicação: nesta camada estão os JavaBeans, responsáveis por processar as consultas realizadas nas páginas JSP; e Servlets, que preparam aos dados para serem expostos nas páginas JSP.
- Camada de Dados: nesta camada a EDLib guarda os metadados e dados armazenados na biblioteca digital. Estes dados são modelados em três camadas e utilizam-

se bibliotecas específicas do SGBD para suporte à consultas multimída em textos, imagens, vídeo e áudio.

Modelo de Dados da EDLib

O modelo de dados da EDLib contempla três níveis. A figura 2 mostra este modelo usando um diagrama de classes em UML.

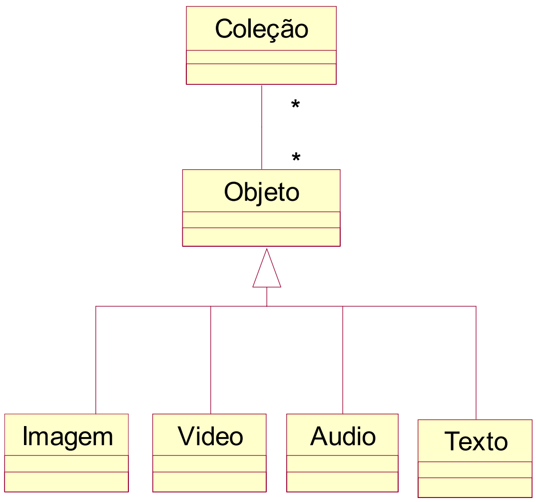

FIGURA 2: MODELO DE DADOS EDLIB

De acordo com a figura 2 temos as seguintes classes:

- Coleção: nesta classe temos informações sobre o título, descrição, responsável e data de criação;
- Objeto: nesta classe armazenamos os metadados que são genéricos a qualquer tipo de dado seja ele imagem, vídeo, áudio ou texto. Estes atributos são: título, descrição, temas (palavras-chave), criador, e data de criação;
- Imagem: esta classe contém os atributos herdados de Objeto mais os atributos específicos a uma imagem tais como: tamanho (em bytes), numX e numY (número de pixels nas coordenadas x e y, respectivamente);
- Video: esta classe contém os atributos herdados de Objeto mais os atributos específicos a um vídeo tais como: tamanho em bytes, duração do vídeo em horas, minutos e segundos, bitRate (velocidade em bits/seg), frameRate (quantidade de quadros por segundo);
- Audio: esta classe contém os atributos herdados de Objeto mais os atributos específicos a um áudio tais como: tamanho em bytes, número de samples/seg, número do canal associado ao áudio, duração do áudio em horas, minutos e segundos;
- Texto: esta classe contém os atributos herdados de Objeto mais os atributos específicos a um texto tais como: língua em que o texto foi escrito, tamanho do texto em bytes, wordCount quantidade de palavras no texto.

Além destes atributos, os metadados específicos informam qual o formato do dado. Os formatos disponíveis serão armazenados em tabelas separadas, para facilitar sua consulta. Exemplos de formatos disponíveis no Meridional incluem:

- *VideoFormat*: VHS, Hi-8, D-1;
- *VideoSTD*: pal, ntsc, secam;
- *ImageFormat*: jpeg, gif, tiff, bmp, etc;
- *TextFormat*: ascii (txt), MS word (doc), pdf, post script (ps);
- *AudioCompress*: mp3, wav, real audio (ram).

O esquema conceitual da EDLib foi mapeado para um esquema objeto-relacional do SGBD Oracle. Desta forma, fez-se uso de algumas bibliotecas (data cartridge no jargão Oracle) para o armazenamento de dados multimídia tais como interMedia e Text do Oracle 9i [8].

4. EXEMPLO DE FUNCIONAMENTO DA EDLIB

Nesta seção mostraremos alguns exemplos de interação com a EDLib. Assim que o usuário se loga na biblioteca ele obtém a interface que é mostrada na figura 3.

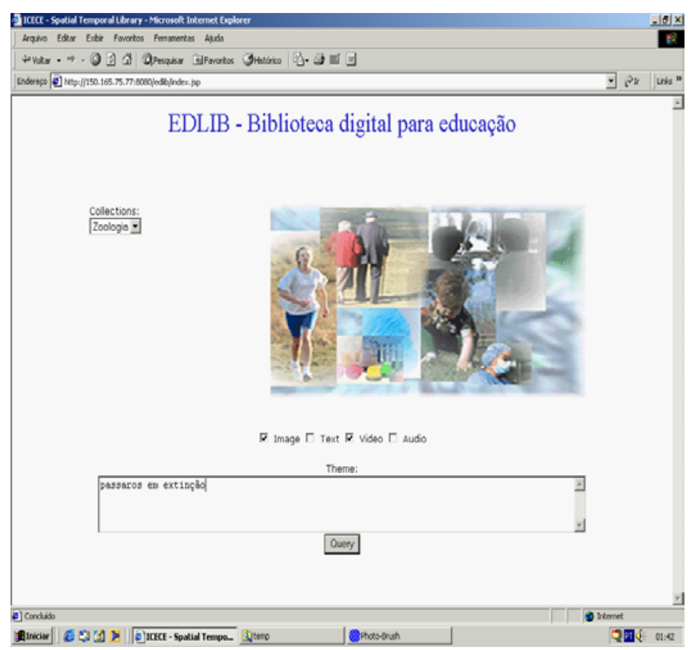

FIGURA 3 EDLIB: INTERFACE PRINCIPAL

Como pode ser visto na figura 3, o usuário pode selecionar a coleção que deseja realizar buscas. Exemplos de tais coleções incluem zoologia, computação, medicina, engenharia elétrica, engenharia civil, matemática, sociologia, dentre outras. Logo em seguida, o usuário informa, através de checkboxes, quais tipos de dados ele está interessado, podendo escolher entre vídeo, áudio, texto e imagem. Por último, o usuário informa palavras chaves que identificam o tema que se está pesquisando, por exemplo 'aves em extinção'. Após preencher estas informações o usuário submete sua consulta ao pressionar o botão query.

Em seguida, a EDLib retornará os metadados dos objetos que satisfizerem à consulta. A figura 4 mostra um exemplo de um conjunto resultado pertencente à coleção Zoologia.

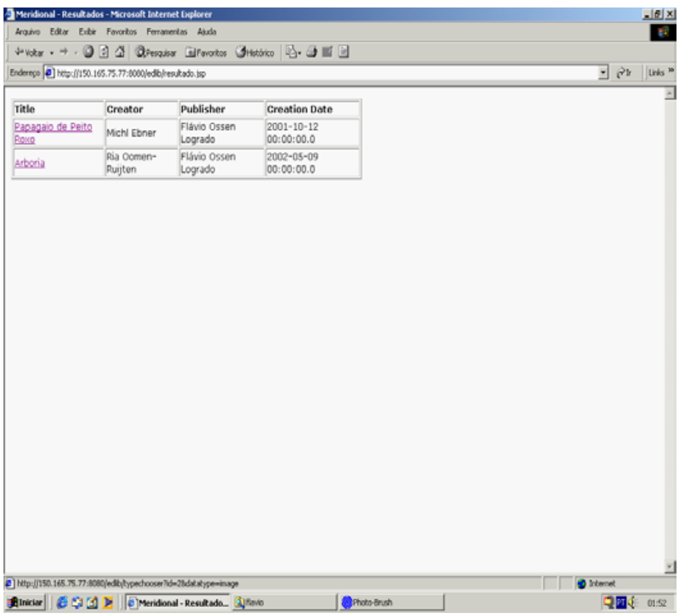

FIGURA 4 EDLIB: RESULTADO DE UMA CONSULTA

O usuário pode então, ao analisar os metadados, abrir qualquer documento multimídia, bastando para isso clicar no link contido no título de cada objeto do conjunto resultado. Estes objetos podem ser uma aula (vídeo), um livro (texto), o canto de um pássaro (áudio) ou uma fotografia de uma ave (imagem). Ao abrir um objeto e fazer a carga do objeto multimídia uma nova janela é aberta dependendo da mídia associada. As figuras 5 e 6 mostram exemplos de tais janelas.

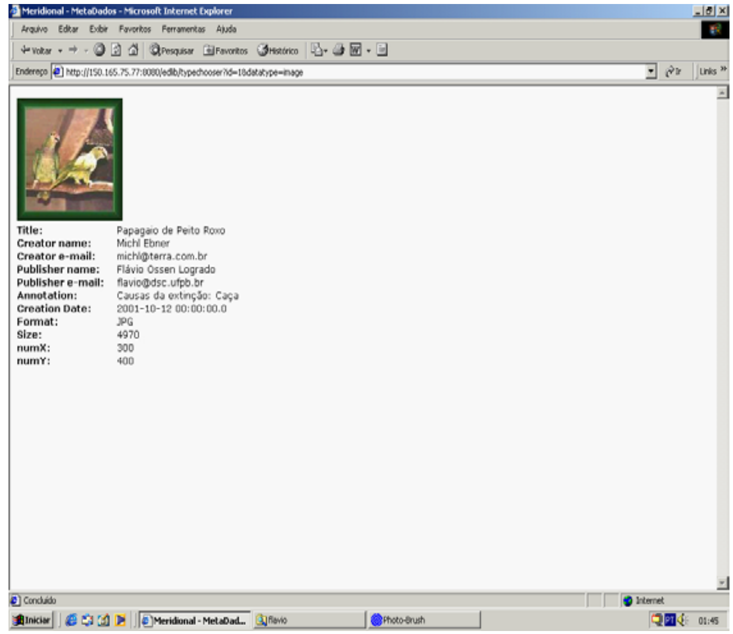

FIGURA 5 EDLIB INTERFACE DE IMAGENS

FIGURA 6 EDLIB INTERFACE DE ÁUDIO

5. CONCLUSÕES

Bibliotecas digitais completam um ambiente de educação assistida por computador. O grande volume de dados disponibilizados em diversas mídias e o sucesso da Internet como um grande repositório de dados universal tem impulsionado pesquisas na área de bibliotecas digitais. Neste artigo apresentamos uma biblioteca digital multimídia para o apoio educacional chamada EDLib. A EDLib é baseada numa aruitetura em n camadas que permite uma maior escalabilidade da solução; manipula dados multimídia tais como textos, vídeos, áudio e imagens em diferentes formatos; é desenvolvida no ambiente Java que permite a independência de plataforma de software; e implementa a persistência dos dados usando um SGBD objeto-relacional que permite estensibilidade.

Como futuros trabalhos, pretendemos migrar a camada de metadados para o padrão MPEG-7[9] e usar além de consultas estruturadas via SQL, como na versão atual da EDLib, consultas a dados semi-estruturados via XQuery[10]. A idéia é poder ter um repositório MPEG-7 no qual possamos fazer consultas diretamente sem a necessidade de transportar estes dados para um esquema Dublin Core num SGBD objeto-relacional.

Processo Didático na Fabricação de Chips MOS para estudantes de Engenharia/UNISANTA

Djalmir Corrêa Mendes[1], *Aureo Emanuel Pasqualeto Figueiredo*[2], *Jean Louis Noullet*[3]

Introdução *— A finalidade deste trabalho é demonstrar a estratégia didática dirigida aos alunos dos cursos de graduação nas diversas habilitações em Engenharia Elétrica, de processos de tecnologia de ponta, como subsídios e meios no desenvolvimento de estudos, pesquisas, treinamento e fabricação de CIs, no âmbito da MICROELETRÔNICA.*

A base operacional é o intercâmbio franco-brasileiro entre o AIME (Atelier Interuniversitaire de Microelectronique) Toulouse/França e a UNISANTA (Universidade Santa Cecília) Santos/Brasil, que envolve além de professores/técnicos franceses e brasileiros, um grupo de alunos com o pré-requisito de conhecimento de eletrônica básica, circuitos e sistemas digitais.

O programa se desenvolve em 6 meses, de fevereiro a julho, com aulas específicas enfocando conceitos da física quântica, física do semicondutor e microeletrônica, etapa realizada na UNISANTA.

A etapa de fabricação dos chips é realizada na "salle blanche" do AIME, quando os alunos estudam um projeto segundo as normas do "Atelier", aplicando seus conhecimentos nos processos de fabricação dos Cis, em Toulouse.

Dentro dos conceitos"VLSI", quatro máscaras são, então, utilizadas, assim como o processo de auto-alinhamento de "gate". Com isso, pode-se obter transistores cujos canais são menores que 10 micra, possibilitando, desta forma, grupar cerca de 25 transistores numa área 1 milímetro quadrado. Além dos transistores, também são implementados capacitores MOS, diodos e resistores MOS, perfazendo um conjunto de dispositivos úteis na diversificação dos projetos envolvendo contadores, seqüenciadores, osciladores em anel, portas lógicas, etc .

Ao final são realizadas medições, especificações e encapsulamento dos chips como produto final.

O PROJETO

Este projeto na área da microeletrônica, fundamentalmente se baseia nos conceitos e processos para implementação de " chips " contendo transistores de canais NMOS, com portas de polisilício construídas por auto alinhamento, em prazo limitado de uma semana, na *salle blanche* (sala limpa) do AIME.

Dada a avançada tecnologia necessária à realização de um CI, são necessários equipamentos altamente sofisticados como microscópios eletrônicos, fornos de altas temperaturas, câmaras de vácuo, computadores de médio porte, micro processadores, sala de fotolitografia, sala limpa de alta assepsia e super pressionada, reator LPCVD (Low Pressure Chemical Vapour Deposition), equipamentos para teste químicos e eletrônicos a nível molecular, etc.

Assim, através do intercâmbio entre a UNISANTA e o AIME, alunos do curso de graduação de engenharia eletrônica, de telemática e de computação, tem acesso de forma diferenciada a uma tecnologia de ponta que no Brasil, raramente poderiam dispor em sua graduação.

A Universidade de Toulouse e do INSA apóiam o programa aceitando os alunos para o estágio com facilidades no acesso ao campus e restaurante universitário, material para fabricação dos "chips", indicações bibliográficas, acesso da *salle blanche* e informações sobre equipamentos, enfatizando a de segurança individual e coletiva. Destaca-se, além da cooperação prática, um sólido e amigável acompanhamento dos professores e técnicos franceses, proporcionando aos alunos brasileiros um rendimento relevante.

O AIME, segue os princípios básicos na fabricação de um chip de tecnologia MOS, de forma dirigida a torna-los instrumento de aprendizado, viabilizando a assimilação do conhecimento aplicado com alta confiabilidade. Considera-se essencial o aprendizado do processo, buscando sempre um produto final da melhor qualidade.

Por exemplo, a implementação do elemento ativo fundamental de um "CI", o transistor NMOS com porta auto-alinhada, tem suas etapas são definidas em:

1. Análise e caracterização do substrato tipo P
2. Oxidação de Mascaramento
3. Fotogravura 1: Abertura da difusão
4. Limpeza R.C.A.
5. Oxidação seca para a realização da porta
6. Depósito de polisilício dopado tipo N por LPCVD
7. Fotogravura 2: Abertura no Polisilício por plasma
Abertura química do SiO2 da Porta
8. Difusão de Fósforo na Fonte e no Dreno: Pré-deposição e Redistribuição
9. Depósito de SiO2 à baixa temperatura por LPCVD
10. Fotogravura 3: Abertura dos contatos
11. Metalização
12. Fotogravura 4: Gravação do Metal
13. Recozimento do Metal
14. Montagem/encapsulamentoe teste com micropontas
15. Teste elétrico e eletrônico

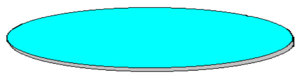
[3] Jean Louis Noullet, Institut National Polytechnique de Toulouse, Avenue de Rangueil, 135, 31077, Toulouse, France, noullet@aime.insa-tlse.fr

Os procedimentos específicos, são consolidados de forma a evidenciar as principais fases do processo como um todo.

1 - Análise e caracterização do substrato tipo P

Nesta etapa, a placa componente é examinada e medidas da espessura da placa e determinando a relação tensão/intensidade. São calculadas a resistividade "r" e a concentração da Dopagem Aceitadora "N_A" imposta à placa.



Observações : Placa de Silício tipo P
Espessura de 300 µm

2 - Oxidação de Mascaramento

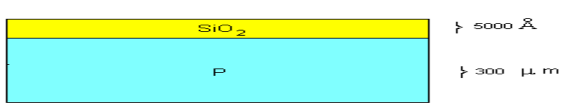
Promove-se a oxidação da plaqueta com espessura de óxido suficiente para que a camada sirva de máscara para a difusão de Fósforo na fonte e no dreno, com:

Limpeza preparatória

- Desengorduramento - Tricloroetileno, após acetona e água DI (a quente)
- Oxidação química - $H_2 SO_4 + H_2 O_2$ (1/1) 2 min. e água DI
- Ataque do Si O_2 - HF diluído, por 30 s.; rinçagem água DI; secagem c/ Nitrogênio
- Lavagem /secagem - Máquina lavadora/secadora

Oxidação Térmica em cinco etapas de forno

Nº	Temperatura	Tempo	Fluxo
01	T=800º C à1100ºC	t=25mim	N_2 = 01 l / min
02	T = 1100º C	t = 40 min	H_2 = 2,7 l / min e O_2 = 1,5 l / mn
03	T = 1100º C	t = 30 min	O_2 = 2,2 l / min
04	T = 1100º C	t = 10 min	Ar = 1,5 l / min
05	T = 800º C à 110	t=60min	N_2 = 01 l / min



" Wafer " de Silício P com o óxido de mascaramento

3 - Fotogravura 1 : Abertura da difusão

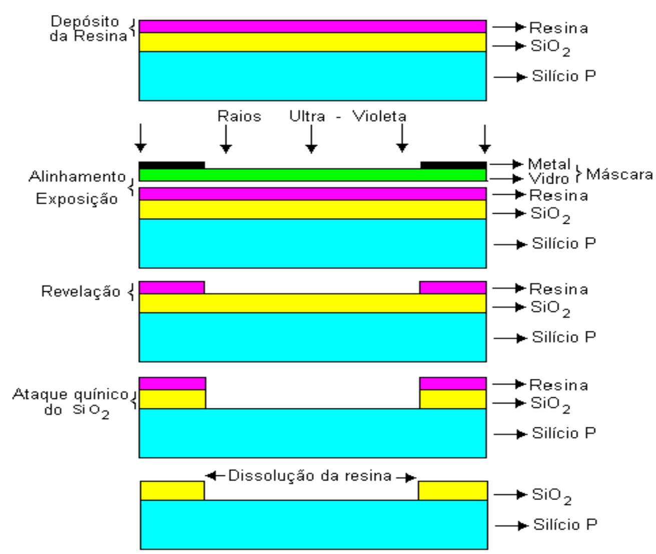
O objetivo dessa etapa é a de realizar aberturas no óxido de mascaramento nas zonas onde se pretende implementar o óxido de Porta. Nesta ocasião, será definido o rendimento do chip fabricado.

Esta etapa requer operações executadas rigorosamente dentro de padrões, e de sua precisão decorre o sucesso nos testes eletrônicos de checagem a que será submetido no final do processo.

Assim sendo, a tabela a seguir mostra os passos das operações e condições de execução.

Nº	Operações	Condições
01	Secagem	Estufa com 120 ° C por 5 min
02	Depósito da resina	Ref : 14000 – 27 Positiva / Centrífuga por 30 s
03	Primeiro recozimento	Chapa a 100 ° C por 30 s
04	Alinhamento / Insolação	Por 5 s
05	Revelação	20 ° C por 30 s
06	Gravação do Si O_2	Buffer HF conforme tempo da "placa testemunha"
07	Observações / Análises	Microscópio eletrônico
08	Dissolução da resina	Acetona e água D I
09	Limpeza	$H_2 SO_4 + H_2 O_2$

As operações enumeradas acima, também podem ser interpretadas através dos seguintes esquemas:



4 - Limpeza R.C.A.

Antes da oxidação da Porta, a presente operação tem por finalidade preparar a interface de Si/SiO2. São cinco os procedimentos:

01 - Banho A' - HF diluído por 30 s rinçagem e secagem

02 - Banho A - HNO3 fervente por 10 min rinçagem e secagem

03 - Banho A’ - HF diluído por 30 s rinçagem

04 - Banho B - NH2 OH + H O2 + H2 O por 10 min rinçagem

05 - Banho C - HCl + H2 O2 + H2 O por 05 min rinçagem e secagem.

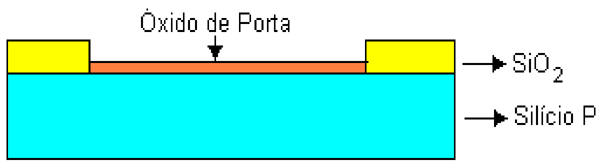
5 - Oxidação seca para a realização da Porta

Antecipando a fase do depósito de polisilício na região da Porta, uma camada bastante fina de óxido deverá ser implementada com a finalidade de estabelecer uma região própria para produção de campo elétrico. Esta operação, realizada em forno com temperatura de 1100 ° C, é dividida em dois ensaios:

1° - Com a duração de 30 minutos estimula-se um fluxo de O2 igual a 2 l/min.

2° - Com a duração de 10 minutos estimula-se um fluxo de ar igual a 2 l/min

Deve-se como norma de projeto, dar início nesta fase às especificações e caracterizações do processo. O esquema abaixo mostra a oxidação.

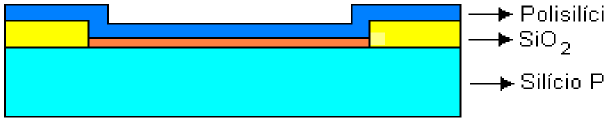


6 - Depósito de Polisilício dopado tipo N por LPCVD

Esta etapa enfoca o depósito de uma camada de Sílicio Policristalino no intuito de proteger-se o Óxido de Porta da difusão pelo processo "LPCVD" (Depósito de Vapor Químico a Baixa Pressão) e é realizada no reator "LPCVD" em três fases:

Nº	Temperatura	Tempo	Fluxo	Pressão
01	T =400 ° C à 585 ° C	t = 45 min	N_2 = 11 l / min	p= 1 Torr
02	T =585 ° C	t = 100 min	SiH_2= 50 cc/min; PH_3= 2 cc/min	p= 250m Torr
03	T =585 ° C à 400 ° C	t = 4x2 min	$N_{2\,=}$ 1 l /min:ciclos expulsão gas	p= 1 Torr

O resultado final do processo executado no reator de Depósito de Vapor Químico a Baixa pressão, pode ser resumido no esquema abaixo:



7 - Fotogravura 2 :

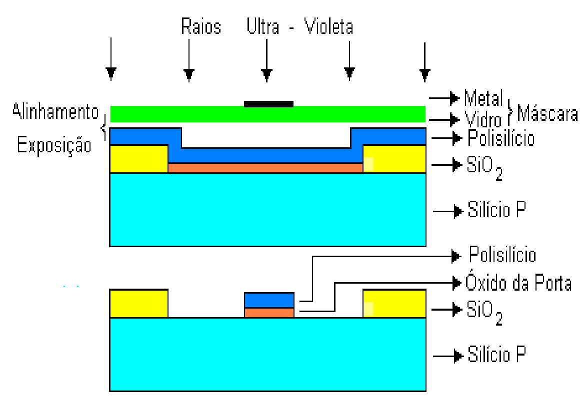
Abertura no Polisilício por plasma

Abertura química do SiO_2 da Porta

Destina-se esta etapa do processo às aberturas do polisilício e no óxido, com objetivo de difundir as regiões de dreno e fonte no "chip", buscando fixar o comprimento "L" do canal. São doze os passos a serem efetuados:

Operações	Condições
01 – Secagem	Estufa de 120 ° C por 5 min
02 – Depósito de resina	1400 – 27 Positiva (4000 r / min por 30 s)
03 – Recozimento	Chapa de 100 ° C por 60s
04 - Alinhamento / Insolução	Por 5 s
05 – Revelação	20 ° C por 45 s
06 – Observação	Microscópio
07 – Recozimento	Chapa 120 ° C por 45 s
08 – Gravação do Polisilício	Gravação iônica reativa (Fluxo SF_6 : 30cc/mn; Pressão : 0,02 m bar; Potência RF : 50 W)
09- Gravação do Si O_2	Buffer HF : Tempo conforme placa testemunha 1
10 – Observação	Microscópio
11 – Dissolução da resina	Acetona e água DI
12 – Limpeza	$H_2 SO_4 + H_2 O_2$

O produto final está representado abaixo:



08 Difusão de fósforo na fonte e no Dreno : Pré-deposição e redistribuição

Para a difusão do fósforo nas regiões do dreno e da fonte realizam-se duas tarefas definidas por pré-deposição e redistribuição. Também nesta etapa, as placas testemunhas são expostas aos fornos.

Na pré-deposição, três ciclos são observados

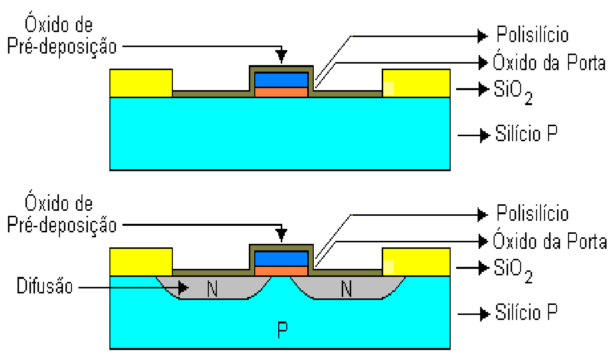
Nº	Temperatura	Tempo	Fluxo
01	T = 1050 ° C	t = 5 min	N_2 = 2 l / min

02	T = 1050 ° C	t = 5 min	N_2 = 2 l / min PO Cl_3 = 5 mg / min
03	T = 1050 ° C	t = 5 min	N_2 = 2 l / min

Na redistribuição, a tarefa é concluída num único ciclo, sendo, nesta ocasião medida a espessura do óxido de difusão pelo método da elipsometria .

Nº	Temperatura	Tempo	Fluxo
01	T = 1100 ° C	t = 10 min	N_2 = 1 l/min

Esta etapa pode ser esquematizada da seguinte forma:

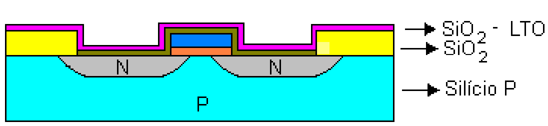


9 - Depósito de SiO_2 à baixa temperatura por LPCVD

Em seguida à difusão de fonte e de dreno, deposita-se sobre toda a placa uma camada isolante protetora de Óxido de Silício (Si O_2) a LTD (Low Temperature Oxidation) para limitar as correntes de superfície. Esta operação é realizada no forno LPCVD (Low Pressure Chemical Vapor Deposition), que também deverá conter a placa testemunha 2. As medidas da espessura e do índice de refração deste óxido pelo método da elipsometria são realizadas em duas fases sob as condições:

Nº	Temperatura	Tempo	Fluxo	Pressão
01	T = 420 ° C	t = 100 min	SiH_4 = 30cc/min ; O_2 = 60 cc/min	p = 3000 mTorr
02	T = 420º C	t = 2x2 min	N2 = 1 l/min : ciclos de vácuo e expulsão do gases	p = 1 Torr

Esta etapa pode ser representada como :

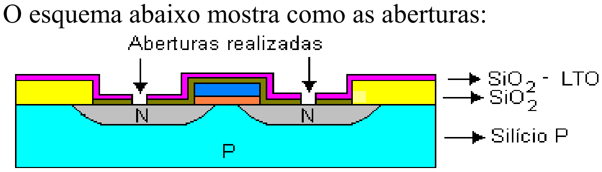


10 - Fotogravura 3 : Abertura dos contatos

A máscara de número 3, é utilizada para abrir as regiões onde serão conectados os contatos metálicos. Tal operação é realizada nas onze fases seguintes:

Operações	Condições
01 – Secagem	Estufa de 120 ° C por 5 min
02 – Depósito de aderência(HMDS)	Centriífuga com 4000 r / min por 30 s
03 – Depósito da resina	Ref 1400-27 pos Centriífuga com 4000 r/min p/30 s
04 – Recozimento	Chapa com 100 ° C por 60s
05 – Alinhamento / Insolação	Por 5 s
06 – Revelação	A 20 ° C por 30 s
07 – Observação	Microscópio
08 – Recozimento	Chapa com 120 ° C por 45 s
09 – Gravação do Si O_2	Buffer HF : Tempo conforme placa testemunha 2
10 – Observação	Microscópio
11 – Dissolução da resina	Acetona e água DI

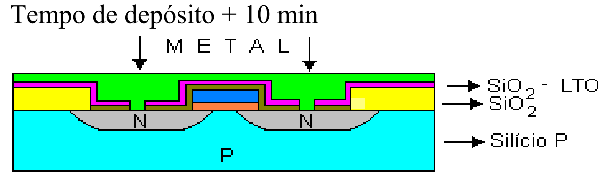
O esquema abaixo mostra como as aberturas:



11 – Metalização

A operação de *metalização* tem por finalidade depositar uma camada de cerca de 500 ηm de alumínio sobre a placa. Há dois métodos para se realizar a operação:

1°) Evaporação térmica sob vácuo
Degazagem – Temperatura por Tempo
Depósito : - Pressão antes do depósito em mbar
Pressão durante o depósito
Pressão após o depósito
2°) Pulverização catódica
Depósito: - Pressão antes do depósito = 10 - 7 mbar
Pressão durante o depósito = 2.10 – 3 mbar
Potência RF = 250
Distância alvo – substrato = 75mm
Tempo de depósito + 10 min

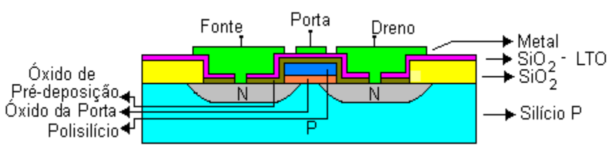


12 - Fotogravura 4 : Gravação do Metal

Nesta etapa o metal é gravado por processo químico na máscara número 4. Para isso realizam-se de 17 passos :

Nº	Operações	Condições
01	Homogeneizar a solução de ataque ao "alumínio".	Colocar a solução nos ultrasons
02	Secagem	Estufa com 120 °C p/5 min
03	Depósito da resina	Ref 1400-27 pos.Centriífuga com 4000 r/min por 30 s
04	Recozimento	Chapa com 100 ° C por 60s
05	Alinhamento / Insolação	Por 5 s
06	Revelação	A 20 ° C por 30 s
07	Observação	Microscópio
08	Recozimento	Chapa com 120 °C por 45s
09	Gravação do alumínio	Solução: (40 vol. H_3PO_4 + 7vol. HNO_3 + 7vol. H_2O) com controle visual mais 30s de ataque suplementar
10	Observação	Microscópio
11	Dissolução da resina	Acetona e água DI
12	Proteção face AV	Cera ou resina
13	Desoxidação face AR	Buffer HF (ataque SiO_2 LTO residual)
14	Gravação de polisilício face AR	Solução: (1vol. H_3PO_4 + 71vol. HNO_3 + 28vol.H_2O) controle final visual:c
15	Desoxidação face AR	Buffer HF (ataque SiO_2 na Porta ou "Gate")
16	Dissolução da cera+resina	Trichlo + acetona + água DI
17	Secagem	Máquina secadora

O modelo final do chip poderá ser representado pelo esquema abaixo.



13 - Recozimento do Metal

Nesta etapa, um novo forno será requisitado sob novas condições. Nesta operação, é medida a espessura do alumínio na placa componente com o profilômetro. As novas condições são apresentadas a seguir:

Nº	Temperatura	Tempo	Fluxo
01	T = 400 ° C	t=20min	$N_2 + H_2$ (5%) = 1 l / min

14 - Montagem/encapsulamento e teste com micropontas

Esta etapa é realizada em quatro operações:

1) Teste sob pontas – deve ser feito um mapeamento (cartografia) da placa para determinar a/as região/ões onde se situa/m os melhores componentes, para então selecioná-los .

2) Corte – a placa será cortada com microserra de corte diamantado, devidamente comandada e programada por microcomputador. .

3) Montagem – será realizada em base para soldas por eutética ouro/silício numa temperatura de 370° C.

4) Microsolda – são realizadas por ultra-som . Utiliza-se *Wedge bonding* de fio de alumínio /silício 5% com seção circular de diâmetro igual a 25μm, com o auxílio de microscópio eletrônico.

15 - Teste elétrico e eletrônico

É a tarefa final do processo. Através de medidas efetuadas sobre o desempenho do CI, poder-se-á registrar valores de corrente e capacitâncias em função da tensão, construindo os gráficos e tabelas, que por simples inspeção e análise mostrarão o grau de rendimento alcançado na implementação do "chip" .

Estas medidas podem ser classificadas em dois grupos :

1°) Medidas de corrente (I) em função da tensão (V)

Características da "I_d" em função da "V_{ds}"/"V_{gs}" de um transistor de canal longo.

Características da "I_d" em função da "V_{ds}"/"V_{ds}" de um transistor de canal longo.

Características da "I_d" em função da "V_{ds}"/"V_{gs}" de um transistor de canal curto.

Características da "I_d" em função da "V_{ds}"/ "V_{ds}" de um transistor de canal curto.

Características da "I" em função da "V".

2°) Medidas de capacitância (C) em função da tensão (V).

Características da "C" MOS em função da "V".

Conclusões

Além de transistor de canal NMOS, pode-se também implementar outros dispositivos com a metodologia inerente à microeletrônica, com por exemplo resistores NMOS , capacitores NMOS , portas lógicas, Flip-flops, etc. através de outras etapas e processos, com a mesma tecnologia. Porém, o melhor resultado é alcançar o objetivo do aprendizado, que vai incentivar os alunos na continuidade das pesquisas e servir de valioso elemento em suas carreiras.

Por esta razão, em oito anos de intercâmbio, oitenta e dois alunos já participaram do programa na França, dos quais dezessete optaram pela iniciação científica em microeletrônica e seis engenheiros recém formados, cursam mestrado no LSI (Laboratório de Sistemas Integrados) da USP - SP .

ENGENHARIA: PRÁTICA DOCENTE E FORMAÇÃO DE PROFESSORES

Danilo Pereira Pinto, Jorge Luiz do Nascimento, Júlio Cesar da Silva Portela, Maria Helena Silveira, Protásio Dutra Martins Filho e Vanderli Fava de Oliveira

Resumo - O objetivo deste trabalho é apresentar uma reflexão sobre a prática docente com vistas às mudanças que vêm ocorrendo em termos de diretrizes curriculares e projetos pedagógicos para os cursos de engenharia. Foi estruturado a partir da vivência acadêmica dos autores, da participação em eventos científicos, e da discussão da bibliografia corrente sobre a área.

Até os anos 60, o corpo docente das escolas de engenharia no Brasil era formado por renomados engenheiros, matemáticos e outros especialistas, com dedicação parcial à academia. A docência era incorporada pela repetição dos modelos dos mestres. As reformas da educação, iniciadas em 1968, estabeleceram uma nova ordem, contribuindo para sistematizar a pesquisa e estruturar os cursos de pós-graduação, modificando o perfil do engenheiro-docente, que atualmente é mestre ou doutor, com conhecimentos especializados, dividindo sua atuação entre ensino, pesquisa e extensão.

Os autores crêem ser necessário estimular a pesquisa em Educação em Engenharia como estratégia político-acadêmica visando aprimorar a formação profissional neste campo, sugerindo sua inclusão como área de pós-graduação "stricto sensu".

Sem a pretensão de esgotar o tema ou apresentar verdades absolutas e imutáveis, o que se quer é levantar questões sobre a prática docente, apontar algumas soluções já adotadas, identificar alternativas e ampliar a discussão.

Palavras-chave: Formação de professores, Professor de engenharia, Formação docente

INTRODUÇÃO

Este trabalho é resultado de uma construção coletiva. Os autores elaboraram interagindo um texto básico e cada um contribuiu com o seu pensar sobre o tema central. Todos estão vinculados a Cursos de Engenharia, sendo natural que as reflexões tenham esse foco, o que não quer dizer que em outros cursos, principalmente os da área tecnológica, os problemas sejam diferentes.

Até recentemente, a figura do professor de engenharia era a de um engenheiro com experiência técnica especializada em uma sub-área de conhecimento desta habilitação (Ex.: Engenheiro Civil especializado em Pontes), formado na prática do dia a dia, desde o início de sua atuação profissional, acompanhando um outro grande engenheiro. Com reconhecimento no mercado e com algum conhecimento no meio acadêmico, era convidado para lecionar, exercendo a docência muitas vezes por "hobby" ou por espírito altruísta. Não havia um compromisso sólido com a docência. Buscava-se a formação de novos engenheiros que iriam, apenas, ser subordinados nas empresas onde trabalhavam. A titulação acadêmica não era ponto importante para ingressar na carreira docente. Em geral, bastava ter sido bom aluno de graduação na concepção dos professores do curso e ter interesse pelo magistério. Isto levava, com freqüência, ao comprometimento da qualidade dos cursos.

O ensino nessa época funcionava através de aulas expositivas, estudos individuais e exames escritos e orais. O desempenho do aluno dependia muito mais de seu próprio esforço do que de orientação, apesar do empenho do professor estar concentrado em ampliar a clareza de suas exposições e em encadear os conteúdos explicitados em planos de curso e livros.

PUBLICAR É PRECISO

Com as reformas da educação, implantadas a partir de 1968, a organização da academia sistematizou a pesquisa e estruturou os cursos de pós-graduação no país. Muitos engenheiros, recém formados ou não, foram mandados ao exterior para realizar cursos de pós-graduação, retornando ao Brasil para implantar os nossos próprios cursos de mestrado e doutorado. Com pouca experiência na docência e na atuação técnica, chegaram pesquisadores formados, com especializações nas ciências-da-engenharia, preparados para um trabalho totalmente diferenciado em relação aos modelos anteriores. Com isso, não só, o panorama acadêmico começa a mudar, como também muda o perfil de atuação profissional dos engenheiros. Novas técnicas foram trazidas do exterior e também desenvolvidas no país. O uso do computador pessoal se dissemina grandemente na universidade junto com "pacotes-software" com soluções prontas para problemas da engenharia. Todas essas ferramentas são, em geral, mais bem manejadas pelos novos acadêmicos. A universidade inicia assim uma outra fase: agora é procurada para resolver problemas da engenharia, através de docentes-pesquisadores. A prevalência desta diretriz retarda a reflexão sobre a graduação dos engenheiros ao privilegiar a pesquisa e a busca do desenvolvimento tecnológico como atividades acadêmicas.

Com a super valorização da produção científica pelos órgãos de fomento, que exigem cada vez mais um aumento na quantidade de publicações em revistas e congressos, atrelando a isto a liberação de recursos para os projetos e programas de pós-graduação, grande parte dos docentes volta suas preocupações, quase exclusivamente, para a publicação. As universidades públicas e os sistemas oficiais de controle criam regras e sistemas de avaliação, forçando o "docente de engenharia" a ter qualificação máxima. Entretanto, pouco se considera a necessidade da formação pedagógica. Por conta disso, na maioria dos casos, ele é um profissional que dá pouca ou quase nenhuma atenção para os problemas do ensino-aprendizagem e para a evolução de sua função docente.

PREOCUPAÇÃO DE DOCENTES: CARÁTER SIGNIFICATIVO DO SABER

A seleção de conteúdos programáticos para a formulação de um projeto pedagógico de curso tem que se embasar na importância significativa para a constituição do sistema de conhecimentos imprescindíveis aos futuros profissionais. Além disso, envolver todos os participantes, que serão obrigados a aprofundar reflexões sobre os objetivos sociais da aprendizagem na formação universitária. Cada proposta vai implicar a promoção cultural, científica, social, moral, tecnológica da parcela de estudantes que nela se inscreve. Para formar cidadãos capazes de situar-se além do primarismo individualista será preciso integrar harmônica e dialeticamente o experimental, o histórico e o teórico, ao mesmo tempo que desenvolver uma forma autônoma de pesquisar, capaz de vir a produzir coletivamente as teorizações.

Os que dominam politicamente os diferentes campos de educação simulam distanciamento e neutralidade quando falam do mundo social, como se dele não se ocupassem. E os educadores são levados a interiorizar a idéia de que não são científicos, porque se envolvem em conflitos, confrontam aspirações e disputam espaços de gestão acadêmica. A universidade é um campo, talvez mais do que qualquer outro, que está voltado para sua própria reprodução pelo fato de seus componentes deterem o controle de formação e seleção.

Esta não é uma crise mais grave do que outras, é uma crise de uma ortodoxia. Voltaire fazia, às universidades européias de seu tempo, acusações tão graves quanto as atuais. Muitas crises foram favoráveis ao desenvolvimento das instituições, das ciências e das metodologias. Quem se insurge, gritando contra, são os que se beneficiam da atual estrutura. Há uma luta pelo monopólio da cientificidade e da legitimidade que não é só acadêmica.

Os filósofos, os sociólogos e todos aqueles cujo ofício é pensar o mundo desenvolvem também parte do trabalho científico ao colocar questões sobre a natureza do próprio olhar científico. Para operar uma conversão radical do olhar é preciso ter um ponto de vista teórico sobre o ponto de vista teórico e tirar conseqüências sobre o que vem sendo investigado, propondo metodologias e dispondo-se a mudar de opinião diante de argumentos melhores que os próprios.

A falsa clareza é freqüentemente o cerne do discurso dos que acham tudo normal, natural porque não querem qualquer mudança. Mantém a posição conservadora em nome do bom senso. Sabemos, entretanto, que às vezes a exposição tem que ser, por razões científicas ou políticas, tão complexa quanto o problema exige. A ciência é uma iniciação lenta, exige em geral, uma verdadeira reconversão de toda a visão de mundo.

As ciências específicas da educação, constituídas na transdisciplinaridade entre filosofia, sociologia, história, psicologia, pedagogia, análise de processos, planejamento, economia, comunicação exigem um percurso simultâneo entre teorias e práticas, sempre em re-exame, para acompanhar as mutações das sociedades e as teorizações atualizadas dos diferentes campos de conhecimento. Para isso será necessário manter a "falha", onde se gera o desejo de saber, o compromisso político-filosófico com as novas gerações e, também, concretamente, tempos de estudo em grupos de pares para a produção compartilhada. E, ainda, boa bibliografia e conexões com bibliotecas e redes de pesquisa.

É muito, mas, não é tudo. Temos de fazer de cada aluno uma razão. Fazer refletir sobre as palavras e seus sentidos, de certa forma, quase cartesianamente. Serão pessoas que se preocupam em ver claro em suas idéias, mas que, ao mesmo tempo, serão intelectuais novos porque saberão "que as coisas quer humanas, quer físicas, são de uma complexidade irredutível" e que "só podemos chegar a pensar, lentamente, progressivamente, ainda assim, imperfeitamente", como afirma Durkheim, em "*Evolution Pedagogique en France*".

O DESAFIO DOS NOVOS TEMPOS

A atual reestruturação das relações econômicas e produtivas, bem como o processo de intensificação de incorporação de tecnologias à produção, passam a exigir profissionais que dominem um conjunto cada vez mais amplo de conceitos e informações, voltados ao trabalho inter e multidisciplinar. Em segundo lugar, verifica-se uma crescente ampliação do campo de atuação dos engenheiros para as áreas gerenciais e administrativas, bem como para áreas de interface com outras ciências. Essas mudanças exigem remodelações curriculares e adaptações metodológicas para o ensino da engenharia.

Os conhecimentos, as habilidades e atitudes que vão conseguir o perfil do engenheiro moderno deverão ser incorporados num trabalho metodológico, que implique o envolvimento do aluno em práticas específicas e apropriadas à finalidade. Estas práticas devem conduzir o aluno para a pesquisa, para a análise e para a crítica dos saberes. Devem também estimulá-lo a buscar respostas ainda não encontradas e identificar novos problemas da sociedade, além de facilitar a sua participação em atividades de planejamento, de execução de projetos, de administração de pessoal e materiais, trabalhando individualmente e em equipe.

Há uma variedade de práticas de ensino a serem utilizadas, quando novos conceitos e matérias devem ser trabalhados de forma contextualizada, dentro de problemas da engenharia, antecipando o que se vai praticar na vida profissional.

Observa-se que aspectos didáticos e pedagógicos vêm adquirindo uma importância destacada na engenharia e na área tecnológica. Percebe-se que o docente do curso de engenharia vem, aos poucos, entendendo a questão pedagógica como algo intrínseco à sua atuação profissional, como se pode observar pelo aumento, quantitativo e qualitativo, em fóruns que discutem o "Ensino de Engenharia" e a "Educação em Engenharia"[14].

Para a grande maioria dos professores-engenheiros, sem formação didático pedagógica, ensinar estaria ligado a um inatismo, a ter um dom. Bastava saber, dentro da concepção vigente então, "transmitir conhecimentos". Avaliar seria preparar e aplicar uma prova, contabilizando o resultado. A qualidade do professor muitas vezes era medida pelo índice de insucesso dos alunos. O melhor professor seria aquele que conseguisse fazer seus alunos estudarem mais sua disciplina e quase sempre aquele com maior índice de reprovação. "Só resta ao professor, sem formação pedagógica, começar pela reprodução dos caminhos que fez" [16]. Em geral, procura-se reproduzir aquilo que se achou que era melhor na própria formação ou repete-se o professor pelo qual se teve mais empatia ou maior respeito, buscando alcançar o mesmo patamar.

Na educação formal, o exercício docente exige o emprego de técnicas específicas, que encaminham as atividades discentes para constituir, em relações com diferentes pessoas e fontes, seus próprios conceitos, integrando simultaneamente o novo (para ele) nas amplas teias do conhecimento historicamente acumulado. Por isso, é preciso afirmar que não há transmissão de saberes, nem aceleração de aprendizagem possível, o processo exige observação, reflexão, práticas, leituras e experimentação, entre outros, para construir o percurso educativo. Cada um tem necessidade de um certo tempo para percorrer as atividades que o levarão a apropriar-se de um tema, essa é a zona de desenvolvimento proximal ou aproximativa (Z.D.P.) de que fala Vigotsky. Nesse período se garante um direito inalienável de aprender a incluir, excluir, conectar, ordenar, distinguir, deslocar, projetar, corrigir, manipular, classificar, intercalar, identificar – operar sobre o que se quer conhecer. Não basta ouvir/anotar. Não se pode separar conteúdos das ações pedagógicas.

EXPERIÊNCIAS E SUGESTÕES

Diversas alternativas têm sido aventadas. Se for observado o número de trabalhos apresentados nos Congressos Brasileiros de Ensino de Engenharia, cujo número de participantes vem crescendo a cada ano, os congressos internacionais de Ensino de Engenharia que têm sido realizados no Brasil, verifica-se que o tema está na ordem do dia. Entretanto, ainda são ações isoladas de um ou outro professor, que por se identificar com o tema, ou por estar em função de coordenação de Curso de Graduação, descobre, se apaixona, identifica-se e procura se aprimorar na docência. Mas não há uma ação efetiva, institucionalizada, unificada que vise à mudança da prática docente nos cursos de engenharia do Brasil.

A seguir são listadas algumas experiências e sugestões que podem contribuir para mudar o cenário atual:

Estágio em docência: trata-se de uma exigência atual da CAPES para alunos de mestrado e doutorado, o que traduz um momento ímpar para começar a mudar a prática docente, através da inserção de conteúdos relacionados à didática e pedagogia, uma vez que o ingresso na carreira docente requer esta qualificação; na experimentação inicial procura-se não separar conteúdos das ações pedagógicas; professores de diferentes áreas (psicopedagogia, engenharia e pesquisa em sociologia) compartilharam a formulação da proposta inicial, para criar um traçado ético-profissional nos pós-graduandos, quanto à política de ensino superior e as práticas de aula onde virão a se exercer enquanto docentes;

Participação e promoção de eventos: os Encontros de Educação em Engenharia, as oficinas de meios educativos, os congressos nacionais e internacionais na área de ensino de engenharia, servem para mapear os campos de conhecimento sobre os quais vão incidir as preocupações docentes, contribuindo para recortar seus limites;

Estágio Probatório: na renovação dos quadros, principalmente nas IFES, prevista para 20%, com a obrigatoriedade do Estágio Probatório, há uma maneira de promover alterações significativas no perfil dos docentes, incorporando nesse período a discussão e a prática docente supervisionada, caso seja institucionalizada a obrigatoriedade de os ingressantes na carreira participarem de "cursos", oficinas ou grupos de qualificação didático-pedagógica;

Cursos de mestrado e doutorado em educação em engenharia: visando desenvolver linhas de pesquisa na área de docência, estudando, por exemplo, metodologias de ensino/aprendizagem e avaliação e outras linhas de gestão acadêmica ou para fundamentação psicopedagógica no ensino superior:

As práticas em atividades como a participação nas experiências de laboratórios abertos, sem experimentos focados, visam despertar a criatividade dos alunos, têm contribuído para a melhoria no processo de ensino/aprendizagem. Nas situações de laboratório o projeto se formula em conjunto, portanto, todos podem se sentir autores e responsáveis pela consecução dos resultados. É necessário, também, investir nas atividades em que docentes e discentes trabalhem em conjunto, buscando criar uma outra ordem de relação interpessoal. Estreitar relacionamentos, colaborar em grupos são formas de interferir diretamente no processo de ensino/aprendizagem, transformando-o. Desenvolve-se nessas situações, uma forma para conseguir estudo produtivo e não apenas reprodutivo.

A resolução CNE/CES 11/2002, publicada em 9 de abril de 2002, trouxe avanços nesta direção quando comparada com a resolução anterior (48/76 – CFE) que regia os cursos de Graduação em Engenharia, na medida em que traça um perfil de egresso que prevê, dentre outros a formação "crítica e reflexiva"... "considerando seus aspectos políticos, econômicos, sociais, ambientais e culturais, com visão ética e humanística, em atendimento às demandas da sociedade". Além disso, estabelece que "cada curso de Engenharia deve possuir um projeto pedagógico que demonstre claramente como o conjunto das atividades previstas garantirá o perfil desejado de seu egresso e o desenvolvimento das competências e habilidades esperadas. Ênfase deve ser dada à necessidade de se reduzir o tempo em sala de aula, favorecendo o trabalho individual e em grupo dos estudantes". Quando se consegue propor um projeto pedagógico que considere central o caráter significativo do saber para a época, para a sociedade, para a geração com que se interage, para o convíviio de base também afetiva, é muito mais fácil instalar condições de produção intelectual coletiva porque os objetivos sociais da aprendizagem se fazem evidentes.

Com essa nova Resolução, verifica-se que em termos de legislação, está aberta a possibilidade para criar mecanismos que flexibilizem a formação e os meios para tal, tanto em termos de conteúdos quanto de metodologias de ensino/aprendizagem. O trabalho individual e em grupo exige, para que logrem êxito, uma orientação adequada por parte do docente e um dos caminhos são os "trabalhos de síntese e integração dos conhecimentos adquiridos ao longo do curso" que também estão previstos na Resolução 11/2002. No entanto, esta resolução continua ignorando o fato de que um dos aspectos da formação do engenheiro é a docência, tanto a ligada a Instituições de Ensino quanto à de treinamento e formação que ocorre dentro do exercício profissional nas organizações de maneira geral

PÓS-GRADUAÇÃO NA FORMAÇÃO DOCENTE EM ENGENHARIA

Os desafios hoje enfrentados na gestão e planejamento do sistema educacional em Engenharia envolvem, além da organização curricular dos cursos em matérias, aos conteúdos e às articulações entre as diversas disciplinas, novos desafios como o tratamento interdisciplinar de problemas de Engenharia e a formação para atuação coletiva nestes problemas.

A perspectiva de crescente complexidade para os objetos e problemas da Engenharia no futuro mostra necessidade de investimento no planejamento da formação do Engenheiro. Esta formação profissional não mais se completa no tempo do curso de graduação, o que obriga o repensar da estrutura acadêmica atual, para incorporar uma base de sustentação que alicerce a capacitação científico-tecnológica do engenheiro continuamente, ao longo de sua vida profissional ativa. O mesmo tratamento acadêmico dispensado às "ciências da engenharia", formalizado pelos programas de formação de pesquisadores precisa ser dado à pesquisa em Metodologias Educacionais da Engenharia. Na verdade, ao se considerar a importância estratégica deste profissional para o desenvolvimento e a soberania do País, percebe-se a importância da Educação em Engenharia passar a constituir objeto de pesquisa científica formal.

A Educação em Engenharia lida com questões que têm sido, via de regra, resolvidas a partir de ações individuais e precárias. Esporádicos editais de fomento que, incentivam a busca de resultados nesse campo, sem a estabilidade necessária para manter o fôlego questionador e reformulador hoje necessários.

Reconhecendo a especificidade do tema e a dificuldade histórica em se fertilizar mutuamente os domínios acadêmicos de sustentação das engenharias e as ciências humanas, a proposta de criação de um Programa de Pós-Graduação "senso estrito" busca representar a via de superação deste desafio. É necessário que a instituição envolvida com a formação de Engenheiros desenvolva pesquisa acadêmica formal e experiências de ensino/aprendizagem no âmbito da Educação para Engenharia. Isto exige a atuação sistemática do corpo docente dos Cursos de Engenharia em projetos de pesquisa em ensino e de qualificação docente, de modo a atender o que hoje é imposto como desafio a estas instituições.

Em síntese, a estrutura elaborada pelos fóruns de discussão entre a UFRJ e UFJF para o Programa de Pós-graduação compreende uma área geral e uma área aplicada. Na geral são abordados os temas: Filosofia, Sociologia, Epstemologia, Psicologia, Pedagogia, Psicopedagogia, Metodologia de Ensino, Inclusão da Imagem Reprodutível, Metodologia de Pesquisa. Na aplicada os temas abordados são: Plíticas Educacionais e Acadêmicas, Aspectos Normativos e Interpretativos dos Sistemas Educacionais e do Exercício Profissional, Planejamento e Gestão de Sistemas educacionais, Acaliação Instituciuonal e da Aprendizagem. Formação Profissional e Organização Curricular, Analise e Produção de Meios Educatios e Metodologia de Ensino de Disciplinas de Base Ex-perimental. O programa pretende criar um fórum vivo e fértil para promover a troca de saberes e o contato interdisciplinar entre as áreas da própria engenharia, visando uma interpenetração interdisciplinar ainda não tratada na academia.

Os futuros Mestres e Doutores em Educação em Engenharia, como parte do corpo docente, contribuirão com a inovação das práticas pedagógicas, pesquisando entre outrao temas: a relação teoria-prática nas metodologias educacionais, a avaliação dos processos de apropriação do conhecimento, planejamento e elaboração de novos meios educativos, modelação experimental de fenômenos próprios das ciências e tecnologias da engenharia, determinação das invariantes específicas das matérias de formação do engenheiro, metodologias específicas do ensino à distância, além da temática afeita à gestão de sistemas de ensino de engenharia, frente às demandas de produção e desenvolvimento do país.

Talvez esses novos doutores em engenharia fertilizem a participação das discussões departamentais e dos outros órgãos ao socializarem experiências e resultados.

Entre os estudantes as inovações vêm sendo aceitas com entusiasmo como uma forma de realmente aprender a aprender. A tradição oral sempre repassa aos "novos alunos" os resultados das experiências vividas em diferentes cursos. É evidente que alunos capazes civilmente são competentes para distinguir as diversas relações pedagógicas que perpassam as propostas de trabalho dos diferentes professores. A interrelação dos conhecimentos das ciências educacionais com os saberes específicos dos engenheiros facultará rearranjos dos conteúdos, auxiliando a organizar uma visão mais abrangente da engenharia.

Na formulação do programa de pós-graduação *strictu-sensu* foi usada como base a experiência secular em método tutorial das universidades de Oxford e Cambridge, adaptando-a às condições reais do número de alunos por turma e aproveitando as novas tecnologias, como recursos educativos, atendendo à realidade do país. Além dos trabalhos em laboratório, as salas de aula se transformam em espaço de observação e orientação direta dos alunos que normalmente trabalham em grupo. A intenção inicial foi de procurar levar estudantes de pós-graduação a aplicarem, com supervisão dos professores dos cursos, em aula as metodologias embasadas especialmente na atividade dos alunos, mais do que nas "conferências" dos professores. Abrindo espaços para a constituição de hábitos de trabalho em equipe e de produção coletiva do conhecimento a ser utilizado socialmente, no desempenho das funções de profissionais de engenharia.

CONSIDERAÇÕES FINAIS

A discussão apresentada neste trabalho reflete a preocupação de um grupo de professores de duas universidades que há mais de 8 anos trabalham e refletem juntos sobre os problemas de ensino/aprendizagem nos cursos de engenharia de universidades brasileiras. Decorrem do exercício da profissão docente e do desempenho dos alunos frente aos "projetos pedagógicos" vigentes. Consideramos que estas questões devem ser tratadas de forma adequada, através de projetos específicos na área da "Educação em Engenharia". Baseados na experiência dos diversos projetos de ensino de engenharia, nas oficinas realizadas e nas atividades dos Encontros de Educação em Engenharia, promovidos em conjunto pela UFRJ, UFJF e agora pela UFF, chegamos a esta convicção. Acreditamos portanto que os problemas do ensino em engenharia poderão ser minimizados através da pesquisa científica em metodologias, projetos pedagógicos e com a contextualização socio-histórica no processo de ensino-aprendizagem.

Há sinais de que está se processando uma mudança didática e pedagógica, com pertinentes adequações ao universo da engenharia, que tem que ocupar seu espaço na bagagem de conhecimento e de formação dos professores. Ao professor de engenharia não basta mais dominar o conhecimento científico e técnico dos conteúdos, ou o funcionamento dos meios disponíveis para "ministrar" esses conteúdos. Faz-se necessário que o docente conheça e aplique métodos e técnicas de ensino/aprendizagem estruturados e consistentes que pressuponham a apropriação do conhecimento, sem o que não conseguirá contribuir para a formação de profissionais em condições de educar-se ao longo da vida e de atender às demandas da sociedade.

A formação profissional na atualidade só pode ocorrer, de maneira a atender tais demandas, a partir de metodologias que possibilitem ao aluno aprender inclusive com erros e críticas, vislumbrando um contexto de aplicações, ao invés da reprodução pura do conhecimento, que forma aplicadores de fórmulas e tabelas ou manipuladores de *softwares*, talvez exímios, mas fortes candidatos a "analfabetos tecnológicos", na medida em que suas fórmulas, tabelas e *softwares* forem se tornando ultrapassados. Isto significa, principalmente, fugir para sempre da aula meramente expositiva, que só considera importante: as transparências, o quadro-negro e os conteúdos discursivamente apresentados.

Quem justifica a atividade docente é o aluno que trabalha e aprende com entusiasmo na busca do saber e na responsabilidade compartilhada.

AVA- UM AMBIENTE VISUAL PARA A CONSTRUÇÃO DE ALGORITMOS

Ianos Julio da Silveira Junior [1], *Ahmed Ali Abdalla Esmin* [2]

Abstract — *This paper present the development of a tool to construct algorithms by using of Flowchart. The user has many resources, like: resource to create and manipulate of flowchart by using of objects. Define variables, operations and connectivity objects. The user will be able to verify the consistency of the flowchart, by analyzing the expressions objects,, and to execute the flowcharts (algorithm) interacting with them by I/O operations. The tool was developed using the RAD Delphi and Object Orientated methodology.*

Index Terms — *Programming, Algorithms, Object Oriented, Teaching of Programming.*

INTRODUÇÃO

O ensino da lógica de programação geralmente é tratado nas primeiras fases dos cursos de informática, onde os alunos iniciantes aprendem a desenvolver o raciocino lógico para então escrever algoritmos para solução de problemas.

Estes alunos iniciantes do curso de informática geralmente encontram-se uma grande dificuldade de assimilar o conteúdo referente a disciplina de algoritmos.

O Fluxograma é uma forma gráfica muito utilizada na descrição de algoritmos, destaca-se pela abstração e o uso de objetos gráficos (figuras), o que facilita aprendizado da lógica de programação, habituando o iniciante com o formalismo de programação.

Apesar de todas essas vantagens, o Fluxograma apresenta o inconveniente dos algoritmos não poderem ser executados no computador. Dessa forma, o aluno precisa imaginar a sua execução, o que não é uma tarefa tão fácil para quem está começando.

A lógica para programação consiste em aprender a pensar na mesma seqüência em que o computador executa as tarefas, aprende-se a imaginar como as ações serão executadas partindo-se do estudo de um problema até chegar a construção de um algoritmo (solução).

Outras forma muita utilizada no ensino de algoritmos é o uso do PORTUGOL[1,2] . A grande diferencia é em relação ao Fluxograma, é o fato que contém mais detalhes o que pode dificultar o ensino dos algoritmos para os alunos incitantes.

O ALGORITMO E SUAS FORMAS DE REPRESENTAÇÃO

É uma seqüência de passos ordenados que devem ser seguidos para a realização de uma tarefa[5]. Este conceito não foi criado para satisfazer somente às necessidades da computação mas sim para a padronização do exercício de tarefas rotineiras.

As formas de representação de algoritmos tratam os problemas apenas em ível lógico, abstraindo-se de detalhes de implementação muitas vezes relacionados com alguma linguagem de programação específica. Existem formas de representação de algoritmos que possuem uma maior riqueza de detalhes e muitas vezes acabam por obscurecer a idéia principal, o algoritmo, dificultando seu entendimento.

As principais formas de representação de algoritmos, são:

- **Descrição Narrativa**: representada o algoritmo em forma de linguagem natural.
  Ex.: Troca de um pneu furado

  Afrouxar ligeiramente as porcas
  Suspender o carro
  Retirar as porcas e o pneu
  Colocar o pneu reserva
  Apertar as porcas
  Abaixar o carro
  Dar o aperto final nas porcas

- **Pseudocódigo (Portugol) :** Esta forma de representação de algoritmo é rica em detalhes, como a definição dos tipos das variáveis usadas no algoritmo e, por assemelhar-se bastante à formo em que os programas são escritos.
  Ex.: Calcular a média de duas notas.

  Algoritmo Média

- **Fluxograma Convencional:** É uma representação gráfica de algoritmos onde formas geométricas diferentes implicam ações (instruções, comandos) distintos. Tal propriedade facilita o entendimento das idéias contidas nos algoritmos e justifica sua popularidade..
  Ex.:

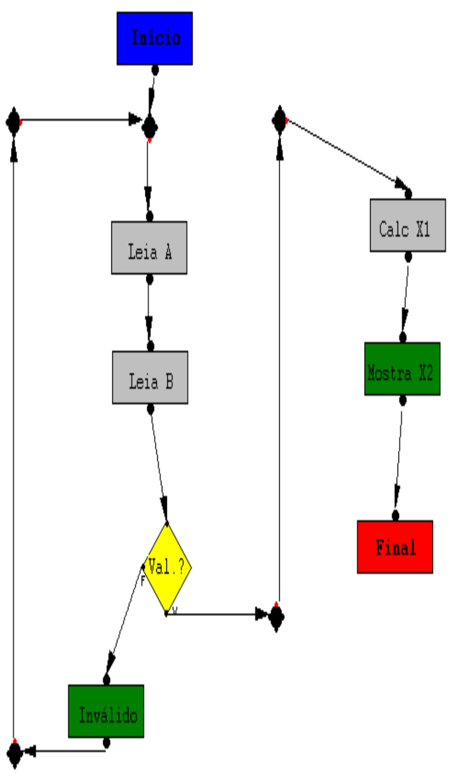

FIGURE. 1: UM EXEMPLO DE FLUXOGRAMA

O objetivo deste trabalho é apresentar um ambiente para o desenvolvimento composto por um interpretador animado, que visa auxiliar o aluno iniciante em Computação, facilitando seu aprendizado através da execução e visualização das etapas de um algoritmo estruturado em Fluxograma. Através da utilização deste ambiente, o aluno poderá implementar seus próprios algoritmos utilizando recursos gráficos.

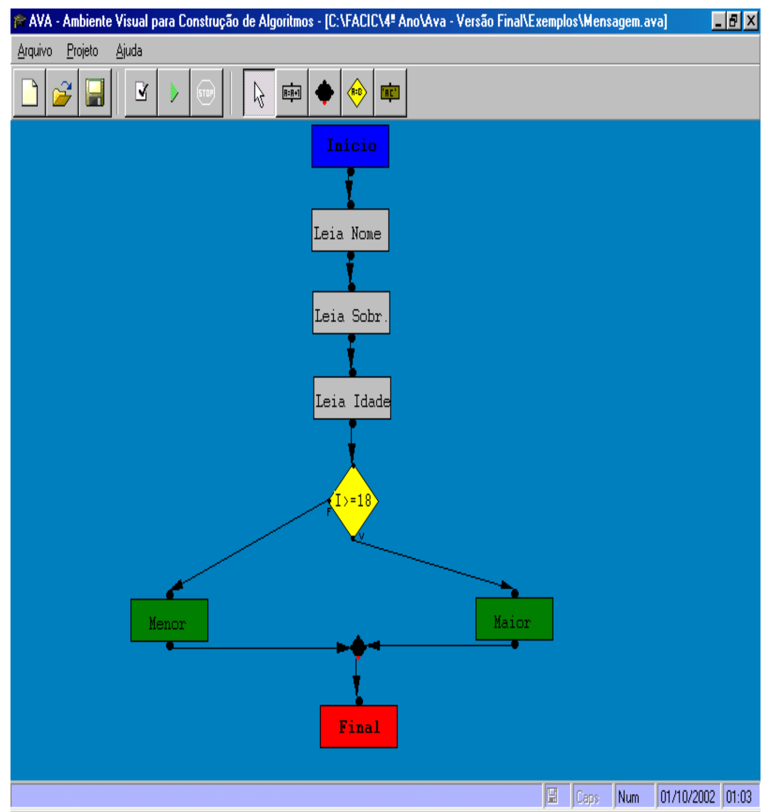
O AMBIENTE AVA

Nesta seção será apresentado o ambiente AVA – Ambiente Visual de Algoritmos

VISÃO GERAL

O AVA trás um ambiente com interface gráfica para a construção de fluxogramas [4].

Em seguida será apresentados os principais objetos utilizado para a construção e a execução dos fluxograma.



OBJETOS DO AMBIENTE

Os objetos INICIO e FINAL são criados automaticamente quando o usuário inicia um novo projeto, os demais podem ser inseridos no botão correspondente e em seguida no local onde ele será colocado (Área de Trabalho). Todos os objeto mostram suas funções quando clicados com o botão direito do mouse.

- **Objeto INÍCIO:**

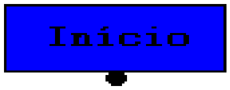


FIGURA. 3: O OBJETO INCIO

Representa o inicio do algoritmo. Quando clicado com o botão direito mostra a seguinte opção:

FIGURA. 4: O OBJETO INCIO COM AS OPÇÕES

Clique nesta opção e em seguida no objeto que receberá a sua saída. Automaticamente será feita uma ligação entre os objeto, o que representa que a seqüência durante a execução será definida desta forma. A próxima vez que este objeto for clicado com o botão direito, se tiver sido concluída a ligação, a opção mudará para "Desligar Saída" que quando acionada irá desfazer esta ligação.

- **Objeto FINAL**

FIGURE. 5: O OBJETO FINAL

Não possui nenhuma função específica, apenas representa o ponto final do fluxograma.

- ATRIBUIÇÃO

Objeto responsável por atribuir valores às variáveis declaradas. Possui as seguintes funções:

FIGURA 6 : EXEMPLO DO OBJETOS DE ATRIBUIÇÃO

FIGURA 7 : JANELA DE ATRIBUÇÃO

- **Propriedades:**

Variável: Variável a qual será atribuída o valor.
Valor: Valor que será associado à variável selecionada. Poderá ser uma expressão de acordo com o tipo da variável. Nota: se for deixado em branco significa que o valor será atribuído pelo usuário durante a execução.
Rótulo: Texto que será exibido no objeto do fluxograma.

- **Ligar Saída**

Mesma função do objeto INÍCIO.

- **Apagar**

Elimina o objeto do fluxograma. Esta função só será bem sucedida se o objeto não estiver ligado a nenhum outro objeto. Neste caso retire as ligação execute a função novamente.

- **Objeto LIGAÇÃO**

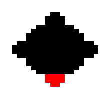

FIGURA 8: OBJETO DE LIGAÇÃO

Serve como uma ponte de ligação intermediária entre os objeto. Possui três entrada e uma saída(de vermelho). É usada quando se quer que mais de um objeto tenham o mesmo objeto de saída. Suas funções são:

- **Ligar Saída**

Mesma função do objeto INÍCIO.

- **Girar**

Muda a posição da saída girando em sentido horário.

- **Apagar**

Mesma função do objeto ATRIBUIÇÃO.

- **Objeto CONDIÇÃO**

Faz com que a execução do algoritmo possa tomar dois caminhos diferentes de acordo com a validade a condição associada ao objeto.

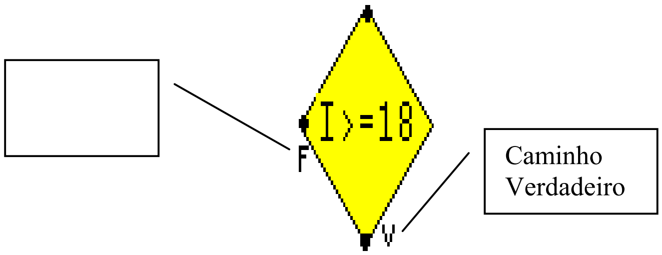

FIGURA 9 : O OBJETO CONDIÇÃO

- **Objeto MENSAGEM**

Este objeto faz com que seja mostra uma caixa com uma mensagem para o usuário durante a execução do algoritmo.

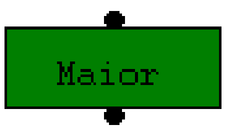

FIGURA 10 : O OBJETO PARA A SAIDA

ASISTENTES DE EXPRESSÃO

O ambiente AVA contém assistentes para ajudar o usuário a construir seus algoritmos, são:

- **Expressão Numérica**

Neste assistente, o usuário poderá montar de forma iterativa expressões numéricas usando a ADIÇÃO, SUBTRAÇÃO, MULTIPLICAÇÃO, DIVISÃO, RADICIAÇÃO, SENO e COSENO.

- **EXPRESSÃO LITERAIS**

Com este assistente o usuário poderá montar expressões literais que podem CONCATENAR com as variáveis do projeto.

FIGURA 11 ASSISTENTE DE EXPRESSÃO NUMÉRICA

- **EXPRESSÃO LÓGICA**

Este assistente é utilizado para montagem de expressões lógicas.

OPERAÇÕES DO AMBIENTE

No menu projeto existem vários opções para a realização de operações, as mais importantes são:

- **Operação EXECUTAR**

Se o fluxograma estiver consistente, ou seja, não tem nenhuma ocorrência de erro na verificação de sintaxe, o mesmo será executado animando os objetos do fluxograma. O usurário poderá ser solicitado a entrar com valores para atribuir as variáveis previamente criadas (Figura 12) permitindo que o usuário acompanhar o andamento da sua execução.

FIGURA 12 : ENTRADA DE VALORES

O andamento da execução pode ser interrompido de duas formas. A primeira seria através dos objetos de INPUT e OUTPUT apenas clicando no botão TERMINAR, ou através da opção Parar Execução do menu Projeto. A execução só irá ser concluído quando aparecer a seguinte mensagem na tela:

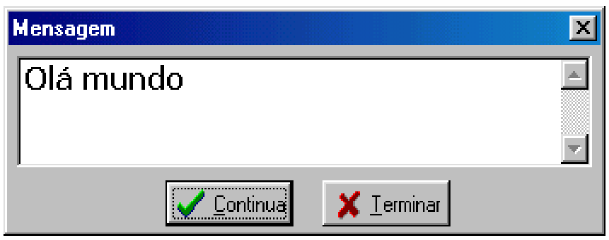

FIGURA 13 : SAIDA DOS VALORES

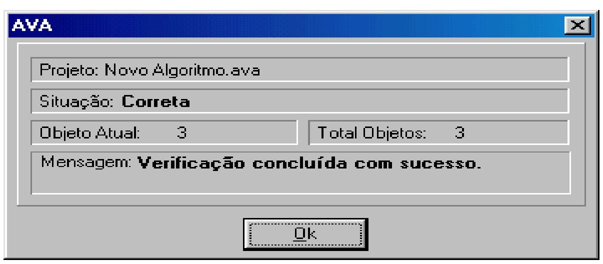

FIGURA 14 – VERIFICAÇÃO DO SINTAXE

- **Operação VERIFICAR SINTAXE**

Esta operação utilizada para a verificação da consistência dos fluxograma e todos os objetos que estão entre os objetos INICIO e FINAL. Exibe uma tela de informações sobre o andamento da verificação (Figura 14). Se houver alguma ocorrência de inconsistência, o usuário será avisado e irá parar a verificação ou caso contrario receberá uma mensagem indicando o sucesso da operação da verificação.

- **Operação PARAR EXECUÇÃO**

Esta operação é utilizada para fazer uma parada forçada na execução do fluxograma.

- **Operação LISTA VARIÁVEIS**

Esta operação lista as variáveis do projeto atual. Nesta tela (Figura 15), o usuário poderá INCLUIR, ALTERAR e APAGAR variáveis do projeto:

FIGURA 15 JANELA COM AS VARIÁVEIS

Ao incluir ou alterar variáveis, o usuário deverá preencher as informações necessárias para cadastrar uma variável (nome tipo e valor inicial).

CONCLUSÕES

A programação de computador, não é algo muito complexo de ser aprendida, no entanto, para o seu aprendizado é necessário dominar a lógica de programação. O ensino da lógica depara-se hoje com uma problemática, que é a falta de experimentar na prática o que é estudado na teoria. A falta de prática não estimula os alunos iniciantes a aprofundar no conteúdo a ser aprendido.

Visando a melhoria do ensino da lógica foi desenvolvido o AVA, que é um ambiente que auxilia na tarefa de ensinar e estudar a lógica de programação. Ele estimula o aluno a praticar e exercer o desenvolvimento de algoritmos, facilitando assim o trabalho do professor e também ajudando o aluno a ter um domínio melhor sobre o assunto.

O principal público alvo são os alunos iniciantes dos cursos de Informática, onde se espera, com a utilização desta ferramenta, um aumento no domínio do conteúdo da lógica.

Existem algumas propostas para o desenvolvimento futuro, como, transformar os fluxogramas em formato de programas em linguagem já conhecidas como o Pascal e C. A criação de subfluxogramas, o que irá trazer mais recursos para a ferramenta, permitindo ao usuário criar algoritmos mais complexos e reutilizar as rotinas prontas encaixando em novos algoritmos.

Atualmente, o AVA está sendo utilizado em caráter experimental pelo professor da matéria (Introdução à Computação), onde será avaliada a sua utilidade prática.

COMUNIDADE VIRTUAL DE MENTORES E TUTORES DO SENAC - SP

Rita Maria L. Tarcia [1]

Abstract — *Considering that distance education is configurated as a new teaching and learning modality, the SENAC-SP Mentors and Tutors Community was created with the purpose of making conditions for teachers and professionals to develop new and specific competencies for the management of these processes in virtual enviroments. The leading principles of the Community are: virtuality, autonomy, flexibility, interdisciplinarity, communication and interaction. Many distance teaching projects have been created from present models and approaches, by means of changing experiences it is hoped to be created a space of knowledge production centered exclusively in virtuality, creating proper theories and concepts of this new modality of Education.*

Index Terms — *Pedagogical competencies specifc for distance education, pedagogical support, mentor's and tutor's role, virtual enviroment for knowledge production.*
.

INTRODUÇÃO

Considerando que os processos pedagógicos em EAD são muito atuais e estão sendo estudados durante a evolução dessa modalidade de ensino, a criação de um espaço virtual para troca de experiências e construção de conhecimentos dos profissionais de diferentes áreas do saber que estão atuando em cursos a distância configura-se como um projeto inovador e importante para o desenvolvimento da pesquisa nessa área.

A missão da coordenação pedagógica da GEAD – Gerência de Educação a Distância é de desenvolver estratégias que garantam a consistência teórica e a coerência pedagógica dos cursos, a qualidade dos processos, dos produtos e da aprendizagem dos alunos, portanto, torna-se necessária a criação de estratégias centradas na formação dos profissionais que atuam diretamente com as questões pedagógicas dos cursos a distância.

Acredita-se que para a GEAD concretizar sua visão de ser reconhecida como uma instituição brasileira de e-learning especializada no segmento de Educação Profissional e Acadêmica, é mister o desenvolvimento de pesquisas e a divulgação dos saberes construídos por sua equipe.

Cabe salientar que a Comunidade de Tutores é um espaço com processos de geração e produção do conhecimento sobre Educação a distância e tal conhecimento será divulgado por meio de um portal.

O objetivo geral do projeto é criar um espaço virtual atualizado e respeitado pela comunidade acadêmica e pelo mercado profissional como centro de produção e divulgação de saberes relacionados aos processos pedagógicos de diversas experiências educacionais realizadas na modalidade a distância.

Destacam-se como objetivos específicos da Comunidade de Mentores e Tutores o desenvolvimento de competências específicas e necessárias para os processos de EAD, utilizando EAD; capacitação para o uso dos diferentes recursos tecnológicos da EAD; a comunicação entre coordenadores, mentores, tutores dos cursos oferecidos pela GEAD; a comunicação entre os profissionais que trabalham na GEAD e outros profissionais de diferentes áreas relacionadas com os cursos que atuam em diferentes instituições; a orientação pedagógica para garantia da consistência teórica e da coerência pedagógica dos cursos; a atualização de informações referentes a temas de educação, tecnologia da informação e educação a distância; a informação acerca de eventos científicos e empresariais de relevância na área de EAD e a produção de pesquisas a partir de cursos em andamento e da modelagem de novos cursos.

DESENVOLVIMENTO DO AMBIENTE

A partir de encontros presenciais com coordenadores de cursos, mentores e tutores, identificamos a falta de experiência e de conhecimentos referentes não só aos processos de ensino e de aprendizagem a distância, mas também com relação aos recursos tecnológicos vinculados a esses processos. Considerando que todos são profissionais de diferentes áreas, julgamos inadequado qualquer tipo de treinamento. A proposta era de auxiliar tais profissionais na formação de competências não só para os cursos em andamento, mas também, para a inserção nesse novo mercado de forma a agregar valor ao perfil já existente. Surge a idéia da comunidade como um Projeto de formação continuada e em exercício, cujo conhecimento seria produzido a partir da vivência dessa nova modalidade de educação. Com relação ao modelo presencial, acredita-se que todos têm um referencial construído durante sua vida escolar e acadêmica, premissa que não se aplica à modalidade a distância.

© 2003 ICECE

No desenvolvimento da Comunidade de Mentores e Tutores foram considerados os seguintes aspectos:

- Virtualidade: todos os processos acontecerão exclusivamente no ambiente virtual, de modo que os profissionais possam vivenciar a aprendizagem a distância, procurando produzir seus próprios referencias para a gestão do ensino;
- Autonomia: respeitando a aprendizagem autônoma [1], a navegabilidade do ambiente permite que cada mentor/tutor procure as informações que julgar mais importantes e encontre estratégias que possibilitem a reflexão e a construção do seu próprio conhecimento, a partir de suas próprias experiências e expectativas;
- Flexibilidade: todo o conhecimento disponibilizado no ambiente possibilita a construção de novas relações e produções, a partir da hipertextualidade;
- Interdisciplinaridade: apesar da Comunidade de Mentores e Tutores ter uma característica pedagógica muito significativa, o ambiente contempla temas e discussões de diferentes áreas do conhecimento, uma vez que os aspectos pedagógicos são ferramentas para o desenvolvimento de conhecimentos em diferentes áreas do saber. Esse aspecto assume um papel motivador, uma vez que os profissionais terão oportunidade de refletir e discutir temas de sua área específica de interesse, formando grupos de discussão dentro da própria comunidade e inserindo essa temática em cursos ou situações de aprendizagem a distância.
- Dialogicidade [2]: tanto os textos quantos os recursos de interatividade valorizam e estimulam o diálogo. A comunicação é o meio pelo qual a aprendizagem se processa, portanto o mentor/tutor deve vivenciar situações dialógicas ricas por meio das quais ele identifique a possibilidade de construção do conhecimento por parte dos alunos.
- Comunicação e interatividade: esses aspectos estão diretamente relacionados com o anterior. O mentor/tutor deve reconhecer a importância dos processos de comunicação para a construção das relações tanto pessoais quanto de conhecimento. É a partir da comunicação que a interatividade é construída. *O significado das palavras é um fenômeno de pensamento apenas na medida em que o pensamento ganha corpo por meio da fala* [3], da palavra expressa nos fóruns, chats e e-mails.

Atualmente, os cursos oferecidos pela Gerência de Educação a Distância do SENAC –SP são desenvolvidos no WebCt e para estimular o conhecimento dessa ferramenta por parte dos mentores/tutores, a Comunidade Virtual também foi construída, inicialmente, dentro desse ambiente.

Para modelagem desse ambiente, decidiu-se utilizar todos os recursos disponíveis de modo a gerar a experiência e estimular sua utilização na construção dos cursos; o conteúdo foi organizado em categorias, tais como: informativa, teórica, prática, auxiliar e subsidiária.

Considerando os aspectos descritos anteriormente e a justificativa de utilização da ferramenta WebCt, passamos a descrever o processo de implantação do Projeto em questão.

IMPLANTAÇÃO DO PROJETO

A primeira fase de implantação da Comunidade Virtual aconteceu no período de dois meses, com o objetivo de teste e contou com a participação dos profissionais da própria GEAD que atuam diretamente com a questão da educação a distância e já possuem um saber elaborado ou pesquisas em andamento sobre o tema. Nessa fase foram avaliados os seguintes aspectos: construção do ambiente, organização do conteúdo, navegabilidade, recursos de interação e tecnológicos, relação entre os objetivos e os processos.

A segunda fase de implantação durou mais dois meses e contou com a participação dos funcionários do SENAC-SP que exercem a função de coordenadores de cursos a distância. Tais profissionais trouxeram contribuições de ordem prática, na medida em que avaliaram a Comunidade Virtual considerando as necessidades e dificuldades que os mentores e tutores apresentam no desenvolvimento e gestão dos cursos.

Finalmente, na terceira e última fase de implantação, o ambiente de apoio pedagógico para processos de educação a distância do SENAC-SP foi aberto para todos os profissionais que atuam direta ou indiretamente com os processos a distância, sendo esse o público alvo do projeto.

O objetivo de dividir o processo de implantação em três fases foi o de garantir a análise, a verificação e a avaliação do ambiente por grupos diferentes, de modo que ao ser aberto para todos os profissionais, que assumem o papel de mentor e de tutor, as possibilidades de identificarmos problemas tanto tecnológicos como pedagógicos fossem bastante reduzidas.

Cabe destacar que o desenvolvimento da Comunidade Virtual foi resultado da análise de inúmeros instrumentos de avaliação e situações reais de ensino e de aprendizagem. O relato dos profissionais expressava a necessidade do diálogo e do auxílio para refletir acerca das novas exigências pedagógicas e tecnológicas. É na comunidade que os mentores e tutores terão condições de desenvolver competências que possibilitem um trabalho de mediação mais qualificado e eficiente.

CONSIDERAÇÕES FINAIS

Devido ao processo de avaliação continuada da Comunidade Virtual, pudemos acompanhar a navegação dos participantes de modo a reorganizar o material informativo disponibilizado e a modelagem do ambiente.

Assim sendo, uma nova versão já está sendo desenvolvida com as algumas alterações. A comunidade deixa de ser organizada dentro do WebCt e passa a ter uma estrutura de Portal, no qual dois eixos são priorizados: um de material teórico e textos de referência e outro de informações práticas, com relatos e exemplos que contribuem com a formação profissional e criação de referenciais e balizadores do processo. Os recursos de interatividade serão mantidos, havendo espaço para os profissionais que atuam em cursos específicos possam se encontrar para trocar informações, inclusive junto com a Coordenação.

Uma inovação no ambiente é a inserção de um programa de rádio com entrevistas, relatos, música e informações sobre eventos e acontecimentos importantes relacionados com a área de educação a distância.

Respeitando o objetivo de capacitação em exercício, haverá um espaço para o mentor/tutor utilizar o WebCt de forma experimental, de modo a familiarizar-se com a ferramenta antes do início do curso.

Citamos algumas das muitas transformações pelas quais a Comunidade Virtual de Mentores e Tutores do SENAC-SP está passando, definido assim os princípios de atualização constante e de produção de conhecimento em fluxo, em movimento.[4]

Finalmente, a evolução do Projeto mostra a seriedade e o compromisso com que está sendo desenvolvido, de modo a contribuir sobremaneira com a evolução dos processos de ensino e de aprendizagem a distância, com a formação de profissionais para atuarem de maneira eficiente e com qualidade, possibilitando melhores resultados/aprendizagem por parte dos alunos. Assim sendo, este projeto possibilita o desenvolvimento de competências pedagógicas para a educação a distância, colaborando no processo individual de construção da identidade do mentor/tutor, a partir da mobilização dos saberes da experiência e da vivência de diferentes situações de aprendizagem.

Acreditamos ser esse ambiente um objeto rico de informações e dados que possibilitarão aos pesquisadores a produção de referenciais teóricos próprios da modalidade de ensino e de aprendizagem em questão, afastando-se assim da adaptação de modelos e abordagens presenciais.

SOFTWARE EDUCACIONAL PARA DISTRIBUIDORES DE GASES E LÍQUIDOS

Fabiano A.N. Fernandes[1], Sueli Rodrigues[2], Sandro M. Pizzo[3], Marina S.Kobayasi[4] and Deovaldo Moraes Jr.[6]

Abstract *— Com o intuito de potencializar o ensino das operações unitárias, o software Distrib foi desenvolvido, trazendo cálculos e exercícios relativos ao uso de distribuidores de gases e líquidos e na qualidade da distribuição de líquidos em colunas de recheio. O software foi idealizado de forma a possuir um módulo de exercícios e um módulo de simulação. Os exercícios propostos envolvem a melhoria da eficiência dos distribuidores; suas vantagens e limitações; a variação das dimensões, configuração e variáveis operacionais. Os resultados obtidos no módulo de simulação devem ser analisados para se chegar a uma resposta, estimulando dessa forma o desenvolvimento do senso crítico nos alunos e um melhor entendimento do equipamento. A proposta do software é contribuir para o desenvolvimento da percepção da influência de cada um dos parâmetros de construção do equipamento, das variáveis de processo bem como das dimensões do equipamento na eficiência e adequação do seu uso para um determinado processo*.

Index Terms *— distribuidor de líquido, distribuidor de gás, colunas empacotadas, software.*

INTRODUÇÃO

Nos últimos três anos temos acompanhado de perto a aplicação de softwares educacionais junto aos cursos de operações unitárias e simulação de processos químicos. Estando abertos a ouvir as opiniões e críticas dos alunos quanto a aplicação destes softwares em sala de aula pudemos perceber o quanto este tipo de material é importante para os cursos. Uma das principais críticas dos alunos quanto aos cursos dados atualmente é a falta do uso de recursos computacionais, especialmente quando se trata de simulação de processos e projeto de equipamentos industriais, em especial aos equipamentos que requerem uma grande quantidade de cálculos como as colunas de destilação, trocadores de calor, extração líquido-líquido, ciclones, hidrociclones e outros equipamentos de separação gás-sólido e líquido-sólido. Devido à complexidade de operação ou mesmo à carga horária reduzida, alguns equipamentos nem sempre são detalhados no ensino de graduação, embora sejam bastante utilizados nas indústrias.

Para equipamentos complexos muitas vezes apenas um único exercício é dado ao aluno para projetar o equipamento, devido ao montante de tempo necessário para se fazer os cálculos para estes exercícios. Em muitos exercícios o aluno acaba simplesmente refazendo um modelo pronto de projeto do equipamento e desta forma passa a ser apenas um apêndice da máquina de calcular e pouco conhecimento é realmente adquirido.

Uma maior quantidade de conhecimento é adquirida pelo aluno quando um software educacional é usado, sendo que a teoria relativa ao equipamento fica mais fortalecida na mente do aluno. É claro que uma boa carga teórica deve ser dada como base para o aluno, porém esta carga pode ser centrada nos conceitos físicos do equipamento, em suas especificações mais comuns, na sua funcionalidade, aplicações e limitações, deixando que o cálculo e projeto do equipamento sejam realizados com o auxílio do software.

Do ponto de vista docente, a utilização do software pode ser uma grande fonte de informação no que concerne ao aprendizado do conteúdo teórico desenvolvido em sala de aula. Fazendo uma maior quantidade de exercícios e entregando pequenos relatórios sobre suas conclusões, muitas falhas de entendimento da teoria podem ser identificadas. Desta forma o desenvolvimento de softwares educacionais pode trazer muitos benefícios para o ensino, fazendo com que o senso crítico seja incentivado e mais conhecimento seja agregado.

DISTRIDORES DE GASES E LÍQUIDOS

Nas colunas de recheio, os distribuidores de líquidos são um dos constituintes mais importantes. Esses dispositivos são determinantes para que se consiga uma separação eficientes dos fluidos que entram no equipamento e muitos dos problemas relacionados aos processos de absorções, limpeza de gases e destilação são originários da distribuição heterogênea da fase líquida descendente.

[3] Sandro M.Pizzo, Departamento de Engenharia Química, Universidade Federal de São Carlos, 13565-905 São Carlos, SP, Brazil, sandromp@bol.com.br
[4] Marina S.Kobayasi, Departamento de Engenharia Química, Universidade Metodista de Piracicaba, Rod. Santa Barbara-Iracemapolis, km 1,5, 13450-000, Santa Bárbara D'Oeste, SP, Brazil
[5] Deovaldo Moraes Jr., Departamento de Engenharia Química, Universidade Santa Cecília, 13450-000, Santos, SP, Brazil, deovaldo@stcecilia.br

Já, nos leitos fluidizados, leitos de jorro e leitos borbulhantes, os distribuidores de gás também tem importância fundamental na eficiência do processo sendo responsáveis pela melhor ou pior mistura do gás e dos tamanhos das bolhas que são formadas (em sistemas gás-sólido-líquido ou gás-líquido).

Com o intuito de potencializar o ensino destas operações unitárias e suas aplicações, o software *Distrib* foi desenvolvido, trazendo cálculos e exercícios relativos ao uso de distribuidores de gases e líquidos. O software foi idealizado de forma a possuir um módulo de exercícios e um módulo de simulação. Os exercícios propostos envolvem a melhoria da eficiência do equipamento; suas vantagens e limitações; a variação das dimensões, configuração e variáveis operacionais. Os resultados obtidos no módulo de simulação devem ser analisados para se chegar a uma resposta, estimulando dessa forma o desenvolvimento do senso crítico dos alunos e um melhor entendimento do equipamento.

A utilização do software contribui para o desenvolvimento da percepção da influência de cada um dos parâmetros de construção do equipamento, das variáveis de processo bem como das dimensões do equipamento na eficiência e adequação do seu uso para um determinado processo. O software segue uma linha iterativa, com interface visual orientada a objeto de forma a simplificar ao máximo a utilização do programa pelos alunos.

EXERCÍCIOS

O módulo de exercícios contém uma série de práticas relacionados ao uso de distribuidores de gases e líquidos e distribuição de líquidos em colunas de recheio.

Nos exercícios relacionados aos distribuidores de gases e líquidos é abordado a qualidade inicial da distribuição e a influência dos parâmetros de construção deste acessório. Para as colunas de recheio são abordados exercícios relacionados com a qualidade de distribuição ao longo da coluna.

A Figura 1 mostra a tela inicial do programa. A navegação pelo software foi desenvolvida nos moldes utilizados na internet.

Para cada exercício existe um enunciado que traz toda a informação que o aluno irá necessitar para realizar o exercício. Os enunciados são apresentados em multimídia, numa interface gráfica bastante moderna, com textos claros e concisos, contendo ilustrações e tabelas acompanhando o texto. A Figura 2 apresenta a tela do enunciado de um dos exercícios do software.

Os exercícios são associados ao módulo de simulação, transferindo automaticamente partes dos dados que serão usados na simulação. Porém o aluno ainda terá bastante o que fazer para realizar e analisar os resultados.

FIGURE. 1
TELA DE APRESENTAÇÃO INICIAL.

FIGURE. 2
APRESENTAÇÃO MULTIMÍDIA DO EXERCÍCIO A SER REALIZADO PELO ALUNO.

SIMULADOR

Este módulo contém os simuladores dos distribuidores de gases e líquidos. Os simuladores foram projetados utilizando-se os principais métodos de cálculo para estes acessórios (Kunii & Levenspiel, 1991; Klemas & Bonilla, 1995; Chen, 1984; Pizzo et al., 1998). O módulo simulador abre espaço para que novos exercícios possam ser propostos pelos professores bem como para execução de projetos dos próprios alunos. No módulo simulador pode-se projetar ou estudar a performance dos distribuidores. A Figura 3 apresenta a tela de entrada de dados do software.

FIGURE. 3
TELA DE ENTRADA DE DADOS PARA SIMULAÇÃO DOS DISTRIBUIDORES DE LÍQUIDOS.

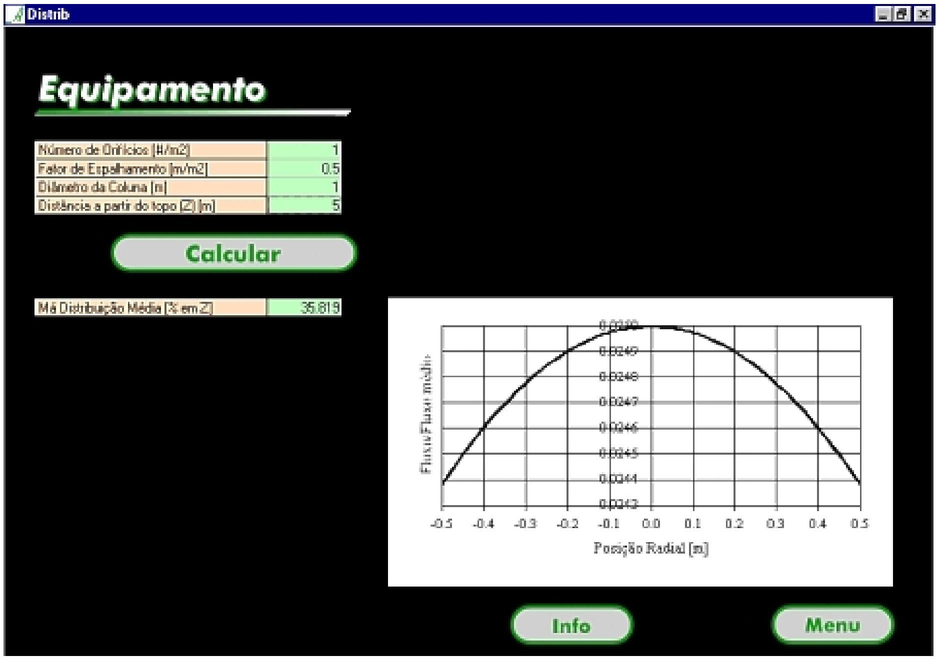

FIGURE. 4
TELA DE APRESENTAÇÃO DE RESULTADOS PARA COLUNAS EMPACOTADAS.

As entradas de dados e a apresentação dos resultados são categorizadas, de forma a apresentar de forma didática os diversos parâmetros envolvidos no cálculo do equipamento, como as variáveis de processo e de projeto. A Figura 4 mostra a tela de apresentação dos resultados.

Informações relativas ao distribuidor, às restrições operacionais podem ser acessadas num módulo de informação.

CONSIDERAÇÕES FINAIS

A introdução de um software didático no curso de engenharia traz consigo uma dinâmica diferenciada onde o aluno tem uma participação mais efetiva e menos passiva, pois terá a oportunidade de colocar o conhecimento adquirido nas aulas teóricas em prática para analisar e resolver um problema proposto, especialmente se o problema proposto for baseado num caso industrial, ou seja num caso real do ponto de vista do corpo discente. O que pudemos observar durante a aplicação de aulas computacionais é que os alunos realmente participam muito mais da aula, existe um interesse grande na aula computacional e os alunos acabam trazendo questionamentos novos sobre a teoria ou a resolução dos problemas. O uso de softwares educacionais muitas vezes extrapola os limites das aulas computacionais e muitas vezes os alunos acabam usando o software posteriormente para resolver problemas de outros cursos ou mesmo para saciar a própria curiosidade quanto á aplicações destes equipamentos em outros casos de estudo.

Independente da utilização do software, os métodos tradicionais não devem ser abandonados, e consideramos que o aluno deva realizar pelo menos um projeto ou exercício sem o uso do software de forma que ele utilize as equações e entenda o procedimento de cálculo. Caso contrário, um grave efeito colateral pode ser gerado: a formação de um “piloto de software” ao invés de um engenheiro que entenda o processo como um todo.

CONCEPÇÃO DE UM PROJETO PEDAGÓGICO BASEADO EM CICLOS DE FORMAÇÃO

Cristiane Koehler[1], *Marcos Eduardo Casa*[2] *e Márcia Maria Capellano dos Santos*[3]

Resumo — *Este artigo apresenta um Projeto Pedagógico que não privilegia a manifestação formal de um currículo, mas concentra-se na concepção sistêmica do curso e nas respectivas formas de organização e estruturação. É proposto a oferta do curso em Ciclos de Formação e com problemas em comum. Constam deste Projeto Pedagógico os seguintes elementos constitutivos: Contexto de Inserção, Referenciais Orientadores, Perfil do Egresso, Objetivos, Organização das Disciplinas em Ciclos de Formação, Concepção da Organização das Disciplinas, Concepção Metodológica, Concepção de Avaliação, Articulação entre Ensino, Pesquisa e Extensão. O desenvolvimento de competências/habilidades dentro dessa concepção curricular acontece de maneira contínua e gradual. O foco central de formação reflete os objetivos do curso, permeia todo o processo de formação do profissional, em diferentes níveis de complexidade. O Problema Comum é proposto para um conjunto de unidades de ensino, onde o mesmo é retomado e são identificadas as contribuições que os elementos trabalhados naquela unidade podem dar para sua solução.*

Palavras-Chave — *Projeto Político Pedagógico, Ciclos de Formação.*

INTRODUÇÃO

As mudanças educacionais exigidas pela sociedade contemporânea, assim como os ditames estabelecidos pela LDB e demais instruções do MEC e CNE acerca do ensino de graduação, indicam que profundas alterações, inclusive de ordem conceitual, deverão ser introduzidas na estrutura e organização dos currículos dos cursos de graduação.

Observando-se o modelo organizacional em que estão estruturados os atuais cursos, percebe-se que as experiências de ensino são vivenciadas isoladamente, de forma particularizada, não se constituindo em referências para o debate e a reflexão. São experiências que se perdem no isolamento das especialidades – vale dizer que o vigente modelo compartimentalizado em que se assentam os cursos está um tanto quanto ossificado diante de um tempo que exige o encontro, a convivência e a troca permanente de informações como forma de potencializar novas experiências no processo de formação.

Entre os novos componentes da reforma proposta pela atual legislação, destacam-se, sobremaneira, a *flexibilidade curricular* e a *interdisciplinaridade*. Como norteadoras de uma nova atitude acadêmica de ensinar, contemplam uma esperança de ruptura com a tradição do ensino fragmentário, mas geram, por constituírem-se, de fato, em objetivos *atitudinais* – portanto, direcionados ao *método* e não apenas ao *objeto de ensino* convencional – uma insegurança generalizada por parte da comunidade universitária.

Tal insegurança é compartilhada tanto pela parcela de interessados em promover uma efetiva mudança, como por aqueles que a rejeitam. É preciso que se compreenda que as diversas tradições que integram o mosaico dos formatos dos cursos, tanto das ciências sociais, as chamadas *humanidades*, como das ciências da natureza, as chamadas *tecnológicas, hard* ou *soft,* detêm, em seu currículo, a mesma arquitetura linear e hierarquizada centrada no *objeto,* desarticulada dos processos de aprendizagem peculiares dos sujeitos.

Historicamente a questão da *subjetividade* tem sido enfocada isoladamente como um fragmento da história do pensamento humano. Recentemente, entretanto, a partir da mútua influência dos campos da Filosofia da Educação, da História, da Antropologia, da Biologia, da Física e de suas interfaces com a Teoria dos Sistemas, com a Teoria da Auto-Organização e, especialmente, da Sociologia e das Artes, com o campo da Educação, procurou-se vencer a fragmentação do conhecimento gerada pelo paradigma cartesiano.

A partir da emergência de um novo paradigma unificador do pensamento e da ação humana, o enfoque da subjetividade passou a ser compreendido não mais como um mero objeto de estudo, mas como um componente essencial para impulsionar uma ressignificação da própria atitude de ensinar e aprender. O que está em debate, portanto, é a

[2] Marcos Eduardo Casa, Universidade de Caxias do Sul, Departamento de Informática, Rua Francisco Getúlio Vargas, 1130, Bairro Petrópolis, Bloco G, 95070-560, Caxias do Sul, RS, Brasil, mecasa@ucs.br
[3] Márcia Maria Capellano dos Santos, Universidade de Caxias do Sul, Pró-Reitoria de Graduação, Rua Francisco Getúlio Vargas, 1130, Bairro Petrópolis, Bloco A, 95070-560, Caxias do Sul, RS, Brasil, mcsanto@ucs.br

necessidade da busca de sentido para o ensino contemporâneo, numa perspectiva não fragmentária.

A dicotomia entre sujeito e objeto, embora há muito tempo superada na história do pensamento humano, ainda é imperativa, não no campo conceitual do ensino, mas, ironicamente, na prática da sala de aula. Talvez possamos depreender deste contexto, analisado com a profundidade que o tema suscita, a necessidade de se procurar, tendo a lei como ponto de apoio, os princípios: *flexibilidade* e *interdisciplinaridade*. Deve esse resgate do sentido e da subjetividade, como atitudes necessárias às relações humanas contemporâneas, relacionar-se a um método de trabalho condizente com a inteligência não-fragmentária.

A flexibilidade curricular dos programas de ensino em todos os níveis, como atitude propositiva, dá, portanto, o crédito ao educando para que ele exerça sua autonomia na escolha de seus objetivos, ou seja, na busca do sentido para a sua vida acadêmica. A *interdisciplinaridade*, por outro lado, é a resposta do corpo docente à busca maior de sentido para a vida em comunidade.

De acordo com Jantsch, há três níveis na construção do conhecimento além da *disciplina*: o *Multidisciplinar*, no qual as disciplinas aparecem justapostas, com uma temática comum, porém sem integração entre as mesmas; o *Interdisciplinar*, que pressupõe integração entre as disciplinas e entre os ministrantes, a partir de um método de trabalho compartilhado; e o mais abrangente de todos, o *Transdisciplinar*, no qual não há necessariamente disciplinas, mas eixos integradores das áreas de conhecimento. Não há hierarquia entre essas áreas. O trabalho baseia-se no planejamento coletivo dos programas e em experimentos educacionais, que dão suporte a essa integração[4].

A legislação que ora está se construindo refere-se, usualmente, ao termo *interdisciplinaridade* [5]. Entretanto, para efeito de síntese, passaremos a refletir sobre o conceito de *transdisciplinaridade*, uma vez que os documentos que embasam a mudança paradigmática para o ensino superior, a nível mundial, adotam o conceito de transdisciplinaridade como referência. Estes documentos fazem parte do acervo das conferências mundiais realizadas pela UNESCO no evento *A Educação Superior para o Século XXl.*

Compreenderemos melhor a transdisciplinaridade como atitude propositiva se lembrarmos Os Quatro Pilares da Educação Para a Virada do Milênio, propostos pela UNESCO: **aprender a conhecer, aprender a fazer, aprender a viver em conjunto e aprender a ser** [6].

No contexto de transição que ora vivemos, necessitamos resgatar o convívio dos grupos, estabelecendo um colóquio transdisciplinar permanente que dê conta de uma resposta mais convincente à sociedade acerca de questões pragmáticas do ensino, como: Para que serve Cálculo e Didática? Mais especificamente, a disposição das disciplinas em gavetas isola os sentidos que se entrelaçariam naturalmente a partir da realização de uma meta comum a todas as disciplinas: formar um docente para a educação básica ou superior ou, ainda, formar um profissional para o mundo do trabalho. Neste contexto, a abordagem transdisciplinar tem muito a contribuir.

A hierarquização dos conteúdos, ou seja, o que se deve ensinar e em que ordem, também está em questão, assim como o currículo como modelo organizacional fechado e as relações hierárquicas entre as áreas de conhecimento, entre as disciplinas e entre os ministrantes e usuários desses modelos.

Jurjo Santomé[7], em seu levantamento sobre as tendências teóricas que subsidiam a prática pedagógica multi, inter e transdisciplinar, expõe diversos modelos que estão em funcionamento no panorama internacional, como: a interdisciplinaridade complementar, o ensino centrado em evidências, na resolução de problemas, ou baseado em projetos. O processo tutorial, já adotado por algumas instituições de ensino superior, demonstra resultados positivos. Neste método o papel do docente transcende ao mero instrucional, na medida em que os tutores colocam-se como guias auxiliares na busca de um caminho pessoal[8].
Uma vez equalizadas as áreas do conhecimento, abre-se naturalmente o caminho da flexibilidade, a partir da qual o educando defronta-se com o aprendizado autoconstruído. De acordo com [1]:

---

[4] Consideramos esses três conceitos a partir dos referenciais de Jantsch (In: Santomé, Jurjo. *Globalização e Interdisciplinaridade- o currículo integrado,* Porto Alegre:Artes Médicas, 1998 e de Walgenbach, Wilhelm. *Interdisziplinäre System - Bildung*. Frankfurt: Peter Lang, 2000).

[5] Especialmente nos textos das *Diretrizes Curriculares para os Cursos de Graduação / SESu-MEC.*

[6] Relatório da Comissão Internacional sobre a Educação para o Vigésimo Primeiro Século, presidida por Jacques Delors, UNESCO, 1998,

[7] Op. Cit.

[8] Este método traz à cena a figura do *tutor*, que difere da figura do professor. De modo genérico, o tutor deve orientar o educando em seu projeto de trabalho. Isto quer dizer, que o educando é que deverá exercer sua autonomia no sentido de pesquisar individualmente, a partir da ***tutela*** de seu orientador. As práticas de orientação dos alunos nos projetos de conclusão de curso, constituem-se em valiosos experimentos para os docentes, na compreensão dessa modalidade, assim como as orientações individuais no âmbito da Pós-Graduação. Entretanto, num sistema de tutoria, não basta estar contemplada apenas a escolha da temática pelo educando. A atitude do tutor consiste, acima de tudo, em ***não ensinar as respostas às perguntas da pesquisa***. Cabe-lhe orientar o educando em suas escolhas, até que ele descubra, por si só, as respostas para suas investigações.

(...)Não é a assimilação de uma enorme massa de conhecimento científico que dá acesso ao espírito científico, mas a qualidade do que é ensinado. E aqui qualidade significa guiar o aluno até o verdadeiro coração da abordagem científica que é o permanente questionamento com relação ao que resiste aos fatos, às imagens, às representações e às formalizações.

Destacamos como fundamental a idéia de aprender a conhecer, na medida em que, num tempo onde as transformações se processam em impensável velocidade, apresenta-se como indispensável criar estruturas que sejam capazes de apreender essas mudanças no campo social, no caso especifico, no ensino, na sua dimensão mesmo de processualidade. Decorre, também, desse fato a necessidade de uma educação continuada e permanente, que aponte para novos formatos organizacionais das instituições.

PROPOSTAS CONCEITUAIS PARA DISCUSSÕES SOBRE CONSTRUÇÃO DE PLANOS PEDAGÓGICOS

Na tentativa de estimular o debate em torno das propostas de planos pedagógicos, sugere-se que se promova um estudo acerca da relevância de se adotar uma proposta pedagógica não-linear, capaz de estimular o discente a buscar espontaneamente a pesquisa dos conteúdos de formação básica, a partir da necessidade de solucionar problemas imediatos ou executar projetos.

Tal atitude poderá inverter o desenho fragmentário do currículo *em gavetas*, dando lugar a um currículo mais dinâmico e transdisciplinar. A realização de um projeto ou a pesquisa de soluções para a resolução de problemas requer, ao mesmo tempo, criatividade e objetividade – ou seja: de um lado, o exercício do pensamento divergente, criativo, aberto ao novo e, de outro, a busca do pensamento convergente, seletivo, objetivo e conclusivo.

A dissociação entre a teoria e a prática gera desinteresse e falta de sentido para a vida dos acadêmicos, muitas vezes intimidados pelo estilo magistral da aula teórica convencional, centrado na memorização de conteúdos objetivos que, via de regra, não estimula a inventividade dos alunos e não lhes confere a devida autonomia para dar vazão ao seu espírito crítico e promover um envolvimento efetivo com o tema abordado.

Estudos contemporâneos no campo do ensino afirmam que o problema está na hierarquização das disciplinas e nas relações de poder que se estabelecem entre os docentes das áreas de conhecimento mais ou menos prestigiadas. Para [3], nada é mais importante, para os professores, do que a autoridade e o controle, que pode configurar-se como uma imposição externa a eles que contamina o currículo.

A escolha dos temas ou conteúdos praticados no currículo deverão ser relevantes para cada unidade social e não apenas protocolares, taxionômicos. Avalia-se, portanto, na rotina de sala de aula, não só o produto final do estudo, mas também o processo de aprendizagem, o método de ensino dos docentes e a dinâmica do trabalho em grupo.

O que muda, pois, notadamente, na construção de um currículo mais transdisciplinar, é, na base de sua construção, adotar como ponto de partida não a *disciplina*, mas o *conteúdo essencial* como elemento gerador de um sistema que irá desdobrar-se, entrelaçando-se com outros conteúdos essenciais. A organização do currículo por *módulos* ou por *eixos transversos* é decorrente deste enfoque, assim como a flexibilidade e a autonomia dos alunos na escolha de seus objetivos de estudo geram, por conseqüência, as chamadas *ênfases*, que são terminalidades dos cursos, diversificando as especificidades e ampliando o leque de profissões.

O que ocorre no modelo compartimentalizado dos currículos atuais é a justaposição de disciplinas, cujos solitários ministrantes, normalmente, não tecem comentários com os alunos acerca das relações entre as suas disciplinas e as demais. Tais relações, de fato, existem e, provavelmente, deram origem à proposta pedagógica inicial, mas, ao longo do tempo, deixaram de ser explicitadas. É comum, entre os docentes, a impaciência, ao perceberem a alienação dos alunos quanto aos reais objetivos dos cursos, e de não lembrarem de determinados referenciais já trabalhados em disciplinas anteriores, cujos pré-requisitos foram cuidadosamente colocados com a finalidade de embasar o conhecimento específico a ser desenvolvido.

Entretanto, em desenhos de currículos flexíveis, é o próprio aluno que irá buscar os referenciais para embasar sua pesquisa. Neste percurso, de imersão total no tema e de exercício de sua inventividade, seu processo de aprendizagem como um todo será valorizado e sua memória irá registrar a presença de um novo componente muito importante, que irá constituir-se no diferencial para incorporar definitivamente os conteúdos objetivos trabalhados: seu envolvimento afetivo com a temática escolhida e a valorização de sua performance pessoal.

Outro problema do modelo convencional, alvo das críticas de alunos e docentes, é a sobreposição dos mesmos conteúdos, que aparecem em diferentes disciplinas, com enfoques, por vezes, antagônicos ou dissociados entre si. Não há, em geral, uma orientação pedagógica nos cursos capaz de coordenar um debate sobre as diferentes tendências pedagógicas presentes na prática dos docentes. Seria bem-vindo um fórum permanente em que essa diversidade pudesse ser explicitada em prol de uma elucidação de conceitos e de linhas filosóficas, de modo a contribuir para uma formação menos fragmentária, menos competitiva e, por fim, menos *esquizofrênica* dos alunos.

Em decorrência, a partir de um enfoque dialógico, centrado no debate e no trabalho em equipes, poderia constituir-se, na esfera dos cursos e entre os cursos, nas suas áreas proximais, finalmente, a prática do trabalho interdisciplinar. Para [4], é importante o trabalho em parceria, característica fundamental desta modalidade.

Há muitos modelos de currículos interdisciplinares, uns mais centrados na resolução de problemas, outros na aquisição de um conhecimento mais globalizado, outros voltados para interesses do mercado, alguns mais artesanais, mais multiculturais, outros mais voltados para a tecnologia informatizada. Enfim, o importante, concordando com [5], é que se promova o debate em torno das peculiaridades de cada curso, da realidade particular, de todas as histórias de vida dos grupos constituídos e que este debate possa enriquecer o imaginário de cada curso.

O Projeto Pedagógico para o Curso de Bacharelado em Sistemas de Informação da Universidade de Caxias do Sul

Tendo por referência as considerações anteriores, este Projeto Pedagógico não privilegia a manifestação formal de um currículo, mas concentra-se na concepção sistêmica do curso e nas respectivas formas de organização e estruturação. A formalização do desenvolvimento da proposta de um curso por meio de uma "grade curricular" não implica, por si mesma, a efetivação de compartimentalização metodológica e do conhecimento; por outro lado, a formalização em módulos ou unidades de ensino também não garante a efetivação de multi, inter, ou transdisciplinaridade. Esta efetivação se concretiza na ação docente, na realização das atividades de ensino/aprendizagem norteadas pela concepção curricular do curso.

De acordo com [2], um Projeto Pedagógico deve constar os seguintes elementos constitutivos: a) Contexto de Inserção, 2) Referenciais Orientadores, c) Perfil do Egresso, d) Objetivos, e) Organização Curricular, f) Concepção da Organização Curricular, g) Estrutura do Currículo, h) Concepção Metodológica, I) Concepção de Avaliação, j) Articulação entre Ensino, Pesquisa e Extensão.

O que há de novo nesse Projeto Pedagógico é que a Organização Curricular está projetada em **Ciclos de Formação**, e está fundamenta em dois Eixos de Sustentação e um Eixo Central, a saber: Eixo de Formação em Informática e Eixo de Formação em Administração, como Eixos de Sustentação e Eixo de Formação em Sistemas de Informação como Eixo Central.

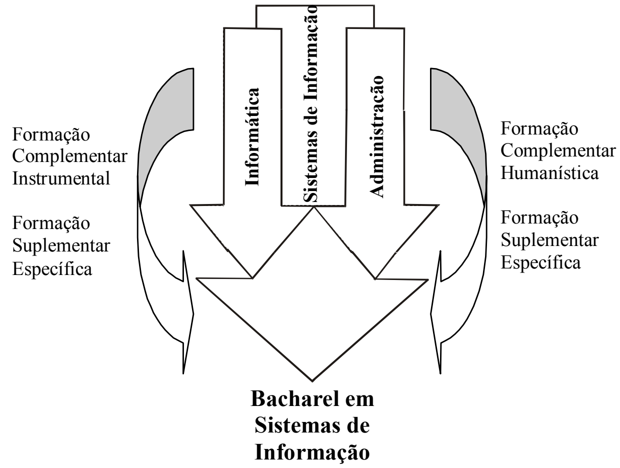

FIGURA. 1
EIXOS DE FORMAÇÃO

Ciclos de Formação

O desenvolvimento de competências/habilidades dentro dessa concepção curricular acontece de maneira contínua e gradual, isto é, em **Ciclos**. O foco central de formação, *desenvolvimento e aplicação de sistemas de informação no contexto das organizações*, reflete os objetivos do curso, permeia todo o processo de formação do profissional, em diferentes níveis de complexidade, e é abordado em cada Ciclo, de forma a contribuir para que os objetivos de aprendizagem sejam atingidos progressivamente. A cada Ciclo, **novos níveis de complexidade dos Sistemas de Informação e uma compreensão mais ampla e aprofundada do contexto organizacional** são contemplados na formação do profissional. A seguir, tem-se uma explanação dos objetivos e objetos de estudo de cada Ciclo do Curso de Bacharelado em Sistemas de Informação da Universidade de Caxias do Sul:

Objeto de estudo do Ciclo 1: Desenvolvimento de programas e o contexto das organizações.
Objetivo do Ciclo 1: Desenvolver habilidades de projetar e escrever programas de computador, considerando sua aplicação no contexto das organizações.

Objeto de estudo do Ciclo 2: Aplicação de tecnologia para tratamento da informação no desenvolvimento de programas e o contexto das organizações.
Objetivo do Ciclo 2: Projetar e escrever programas considerando sua aplicação em contextos organizacionais, agregando tecnologias e metodologias com maior grau de complexidade no tratamento da informação.

Objeto de estudo do Ciclo 3: Desenvolvimento e aplicação de sistemas de informação no contexto das organizações
Objetivo do Ciclo 3: Desenvolver e aplicar sistemas de informação com qualidade no contexto das organizações.

O trabalho realizado em cada módulo de ensino na estrutura curricular leva em consideração o Objeto de Estudo e o Objetivo do Ciclo em que está inserido. O desenvolvimento dessa estrutura é favorecido também pela proposição de um Problema Comum para um conjunto de unidades de ensino. Em cada unidade de ensino esse Problema Comum é retomado e são identificadas as contribuições que os elementos trabalhados naquela unidade podem dar para sua solução.

Em resumo, a organização curricular se configura em uma estrutura em Ciclos, que se desenvolvem em torno dos Eixos de Sustentação (Informática e Administração) e do Eixo Central (Sistemas de Informação) – pilares da formação técnica – e que se redimensionam pela formação Complementar Geral (Humanística e Instrumental) e Suplementar Específica. Abaixo é possível observar a inter-relação entre Eixos e Ciclos.

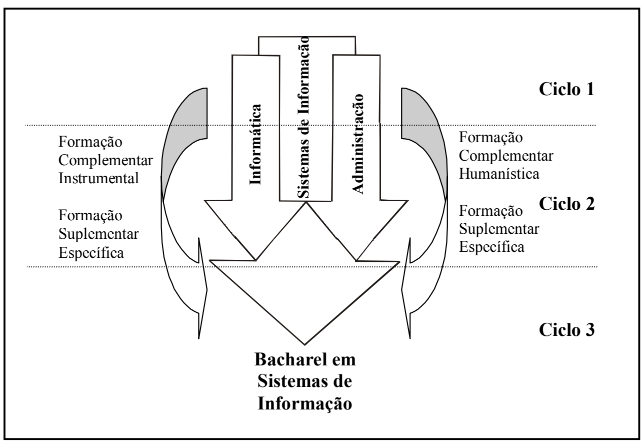

FIGURA. 2
CICLOS DE FORMAÇÃO

Na verdade, a concepção de um Curso em Ciclos de Formação pressupõe a busca de uma construção gradual de competências e habilidades. A meta final é atingir os objetivos do curso, contribuindo para o desenvolvimento do perfil profissional previsto. Nesse processo, em cada Ciclo, os objetivos são retomados em uma escala mais alta de complexidade. A Figura 3, mostra esse processo: cada quadrante representa uma área de formação, e as setas representam um crescente de complexidade. Ao final de cada Ciclo, um novo nível é atingido e, após a conclusão do curso, o processo de especialização continua em outros níveis de formação, ou mesmo, através auto-aprendizagem continuada.

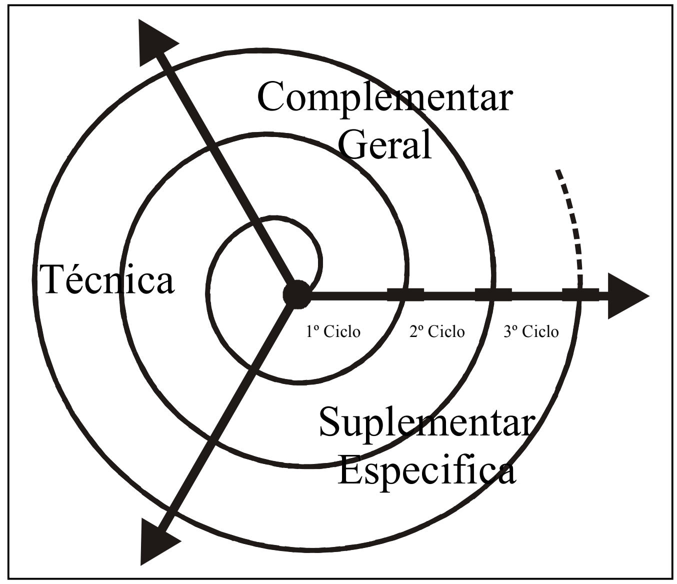

FIGURA. 3
CRESCIMENTO DOS NÍVEIS DE COMPLEXIADADE DE CADA FORMAÇÃO: TÉCNICA, COMPLEMENTAR GERAL E SUPLEMENTAR ESPECÍFICA EM CADA CICLO DE FORMAÇÃO

CONSIDERAÕES FINAIS

Conforme salientado, o presente Projeto Pedagógico, se, de um lado traduz uma perspectiva de mudança paradigmática nos referenciais científico-pedagógicos para o Curso de Bacharelado em Sistemas de Informação, de outro, traz uma alternativa de operacionalização, ainda que gradual, considerada possível e pertinente para que os agentes envolvidos (professores, alunos, coordenadores) possam progressivamente assimilar as referidas mudanças. Somente a discussão coletiva e contínua sobre o Projeto Pedagógico, permitirá, com maior adesão dos agentes, a efetivação das mudanças estruturais para as quais apontam os novos referenciais.

INTERFACE COMPUTACIONAL PARA APLICAÇÕES DE ALGORITMO GENÉTICO

Max Ricardo Pantoja Trindade[1], Rejane de Barros Araújo[2] and Roberto Célio Limão de Oliveira[3]

Resumo *— O objetivo deste trabalho é apresentar um ambiente computacional, com interfaces amigáveis para ensino de Algoritmos Genéticos (AG's), de forma a facilitar ao usuário um melhor entendimento da aplicação do AG. Como o AG é um método utilizado basicamente para resolver problemas em pesquisa numérica, otimização de funções e aprendizagem de máquina, optou-se por escolher quatro aplicações diferentes usando o algoritmo genético: O Problema do Caixeiro Viajante, O Dilema do Prisioneiro, Otimização de Funções e a Sintonização de um PID (Controlador Proporcional Integral Derivativo).*

INTRODUÇÃO

Este artigo trata de *Algoritmos Genéticos,* que são definidos como uma família de modelos computacionais inspirados na teoria da evolução, que incorporam uma solução potencial para um problema específico numa estrutura semelhante a de um cromossomo e aplicam operadores de seleção e de "*cross-over*" a essas estruturas de forma a preservar informações críticas relativas à solução do problema (Barreto, 1999; Dias, 1998). Normalmente os AG's são vistos como otimizadores de funções, embora a quantidade de problemas para os quais os AG's se aplicam seja bastante abrangente. Uma das vantagens dos algoritmos genéticos é a simplificação que eles permitem na formulação e solução de problemas de otimização.

Em todas as quatro aplicações de AG, descritas a seguir, a estratégia adotada é a elitista (Sprinner, 1992 & Dias, 1998), na qual o indivíduo mais adaptado ao meio é sempre mantido na próxima geração. Uma outra estratégia adotada, e que se mostrou bastante eficaz no aumento da velocidade de convergência do AG, foi a aplicação de uma nova mutação com uma alta probabilidade (30-50%). Esta mutação adicional somente é aplicada quando o *fitness* do melhor indivíduo se mantém por várias gerações.

O Problema do Caixeiro Viajante (*Travel Salesman Problem* – TSP) consiste em visitar n cidades. O caixeiro sai de uma determinada cidade (por exemplo, cidade 1), vai visitando cada uma das $n-1$ cidades restantes, sem passar novamente pela cidade já visitada, e retorna para a cidade 1. Dessa maneira, a trajetória descrita pelo caixeiro forma um percurso fechado. O objetivo deste problema clássico de otimização é determinar a seqüência de cidades a serem visitadas, de forma que a distância total percorrido pelo caixeiro seja a menor possível (Sprineer, 1992).

No Problema do Dilema do Prisioneiro existem dois indivíduos (Alice e Bob) que são mantidos presos por terem praticado um crime em conjunto.

Os dois prisioneiros são mantidos em selas separadas, sem nenhuma possibilidade de comunicação entre ambos. A polícia oferece para Alice o seguinte trato: se ela confessar o crime e concordar em testemunhar contra Bob, ela ganha liberdade condicional, enquanto que Bob passa 5 anos na cadeia;

Entretanto, se ao mesmo tempo Bob confessar o crime e concordar em testemunhar contra Alice, esta última será desacreditada, e cada um deles irá cumprir 4 anos de pena por admitirem a culpa.

Alice é informada de que um trato nas mesmas condições está sendo oferecido a Bob. Ambos sabem que se permanecerem em silêncio e não se acusarem mutuamente, poderão ser condenados somente a uma pena mais branda de 2 anos na cadeia, cada um.

Portanto existem duas escolhas: Cooperar (C) mantendo silêncio, ou trair (D) (to defect) acusando-o.

Os resultados possíveis para uma única partida são descritos na matriz de recompensa ilustrada na Tabela I.

Tabela I: Matriz de recompensa

		Jogador B	
		Cooperar (C)	Trair (D)
Jogador A	Cooperar (C)	(3,3)	(0,5)
	Trair (D)	(5,0)	(1,1)

O dilema consiste no fato de que se ambos os jogadores traírem, cada um recebe uma recompensa menor de que aquela que ganharia caso os dois cooperassem (Fogel, 1995).

Na Otimização de Função, implementou-se um AG para encontrar os pontos de máximos ou de mínimos de uma funções de duas variáveis.

Para o caso da sintonização do PID, O AG é utilizado para encontrar os valores ótimos de K_P (Ganho Proporcional), K_i (Ganho Integral) e K_d (Ganho Derivativo), para uma planta qualquer de no máximo 3ª ordem, que minimize o sinal de erro entre a saída da planta e o sinal de referência (Rensburg, 1998), como mostra a Figura 1. Nesta implementação, utilizou-se os modelos discretos (método de Tustin) da planta e do controlador.

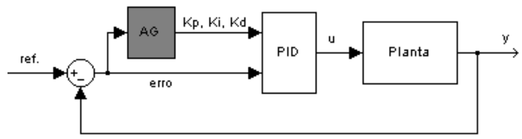

Figura 1: Sistema em Malha Fechada com uma Planta, Controlador PID e AG.

VISÃO GERAL DO AMBIENTE

Os Ambientes Computacionais para Ensino de Engenharia vem ganhando espaço de forma progressiva e significativa na área educacional e até mesmo nas industriais, para treinamento de pessoal. Este recurso é capaz de substituir vários aparelhos eletrônicos de propósito específico e aparelhos de medições, por computadores de propósito geral munidos de *hardware* e *software* específicos para o tratamento dos dados. Há vários aspectos vantajosos no emprego destes ambientes, como: flexibilidade, versatilidade e principalmente boa relação entre custo e benefício. Hoje existe uma forte demanda para desenvolvimento de ambientes computacionais de ensino de engenharia de propósito

[1] Max Ricardo Pantoja Trindade, Universidade Federal do Pará, Rua Augusto Corrêa, 01, 66075-900, Belém, PA, , PA, Brazil, maxtpt@bol.com.br
[2] Rejane de Barros Araújo, Universidade Federal do Pará, Rua Augusto Corrêa, 01, 66075-900, Belém, PA, , PA, Brazil, rebarros2000@yahoo.com.br
[3] Roberto Célio Limão de Oliveira, Universidade Federal do Pará, Rua Augusto Corrêa, 01, 66075-900, Belém, PA, , PA, Brazil, limão@ufpa.br

geral ou específico, que venham atender à realidade das instituições de ensino de engenharia do país.

O ambiente foi criado levando-se em consideração aspectos como: modularidade, simplicidade de uso e facilidade de manutenção.

A modularidade permite que futuras extensões, manutenções e atualizações possam ser realizadas de forma rápida e segura. A *interface* simples e intuitiva ao usuário deve propiciar o mínimo de tempo possível para adaptação ao ambiente, evitando-se assim possíveis desmotivações por parte do mesmo.

O ambiente foi desenvolvido no Matlab & Guide (Mathworks, 1997), pelo mesmo apresentar várias características desejadas, como: fácil manipulação pelos usuários (por ser bastante difundido no meio acadêmico), ter funções definidas (pois facilita a implementação do AG e diminui o esforço computacional) e facilidade de desenvolver interfaces amigáveis para o usuário.

FUNCIONALIDADE DO AMBIENTE

Neste tópico são apresentadas de forma sistêmica as interfaces criadas. A figura 2 apresenta a tela principal do ambiente, onde pode-se observar os botões que dão acesso as quatro aplicações atuais.

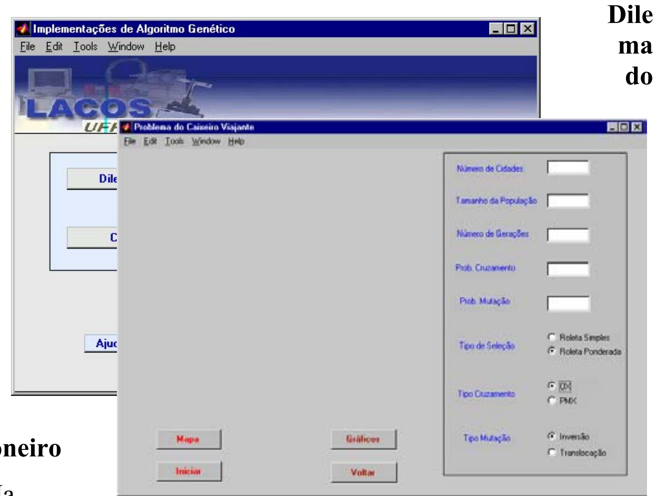

Figura 4: Interface do Caixeiro Viajante

Dilema do Prisioneiro

Na interface do Dilema do Prisioneiro o usuário pode escolher dois tipos de seleção para implementar o AG: roleta simples ou roleta ponderada. O botão **O Que é o Dilema do Prisioneiro?** dá acesso a uma pequena descrição do problema para que o usuário tenha conhecimento do mesmo. O usuário poderá escolher os valores de probabilidade de mutação (P_m), probabilidade de cruzamento (P_c), tamanho da população e número de gerações. Depois da sintonização de todos os parâmetros, existe um botão para iniciar o AG e um outro botão para visualizar os gráficos da média e do melhor indivíduo por geração, como pode ser visto na figura 3.

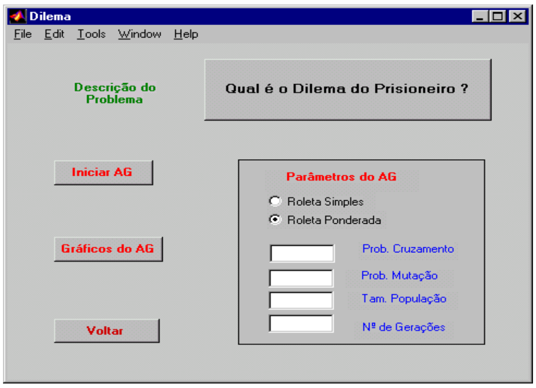

Figura 3: Interface do Dilema do Prisioneiro

Com esta implementação, o usuário tem a oportunidade de analisar o problema do dilema com mais de um tipo de seleção e valores diferentes de P_m, P_c, tamanho da população e número de gerações, podendo analisar a influência dos mesmos no comportamento do AG.

Caixeiro Viajante

Na interface do Caixeiro Viajante, o usuário pode escolher os parâmetros do AG, ou seja, P_m, P_c, tamanho da população e número de gerações, assim como o número de cidades a serem visitadas. O usuário poderá também escolher o tipo de seleção (roleta simples ou ponderada), cruzamento (OX ou PMX) e mutação (inversa ou translocação) a ser utilizado (Sprineer, 1992). Após o usuário clicar no botão **Mapa**, aparecerá na tela em cinza o mapa do Estado do Pará, com as cidades dispostas aleatoriamente. A partir desse ponto, pode-se iniciar o AG, clicando-se no botão **Iniciar**. O melhor caminho é mostrado no mapa a cada 10 gerações. A adaptação média da população e do melhor indivíduo podem ser vistas após a finalização do AG, através do botão **Gráficos** da figura 4**.**

Otimização de Função

Na interface da Otimização de Função, o usuário poderá encontrar os pontos de máximos ou mínimos de qualquer função de duas variáveis. Nesta interface, o usuário precisará digitar a função desejada e escolher se quer maximizar ou minimizar. Além disso, deve-se definir os pontos de máximos (X_{1max} e X_{2max}) e de mínimos (X_{1min} e X_{2min}), que são os intervalos de busca da solução.

Antes de iniciar o programa de Otimização de Função, o usuário deve escolher os parâmetros do AG, como P_m, P_c, tamanho da população e número de gerações. O tipo de seleção também é uma outra flexibilidade da interface, ou seja, o usuário pode fazer a análise do AG tanto com seleção simples, como seleção ponderada. Depois de todos os parâmetros serem estabelecidos, o usuário deve clicar no botão **Iniciar AG** da figura 5, e apareceram na tela branca um gráfico 3D da superfície da função sob estudo e seu ponto de mínimo ou de máximo obtido pelo GA, a cada 10 gerações. O *fitness* médio e do melhor indivíduo também podem ser vistos, após o usuário clicar no botão **Gráficos do AG**.

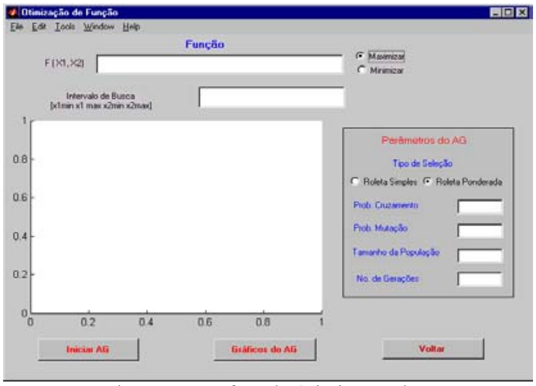

Figura 5: Interface da Otimização de Função

Sintonização do PID

Na interface da Sintonização de um PID (Controlador Proporcional Integral Derivativo), o usuário poderá obter os melhores valores de K_p (Ganho Proporcional), K_i (Ganho Integral) e K_d (Ganho Derivativo), usando o AG para qualquer planta de, no máximo 3ª ordem, bastando para isso escolher os parâmetros do AG, ou seja, P_m, Pc, tamanho da população e número de gerações. O usuário deve escolher também a planta a ser controlada, tendo que digitar o numerador, o denominador e o período de amostragem. Deve-se ter a preocupação de escolher adequadamente os limites de K_p, K_i e K_d (Datta, 2000). Após o usuário clicar no botão **Iniciar AG**, aparecerá na tela branca, a cada dez gerações, o sinal da saída da planta controlada pelo PID, cujos parâmetros são obtidos pelo AG. Para visualizar o *fitness* médio da população e o do melhor indivíduo, deve-se clicar no botão **Gráficos do AG** da figura 6.

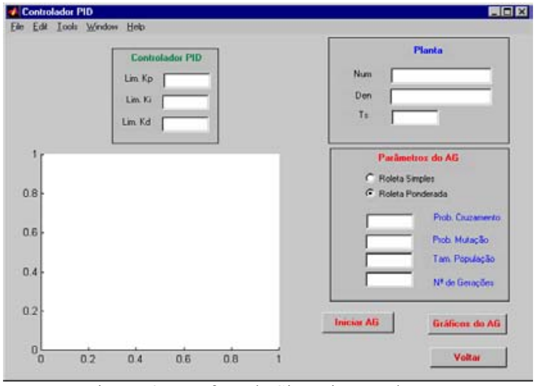

Figura 6: Interface da Sintonização do PID

SIMULAÇÕES OBTIDAS

Foram realizadas algumas simulações utilizando os recursos das interfaces, para se mostrar a funcionalidade de cada uma delas no estudo dos Algoritmos Genéticos. Em seguida, serão mostrados os resultados de uma simulação de cada aplicação.

Dilema do Prisioneiro

Para o Dilema do Prisioneiro escolheu-se os seguintes parâmetros do AG: $P_m = 0{,}01$; $P_c = 0{,}85$; tamanho da população de 20 indivíduos, 400 gerações e seleção do tipo roleta simples. Com esses parâmetros, obteve-se os gráficos do *fitness* médio da população e *fitness* do melhor indivíduo, como pode ser visto na figura 7.

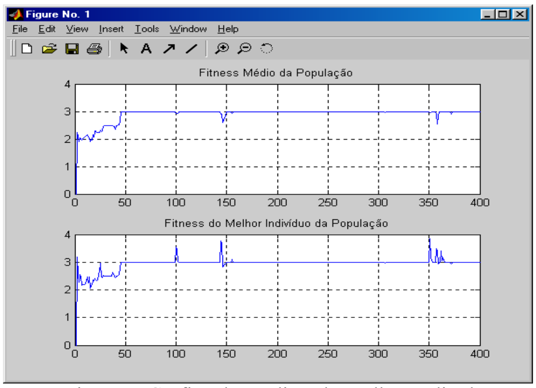

Figura 7: Gráfico da Média e do Melhor Indivíduo por Geração para o Dilema do Prisioneiro

Fazendo-se uma análise do gráfico observa-se que a partir da geração 50 o AG converge, mantendo os indivíduos melhores adaptados nas próximas gerações. Os resultados são bem satisfatórios, pois o AG consegue convergir para um valor ótimo, em poucas gerações.

Caixeiro Viajante

No caso do Caixeiro Viajante, deseja-se determinar o menor caminho percorrido pelo caixeiro para visitar 15 cidades, dispostas aleatoriamente no mapa do Estado do Pará. Os pontos em azul indicam as localizações das cidades e as linhas em amarelo definem o menor caminho percorrido pelo caixeiro, após execução do AG.

Os parâmetros do AG, o tipo de seleção, cruzamento e de mutação podem ser vistos na figura 8. Os resultados do *fitness* médio da população e do melhor indivíduo são mostrados na figura. 9. Nela, observa-se que o menor caminho, ou seja, o maior valor de *fitness* do melhor indivíduo é obtido na geração 37, isto mostra que para os parâmetros utilizados, o AG pode ser considerado eficiente.

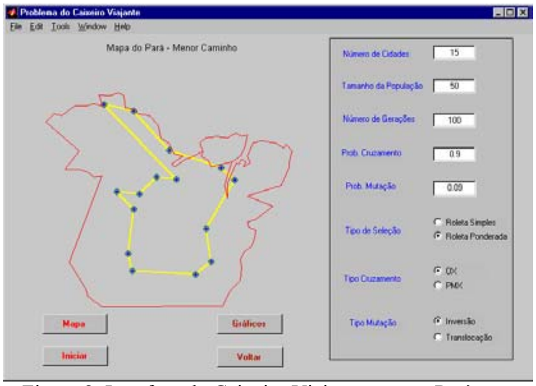

Figura 8: Interface do Caixeiro Viajante com os Parâmetros Escolhidos e o Menor Caminho obtido pelo AG

través de várias simulações, o usuário poderá verificar que os tipos de cruzamento e de mutação não exercem influências significativas na velocidade de convergência do AG. Por outro lado, a utilização da estratégia elitista neste problema é de extrema importância, pois garante que o melhor indivíduo (menor caminho) não seja perdido durante os processos de seleção, cruzamento e mutação. Já o tipo de seleção tem uma grande influencia na velocidade de convergência do AG.

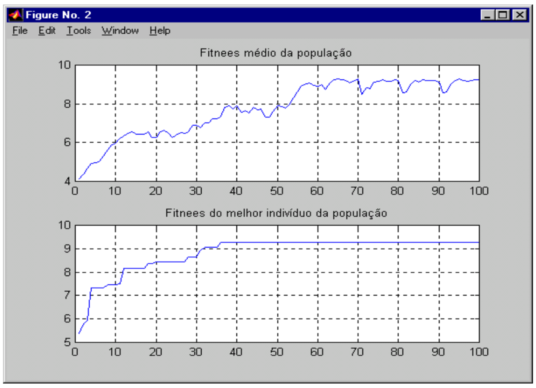

Figura 9: Gráfico da Média e do Melhor Indivíduo a cada Geração para o Caixeiro Viajante

Otimização de Função

Para a Otimização de Função, digitou-se uma função de duas variáveis e escolheu-se a opção maximizar, definindo-se também o intervalo de busca da solução, como mostrado na figura 10.

A figura 10 mostra os parâmetros necessários para executar o AG. Depois de iniciar o AG, observa-se um gráfico em 3D, onde o ponto em vermelho é o valor obtido pelo AG e o ponto em azul é o valor máximo da função.

Na figura 11, observar-se o *fitness* médio e *fitness* do melhor indivíduo da população por geração. Neste ultimo,

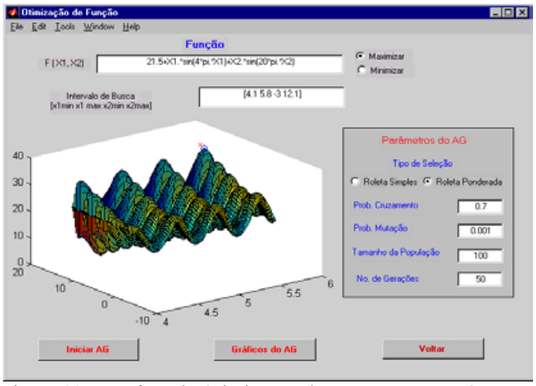

Figura 10: Interface da Otimização da Função com Parâmetros

verifica-se que o ponto máximo da função é obtido na geração 18. A partir da geração 35, observa-se através do gráfico, *fitness* médio, que há uma grande variação na curva da adaptação média da população. Isto ocorre devido a estratégia adotada nas implementações do AG, na qual há um grande aumento na probabilidade de mutação dos indivíduos da população, quando o valor do *fitness* do melhor individuo é mantido por algumas gerações.

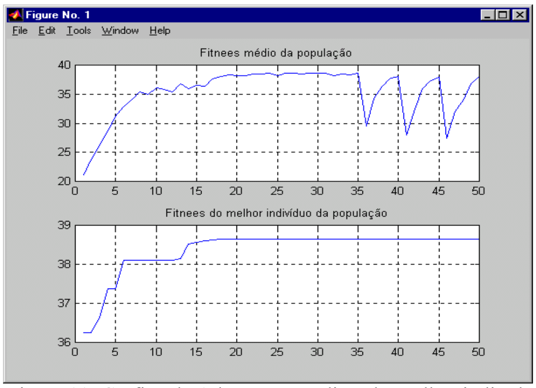

Figura 11: Gráfico da Adaptação Média e do Melhor indivíduo por Geração da Otimização de Função.

Sintonização do PID

Na sintonização do PID, utilizou-se uma planta de 2ª ordem com pólos complexos e conjugados em –0,6 ± j1,9079 e sem zeros, cuja resposta ao degrau é mostrado na figura 12. Na implementação do Algoritmo Genético para esta aplicação, a planta e o controlador PID são discretizados com período de amostragem de 0.05 segundos.

Os parâmetros do AG implementado para sintonizar o Controlador PID e os limites de K_p, K_i e K_d estão mostrados na figura 13, onde se tem o gráfico de saída da planta com o controlador PID, no qual se observa uma redução consideravelmente no número de oscilações e na amplitude do sobressinal do sistema. Observa-se também que o sistema não tem erro em regime permanente, o que era de se esperar por causa da parte integral do controlador. Para esta situação, o AG obteve os seguintes valores dos parâmetros do Controlador PID: Kp=3.56, Ki=2.45 e Kd=0.62.

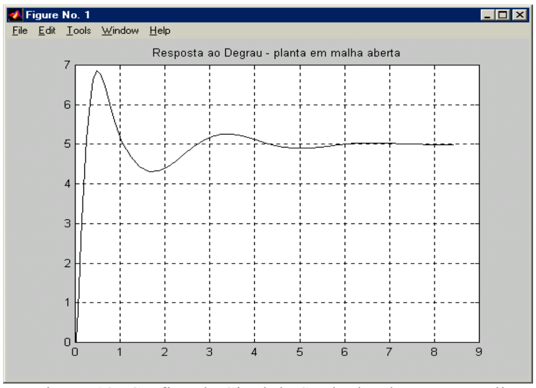

Figura 12: Gráfico do Sinal de Saída da Planta em Malha Aberta

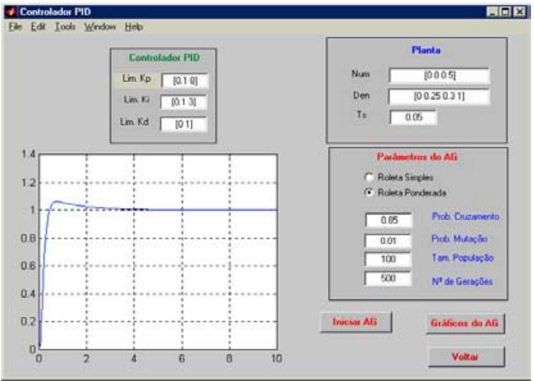

Figura 13: Interface da Sintonização do PID com o Gráfico de Saída da Planta com o Controlador Sintonizado.

Na figura 14 têm-se o *fitness* médio e o *fitness* do melhor indivíduo por geração. Nela pode-se observar que na geração 50 o AG consegue convergir, adaptando sempre o melhor indivíduo da geração anterior à próxima (elitista), melhorando assim o desempenho do controlador.

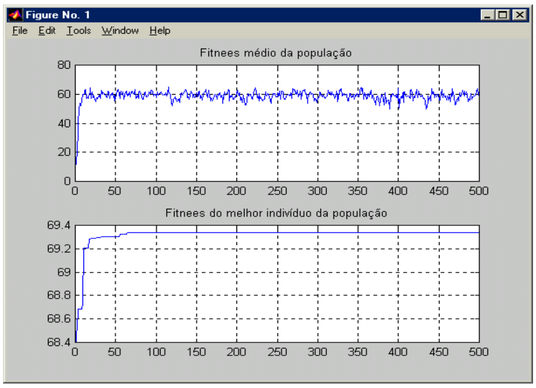

Figura 14: Gráfico da Média e do Melhor Indivíduo por Geração

CONCLUSÕES

As interfaces criadas para a simulação de várias técnicas de implementação de AG foram bastante satisfatórias, conseguindo-se fazer adaptações e colher resultados bastante interessantes, além de se ter conseguido criar interfaces simples e interativas com os usuários.

Observou-se também que as estratégias utilizadas no Algoritmo Genético mostram-se bastante eficazes na solução de problemas de otimização de funções, entre outros. Entretanto, o tempo de processamento gasto para realizar todas as operações, tais como seleção, cruzamento e mutação, é relativamente alto e aumenta consideravelmente quando o número de indivíduos da população cresce. Portanto, a utilização do AG's na forma híbrida, como por exemplo: métodos matemáticos de otimização-AG, RNA-AG, Lógica Fuzzy-AG, podem ser uma ótima opção, para superar esta dificuldade.

PROJETO DE GRADUAÇÃO EM ENGENHARIA QUÍMICA/UNISANTA

Deovaldo de Moraes Júnior[1]*, Luiz Renato Bastos Lia*[2]*, Gilmar Alcantara*[3]*, Volnei de Lemos*[4] *e Marlene Silva de Moraes* [5]

Resumo *— Criativos, empreendedores, inovadores, atualizados, ousados, éticos, bem-humorados, flexíveis e que gostem de trabalhar em equipe, são alguns dos requisitos considerados básicos para um bom profissional, além de uma formação técnica abrangente na área. Objetivando contribuir com o desenvolvimento destes predicados comportamentais-sociais e multidisciplinares dos graduandos do curso de Engenharia Química da UNISANTA, foi criada as disciplinas Projeto de Graduação em Engenharia Química I e II.*

Palavras chave — Engenharia química, projeto de, graduação, trabalho de conclusão de curso, requisitos comportamentais-sociais e multidisciplinares.

INTRODUÇÃO

O Curso de Graduação em Engenharia Química da Universidade Santa Cecília contempla no nono ciclo da grade curricular a disciplina denominada Projeto de Graduação em Engenharia Química I (PGEQ I) e no décimo e último ciclo a disciplina PGEQ II. A primeira tem por objetivo apresentar, com laboratórios, trabalhos teóricos em grupos, miniexposições orais pelos alunos e pelo docente, o caráter interdisciplinar dos fundamentos desenvolvidos nos oito ciclos anteriores. Objetiva também aplicar estes conceitos multidisciplinares para o projeto, seleção e análise dos principais equipamentos e acessórios de indústrias químicas, petroquímicas, alimentícias e estações de tratamento de efluentes visando fornecer os fundamentos práticos e teóricos para a disciplina PGEQ II. Esta última disciplina enfatiza a criação, o empreendedorismo, o trabalho em grupo, o desenvolvimento da metodologia científica, a pesquisa bibliográfica a apresentação oral (com vários ensaios ao longo do semestre) e a redação de um trabalho científico oriundo de experimento em laboratório livre com um ou mais equipamentos na escala de bancada. Os grupos, de no máximo quatro alunos, possuem um ou dois professores orientadores e recebem suporte de oficina mecânica, elétrica/eletrônica e de computação. Os graduandos apresentam e defendem os trabalhos perante uma banca examinadora composta de pelo menos dois professores ou engenheiros de indústrias da região especialistas no assunto.

Projeto de Graduação em Engenharia Química I

A disciplina semestral PGEQ I, com uma aula por semana, possui uma carga total de 68 horas/semestre.

O desenvolvimento de todos os tópicos desta disicplina se inicia no Laboratório de Engenharia Química (Figura 1) junto com o equipamento ou a planta em estudo onde se discute, com a participação de todos os alunos, a aplicação, os fundamentos teóricos e o equacionamento da unidade ou do processo (motivação e desenvolvimento da exposição oral). O tópico é concluído com problemas e projetos resolvidos em grupos pelos graduandos. A resolução pelos grupos se inicia na sala de aula (acompanhamento continuo do aprendizado e aperfeiçoamento da sociabilidade).

A Tabela 1 apresenta, como exemplo, a programação do curso ministrado no primeiro semestre de 2002.

TABELA 1

PROJETO DE GRADUAÇÃO 1. PRIMEIRO SEMESTRE DE 2002

Aula	Laboratório	Tópico abordado
1	a) Medidores de massa, vazão, (placa de orifício, venturi, rotâmetro, vertedouro e calha parshall), pressão, temperatura, concentração, potência, viscosidade, massa específica e b) Sedimentador contínuo.	ESTÁTICA DOS FLUIDOS E BALANÇO DE MASSA EM REGIME PERMANENTE COM E SEM REAÇÃO
2	a) Tanque com diluição de sal e b) Tanque com várias alimentações e saídas	BALANÇO DE MASSA EM REGIME TRANSIENTE
3	a) Medidores de força, potência e corrente elétrica; b) Caldeira; c) Evaporador; d) Compressor; e) Turbina; f) Válvula de expansão e g) Bocal	BALANÇO DE ENERGIA, ENTALPIA
4	a) Geladeira; b) Ar condicionado e c) Unidade com bomba, caldeira, evaporador, condensador e torre de resfriamento	CICLO DE REFRIGERAÇÃO E CICLO DE VAPOR
5	a) Tanque com aquecimento e b) Termômetro de precisão	BALANÇO DE ENERGIA EM REGIME TRANSIENTE

20	Defesa do trabalho.

As disciplinas PGEQ I e II são ministradas no Laboratório de Engenharia Química da UNISANTA (Figura 1, www.quimica.unisanta.br) em uma área aproximada de 500m^2 contendo mais de 40 equipamentos didáticos diferentes, uma oficina mecânica para construção e manutenção destas unidades de ensino, uma sala para computadores, uma sala de aula com equipamentos em miniaturas e maquetes e uma sala de projeto com mais de 700 livros específicos de Engenharia Química. O suporte bibliográfico para as disciplinas supracitados também é fornecido pela Biblioteca Central da Universidade com acervo aproximado de 80 000 volumes.

Figura 1 – Laboratório de Engenharia Química da UNISANTA.

CONCLUSÃO

A boa avaliação destas duas disciplinas feita pelos graduandos, o número crescente de contratações dos formandos por empresas que realizam provas técnicas e dinâmica de grupo e a apresentação e publicação de vários dos trabalhos desenvolvidos na PGEQ II em congressos de iniciação científica, são indicadores positivos da adequação da técnica adotada.

USO DE ENSAIOS EM LABORATÓRIO COMO FERRAMENTA METODOLÓGICA NO ENTENDIMENTO DO PROCESSO DE ADSORÇÃO

Frede O. Carvalho[1]; Christiano C. Rodrigues[2]; Selêude W Nóbrega[3] e Deovaldo M. Júnior[4]

Resumo — *A adsorção é uma operação unitária muito importante na Engenharia Química devido a sua flexibilidade de poder ser usada como uma técnica de separação de tratamento de efluentes. Apesar desta importância, a adsorção ainda não é explorada nos cursos de graduação como a destilação, evaporação e outras operações unitárias. Dentro deste contexto, este trabalho tem como objetivo apresentar um experimento de montagem simples para a determinação da curva de adsorção de um gás em um leito fixo (curva de ruptura). A montagem experimental é composta de uma coluna em aço inox aquecida por resistência elétrica. O leito é formado por partículas de carvão ativado, adsorvente comum e fácil de ser encontrado. Quanto à mistura gasosa utiliza-se o ar e gás amoníaco, que são facilmente encontrados em cilindros nas distribuidoras de gases. A montagem experimental possui ainda válvulas para o controle da vazão dos gases, medidores de vazão e indicadores de temperatura. Os ensaios consistem na determinação da concentração do gás amoníaco na saída do leito, usando titulação em função do tempo. Estes dados são usados para a construção da curva de ruptura que junto com um balanço de massa no leito possibilita o cálculo da capacidade que o leito tem de adsorver o gás amoníaco.*

Palavras-chaves — Adsorção, Operação Unitária, Leito Fixo.

INTRODUÇÃO

O primeiro registro do uso da adsorção se deu na antiguidade, quando se observou o fato de que a água mudava de gosto quando entrava em contato com a madeira queimada [1].

Durante o século XV descobriu-se que alguns materiais possuíam a característica de remover cor de soluções, porém apenas no final do século XVIII utilizou-se comercialmente carvão obtido a partir da queima de ossos para descolorir soluções de açúcar. No entanto, a adsorção só foi usada em escala comercial no início deste século, quando em 1920 as empresas Bayer (Alemanha) e Union Carbide (Estados Unidos) utilizaram esta técnica para recuperação de vapores orgânicos [1].

As referências [1] a [4], entre outras, apresentam definições para o fenômeno da adsorção que podem ser resumidas da seguinte forma: processo de transferência de massa, no qual uma mais substância (adsorvato) presente em uma corrente gasosa ou líquida é transferida de forma seletiva para a superfície de um sólido poroso (adsorvente).

A adsorção pode ser de dois tipos: física ou química. Na adsorção física, também chamada de fissorção, o processo envolve apenas forças físicas, enquanto na adsorção química, também conhecida por quimissorção, o processo envolve reação química.

A adsorção física ocorre quando as moléculas de uma substância são retidas na superfície de um sólido adsorvente, devido à existência de forças físicas, em especial as de Van der Waals, sem a ocorrência de reação química. Neste tipo de adsorção a superfície do adsorvente é coberta com uma camada de moléculas do adsorvato e sobre esta camada outras podem ser depositadas. Este tipo de fenômeno é muito rápido e permite a recuperação do adsorvato através do processo inverso (dessorção), por diminuição da pressão ou aumento da temperatura do sistema, permitindo assim a recuperação do adsorvato e regeneração do adsorvente para posterior reutilização [2].

A recuperação do adsorvato através da dessorção é possível porque na adsorção física as forças de atração envolvidas são mais fracas que as ligações químicas. Em alguns casos a recuperação do adsorvato não é uma prática usual. Dessa forma, o mesmo pode ser removido do adsorvente por destruição térmica ou outra reação química, ou ainda em outros casos o adsorvente impregnado pelo adsorvato é simplesmente descartado [1].

A adsorção química envolve a transferência ou compartilhamento de elétrons entre o adsorvato e o adsorvente, como em compostos químicos. Como uma reação química ocorre entre o adsorvato e o adsorvente, um novo composto é formado na superfície do sólido. A ligação de uma substância quimissorvida sobre a superfície do adsorvente é em geral muito forte, o que torna o processo praticamente irreversível. Assim, a substância quimissorvida não pode retornar a condição inicial através da dessorção, seja pelo aumento da temperatura ou pela diminuição da pressão do sistema. Durante a quimissorção, as moléculas das substâncias removidas são ligadas à superfície do sólido de modo que somente a camada superficial reage e as camadas internas do adsorvente permanecem inutilizadas [2].

A adsorção pode ser realizada em diferentes configurações, no que se refere a sua operação. Entretanto as mais usadas são o reator de mistura para líquidos ou a coluna com leito fixo para líquidos, gases e vapores.

A configuração mais simples de uma unidade adsorvedora é o reator de mistura. Neste tipo de configuração o adsorvente (sólido particulado) é misturado com a corrente líquida contendo o adsorvato até ser alcançado o equilíbrio. Atingido o equilíbrio, as duas fases

[1] Frede Oliveira Carvalho, DEQ/CTEC/UFAL - BR 104 Norte, Km 97 - Tabuleiro, 57.072-970, Maceió, AL, Brasil, fredo@mailbr.com.br
[2] Christiano Cantarelli Rodrigues, DEQ/CTEC/UFAL - BR 104 Norte, Km 97 - Tabuleiro, 57.072-970, Maceió, AL, Brasil, ccr@ctec.ufal.br
[3] Selêude Wanderley da Nóbrega, DEQ/CTEC/UFAL - BR 104 Norte, Km 97 - Tabuleiro, 57.072-970, Maceió, AL, Brasil, swn@ctec.ufal.br
[4] Deovaldo Moraes Júnior, UNISANTA, Rua Oswaldo Cruz, 266 - Boqueirão, 11.045-907, Santos, SP, Brasil, deovaldo@stcecilia.br

são separadas para tratamento posterior ou disposição final. Entretanto este tipo de configuração não é muito eficiente e, para melhorar a eficiência, é necessário o uso de mais de uma unidade em série [5].

O adsorvedor com configuração do tipo coluna com leito fixo e operação contínua é o mais usado para líquidos, gases ou vapores. Nesta configuração a unidade consiste de uma coluna com leito adsorvente fixo através do qual a corrente do fluido a ser tratado passa continuamente. O fluido é alimentado até que a concentração do adsorvato na saída da coluna alcance um valor pré-determinado ou o valor da concentração na alimentação, definindo assim a saturação do leito. Em geral opera com duas colunas, de forma a permitir que enquanto uma esteja em operação de adsorção a outra esteja em dessorção ou manutenção. A Figura 1 apresenta um desenho esquemático de uma unidade de adsorção com leito fixo [5]-[6].

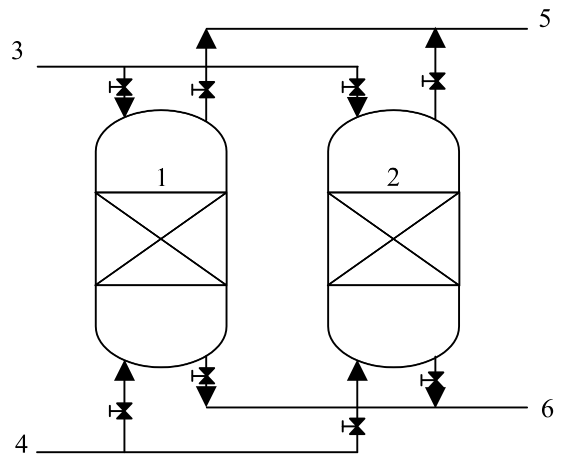

FIGURA 1
ESQUEMA DE UMA UNIDADE ADSORVEDORA: 1) E 2) ADSORVEDORES; 3) ENTRADA DO GÁS A SER PURIFICADO; 4) ENTRADA DO GÁS REGENERADOR; 5) SAÍDA DO GÁS REGENERADOR COM O ADSORVATO; 6) SAÍDA DO GÁS PURIFICADO

O processo de adsorção é muito complexo e depende da natureza química e física do adsorvato e do adsorvente em questão. Dessa forma é muito difícil generalizar o projeto de uma unidade adsorvedora e, em geral, os projetos são feitos baseados em experiências com outros casos similares ou a partir de experimentos em laboratórios ou plantas pilotos [7]. Além da necessidade do conhecimento da natureza química e física do sistema, é necessário também o conhecimento dos parâmetros de equilíbrio e da taxa de adsorção suportada pelo adsorvente. Estas informações são, usualmente, determinadas em experimentos em escala de laboratório [5].

A adsorção tem sido usada com destaque no controle da poluição por gases ou líquidos ou processos de separação, sendo aplicada por exemplo na purificação de gases de exaustão, recuperação de solventes orgânicos e fracionamento de gases [4].

Assim, pelo exposto, o projeto e a análise de uma unidade adsorvedora requer o conhecimento de diversas informações como as características do adsorvente, as relações de equilíbrio entre o adsorvato e adsorvente, a dinâmica do processo, as condições de operação e os conceitos para a ampliação de escala do adsorvedor desde uma unidade de bancada até uma unidade em escala comercial.

Dentro deste contexto, este trabalho tem como objetivo apresentar uma metodologia relativamente simples, para a realização de ensaios de adsorção que permitam a determinação de alguns parâmetros de projeto de uma coluna adsorvedora.

MATERIAIS E MÉTODOS

Material Adsorvente

O adsorvente utilizado foi carvão ativado comercial de biomassa, produzido a partir da casca de coco. Esse material foi inicialmente lavado com água para a retirada do pó mais fino, gerado no processo de produção do mesmo, que fica aderido às partículas maiores. Após secagem, o material foi classificado granulometricamente por peneiramento, permitindo assim uma separação do carvão por faixa de diâmetro de partículas. A faixa de diâmetro das partículas do carvão escolhida e utilizada neste trabalho foi de 1,2 mm a 1,4 mm.

A preocupação em usar um carvão com uma estreita faixa granulométrica, resulta das conclusões apresentadas por [8] que mostram como uma das maiores dificuldades de operação com leito fixo não consolidado, a obtenção da reprodutibilidade e homogeneidade do empacotamento do leito. Assim, para minimizar este problema, o autor recomenda a utilização de um recheio com menor variação possível do diâmetro das partículas, para que o mesmo apresente um empacotamento mais uniforme.

Mistura Gasosa

A mistura gasosa foi produzida usando gás amoníaco (NH_3) puro (99,9%) em cilindros e ar comprimido alimentado de um compressor, que antes de ser misturado com o gás amoníaco passava por um filtro com válvula reguladora de pressão e um leito de sílica gel para eliminação de impurezas e umidade, respectivamente.

Unidade Experimental

A Figura 2 apresenta um desenho esquemático da unidade experimental usada. A mesma é composta, basicamente, por uma coluna de adsorção, um sistema de aquecimento com controle de temperatura, medidores de vazão, frascos absorvedores, medidor de pressão e válvulas.

A coluna de adsorção foi construída em aço inox com 47 mm de diâmetro interno e 400 mm de altura. Na base da coluna foi fixada uma tela de aço inox para servir de suporte ao adsorvente. A 200 mm da base da coluna foi fixado um termopar (item 12 na Figura 2) para medir e permitir o controle da temperatura no interior do leito adsorvente durante os ensaios de adsorção.

O aquecimento do leito foi feito usando uma resistência elétrica, recoberta com miçangas de cerâmica e enrolada ao longo da coluna (item 2 na Figura 2). O isolamento térmico da resistência foi feito por uma manta de fibra de vidro coberta com alumínio corrugado. Esta resistência foi ligada a um controlador de temperatura digital tipo PID modelo Incon CNT 110 (item 10 na Figura 2) que mantinha constante a temperatura no leito.

A unidade possui ainda duas tampas em aço inox para fechar a coluna, com pontos para medida de pressão. A pressão nestes pontos foi medida usando um manômetro digital modelo TSI-MD200D (item 9 na Figura 2). Acoplada a coluna existiam tubulações para entrada e saída da mistura gasosa e rotâmetros (item 4 na Figura 2) para medida das vazões do ar e do gás amoníaco.

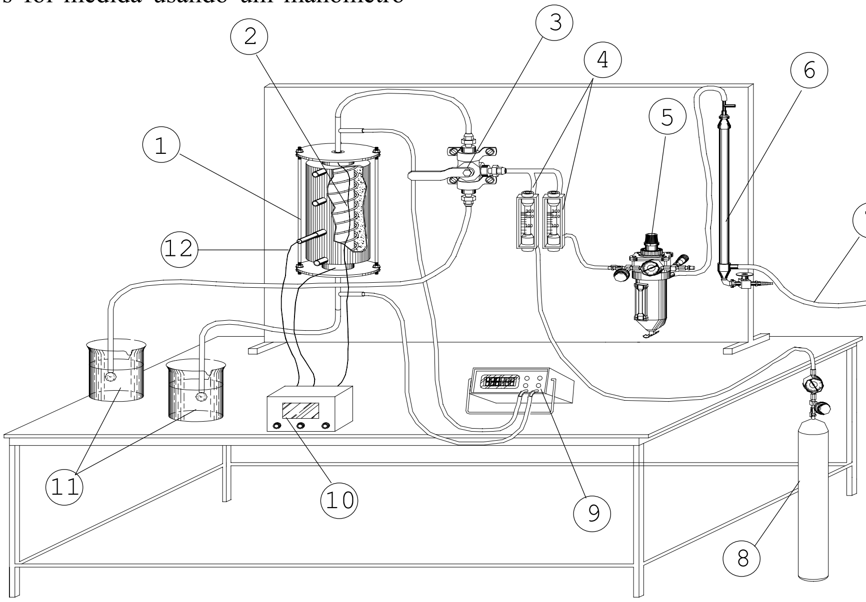

FIGURA 2
UNIDADE EXPERIMENTAL: 1) COLUNA; 2) RESISTÊNCIA ELÉTRICA; 3) VÁLVULA CONTROLADORA DE FLUXO; 4) ROTÂMETROS; 5) VÁLVULA CONTROLADORA DE PRESSÃO DO AR; 6) FILTRO DO AR; 7) LINHA DE AR COMPRIMIDO; 8) CILINDRO DE GÁS AMONÍACO; 9) INDICADOR DE PRESSÃO; 10) CONTROLADOR DE TEMPERATURA; 11) ABSORVEDORES; 12) TERMOPAR.

Medida da Concentração do Gás Amoníaco

A determinação da concentração do gás amoníaco foi feita por titulação, borbulhando-se por um tempo fixo de 1 min a mistura gasosa ar-gás amoníaco em 50 ml de uma solução de ácido bórico gelado. Durante o borbulhamento da mistura gasosa na solução de ácido bórico, a seguinte reação acontece:

$$H_3BO_{3(l)} + NH_{3(g)} \rightarrow NH_4H_2BO_{3(l)} \qquad (1)$$

Após a formação do $NH_4H_2BO_3$, a solução que é incolor assume uma cor marrom com a adição do indicador (solução alcoólica a 1% de verde de bomocresol e vermelho de metila). Esta solução é então titulada com ácido clorídrico padronizado, até que sua coloração mude para verde, quando a seguinte reação acontece:

$$NH_4H_2BO_{3(l)} + HCl_{(l)} \rightarrow H_3BO_{3(l)} + NH_4Cl_{(l)} \qquad (2)$$

Assim, pode-se calcular a concentração do $NH_4H_2BO_3$ através da seguinte equação:

$$V_{NH_4H_2BO_3} . M_{NH_4H_2BO_3} = V_{HCl} . M_{HCl} \qquad (3)$$

na qual $V_{NH_4H_2BO_3}$ é o volume do borato de amônia, $M_{NH_4H_2BO_3}$ é a molaridade do borato de amônia, V_{HCl} é o volume do ácido clorídrico e M_{HCl} é a molaridade do ácido clorídrico.

Com a concentração do $NH_4H_2BO_3$ calculada, é possível determinar a massa de amônia presente na solução, após o borbulhamento da mistura gasosa, usando a seguinte equação:

$$m_{NH_3} = M_{NH_4H_2BO_3} . V_{NH_4H_2BO_3} . PM_{NH_3} \qquad (4)$$

na qual m_{NH_3} é a massa de amônia e PM_{NH_3} é o peso molecular da amônia.

Calculada a massa de amônia, determina-se a concentração do gás amoníaco na mistura gasosa dividindo-se a massa pelo volume de gás borbulhado na solução de ácido bórico através da seguinte equação:

$$C_{NH_3} = \frac{m_{NH_3}}{Q_T . t_b} \qquad (5)$$

na qual C_{NH_3} é a concentração da amônia, Q_T é a vazão total da mistura gasosa e t_b é o tempo de borbulhamento.

Ensaios de Adsorção

Os ensaios de adsorção realizados para a construção das curvas de ruptura usaram as condições de operação apresentadas na Tabela 1.

TABELA 1

CONDIÇÕES DOS ENSAIOS DE ADSORÇÃO

Variáveis	Valores Utilizados
C_o [ppm]	600; 1200; 1800; 2400
T_L [ºC]	40
M_L [g]	100
Q_T [l/h]	160

Uma massa fixa de carvão previamente seca em estufa era pesada e colocada na coluna de adsorção. O preenchimento da coluna com o carvão era feito sempre da mesma maneira, procurando manter constante a altura de queda do carvão na coluna, seguida de batidas na mesma, a fim de que o leito obtido fosse o mais homogêneo e reprodutível possível [8].

Após a montagem do leito e da coluna iniciava-se o aquecimento, fixando-se no controlador de temperatura (item 10 na Figura 2) o valor desejado para o ensaio de adsorção em questão. Atingida a temperatura pré-fixada, alimentava-se ar puro ao leito com a mesma vazão total da mistura gasosa (ar-gás amoníaco) a ser usada na adsorção, com o objetivo de ajustar a temperatura do leito e as perdas de carga na linha de alimentação da coluna e de medida da concentração inicial nas condições de operação. Estabilizada a temperatura, a alimentação do ar era desviada da coluna de adsorção para um frasco absorvedor e, iniciava-se então a alimentação do gás amoníaco puro na linha de ar com uma vazão conhecida, objetivando produzir uma mistura com a concentração inicial (C_0) desejada. Após o início da alimentação do gás amoníaco na linha de ar, media-se a concentração do mesmo na corrente gasosa. Quando a concentração atingia o valor desejado, media-se a concentração por mais três vezes em intervalos de 10 minutos e, se o valor permanecesse constante, a mistura era então desviada para a coluna de adsorção. Caso contrário, faziam-se ajustes na vazão do gás amoníaco e novas medidas da concentração eram feitas, até que o valor desejado fosse alcançado. As concentrações de entrada C_0 experimentais tiveram um pequeno desvio em relação às fixadas na Tabela 1.

Após o início da alimentação da mistura gasosa na coluna, media-se a concentração de saída (C) a cada 5 minutos até que a concentração na saída (C) fosse igual à concentração na entrada (C_0).

Terminado o período de adsorção, a alimentação da mistura gasosa era interrompida, o aquecimento desligado e a coluna desmontada para limpeza e o início de um novo ensaio. Os dados obtidos para a concentração de saída em função do tempo de adsorção e da concentração de entrada, foram utilizados na construção das curvas de ruptura de cada ensaio.

Em geral, as curvas de ruptura típicas do processo de adsorção apresentam o formato de "S". Assim, a partir dos dados experimentais, foram feitos ajustes para cada ensaio, usando-se uma equação do tipo sigmoidal, para encontrar uma expressão que representasse a relação de C/C_0 em função de t. A expressão usada foi:

$$\frac{C}{C_0} = \frac{t}{t + A' e^{-B' t}} \qquad (6)$$

na qual C é a concentração do adsorvato na fase fluida na saída da coluna, C_0 é a concentração do adsorvato na fase fluida na entrada da coluna, t é o tempo de adsorção e A' e B' parâmetros de ajuste de (6).

Os dados experimentais de todos os ensaios foram usados para ajustar (6), estes ajustes foram utilizados nos cálculos referentes às curvas de ruptura.

Cálculo da Capacidade de Adsorção

A capacidade de adsorção pode ser calculada usando as curvas de ruptura e um balanço de massa no leito [3].

A massa adsorvida pelo leito pode ser calculada usando a seguinte expressão:

$$M_{ads} = M_e - M_s \qquad (7)$$

na qual, M_{ads} é a massa de adsorvato adsorvida, M_e é a massa do adsorvato que entra no leito e M_s é a massa do adsorvato que sai do leito.

As massas do adsorvato que entra e sai no leito podem ser representadas por (8) e (9) respectivamente:

$$M_e = Q_T C_0 t \qquad (8)$$

$$M_s = Q_T C_o \int_0^t \frac{C}{C_o} dt \qquad (9)$$

nas quais Q_T é a vazão total da mistura gasosa.

Substituindo-se (8) e (9) em (7), obtém-se a expressão para o cálculo da M_{ads}:

$$M_{ads} = Q_T C_o \int_0^t \left(1 - \frac{C}{C_o} \right) dt \qquad (10)$$

Com a massa adsorvida, calculada a partir de (6) e (10), pode-se determinar a capacidade de adsorção do leito dividindo-se a massa adsorvida pela massa do leito:

$$W = \frac{M_{ads}}{M_L} \qquad (11)$$

na qual W é a capacidade de adsorção do leito e M_L é a massa do leito.

A capacidade de adsorção foi determinada como sendo a máxima na condição de saturação definida para a razão de C/C_0 igual a 0,95.

Determinação das Isotermas de Adsorção

As isotermas de adsorção foram construídas usando os valores das capacidades máximas de adsorção do gás amoníaco, calculadas por (11), em função da concentração de entrada do gás amoníaco na mistura gasosa.

Após a construção das isotermas de adsorção, foi feito um ajuste usando-se os modelos de isotermas propostos por Langmuir e Freundlich [9], representados por (12) e (13), respectivamente:

$$W = \frac{W^0.b.C_o}{1 + b.C_o} \quad (12)$$

$$W = K_F C_0^{\frac{1}{n}} \quad (13)$$

nas quais b é o coeficiente de adsorção de Langmuir, W^0 é a concentração do adsorvato no adsorvente para uma cobertura total dos poros disponíveis, K_F é a constante característica da isoterma de Freundlich e n é o expoente da isoterma de Freundlich.

RESULTADOS E DISCUSSÕES

A Figura 3 mostra que de uma forma geral os ensaios produziram curvas de ruptura típicas para o processo de adsorção, com um formato de "S". Os dados das curvas mostradas na Figura 1 foram usados para ajustar (6). Todos os ajustes apresentaram um coeficiente de correlação (R^2) superior a 0,98. Este valor para o coeficiente de correlação, é um indicativo de que a equação de ajuste do tipo sigmoidal escolhida, representou de forma coerente os dados experimentais.

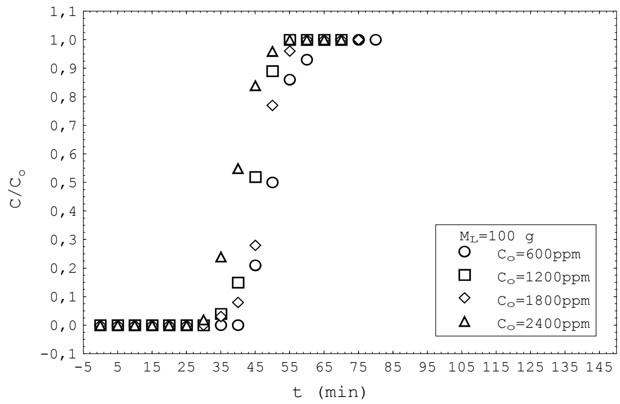

FIGURA 3
CURVAS DE RUPTURA

A partir das curvas de ruptura e dos resultados dos ajustes de (6), foi determinada a massa do gás amoníaco adsorvida (M_{ads}) na condição de saturação (C/C_0=0,95) em cada ensaio usando (10) e a capacidade de adsorção do leito (W) usando (11). Estes resultados foram usados para construir a isoterma de adsorção, apresentada na Figura 4.

A curva obtida foi comparada aos modelos de isotermas de Langmuir (12) e Freundlich (13). A Tabela 2 apresenta os parâmetros de ajuste de cada modelo de isoterma bem como o coeficiente de correlação (R^2) para cada ajuste. Os resultados apresentados na Figura 4 e Tabela 2 mostram que os pontos experimentais podem ser representados de forma coerente pelos dois modelos de isotermas usados. A determinação da isoterma experimental e a escolha de um modelo ou equação que represente esta isoterma é essencial, pois as isotermas são largamente usadas nos projetos de unidades adsorvedoras e na modelagem de sistemas de adsorção.

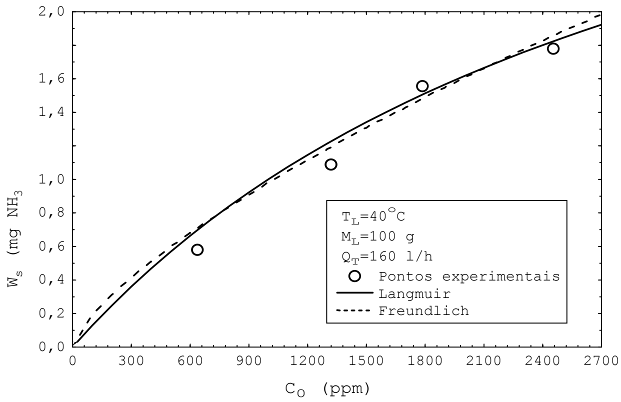

FIGURA 4
ISOTERMA DE ADSORÇÃO

TABELA 2
PARÂMETROS DE AJUSTE DA ISOTERMA DE ADSORÇÃO

Langmuir		
W^0	b	R^2
4,034	3,17 x 10^{-4}	0,993
Freundlich		
K_F	n	R^2
3,5 x 10^{-3}	1,245	0,994

CONCLUSÕES

A partir dos resultados obtidos e da discussão apresentada, pode-se concluir que os objetivos propostos neste trabalho foram satisfatoriamente alcançados, pois a unidade experimental e a metodologia usada permitiram a obtenção de dados que caracterizam a operação de adsorção, indicando que a realização destes ensaios de montagem relativamente simples é uma importante ferramenta para a fixação dos conceitos desta operação unitária importante na indústria química.

ORGANIZAÇÕES DE AGENTES NO APOIO AO ENSINO-APRENDIZAGEM DE COMPUTAÇÃO

Aleksandra do S. Silva[1], Silvana Rossy de Brito[2], Arturo Hernández Domínguez[3] , Eloi Luiz Favero[4], Orivaldo de Lira Tavares[5] e Crediné Silva de Menezes[6]

Resumo — *Este artigo apresenta dois ambientes de aprendizagem modelados com metodologias que adotam a visão de estrutura organizacional na forma de agentes: O TUTA, um sistema tutor inserido na Arquitetura de uma Classe Virtual Adaptativa (ACVA) para aprendizagem colaborativa de orientação a objetos e o MEDIADOR, um ambiente multiagente para apoio a aprendizagem orientada a projetos, com suporte inteligente à mediação, utilizado no contexto da disciplina de compiladores. Na metodologia utilizada, a idéia é comparar um sistema baseado em agentes a uma organização humana constituída de papéis como "aprendiz", "professor" (ou "mediador"), "monitor" e assim por diante. A metodologia utilizada nos dois ambientes fornece uma notação que oferece suporte às características de continuidade temporal, autonomia, reatividade, flexibilidade e pró-atividade dos agentes modelados e implementados. As arquiteturas resultantes desses trabalhos são mostradas de acordo com as vantagens e desvantagens observadas.*

Palavras-chave — *TUTA, MEDIADOR, ambientes de aprendizagem, sistemas multiagentes, compiladores, orientação a objetos, metodologia orientada a agentes.*

I. INTRODUÇÃO

A ampla utilização das redes de computadores tem favorecido significativas mudanças nos mecanismos de apoio ao processo de ensino-aprendizagem.

No contexto da computação, o ensino precisa de inovações, porque envolve conhecimentos cuja aprendizagem requer grande esforço cognitivo para aprender assuntos como programação de computadores, utilização de softwares, bem como o manuseio de softwares específicos [9]. Elaborar soluções algorítmicas para problemas reais, utilizando um conjunto de comandos de uma linguagem exige do aluno diversos conhecimentos como capacidade de abstração e organização das idéias, conhecimentos e habilidades que caracterizam um programador como perito [10].

Segundo Rodrigues et al. [9], a prática de ensino de computação é afetada pela inexistência de literatura de referência sobre construção e utilização de metodologias e materiais didáticos para o ensino de computação, pela escassez de professores com capacitação específica para ensinar computação e pela ignorância sobre as potencialidades das tecnologias educacionais, especialmente da multimídia e dos softwares de autoria que são recursos indispensáveis ao processo ensino-aprendizagem [10]. O desafio tem sido, atualmente, a adoção de suportes computacionais que conduzam a um processo de construção do conhecimento ao mesmo tempo em que destacam a importância da aprendizagem colaborativa e cooperativa [16].

Nos últimos anos, é freqüente a utilização da tecnologia de agentes no projeto e construção de ambientes de aprendizagem informatizados, devido às potencialidades que incorporam em tais ambientes. A adequação do paradigma de agentes para o desenvolvimento de ambientes de aprendizagem pode ser demonstrada pelo poder de abstração desse paradigma para se construir aplicações complexas [14]. Esse paradigma permite a modelagem de entidades autônomas que, juntas, cooperam para atingir um objetivo comum[14]. Assim, ambientes de aprendizagem podem ser observados como organizações onde interagem agentes humanos e agentes artificiais [8].

Este artigo apresenta duas aplicações desenvolvidas para apoiar o processo de ensino-aprendizagem de computação, modeladas sob a forma de estruturas organizacionais e discute as arquiteturas utilizadas e as vantagens e desvantagens dessas arquiteturas. Para isso, constitui-se de mais 5 seções distribuídas da seguinte forma: a seção 2 apresenta a modelagem de organizações de agentes em ambientes de aprendizagem; as seções 3 e 4 apresentam duas aplicações modeladas segundo a visão organizacional de agentes, a seção 5 apresenta as considerações sobre as arquiteturas projetadas e, finalmente, a seção 6 apresenta as conclusões finais desse artigo.

II. ORGANIZAÇÕES DE AGENTES EM AMBIENTES DE APRENDIZAGEM

Dentre as abordagens utilizadas na modelagem e construção de ambientes e softwares de apoio à aprendizagem, as metodologias que consideram a visão de sistema organizacional como abstração para a organização de agentes apresentam-se bastante apropriadas [14]. Essas metodologias são fundamentadas na visão de um sistema como uma organização computacional que consiste de vários papéis interagindo e são aplicáveis a uma grande variedade de sistemas, tratando dos aspectos nos níveis macro (de sociedade) e micro do agente.

No contexto da utilização de agentes em ambientes de aprendizagem, a idéia é comparar um sistema baseado em agentes a uma organização humana constituída de papéis como "aprendiz", "professor" (ou "mediador"), "monitor" e assim por diante. Assim, os papéis são instanciados como os indivíduos existentes: existirá um indivíduo que assume o papel de aprendiz, outro que assume o papel de professor ou monitor, entre outros. Porém, a instanciação não é necessariamente estática. Muitos indivíduos podem assumir o papel de "mediador", por exemplo. Além disso, não existe necessariamente um mapeamento um-para-um entre papéis e indivíduos. Também é possível que um indivíduo assuma muitos papéis, como um aprendiz também ser um "monitor". Da mesma forma, pode haver muitos indivíduos que assumam um único papel como, por exemplo, "observador" [14].

Dentre as metodologias que apóiam a visão de sistemas baseados em agentes como organizações tem-se as metodologias GAIA[17] e ZEUS [4]. A metodologia ZEUS [4] é direcionada para a construção de agentes utilizando-se uma ferramenta computacional. Essa metodologia, assim como a GAIA [17] é orientada a papéis, que atuam no sistema para realizar suas responsabilidades [1]. GAIA [17] e ZEUS [4] capturam aspectos como: a flexibilidade do agente, o seu comportamento autônomo, as interações e a complexidade das estruturas organizacionais nas quais os agentes estão inseridos.

Na GAIA [17], um papel é definido através de três atributos: responsabilidades, permissões, e protocolos. A influência da modelagem de papéis, apesar de estar diretamente relacionada com a análise e especificação de requisitos, se estende à fase de projeto no momento em que um agente executa vários papéis, e assim, durante o projeto, os papéis previamente identificados serão compostos em agentes e só então a funcionalidade associada com cada papel pode ser implementada.

III. TUTA

O TUTA [10] é um sistema tutor para um grupo de alunos virtual e está inserido na Arquitetura de uma Classe Virtual Adaptativa (ACVA) [7]. Esse tutor considera os princípios e modelos de um sistema tutor inteligente e o seu domínio no contexto da ACVA é representado pela reutilização de entidades didáticas (associadas a um domínio) contidas em um servidor.

A arquitetura ACVA prevê que uma Classe Virtual é composta por um grupo de camadas. Desta forma, o acoplamento das camadas *SF_Grupo* e *SF_Básicos* permitem que se tenha um sistema tutor dedicado a aprendizagem de um domínio em particular e associado a um determinado nível de conhecimento. Os principais elementos que devem fazer parte dessa camada são os seguintes (figura 1): o servidor de entidades didáticas associadas a um domínio, o comportamento dos alunos durante a sessão, que são considerados através dos perfis individuais e de grupo, o funcionamento do tutor do ponto de vista didático, o qual depende da recuperação e execução de estratégias didáticas e a interação amigável dos estudantes com o sistema tutor, que é controlada pela interface.

A modelagem do ambiente realizou-se através de duas etapas: a primeira fase orientada a agentes e a segunda fase orientada a objetos.

Utilizando a metodologia GAIA, os elementos do TUTA (Interface, Servidor de Entidades Didáticas, Estratégias Didáticas, Comportamento do Aluno, Comportamento do Grupo e Coordenador de Grupo), são comparados a departamentos, responsáveis pela execução das atividades de treinamento do TUTA.

Após a identificação dos agentes associados aos papéis e a comunicação entre eles propõe-se então a arquitetura detalhada do tutor baseada em agentes [13] baseada nos modelos de papéis, interações, agentes e comunicação da metodologia GAIA [9].

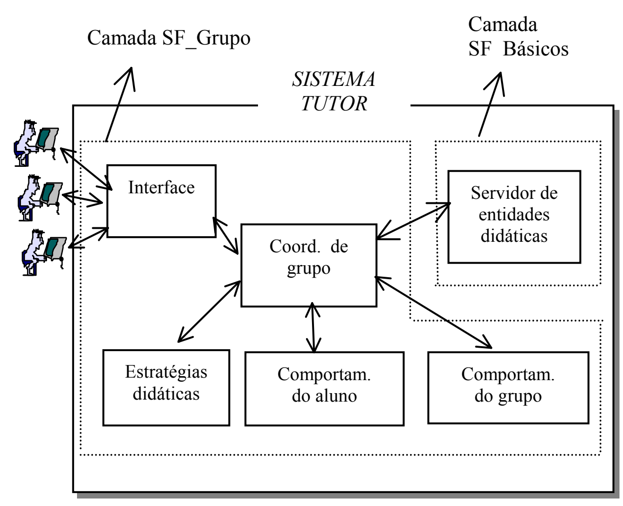

FIGURA 1
ELEMENTOS DO TUTOR NO CONTEXTO DA ACVA

O Funcionamento geral do TUTA ocorre da seguinte forma [10]: Presumindo que um *Professor* possua interesse em utilizar o TUTA para auxiliá-lo no ensino de Orientação a Objetos, ele então notifica o *Administrador do Sistema* a respeito do seu interesse. O *Administrador do Sistema*, após analisar a solicitação do *Professor*, autoriza-o a utilizar o sistema. A partir de então, o *Professor* poderá a qualquer momento, realizar a especificação de um curso; sessões; estratégias e entidades didáticas a serem utilizadas; e registrar os alunos e o grupo de alunos que podem participar do curso. Essa especificação deve ocorrer através do *Agente Interface Especificação Curso.* O *Agente Interface Especificação Curso,* por sua vez, solicitará que um dos agentes pertencente ao *Conjunto de Agentes* armazene os dados em suas respectivas bases de dados (*Sessões de Ensino*, *Estratégias Didáticas*, *Domínio*, *Perfil Aluno* e *Perfil Grupo*). A partir de então, torna-se possível a execução das sessões de um curso. Cada *Aluno*, após receber uma notificação de que haverá sessão, pode utilizar o sistema para participar de tal sessão, juntamente com os demais membros do *Grupo* e o *Professor*. A participação dos Alunos em uma sessão de treinamento do TUTA acontece através dos *Agentes Interfaces de Sessão*. Cada aluno possui o seu *Agente Interface Aluno* e o *Professor* também possui o seu *Agente Interface Professor.* A seguir, o *Conjunto de Agentes do TUTA* começa então a agir, conforme uma *Estratégia Didática* especificada pelo *Professor*.

O funcionamento de uma sessão de ensino no TUTA é determinado pelo módulo de estratégias (multi-estratégias) que permite a interpretação de qualquer estratégia definida pelo professor (armazenada em arquivo). Uma estratégia é representada via um conjunto de primitivas básicas que permitem a definição de um algoritmo-estratégia e o Módulo Didático é representado por um Servidor de Objetos Didáticos, que está associado aos objetos do domínio.

IV. MEDIADOR

Dentre as várias abordagens pedagógicas existentes, a pedagogia de projetos se apresenta como uma abordagem que valoriza a aprendizagem significativa, a cooperação e a colaboração entre aprendizes e mediadores [13]. Essa abordagem é particularmente adequada em disciplinas onde o desenvolvimento do projeto aparece de forma faseada, como é o caso do projeto de um compilador.

Na pedagogia de projetos, os projetos se constituem em planos de trabalho e conjunto de atividades que podem tornar o processo de aprendizagem mais dinâmico, significativo e interessante para o aprendiz, deixando de existir a imposição dos conteúdos de maneira autoritária. A partir da escolha de um tema, o aprendiz realiza pesquisas, investiga, registra dados, formula hipóteses, analisa, aplica e avalia o artefato construído [3].

Nesta concepção, cada mediador tem suas formas de avaliação e acompanhamento dos projetos desenvolvidos pelos grupos que acompanha. Essas formas de avaliação e acompanhamento podem ser vistas como estratégias de acompanhamento. As estratégias de acompanhamento devem servir para identificar falhas no processo, além de motivar o componente do grupo (ou o próprio grupo) para desenvolver as atividades planejadas.

O problema das estratégias de acompanhamento tratado no MEDIADOR é similar ao problema nos Sistemas Tutores Inteligentes (STIs), tratado em Giraffa [6], com a diferença de se tratar de "acompanhamento" de projetos e não de tutoria.

Em um projeto, a responsabilidade e a autonomia dos aprendizes são essenciais. Os aprendizes são co-responsáveis pelo trabalho e pelas escolhas realizadas ao longo do desenvolvimento do projeto. Em geral, essas escolhas são realizadas em equipe, motivo pelo qual a cooperação está também quase sempre associada ao trabalho de projetos. A cooperação é necessária uma vez que o desenvolvimento de um projeto envolve complexidade e resolução de problemas. O objetivo central do projeto constitui um problema que exige o planejamento e a execução de uma ou mais atividades para sua resolução. A execução dessas atividades acontece de forma faseada, ou seja, percorrendo várias fases, conforme sugerem Menezes et al. [8]: identificação do problema, observação e mineração, coleta de dados, análise, síntese, formalização e validação.

No contexto da educação orientada a projetos, as ferramentas de suporte ao processo de aprendizagem a distância devem prever um meio de comunicação multidirecional eficiente entre seus participantes (mediadores, aprendizes e colaboradores), de forma a substituir a interação pessoal entre eles por uma ação sistemática e conjunta de diversos recursos didáticos, proporcionando um aprendizado independente e flexível aos estudantes. Ao contrário de uma sala de aula, não é necessário que todos os aprendizes estejam realizando as mesmas tarefas, ou em um mesmo ponto em relação ao conteúdo e objetivos do curso. Dessa maneira, seria inadequado insistir na prática de longas aulas de exposição de temas e na hierarquia de papéis de mediadores e aprendizes [13].

O foco, na abordagem orientada a projetos, é acompanhar as participações para promover a integração do aprendiz no processo de aprendizagem. No decorrer desse processo, algumas das dificuldades relatadas durante o acompanhamento dos projetos, por mediadores de cursos a distância, *online* e orientados por projetos, permitiram definir uma classificação para esses problemas, detalhados por Tavares et al. [13]: acompanhamento dos aprendizes, sobrecarga dos mediadores, agendamento e comunicação. Os problemas são levantados a partir da experiência dos mediadores do curso de especialização *lato sensu* em informática educativa (formação de multiplicadores do PROINFO), iniciado em Julho de 1999. Esse curso usou, como suporte à interação, a primeira versão do AmCorA, baseado na proposta de Menezes et al [8]. O ambiente AmCorA segue uma abordagem construtivista, com forte enfoque à cooperação. A partir dos problemas identificados, um conjunto de requisitos é proposto por Tavares et al. [13].

Para atender aos requisitos identificados, o MEDIADOR propõe uma solução em três camadas, adicionando uma camada de inteligência sobre as camadas: (C1) de serviços básicos de interação (ferramentas síncronas e assíncronas); e, (C2) desenvolvimento de projetos (cronograma de planejamento do grupo e área para desenvolvimento e divulgação dos projetos). Na camada inteligente (C3) estão as diversas organizações de agentes montadas para facilitar o uso do ambiente pelos participantes do processo (aprendizes, mediadores, colaboradores, administradores do ambiente etc.). O foco da proposta do MEDIADOR está na modelagem de uma organização de agentes que atuam na camada de inteligência (C3), monitorando e acompanhando os aprendizes (e grupos de aprendizes) no desenvolvimento de seus projetos através da definição de estratégias de acompanhamento definidas pelos mediadores.

A modelagem do ambiente em camadas facilitou o desenvolvimento do ambiente, reduzindo a complexidade e permitindo o desenvolvimento incremental. As camadas C1 e C2 foram modeladas segundo o paradigma da orientação a objetos, facilitando, a seguir, a identificação dos agentes da camada de mediação (suas responsabilidades, interações e permissões).

A organização de agentes é baseada nos seguintes papéis (figura 2): Gerenciador de Estratégias; Interpretador de Estratégias; Executor de Estratégias; Acompanhador do Aprendiz; Acompanhador de Grupo; Acompanhador do Mediador; Mensageiro; .Atendente do Mediador e Atendente do aprendiz; Avaliador de Estratégias; Gerenciador de Ferramenta de Comunicação; Gerenciador da Agenda; e, Gerente de Projeto e Gerenciador de Conteúdo.

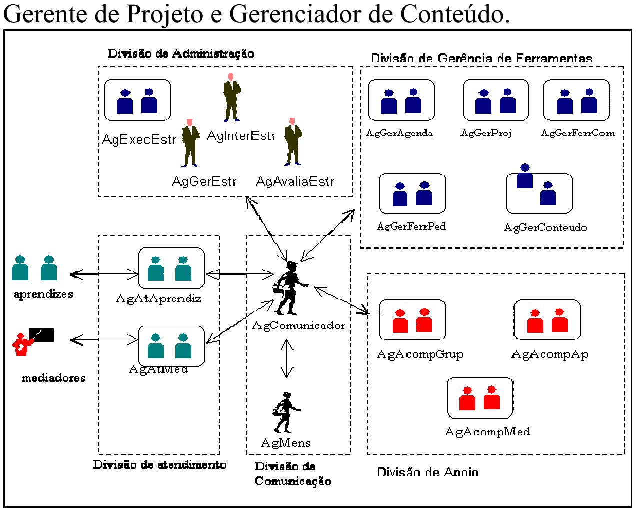

FIGURA 2
MODELO ORGANIZACIONAL DOS AGENTES NO MEDIADOR

Para compreender o funcionamento da organização, abstraindo-se a função do agente comunicador, basta analisar os papéis desempenhados pelos agentes: o agente Gerenciador de Estratégias (AgGerEstr) monitora as estratégias e quando identifica que houve modificação em alguma estratégia, ou se nova estratégia foi definida, encaminha para Interpretador de Estratégias (AgInterEstr). Este, por sua vez, interpreta cada uma das táticas definidas nas estratégias e encaminha para o Agente Executor de Estratégias (AgExecEstr). O agente Executor repassa a condição estabelecida na estratégia para o agente responsável por analisá-la (nesse caso, os agentes monitores das ferramentas presentes na divisão de gerência de ferramentas) e aguarda até que todas as condições estabelecidas na estratégia sejam encontradas. Nesse caso, o Executor de Estratégia deve iniciar a execução (que pode ser, por exemplo, uma mudança na agenda, um aviso no mural ou o envio de mensagens, via e-mail ou através de agentes de interface). Quando mais de uma condição remete à execução de ações, o executor deve solicitar a revalidação das condições encontradas. Por exemplo, a condição 1 pode ter sido encontrada 3 dias de antecedência da condição 2 e, nesse momento, a condição 1 pode não ser mais válida para aquele aprendiz.

V. CONSIDERAÇÕES QUANTO À ARQUITETURA

Os sistemas baseados em agentes são tipicamente distribuídos e, portanto, o projeto de arquitetura deve descrever a organização de um modo que seja possível implementar a comunicação entre eles. Nessa etapa, algumas considerações devem ser feitas, considerando o modo de comunicação e a arquitetura que deve atender a essa comunicação [5]: arquitetura (agentes são, tipicamente, processos separados, que podem estar processando no mesmo espaço ou em máquinas diferentes) e comunicação (suportando mensagens de um agente para um conjunto de agentes ou um-para-um).

O modo de comunicação um-para-um remete ao projeto de organizações baseadas na arquitetura ponto-a-ponto (P2P - peer-to-peer) [14]. Essa arquitetura apóia-se na comunicação direta entre os agentes, garantindo a extensibilidade da organização, de forma que qualquer agente, em qualquer momento, pode juntar-se à organização e instantaneamente colocar novos serviços à disposição da organização. Segundo Szoke, [13], a tolerância à falhas nesses sistemas é grande, visto que a derrubada de algum agente não oferece impacto ao resto da organização (dependendo, é claro, do tipo de serviço oferecido). Uma desvantagem dessa topologia é que, na prática, os algoritmos requeridos para manter uma organização com a comunicação descentralizada acarretam uma sobrecarga, dificultando o desempenho de organizações com um grande número de agentes.

De outro modo, uma arquitetura que atende aos requisitos de comunicação baseia-se na inserção de um agente para gerenciar a comunicação no sistema. Nesse modelo, cada agente, quando inicializado, se apresenta ao comunicador indicando sua posição na rede e fornecendo a sua identificação dentro da organização. Essa opção garante flexibilidade e autonomia, além de permitir a inserção de novos agentes sem necessitar alterar toda a organização (os endereços dos agentes não precisam ser conhecidos a priori, apenas o endereço do comunicador deve ser conhecido). A opção pelo comunicador possibilita executarem vários agentes pertencentes à mesma organização [14]. Esses agentes podem estar em máquinas distintas na rede (Internet ou intranet) ou na mesma máquina e, desde que conheçam o endereço do comunicador, podem interagir entre si e realizar os objetivos da organização. Também é possível criar organizações cooperativas entre si, bastando criar outros agentes de comunicação, cada um responsável por uma organização [1], configurando uma topologia P2P híbrida [13].

Um dos pontos fracos da opção pelo agente comunicador está no aspecto centralizador. A centralização torna a organização vulnerável no sentido em que toda a troca de mensagens depende do agente de comunicação. Caso ocorram falhas com esse agente, toda a organização fica comprometida. Além disso, existe uma sobrecarga causada pela retransmissão da mensagem. Na opção por essa topologia, essa sobrecarga deve ser avaliada em relação à sobrecarga causada pelos algoritmos para gerenciar a comunicação na topologia totalmente descentralizada.

VI. Conclusões

Este artigo apresentou dois ambientes de aprendizagem modelados com metodologias que adotam a visão de estrutura organizacional na forma de agentes. A adequação desse paradigma na construção de ambientes de aprendizagem pode ser observada pelo fato desses sistemas proverem uma estrutura, onde se pode identificar entidades cooperantes, que podem ser diretamente modelados como sendo agentes autônomos, com suas próprias capacidades e potencialidades. A metodologia utilizada fornece uma notação que oferece suporte às características de continuidade temporal, autonomia, reatividade, flexibilidade e pró-atividade dos agentes. Nas duas aplicações apresentadas, o poder da abstração de agentes (na verdade, de papéis) foi combinado com um projeto e implementação orientado a objetos significativamente simplificado e com alta reusabilidade. A grande vantagem dessas estruturas está nas características pró-ativas que incorporam aos ambientes

PARNASO: UMA FERRAMENTA P2P PARA O COMPARTILHAMENTO DE PROJETOS DE COMPILADORES

Pablo Gomes Ludermir[1], Alex Arndt Corteletti[2], Silvana Rossy de Brito[3] e Orivaldo de Lira Tavares[4]

Resumo — *Dentre as arquiteturas que favorecem a comunicação e a colaboração entre aprendizes está a arquitetura P2P (peer-to-peer), cujos objetivos podem ser diretamente associados com as propriedades desejáveis em comunidades virtuais: autonomia, privacidade e dinamismo. Essas propriedades permitem que os membros de um grupo criem e administrem as áreas de colaboração de sua comunidade em tempo real. Este artigo apresenta a modelagem e implementação de uma ferramenta para o compartilhamento de projetos de compiladores, utilizando a arquitetura P2P e técnicas de extração de informações em textos. Essa ferramenta é utilizada no contexto do projeto MEDIADOR, inserindo recursos para facilitar o compartilhamento dos projetos desenvolvidos e em desenvolvimento. No protótipo implementado, um aprendiz pode compartilhar artefatos (partes de códigos e documentação do seu projeto), identificar outros artefatos compartilhados, comunicar-se com outros aprendizes e professores, capturar artefatos compartilhados por outros aprendizes, pesquisar e interagir com outros aprendizes através de recursos de comunicação síncrona ou assíncrona.*

Palavras-chave — MEDIADOR, pedagogia de projetos, compiladores, arquitetura P2P, compartilhamento, cooperação, colaboração.

I. INTRODUÇÃO

Nos últimos anos, é freqüente a utilização de redes de computadores no projeto e construção de ambientes de ensino-aprendizagem informatizados, devido às potencialidades que incorporam em tais ambientes. Apesar desse fato, características como o auxílio personalizado, o suporte à cooperação e o suporte às atividades docentes para lidar com um grande volume de usuários demonstram que os ambientes disponíveis, atualmente, ainda sofrem de limitações, que envolvem desde os aspectos tecnológicos até os aspectos pedagógicos. No sentido de minimizar essas limitações, as pesquisas prosseguem e, a cada tempo, os ambientes são melhorados com novas tecnologias que fundamentam as teorias de ensino-aprendizagem adotadas.

Segundo Brito et al. [1], o aspecto cooperação, considerado uma característica essencial nos ambientes de aprendizagem, vem sendo atacado com o uso de novas tecnologias de desenvolvimento de sistemas, como a incorporação das redes de computadores, a exemplo da Internet, facilitando a colaboração e a cooperação entre pessoas geograficamente distantes. Tais possibilidades expandem as vantagens obtidas com o uso de ambientes de aprendizagem através do reuso de conhecimento, do compartilhamento de informações e da cooperação, além de possibilitarem a integração entre pessoas com diferentes interesses e níveis de conhecimento.

No contexto do modelo pedagógico, dentre as abordagens existentes, destaca-se a pedagogia de projetos, que se insere como uma abordagem que valoriza a cooperação e a colaboração entre aprendizes e mediadores. O MEDIADOR [1] é um ambiente desenvolvido em três camadas: serviços básicos de interação (*chat*, fórum, mural, agenda etc.); camada de projetos, contemplada com ferramentas para apoiar a pedagogia de projetos; e, uma camada de suporte inteligente às atividades de mediação, exercido por uma organização de agentes. O PARNASO está inserido na camada de projetos como um recurso de compartilhamento que permite que os membros de um grupo criem e administrem as áreas de colaboração de sua comunidade em tempo real.

Este artigo constitui-se mais 5 seções distribuídas da seguinte forma: a seção 2 discute a pedagogia de projetos; a seção 3 apresenta o projeto MEDIADOR; a seção 4 apresenta o PARNASO, ferramenta para o compartilhamento de projetos inserida na camada de projetos do MEDIADOR e, finalmente, a seção 5 apresenta as considerações finais desse trabalho.

II. COMUNIDADES VIRTUAIS E A PEDAGOGIA DE PROJETOS

A proposta da pedagogia de projetos reflete os conceitos construtivistas de Piaget, as idéias de Vygotsky [13] e, mais recentemente, encontra nas idéias de Resnick [11], sobre o construcionismo distribuído, um suporte computacional através da utilização de redes de computadores. Além disso, as mídias interativas têm trazido motivação entre os

[4] Orivaldo de Lira Tavares, UFES Universidade Federal do Espírito Santo, Av. Fernando Ferrari s/n, Goiabeiras, 29.060-900, Vitória, ES, Brazil, tavares@inf.ufes.br

aprendizes, fortalecendo a cooperação e colaboração entre eles.

Segundo Resnick [11], a teoria construcionista de Papert, está baseada em dois tipos de construções. A primeira construção baseia-se na afirmação de que as pessoas constroem conhecimento de acordo com as suas experiências no mundo. A última defende que as pessoas constroem um novo conhecimento apenas quando estão comprometidas com o mesmo.

A teoria do construcionismo distribuído [11] é uma extensão do construcionismo, e está voltada especificamente para as atividades de projeto e construção. Resnick defende na sua teoria que uma forma efetiva para construir conhecimento é através de atividades colaborativas que envolvam as etapas de projeto e construção de artefatos em ambientes distribuídos (através de redes de computadores, correio eletrônico, grupos de discussão, fóruns, etc.), que são classificadas em três categorias [11]:

- **construções de discussões**: ocorrem através da troca de idéias, dicas e estratégias sobre projetos e atividades de construção;
- **construções de compartilhamento**: ocorrem através do compartilhamento de construções, encorajando os estudantes a experimentar e "reusar" construções uns dos outros;
- **construções de colaborações**: ocorrem através da colaboração em tempo real dos projetos de construção.

Segundo Costa [3], as comunidades virtuais só sobrevivem quando estas preenchem alguma necessidade real do participante. O participante dessa comunidade precisa conhecer antecipadamente e de forma clara quais são os benefícios que obterá com essa participação. Nesse sentido, é fundamental, para a formação de uma comunidade que a aprendizagem seja significativa. Na concepção da pedagogia de projetos, os alunos são distribuídos em grupos, cabendo a cada grupo investigar e construir conhecimento sobre um tema. A escolha do tema é norteada pela curiosidade visando com isso tornar a aprendizagem mais significativa possível [1].

As atividades cooperativas, através de ambientes distribuídos baseados na Internet não constituem uma mídia recente. Em 1976, Turoff, citado por Rheingold [12], criou um sistema conhecido como "EIES" (*Electronic Information Exchange System*), que tinha por objetivo o intercâmbio de informações eletrônicas. Segundo Turoff, a conferência através de computadores promove um meio para grupos de pessoas exercitarem a capacidade de "inteligência coletiva". Resnick [11] reconhece que a cognição e a inteligência não são propriedades de um indivíduo, mas surgem de interações de uma pessoa com o ambiente ao seu redor. Partindo desse princípio, diversos projetos têm tentado utilizar as redes de computadores para facilitar o desenvolvimento de "comunidades de construção de conhecimento" nas quais grupos de pessoas constroem e estendem coletivamente o conhecimento [11].

Segundo Castells [2], comunidades virtuais são redes eletrônicas de comunicação interativa autodefinidas, organizadas em torno de um interesse ou finalidade compartilhados. Curiosamente, Rheingold [12] destaca um lado prático das comunidades virtuais. Em uma conversa "real", não é educado manter uma comunicação em paralelo com várias pessoas ao mesmo tempo, porém isso não constitui problema algum em um ambiente virtual.

As colaborações, nas comunidades virtuais, são formadas a partir de afinidades de interesses [10] e, no desenvolvimento de um projeto, a partir da escolha do tema e do "par mais capaz" [14]. Segundo Lévy [5], a responsabilidade individual, a opinião pública e seu julgamento aparecem fortemente, favorecendo o desenvolvimento de uma forte moral social, e de um conjunto de leis não escritas, que governam suas relações, principalmente com relação à pertinência das informações que circulam na comunidade.

Desta forma, durante os processos de interação, os participantes ativos constroem e expressam competências, as quais são reconhecidas e valorizadas de imediato pela própria comunidade. A total liberdade de opinião é conferida igualmente a todos os participantes de uma comunidade, sendo que as regras que regulam as interações são construídas na coletividade, isso se opõe fortemente a qualquer tipo de censura e possibilita a exploração de novas formas de opinião pública [2].

A presença de conflitos é parte integrante no desenvolvimento dos projetos, principalmente quando um dos participantes infringe as regras acordadas pela comunidade. Por outro lado, constroem-se afinidades, parcerias e alianças intelectuais, sentimentos de amizade e outros, que se desenvolvem nos grupos de interação, da mesma forma como acontece entre pessoas que se encontram fisicamente para conversar. A personalidade de cada participante acaba sendo expressa através do estilo de escrita, competências, tomadas de posição, evidenciadas nas relações humana presentes nas interações [2].

Também dessa forma, as comunidades não estão livres de manipulações e enganações, assim como em qualquer outro espaço de interação social. Uma comunidade que sustente uma rede ativa de comunicação aprenderá com seus próprios erros, pois serão difundidos por toda a rede e voltarão para a sua origem ao longo de laços de realimentação. Devido a isso, a comunidade pode corrigir seus erros, auto-regulando-se e auto-organizando-se [2].

III. PROJETO MEDIADOR

No contexto da educação orientada a projetos, as ferramentas de suporte ao processo de aprendizagem a distância devem prever um meio de comunicação multidirecional eficiente entre seus participantes (mediadores, aprendizes e colaboradores), de forma a substituir a interação pessoal entre eles por uma ação sistemática e conjunta de diversos recursos didáticos, proporcionando um aprendizado independente e flexível aos estudantes. Ao contrário de uma sala de aula, não é necessário que todos os aprendizes estejam realizando as mesmas tarefas, ou em um mesmo ponto em relação ao conteúdo e objetivos do curso. Dessa maneira, seria inadequado insistir na prática de longas aulas de exposição de temas e na hierarquia de papéis de mediadores e aprendizes [TAV 2001].

O MEDIADOR [1] propõe uma solução em três camadas (figura 1), adicionando uma camada de inteligência sobre as camadas de serviços básicos de interação e desenvolvimento de projetos. Nessa camada estão as diversas organizações de agentes montadas para facilitar o uso do ambiente pelos participantes do processo (aprendizes, mediadores, colaboradores, administradores do ambiente etc.). O foco da proposta do MEDIADOR está na modelagem de uma organização de agentes para atuar na camada de inteligência no sentido de facilitar o trabalho dos mediadores.

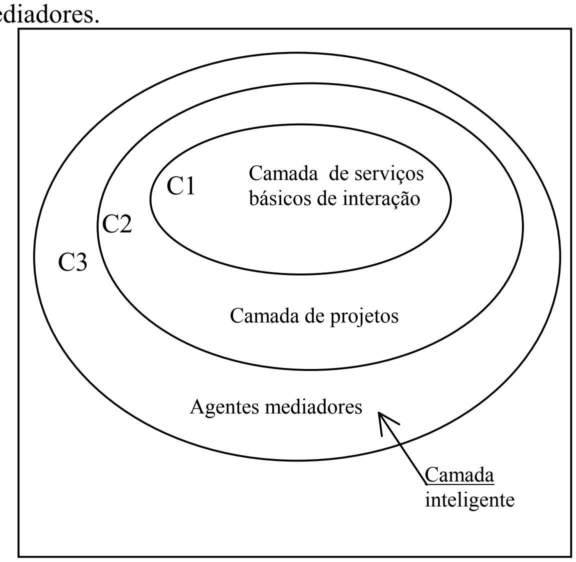

FIGURA 1
MEDIADOR – ARQUITETURA EM 3 CAMADAS

A modelagem do ambiente em camadas facilitou o desenvolvimento do ambiente, reduzindo a complexidade e permitindo o desenvolvimento incremental.

O PARNASO está inserido na camada de projetos, como uma ferramenta para facilitar o compartilhamento dos diversos arfefatos produzidos no desenvolvimento dos projetos de aprendizagem.

IV. PARNASO

Distribuído através de uma arquitetura de rede de computadores peer-to-peer (P2P), o PARNASO permite o compartilhamento de artefatos (partes de códigos e documentação do seu projeto). Essa ferramenta atende alguns requisitos da camada de serviços básicos de interação (C1) permitindo que aprendizes e mediadores possam comunicar-se entre si, capturar artefatos compartilhados por outros aprendizes, pesquisando e interagindo com outros aprendizes através de recursos de comunicação síncrona ou assíncrona.

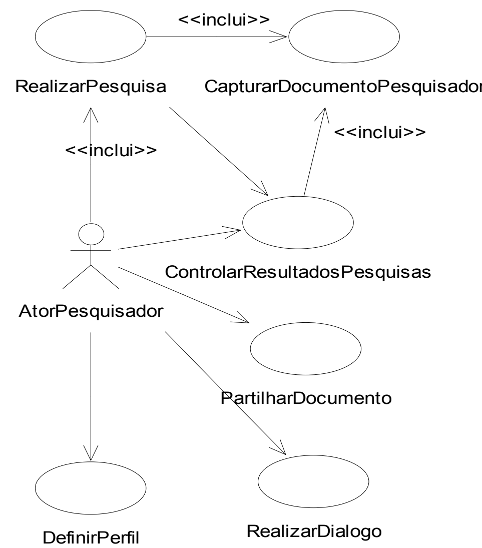

FIGURA2
DIAGRAMA DE CASOS DE USO DO PARNASO

O aprendiz, ao entrar no PARNASO pode, portanto realizar uma série de tarefas, como: compartilhar artefatos, identificar os artefatos partilhados de sua autoria (ou do seu grupo), comunicar-se com outros aprendizes/mediadores, capturar artefatos compartilhados por outros grupos, identificar as áreas/subáreas do seu projeto, procurar aprendizes e procurar artefatos através de atributos como título, autor(es), palavras-chaves e tipo de artefato (gramática, especificação do analisador léxico, ações semânticas, estruturas de dados).

Arquitetura *peer-to-peer*

A arquitetura de redes *peer-to-peer* (P2P) não é baseada em nenhum conceito novo. Diferente da arquitetura cliente/servidor, a arquitetura P2P é uma classe de sistemas e aplicações que emprega a distribuição de recursos para executar tarefas de forma descentralizada. Devido à descentralização, a arquitetura P2P possui vantagens como [7]: maior escalabilidade, infra-estrutura barata e integração de recursos de *hardware* mais barata e autônoma.

Alguns dos objetivos da arquitetura P2P podem ser diretamente associados com as características desejáveis em comunidades virtuais:

- **Autonomia, anonimato e privacidade:** Em muitos casos, usuários de um sistema distribuído estão pouco dispostos a confiar em qualquer provedor de serviços centralizado, preferindo que todos os dados sejam trabalhados localmente, mantendo o anonimato e a privacidade, e impedindo que qualquer pessoa ou provedor acesse informações particulares. Sistemas P2P apóiam esse nível de autonomia, pois estes sistemas requerem que o nó local trabalhe em nome de seu usuário [7];

- **Dinamismo**: Sistemas de P2P apóiam ambientes altamente dinâmicos, ou seja, recursos, como nós computacionais, estão entrando e saindo continuamente do sistema [7];
- **Possibilitar a Comunicação ad-hoc (sem a necessidade de nenhuma estrutura pré-existente a não ser os computadores que irão se comunicar) e a colaboração**: os membros sócios podem ir e vir, baseados talvez em seus locais físicos ou em seus interesses atuais. A arquitetura P2P se ajusta naturalmente a esta classe de aplicações, pois trata essas mudanças de maneira mais natural e dinâmica por não possuir uma infra-estrutura estática [7], permitindo que os membros de grupos criem e administrem áreas de colaboração em tempo real [9];
- **Agentes inteligentes**. Segundo P2PWG [9], a arquietetura P2P permite que redes de computadores trabalhem dinamicamente juntas, utilizando agentes inteligentes. Os agentes residem nos computadores clientes e informam vários tipos de informação, tanto para a rede, quanto para o cliente. Agentes também podem iniciar tarefas em benefício de outros clientes. Essa característica é particularmente interessante no caso do projeto MEDIADOR [1] que conta com uma camada de agentes inteligentes.

A arquitetura P2P é diversificada devido às diversas topologias que atende, porém a classificação não é de consenso na literatura especializada. Szoke [13] classifica as topologias dessa arquitetura em centralizada, descentralizada e híbrida.

A topologia centralizada baseia-se na centralização do despacho de tarefas em um componente central. Esse componente é responsável apenas por receber e distribuir as consultas feitas pelos *peers*, com o mínimo de computação necessária. As vantagens dessa topologia são a simplicidade de manutenção dos dados, uma facilidade maior de impor regras de segurança e de se medir a escalabilidade do sistema. As desvantagens dessa topologia são a dificuldade de estender as redes e a ausência de tolerância a falhas [13].

Na topologia descentralizada, cada *peer* é ao mesmo tempo cliente e servidor. Para se juntar a uma rede, o *peer* anuncia a sua entrada a um determinado grupo de *peers*, e estes últimos anunciam a entrada do primeiro *peer* a outros *peers* e esse processo continua recursivamente, e o processo de busca de dados nos *peers* segue o mesmo caminho do anúncio de entrada na rede. Segundo Szoke [13](, a escalabilidade de sistemas agrupados nessa topologia é difícil de avaliar. Em teoria, quanto mais computadores forem adicionados, mais escalável torna-se a rede. Na prática, os algoritmos requeridos para manter um sistema descentralizado coerente possuem um grande sobrecarga. Se essa sobrecarga cresce com o tamanho do sistema, então o mesmo perde em escalabilidade.

A grande vantagem de sistemas descentralizados é a facilidade de extensão e a tolerância à falhas. A queda de um *peer* não oferece impacto ao resto do sistema.

Segundo Szoke [13], um sistema descentralizado nem sempre é melhor ou pior que um sistema centralizado. A escolha depende inteiramente das necessidades da aplicação. A simplicidade dos sistemas centralizados torna o gerenciamento e controle mais fácil, enquanto os sistemas descentralizados crescem de maneira mais eficaz, são mais tolerantes a falhas ou quedas.

Existem ainda as topologias híbridas, que segundo Szoke [13], são ao mesmo tempo centralizados e descentralizado, apresentam poder de escalabilidade e capacidade de extensão, enquanto mantém a coerência dos sistemas centralizados. Segundo Minar [8], nessa topologia, a maioria dos *peers* tem um relacionamento com um *super-peer* centralizado, e direcionam todas as requisições para o mesmo. Porém, ao invés de utilizarem servidores centralizados eles dividem a capacidade de toda a rede entre vários servidores, propagando as requisições.

Topologia do PARNASO

A arquitetura *Peer-to-peer* é utilizada no PARNASO (figura 3) para atender parte dos requisitos identificados a partir dos problemas encontrados na utilização massiva da arquitetura cliente servidor. Além disso, diversos autores [8] [13] [7] referenciam essa arquitetura como sendo a mais apropriada, atualmente, para aplicações que oferecem suporte à colaboração e cooperação.

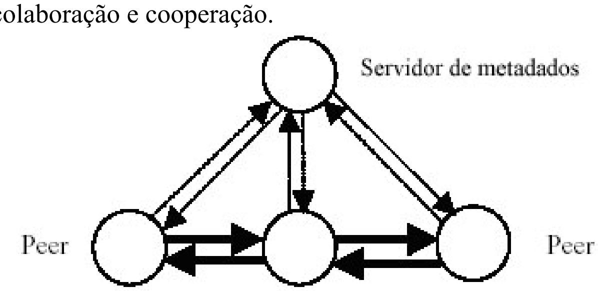

FIGURA 3
TOPOLOGIA DO PARNASO

Apesar da arquitetura P2P sugerir que os participantes da rede comuniquem-se uns com os outros, isso não implica que o sistema deve ser totalmente descentralizado. Um sistema P2P pode ter um servidor de meta-dados, para manter, como neste caso, um servidor de nomes. Esse servidor mantém as informações necessárias com o objetivo de registrar e coordenar as ações dos participantes [4].

Para representar as consultas, selecionaram-se técnicas que atendem a usuários com necessidades dinâmicas e amplas, visto que o sistema é voltado para usuários sem perfil pré-definido. A escolha das técnicas de representação de documentos baseou-se nas características dos artefatos compartilhados. As técnicas escolhidas são descritas a seguir [6]: associação de atributos (título, autor, data de criação);

consultas por navegação, através de *links; b*usca por artefatos relevantes (indicação do próprio autor). A apresentação de resultados é realizada através da localização do *peer* que contém o documento em conjunto com a sua identificação (título, autor)

Os artefatos compartilhados são identificados nas seguintes classes: *units* (procedimentos semânticos), analisadores sintáticos (arquivos com extensão '.y') e analisadores léxicos (arquivos com extensão '.l').

As aplicações Peer e Servidor de Metadados são projetadas para atender às solicitações dos pesquisadores. Embora os métodos implementados sejam específicos para cada uma dessas aplicações, algumas operações podem ser descritas de modo genérico, conforme apresentado na Tabela I.

TABELA I

EVENTOS E AÇÕES DAS APLICAÇÕES PEER E SERVIDOR DE METADADOS

Evento	Descrição	Tarefas que devem ser realizadas
Inicializar	O pesquisador inicia a conexão com o servidor de metadados ou entre peers	Autenticar conexão entre peers ou entre peer e servidor metadados; Preparar metadados;
Solicitar Informações Compartilhadas	Ocorre quando um peer realiza uma pesquisa;	Realizar uma pesquisa junto ao servidor metadados; Capturar material que se encontra em outros peers;
Responder Solicitações	Ocorre quando o servidor metadados recebe qualquer solicitação de um peer;	Direcionar conexões entre peers; Responder a solicitações de pesquisa;
Responder Solicitação Material	Um peer recebe a solicitação de transferência de um arquivo a partir de outro peer;	Transferir material para um peer requisitante;
Finalizar	Uma transferência de material entre peers é finalizada, ou quando um peer desconecta-se do servidor metadados.	Limpar metadados; Finalizar conexão entre peers e/ou entre peer e servidor metadados;

V. CONCLUSÕES

A ampla utilização das redes de computadores e das redes de comunicação, de modo geral, tem favorecido significativas mudanças tecnológicas nos mecanismos de apoio ao processo de ensino-aprendizagem. O desafio tem sido, atualmente, a adoção de suportes computacionais que conduzam a um processo de construção do conhecimento ao mesmo tempo em que destacam a importância da aprendizagem colaborativa e cooperativa. Nesse sentido, uma diversidade de suportes computacionais tem sido desenvolvida para apoiar abordagens que, como a pedagogia de projetos, tornem a aprendizagem significativa, além de favorecer a interação entre os diversos participantes do processo. Nesse contexto encontra-se o MEDIADOR [1] como uma proposta para apoiar a abordagens de projetos. O PARNASO, por utilizar uma arquitetura que naturalmente favorece a construção de comunidades de aprendizagem, está, inicialmente, inserido no contexto do projeto MEDIADOR [1], pode encontrar utilidade nos mais diversos ambientes de aprendizagem, uma vez que fornece o suporte básico para o compartilhamento e as discussões entre os aprendizes.

UM AMBIENTE VIRTUAL PARA APRENDIZAGEM DE COMPILADORES COM SUPORTE INTELIGENTE À MEDIAÇÃO

Silvana Rossy de Brito[1], *Orivaldo de Lira Tavares*[2], *Crediné Silva de Menezes*[3]

Resumo — *Dentre as abordagens pedagógicas existentes, a pedagogia de projetos (PP) destaca-se por valorizar a cooperação e a colaboração entre os envolvidos. Essa abordagem é particularmente adequada em disciplinas onde o desenvolvimento do projeto aparece de forma faseada, como é o caso do projeto de um compilador. Para suportar a PP, é imprescindível a utilização adequada de tecnologias que apóiem a cooperação, característica considerada essencial em um ambiente de apoio à aprendizagem (AAA), e que, atualmente, é tratada com a utilização de recursos como as redes de computadores. Tais possibilidades expandem as vantagens obtidas com o uso de AAA por meio do reuso de conhecimento, do compartilhamento de informações e da cooperação. Este trabalho apresenta a modelagem e implementação de um ambiente virtual para a aprendizagem orientada a projetos com suporte inteligente à mediação, modelado em três camadas: camada de interação, camada de projetos (para apoiar o desenvolvimento de projetos de compiladores) e camada de inteligência (contendo uma organização de agentes para facilitar o trabalho dos mediadores).*

Palavras-chave — *MEDIADOR, agentes inteligentes, pedagogia de projetos, compiladores, compartilhamento, cooperação, colaboração.*

I. INTRODUÇÃO

Nos últimos anos, é freqüente a utilização da tecnologia de agentes no projeto e construção de ambientes de aprendizagem informatizados, devido às potencialidades que incorporam em tais ambientes. Apesar desse fato, características como o auxílio personalizado, o suporte à cooperação e o suporte às atividades docentes para lidar com um grande volume de usuários demonstram que os ambientes disponíveis, atualmente, ainda sofrem de limitações, que envolvem desde os aspectos tecnológicos até os aspectos pedagógicos. No sentido de minimizar essas limitações, as pesquisas prosseguem e, a cada tempo, os ambientes são melhorados com novas tecnologias que fundamentam as teorias de ensino-aprendizagem adotadas.

O aspecto cooperação, considerado uma característica essencial nos ambientes de aprendizagem, vem sendo atacado com o uso de novas tecnologias de desenvolvimento de sistemas, como a incorporação das redes de computadores, a exemplo da Internet, facilitando a colaboração e a cooperação entre pessoas. Tais possibilidades expandem as vantagens obtidas com o uso de ambientes de aprendizagem através do reuso de conhecimento, do compartilhamento de informações e da cooperação, além de possibilitarem a integração entre pessoas com diferentes interesses e níveis de conhecimento.

Além da utilização de redes de computadores, o paradigma de agentes, visa reduzir a complexidade de construção dos ambientes de aprendizagem, permitindo que um sistema trabalhe de maneira cooperativa, considerando agentes humanos externos e agentes artificiais internos ao sistema, num esforço de tornar os ambientes de aprendizagem mais adaptativos e interessantes para seus usuários. Muito do esforço empenhado pelos pesquisadores na utilização do paradigma de agentes no contexto dos ambientes de aprendizagem está na tentativa de incorporar características pró-ativas, reduzindo o sobrecarga dos mediadores (professores) com tarefas repetitivas e permitindo uma adaptação maior ao estilo próprio do aprendiz (alunos) e do mediador.

Do ponto de vista do mediador, ainda são relatadas experiências onde a sobrecarga de trabalho com o acompanhamento dos aprendizes é substancialmente maior do que no ensino presencial [9]. Do ponto de vista dos aprendizes, maior flexibilidade e adaptabilidade são necessárias para que o modelo pedagógico adotado possa ser adequado ao modelo do aprendiz. Essas limitações se devem tanto ao modelo pedagógico adotado, quanto à necessidade de ferramentas que apóiem o mediador nas suas atividades de acompanhamento.

No contexto do modelo pedagógico, dentre as abordagens existentes, destaca-se a pedagogia de projetos, que se insere como uma abordagem que valoriza a cooperação e a colaboração entre aprendizes e mediadores. Para suportar a pedagogia de projetos, é imprescindível a utilização adequada de tecnologias que auxiliam o trabalho cooperativo entre os participantes do processo.

No contexto do ensino de computação, a disciplina de compiladores freqüentemente exige do aprendiz o desenvolvimento de um projeto (o projeto do compilador). Esse desenvolvimento ocorre de forma faseada , através da construção dos diversos componentes do compilador.

Esse artigo apresenta a arquitetura para um ambiente de aprendizagem para apoiar o ensino de compiladores, baseado na pedagogia de projetos e com suporte inteligente à mediação. Constitui-se de mais 4 seções distribuídas da seguinte forma: a seção 2 apresenta a pedagogia de projetos no curso de compiladores; a seção 3 apresenta o MEDIADOR, um ambiente para apoio a aprendizagem baseada em projetos com suporte inteligente à mediação e, finalmente, a seção 6 apresenta as considerações finais.

II. PROJETOS DE COMPILADORES

Na concepção da pedagogia de projetos, os alunos são distribuídos em grupos, cabendo a cada grupo investigar e construir conhecimento sobre um tema. A escolha do tema é norteada pela curiosidade visando com isso tornar a aprendizagem mais significativa possível [9].

Nessa abordagem, os projetos se constituem em planos de trabalho e conjunto de atividades que podem tornar o processo de aprendizagem mais dinâmico, significativo e interessante para o aprendiz, deixando de existir a imposição dos conteúdos de maneira autoritária. A partir da escolha de um tema, o aprendiz realiza pesquisas, investiga, registra dados, formula hipóteses, analisa, aplica e avalia o artefato construído [1]. A aprendizagem é significativa uma vez que a definição de um tema para o projeto pressupõe que o aprendiz possui algum conhecimento prévio sobre o tema proposto, levando em consideração que este se encontra dentro de seu foco de interesse.

A proposta da pedagogia de projetos reflete, portanto, os conceitos construtivistas de Piaget, as idéias de Vygotsky [10], e, mais recentemente, encontra nas idéias de Resnick [7], sobre o construcionismo distribuído, originado do construcionismo de Papert [6] um suporte computacional através da utilização de redes de computadores.

Nessa abordagem, não há professor no sentido clássico do termo. Ao invés disso, cada projeto conta com um, ou mais, mediadores. O envolvimento dos aprendizes é fundamental, sendo uma característica chave do trabalho de projetos. Além disso, a responsabilidade e a autonomia dos aprendizes são essenciais: os aprendizes são responsáveis pelo trabalho e pelas escolhas ao longo do desenvolvimento do projeto [9].

Grégoire & Laferrière [3] defendem a idéia de que um projeto será bem sucedido se a participação dos aprendizes e sua contribuição ao tema tiverem sido importantes para o grupo de maneira geral. Isso acontece se os artefatos de um pequeno grupo de aprendizes atraírem o interesse de outros, permitindo que esses outros expandam ou refinem o seu próprio processo de aprendizagem. Os artefatos são produtos produzidos ou consumidos nas diversas atividades durante a construção do projeto [9].

Em um projeto, a responsabilidade e a autonomia dos aprendizes são essenciais. Os aprendizes são co-responsáveis pelo trabalho e pelas escolhas realizadas ao longo do desenvolvimento do projeto. Em geral, essas escolhas são realizadas em equipe, motivo pelo qual a cooperação está também quase sempre associada ao trabalho de projetos. A cooperação é necessária uma vez que o desenvolvimento de um projeto envolve complexidade e resolução de problemas. O objetivo central do projeto constitui um problema que exige o planejamento e a execução de uma ou mais atividades para sua resolução [5]. A execução dessas atividades acontece em fases [4]: identificação do problema, observação e mineração, coleta de dados, análise, síntese, formalização e validação.

Ao criar um novo curso, o mediador deve definir [9]:

- um conjunto de tarefas a serem realizadas, que podem ser, por exemplo, as etapas do processo descritas na seção anterior;
- a estratégia de execução das tarefas;
- os métodos e as técnicas que serão usados no desenvolvimento de cada tarefa;
- as ferramentas que vão automatizar a aplicação dos métodos e técnicas.

O mediador tem a liberdade de decidir, por exemplo, diferentes estratégias (figura 1) para conduzir os aprendizes durante a aprendizagem, podendo, por exemplo, realizar uma ou mais fases de análise e síntese, antes de partir para a fase de formalização, ou adotar modelos cíclicos em que após a fase de validação, o processo volta à fase de identificação do problema, permitindo que o aprendiz vá amadurecendo seus conceitos a cada iteração do ciclo.

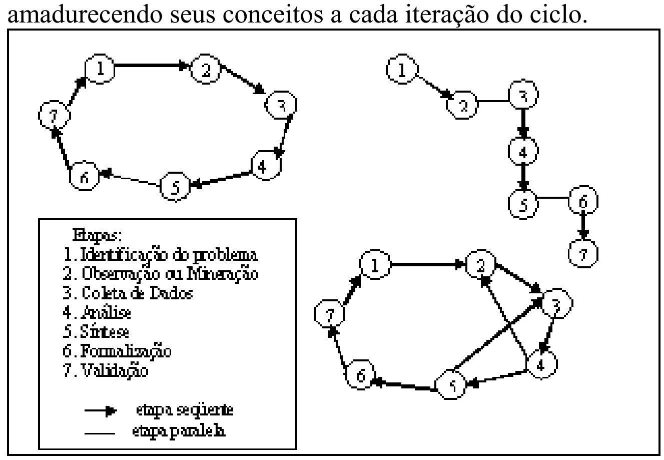

FIGURA 1
ALGUMAS FORMAS DE ESTRUTURACAO DO PROCESSO DE APRENDIZAGEM [9]

No contexto do ensino de compiladores, a pedagogia de projetos pode facilitar a integração com outras disciplinas, como a engenharia de software, favorecer a aprendizagem cooperativa e promover maior envolvimento do aprendiz. Nessa disciplina, o aprendiz, freqüentemente desenvolve o projeto de um compilador de acordo com as especificações de linguagem definidas pelo professor. O projeto de compilador é desenvolvido através de um processo, definido pelos aprendizes, sendo muitas vezes ad-hoc. Apesar disso, o aluno tem a oportunidade de aplicar conceitos e técnicas estudadas no desenvolvimento prático do seu projeto.

III. MEDIADOR

O MEDIADOR [1] é um ambiente virtual para a aprendizagem orientada a projetos modelado em três camadas (figura 1): camada de interação, camada de projetos e camada inteligente, onde atua uma organização de agentes para facilitar o trabalho dos mediadores.

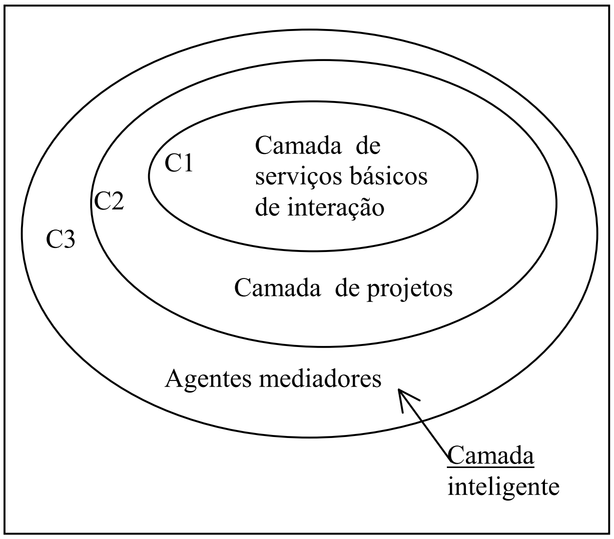

FIGURA 1

MEDIADOR – ARQUITETURA EM 3 CAMADAS [1]

Camada de serviços básicos de interação

Nesta camada estão presentes as ferramentas que facilitam a interação entre os participantes. Essas ferramentas visam atender os requisitos de interação entre os participantes. Entre as ferramentas de interação assíncrona que compõem essa camada, estão: Fórum, Mural, Correio Eletrônico, Mecanismo de Decisão, Listas de Discussão. Entre as ferramentas de comunicação síncrona, tem-se: *Chat* (sala de bate-papo) e Mensagens Instantâneas.

Camada de projetos

Para apoiar as atividades desenvolvidas no ciclo de desenvolvimento de projetos, a camada de projetos propõe mecanismos que permitam planejar, desenvolver e avaliar os projetos realizados pelos aprendizes. Essa camada atende os seguintes requisitos [1]:

- controlar os acessos mediante *login* e senha e permitindo ao aprendiz identificar a comunidade (turma ou grupo) que participa;
- permitir que os participantes (aprendizes, mediadores, colaboradores e observadores) proponham temas para os projetos;
- permitir que os aprendizes formem grupos (comunidades) de trabalho dentro de uma turma;
- permitir a seleção de temas propostos (dentre os vários temas propostos, um número limitado pode ser selecionado para os participantes desenvolverem seus projetos);
- permitir que grupos selecionem temas para desenvolvimento dos projetos; uma vez que um tema seja selecionado, ele está disponível para que um (ou vários) grupos o selecione para elaborar um projeto;
- No desenvolvimento do projeto: prover agenda para marcação dos compromissos da comunidade (grupo ou turma); uma área de trabalho (compartilhada) para o desenvolvimento dos projetos (incluindo o controle de versões);

No processo de desenvolvimento de um projeto de compilador, o primeiro passo consiste na definição da linguagem para a qual o compilador deverá ser desenvolvido. Para essa etapa, o mediador propõe um conjunto de especificações mínimas para cada grupo. Todos os participantes podem sugerir novos requisitos/linguagens que, mais tarde, poderão passar a constituir projetos. Os temas (especificações) propostos podem ser votados através de ferramentas apropriadas (enquetes). Finalmente, após a etapa de votação, os mediadores aprovam os projetos selecionados e uma nova etapa se inicia.

Os participantes formam grupos e selecionam um projeto para ser desenvolvido. Nesse momento, todo o espaço para o desenvolvimento do projeto é criado (agenda, área de desenvolvimento, mecanismos de comunicação). Após a definição do projeto, o ambiente passa a controlar as ferramentas disponíveis para cada projeto.

Durante o desenvolvimento dos projetos, os aprendizes utilizam a agenda do grupo, correio, listas de discussão, reuniões virtuais síncronas (chat) e assíncronas (fórum), para promover a comunicação, a cooperação e a interação. Documentos e porções de códigos para avaliação podem ser disponibilizados, utilizando-se uma área compartilhada. Os diversos artefatos produzidos pelo grupo em etapa do processo (como estruturas de dados, gramáticas, analisadores léxicos) podem ser compartilhados, de modo a promover seu registro e compartilhamento.

Em diferentes etapas do processo de aprendizagem, o mediador precisa intervir. Exemplos dessa intervenção estão relacionados ao acompanhamento das agendas de grupos e no cumprimento das atividades (grupos/participantes). Essa intervenção pode acarretar em uma sobrecarga no trabalho do mediador comprometendo suas atividades de mediação. Assim, a camada de agentes mediadores atua sobre as camadas C1 e C2 no sentido de minimizar essa sobrecarga.

Camada de agentes mediadores

Para apoiar as atividades de mediação, os agentes mediadores, dispostos sobre uma camada inteligente, passam a monitorar e acompanhar os aprendizes no desenvolvimento de seus projetos. A abordagem de agentes é apropriada por inserir características pró-ativas ao ambiente, reduzindo, dessa forma, a sobrecarga de trabalho do mediador no acompanhamento dos aprendizes através do monitoramento de suas ações.

A organização de agentes é projetada segundo a metodologia Gaia [WOO 2000], considerando-se, na modelagem, as camadas C1 e C2 (figura 1) como o ambiente percebido pelos agentes. A metodologia Gaia [WOO 2000] considera o projeto de sistemas multiagentes como uma organização artificial, permitindo combinar o poder da abstração de agentes (na verdade, de papéis) com um projeto e implementação orientados a objetos (ou outro paradigma) significativamente simplificados e com alta reusabilidade. Uma característica particular da metodologia está na ênfase do uso de classes abstratas de agente, como um meio de agrupar papéis durante a análise e durante o refinamento do modelo. Desse modo, algumas decisões sobre agentes podem ser postergadas até a fase de projeto. Assim, alterações quanto a granularidade, por exemplo, remetem a modificações apenas nos modelos de projeto, garantindo que os papéis não sejam modificados. Os seguintes papéis foram identificados [1]:

- **GerEstr**: papel gerenciador de estratégias, responsável pela carga e gerenciamento das modificações nas estratégias definidas pelos mediadores;
- **InterpretEstr**: papel interpretador de estratégias, responsável pela interpretação e delegação de responsabilidades para as condições e ações definidas nas estratégias;
- **ExecutorEstr**: responsável pela execução das ações definidas nas estratégias (para o grupo ou para um componente do grupo);
- **AcompAprendiz**: analisa as ações executadas e acompanha o aprendiz em suas ações, registrando essas ações para auxiliar no processo de mediação;
- **AcompGrupo**: analisa as estratégias e táticas empregadas no acompanhamento dos aprendizes participantes de um grupo/turma, realiza estatísticas de grupo e atende a solicitações relativas a essas informações;
- **AcompMediador**: armazena e analisa as ações do mediador, buscando dar suporte na definição de estratégias para o acompanhamento dos aprendizes;
- **Mensageiro**: realiza as comunicações definidas nas táticas das estratégias. Essas comunicações podem acontecer de forma síncrona ou assíncrona. Para este trabalho as comunicações possíveis são através de correio eletrônico, quadro de avisos (Web) ou agente de interface;
- **AtMediador**: efetua as interações entre o mediador, a organização de agentes virtuais e o ambiente;
- **AtAprendiz**: efetua as interações entre o aprendiz, a organização de agentes virtuais e o ambiente;
- **AvaliadorEstr**: esse papel registra todas as comunicações entre agentes virtuais e entre agentes virtuais e aprendiz. Ele é responsável por avaliar as estratégias definidas, no sentido de auxiliar o mediador com estatísticas relacionadas às ações executadas ou não das estratégias. Para isso, utiliza os registros de comunicação;
- **GerFerrComunic**: fornece informações solicitadas sobre as ferramentas de comunicação no ambiente para um grupo ou para um aprendiz participante de um grupo/turma;
- **GerAgenda**: fornece informações solicitadas sobre a agenda de um grupo/turma ou para um componente de grupo/turma;
- **GerProjeto**: fornece informações solicitadas sobre o andamento do projeto de um grupo/turma;
- **GerFerrPedagogica**: fornece informações sobre usos de ferramentas pedagógicas disponíveis para um grupo/turma;
- **GerConteudo**: fornece informações sobre acessos a conteúdos disponibilizados para turma/grupo;

O modelo de comunicação (figura 2) entre papéis é apresentado na figura 2.

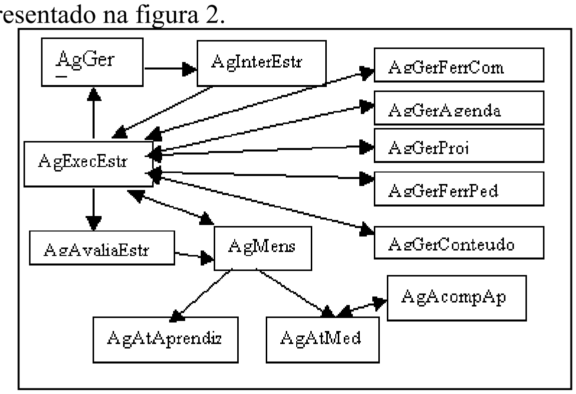

FIGURA 2

MODELO DE COMUNICAÇÃO DOS AGENTES

Uma vez que o projeto orientado da metodologia GAIA não especifica os detalhes para a implementação, realizou-se a modelagem orientada a objetos para cada agente modelado, de forma consistente com a implementação em linguagem orientada a objetos (JAVA). Em tempo de projeto, um novo agente foi projetado para a organização (o agente comunicador), atendendo aos requisitos de comunicação entre agentes.

Para compreender o funcionamento da organização de agentes, abstraindo-se a função do agente comunicador, basta analisar os papéis desempenhados pelos agentes: o agente Gerenciador de Estratégias (AgGerEstr) monitora as estratégias e quando identifica que houve modificação em alguma estratégia, ou se nova estratégia foi definida, encaminha para Interpretador de Estratégias (AgInterEstr). Este, por sua vez, interpreta cada uma das táticas definidas nas estratégias e encaminha para o Agente Executor de Estratégias (AgExecEstr). O agente Executor repassa a condição estabelecida na estratégia para o agente responsável por analisá-la (nesse caso, os agentes monitores das ferramentas presentes na divisão de gerência de ferramentas) e aguarda até que todas as condições estabelecidas na estratégia sejam encontradas. Nesse caso, o Executor de Estratégia deve iniciar a execução (que pode ser, por exemplo, uma mudança na agenda, um aviso no mural ou o envio de mensagens, via e-mail ou através de agentes de interface). Quando mais de uma condição remete à execução de ações, o executor deve solicitar a revalidação das condições encontradas. Por exemplo, a condição 1 pode ter sido encontrada 3 dias de antecedência da condição 2 e, nesse momento, a condição 1 pode não ser mais válida para aquele aprendiz.

Uma das ações estabelecidas nas estratégias pode ser uma parada na estratégia. Nesse caso, o Executor informa ao Gerenciador de Estratégias que a estratégia deve ser desativada e solicita a interrupção de todos os outros serviços. Uma vez que todas as comunicações entre agentes são registradas, o Avaliador de Estratégias (AgAvalEstr) é responsável por acompanhar os registros de comunicação e enviar mensagens (através do Agente Mensageiro – AgMens) para o mediador informando sobre a situação da estratégia. Os agentes Acompanhadores (na divisão de acompanhamento) são responsáveis por fornecer informações (quantitativas) relativas às ações de grupo, aprendiz e mediador, quando solicitadas.

V. Conclusões

O MEDIADOR foi desenvolvido, inicialmente, a perspectiva de ser incorporado ao AmCorA [4], de forma que possa ser utilizado em disciplinas ou cursos que favorecem a utilização da pedagogia de projetos (como é o caso da disciplina de Compiladores, Inteligência Artificial, entre outras).

A utilização do ambiente e acompanhamento da organização de agentes é fundamental para avaliar os requisitos e identificar novos requisitos necessários para atingir os objetivos propostos. Requisitos de interface, por exemplo, podem ser identificados através da utilização do ambiente (visualizar mensagens de acordo com as preferências do aprendiz etc).

Fundamentalmente, deve-se considerar que essa proposta é fortemente baseada nas questões de interatividade do ambiente. A definição de estratégias cujas táticas sejam baseadas na interatividade só pode efetivamente ser avaliada conforme o uso do ambiente por aprendizes e mediadores.

Finalmente, as estratégias definidas nessa proposta baseiam-se em critérios quantitativos. Para uma análise qualitativa do ambiente, a integração desta proposta a outras ferramentas, como [8] e [2] é fundamental, para que se possam obter melhores resultados na execução das estratégias.

TEAVIC: UMA APLICAÇÃO DE TEATRO VIRTUAL NO APOIO AO PROCESSO DE ENSINO-APRENDIZAGEM

Maria da Penha de Andrade Abi Harb[1], *Vivivane Cremasco Daros*[2], *Fabíola Lima Menezes*[3] *e Silvana Rossy de Brito*[4]

***Resumo*— Esse artigo apresenta o TEAVIC, uma aplicação de teatro virtual baseada na Web, que combina a abordagem de agentes sintéticos com conceitos de improvisação dirigida e do modelo social-psicológico, permitindo interação e dinamismo na exibição das estórias. A arquitetura apresentada contempla o modelo dos agentes, a formação de scripts, a configuração (definida pelo usuário/sistema), e uma ferramenta de autoria para esses scripts. O artigo propõe a utilização dessa ferramenta por aprendizes da disciplina de Introdução a Ciência da Computação como uma tecnologia para apoio à síntese, através da elaboração de estórias no contexto da disciplina.**

***Palavras-chave* — Teatro virtual, agentes improvisacionais, modelo sócio-psicológico, atores virtuais, agentes sintéticos .**

I. INTRODUÇÃO

A área de entretenimento tem evoluído rapidamente com a utilização de recursos de redes de computadores e hipermídia, sendo crescente o número de aplicações e jogos que oferecem elevado grau de interatividade e atratividade. Dentre as abordagens mais recentemente utilizadas, a tecnologia de agentes sintéticos encontra sua aplicação no desenvolvimento de ambientes interativos de aprendizagem, favorecendo o processo de aprendizagem através de recursos que tornam essas aplicações mais interessantes e atrativas aos usuários.

O teatro virtual é uma aplicação dentro da área de entretenimento que pode ser direcionada para o desenvolvimento de habilidades como a criatividade, a imaginação, a interpretação crítica, a concentração e a expressão. Nesse sentido, é um recurso que encontra, na educação, uma vasta área de aplicação quando considerado como uma ferramenta pedagógica.

Este artigo apresenta o TEAVIC - uma aplicação de teatro virtual baseada na Web, que permite a interação do usuário durante a exibição das peças. A arquitetura proposta contempla o modelo dos agentes, a formação dos scripts, a configuração (definida pelo usuário ou pelo sistema), e a incorporação de uma ferramenta de autoria para esses scripts.

Além dessa introdução, este artigo está organizado em mais 5 seções: a seção 2 apresenta o conceito de teatro virtual; a seção 3 discute a utilização do teatro virtual como uma ferramenta pedagógica; a seção 4 apresenta uma aplicação de teatro virtual e as possibilidades pedagógicas e, finalmente, na seção 5 são apresentadas as conclusões finais.

II. TEATRO VIRTUAL

O conceito de teatro virtual é vago e não existe um consenso para uma determinação aceita para esse termo. O termo adotado nesse artigo baseia-se na visão de que o teatro virtual pode ser visto como um mundo habitado por agentes sintéticos [7] que agem e interagem de forma independente ou seguindo instruções, que podem vir do usuário ou serem previamente projetadas para execução por outro agente (por exemplo, um agente com papel de diretor da peça) [2]. Destacam-se como algumas aplicações de teatro virtual:

- **Teatrix**. Desenvolvido para fins educativos, é um ambiente de aprendizagem que envolve noções de teatro e de criação de estórias com o propósito de auxiliar aprendizes e professores, em todo o processo de criação de estórias de forma colaborativa. Proporciona à criança o desenvolvimento das noções de narrativas, através da dramatização de diversas situações [4]. Como em um teatro convencional, esta aplicação é divida em fases e cada fase possui um módulo desenvolvido [6].
- **Cybercafé**. Desenvolvido para alcançar um modelo de mente para agentes vrtuais, o Cybercafé [7] apresenta três atores sintéticos, sendo dois autônomos (um garçom chamado Otto, e um cliente chamado Jim) e um avatar (um cliente chamado Gaby). Enquanto os atores autônomos são responsáveis por suas próprias ações, o avatar é controlado pelo usuário selecionando os botões correspondentes às ações que podem ser representadas pela Gaby no contexto corrente. Estas ações são descritas textualmente em uma janela. O cenário explorado é a interação entre os personagens em um bar (cybercafé). A cada exibição do Cybercafé, variam as falas e os comportamentos dos personagens.

III. TEATRO VIRTUAL E A EDUCAÇÃO

O teatro virtual tem sido tradicionalmente defendido no contexto educacional para o desenvolvimento de habilidades como a criatividade, a imaginação, a interpretação crítica, a concentração e a expressão. Uma aplicação de teatro virtual deve envolver mais do que um simples diálogo entre homem-computador por intermédio de uma interface, proporcionando ao usuário a sensação de sentir-se dentro da interface computacional e dialogar com outras entidades que também habitam esta interface [1].

O teatro virtual encontra, na área de educação, uma vasta área de aplicação quando considerado como uma ferramenta pedagógica. Do ponto de vista da aprendizagem, sabe-se que com qualquer metodologia adotada, ela só é obtida com sucesso se houver o comprometimento e a interação entre todas as pessoas envolvidas no ambiente de aprendizagem.

Nesse contexto, quando um educador elege uma aplicação de teatro virtual como recurso metodológico para apoiar o processo de ensino-aprendizagem, é porque está comprometido com os aspectos referentes ao processo de conhecimento e compreensão [9] dos aprendizes. Ensinar com o auxilio de teatro virtual é traçar um paralelo com o ensino que utiliza o conto-de-fadas, o cinema, a televisão ou as estórias em quadrinhos. Segundo Rahde, citado por [8], esses recursos são excelentes para iniciar os jovens à forma expressiva, à linguagem própria que tais meios utilizam.

A contribuição do teatro virtual para a educação, a exemplo das estórias em quadrinhos [8], deve ser analisada por parte dos educadores e psicólogos de forma que a sua aplicação, inicialmente recreativa, seja efetivamente considerada como recurso às atividades envolvidas no processo de ensino-aprendizagem. Essa contribuição pode se dar através de diversos aspectos:

- a imagem é instantânea, enquanto que a palavra é sucessiva, ou seja, precisa que os símbolos (letras) sejam decodificados e interpretados. A imagem possibilita que o aprendiz explore a sua interpretação subjetiva, fornecendo o alimento a sua fantasia, podendo ser observada e interpretada de diferentes maneiras. Dessa forma, a potencialidade pedagógica firma-se no fato de que esta atividade proporciona o desenvolvimento da criatividade, promovendo o debate sobre um tema gerador e sobre os aspectos narrativos da estória[8]. Essa prática auxilia no processo de compreensão [9];
- a utilização do recurso de áudio associados às imagens e à movimentação do cenário incorpora o dinamismo necessário para tornar a ferramenta mais atrativa e interessante aos aprendizes assim como também facilita nos processo de conhecimento e compreensão. Segundo [9], na etapa de conhecimento, a ênfase está nos processos psicológicos da memória, determinando um acréscimo de percepção por parte do aprendiz e na compreensão espera-se do aprendiz que, ao enfrentar uma comunicação, seja capaz de entender o conteúdo que lhe é transmitido e de fazer algum uso dos materiais ou idéias nela abrangidos. Essa comunicação, no caso do teatro virtual, pode ser oral, escrita ou simbólica. Normalmente, a compreensão é a classe mais enfatizada pela escola e para que ela aconteça, é necessária a evocação de algum conhecimento;
- teatro virtual pode ser utilizado pelos aprendizes na composição de suas próprias estórias, transmitindo (comunicando) a sua compreensão sobre determinado conteúdo ou atividade aprendida e estimulando a interação entre os participantes do processo de aprendizagem.

No contexto da computação, o ensino precisa de inovações, porque envolve conhecimentos cuja aprendizagem requer grande esforço cognitivo para aprender assuntos como programação de computadores, utilização de softwares, bem como o manuseio de softwares específicos [12]. Elaborar soluções algorítmicas para problemas reais, utilizando um conjunto de comandos de uma linguagem exige do aluno diversos conhecimentos como capacidade de abstração e organização das idéias, conhecimentos e habilidades que caracterizam um programador como perito [13].

Segundo Rodrigues et al. [12], a prática de ensino de computação é afetada pela inexistência de literatura de referência sobre construção e utilização de metodologias e materiais didáticos para o ensino de computação, pela escassez de professores com capacitação específica para ensinar computação e pela ignorância sobre as potencialidades das tecnologias educacionais, especialmente da multimídia e dos softwares de autoria que são recursos indispensáveis ao processo ensino-aprendizagem [13]. Nesse contexto encontram-se as aplicações de teatro virtual, especificamente como ferramentas de autoria: nelas, uma estória pode ser a estruturação de um algoritmo, onde, no ambiente, podem estar as diversas estruturas (de dados) necessárias para a solução do problema. Para compor uma estória, o aprendiz necessita evocar o conhecimento sobre os dados do problema, decompor problemas grandes em subproblemas menores, que podem ser resolvidos com mais facilidade. Adiciona-se a isso, as vantagens de se utilizar um recurso multimídia, que valoriza a expressão escrita e o envolvimento dos aprendizes.

O teatro virtual, como uma ferramenta de síntese, permite explorar a percepção do aprendiz de que os conceitos científicos não são estanques na divisão em disciplinas. Nesse sentido, os professores podem estruturar trabalhos que exijam do aluno a estruturação de uma estória onde diversos conceitos sejam utilizados. No teatro virtual, o aprender aproxima-se do mundo real, de forma que é possível que o aprendiz explore a sua interpretação subjetiva, fornecendo o alimento a sua fantasia e poder de abstração.

IV. TEAVIC

Uma aplicação para teatro virtual apresenta atores representados por agentes sintéticos [7] que atuam em um ambiente interativo, seguindo instruções do usuário ou agindo de forma autônoma. Para atender a esse objetivo, um conjunto de requisitos deve ser atendido. Esses requisitos são descritos em termos das características do sistema (comportamento e funcionalidades que deve prover) e dos agentes que atuam nesse sistema. A figura 1 apresenta o diagrama de casos de uso da aplicação TEAVIC [11].

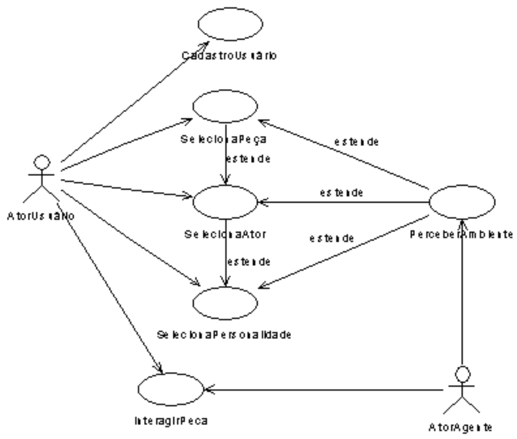

FIGURA 1
DIAGRAMA DE CASO DE USO

O aprendiz (AtorUsuário), para utilizar o sistema, deve ter realizado o seu cadastro. Para se cadastrar, deve preencher um formulário informando seus dados pessoais, login e senha. Entretanto, esse cadastro não precisa ser realizado no caso de desejar apenas conhecer e ter acesso a informações disponíveis na página de Visão Geral do Sistema.

Para acessar as estórias dessa aplicação de teatro virtual, o aprendiz pode selecionar a categoria da estória (contos, desafios lógicos, etc.), a estória desejada, os agentes para cada papel, o narrador, e suas respectivas personalidades, nessa ordem. O sistema pode fazer escolhas automáticas das opções não selecionadas pelo aprendiz.

O usuário pode parar a peça quando desejar e no próximo acesso ao teatro virtual será apresentado ao aprendiz uma opção de continuar a estória de onde parou, com os mesmos agentes e personalidades escolhidas para os mesmos.

Os agentes do teatro virtual saúdam o aprendiz quando esses iniciam o sistema e se despedem do mesmo ao término da interação. Esses agentes improvisam seus comportamentos, ou seja, a cada interação modificam suas falas e ações, mantendo o mesmo contexto, e de acordo com as escolhas do usuário. Para isso, utilizou-se a técnica de improvisação dirigida [7] e a tecnologia MsAgent [5] em conjunto com tecnologias para Web e acesso a banco de dados. O uso desta tecnologia facilita no que diz respeito ao fato da interface gráfica e das ações já estarem prontas.

O TEAVIC também conta com um ambiente para a construção de *scritps* (estórias), onde o próprio usuário pode criar suas peças teatrais.

Utilizou-se a orientação a objetos para a modelagem dos agentes (e do ambiente) em termos de seu comportamento (ações físicas e ações verbais) e sua personalidade. Apesar desse diagrama contemplar uma modelagem genérica para suportar diversas personalidades e comportamentos, a complexidade de se definir essas características requer uma abordagem especificamente desenvolvida para o projeto de agentes sintéticos. Essa abordagem é necessária para detalhar as características do personagem de forma que o modelo fique consistente. A figura 2 destaca a modelagem do personagem (que representa o agente desempenhando um papel com uma determinada personalidade na peça) no diagrama de classes. Em tempo de projeto dos agentes, esses personagens são projetados segundo o modelo social-psicológico [7].

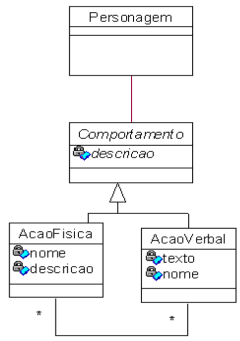

FIGURA 2
MODELAGEM DO PERSONAGEM

A Tabela I apresenta um exemplo de um modelo social-psicológico, a Tabela II apresenta alguns possíveis comportamentos para agentes no teatro, a Tabela III apresenta possíveis ações verbais e a Tabela IV apresenta algumas ações físicas. As tabelas I, II e III são baseadas na peça ‘Contando até o Infinito’, adaptada do livro ‘O diabo dos números’ [10], cujos personagens são um aprendiz, o diabo dos números e um narrador .

TABELA I
EXEMPLO DE UM MODELO SÓCIO-PSICOLÓGICO

Papel	Diabo dos Números
Agente	Merlin
Personalidade	Rabugento
Humor	Irritado
Atitudes	Ações claras, porém ríspidas

TABELA II
EXEMPLOS DE COMPORTAMENTOS

agradar	entristecer-se	mostrar
alertar	escrever	mover-se
anunciar	explicar	observar
aparecer	fazer mágica	ocultar-se
atrair atenção	felicitar	pensar
declinar-se	gesticular	reconhecer
descansar	ler	saudar

TABELA III
EXEMPLOS DE AÇÕES VERBAIS

Categoria: Contos	
Estória: Contando até o Infinito	
Ato 1: Aparição do Diabo dos Números	
Ator: Merlin	
Papel: Diabo dos Números	
Cena 1	
Comportamento do Papel	**Instância da ação verbal**
Estender os braços ao lado Juntar as mãos e sorrir	"Sou o Diabo dos Números"
Coçar a cabeça Abrir as mãos para frente	"Ah, é? Então, porque você está falando comigo?"
Passar uma mão na barba Coçar a cabeça	"Mereço cada coisa nessa vida! Logo, logo explodirei!"

TABELA IV
EXEMPLOS DE AÇÕES FÍSICAS

aparecer	esconder-se	gesticular para cima
aplaudir	ficar alerta	levar um susto
bocejar	ficar parado	pedir atenção
curvar-se	gesticular para a direita	piscar
coçar a cabeça	gesticular para a esquerda	respirar
dar adeus	gesticular para baixo	sorrir e unir as mãos

A arquitetura do TEAVIC é apresentada na figura 3 e apresenta o funcionamento do TEAVIC de acordo as modelagens realizadas. Para atender aos requisitos especificados, essa arquitetura é composta de quatro papéis relevantes que, combinados, realizam todas as funcionalidades necessárias:

- um autor que possui como função a elaboração dos scripts (textos das peças) – neste caso, essa função é realizada pelos projetistas;
- atores (agentes) que são responsáveis pela interpretação dos papéis nas peças e pelo auxilio no uso do sistema;
- um diretor que é a parte do sistema responsável pelas escolhas não realizadas pelo usuário e por e outras decisões relevantes para o funcionamento do sistema - no caso do protótipo implementado, a função de diretor não é realizada por um agente de interface, mas sim através de funções do sistema;
- usuários podem fazer papel de diretor ou simplesmente assistir a exibição da peça, interagindo com o cenário.

Os cenários são trocados de acordo com a apresentação da peça e da situação corrente dos personagens. Nesse caso, as instruções são necessárias para a escolha correta do cenário para cada situação.

O objetivo de uma ferramenta de autoria para os scripts das peças é auxiliar o autor na criação de estórias podendo, principalmente, estender esta função ao aprendiz.

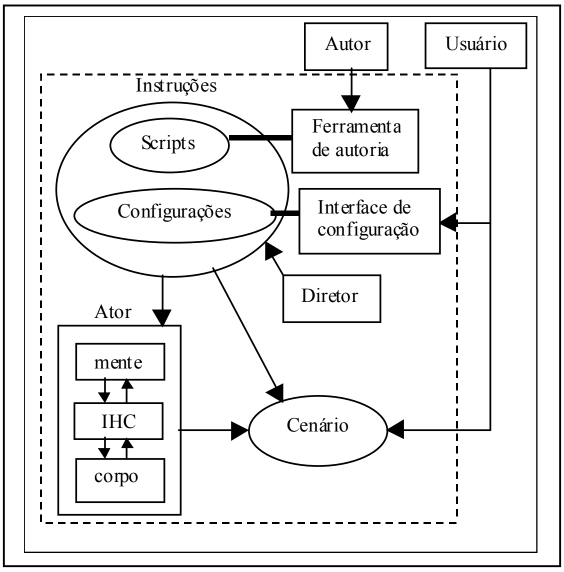

FIGURA 3
ARQUITETURA DO TEAVIC

Através da ferramenta de autoria para os scripts das peças é possível explorar o teatro virtual como uma ferramenta de síntese [9] para os aprendizes. Através dessa interface, é possível que o usuário componha suas próprias estórias, transmitindo (comunicando) a sua compreensão sobre determinado conteúdo ou atividade aprendida, estimulando a interação entre os participantes do processo de aprendizagem.

A estória composta através de scripts é apresentada por meio da tela de exibição de uma peça (Figura 4). Para a exibição desta cena foram selecionados pelo usuário (caso deseja-se) a categoria da estória, a estória e os agentes para cada personagem com suas personalidades.

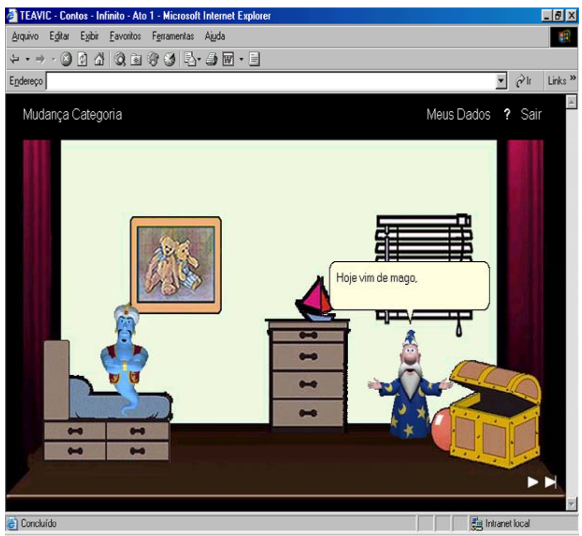

FIGURA 4

APRESENTAÇÃO DE UMA PEÇA NO TEAVIC

V. CONCLUSÕES

Atualmente, uma das preocupações dos educadores é a de trabalhar buscando abordagens educacionais que valorizem o envolvimento do aprendiz através da aprendizagem significativa e oferecendo diferentes recursos tecnológicos. O projeto TEAVIC oferece as mais diversas possibilidades, podendo estar inserido em diferentes abordagens pedagógicas. Os professores podem elaborar atividades curriculares interdisciplinares envolvendo temas da computação e até mesmo problemas que envolvam soluções algorítmicas. A partir da utilização desse recurso, pretende-se identificar requisitos que permitam fornecer registros de forma a potencializar as atividades mediação do processo de aprendizagem.

A metodologia adotada para a concepção do TEAVIC é uma combinação da abordagem de agentes sintéticos com conceitos de improvisação dirigida e do modelo social-psicológico. A combinação dessas abordagens foi adotada com o objetivo de desenvolver personagens com comportamentos, objetivos e características completamente independentes. Nesse modelo, cada agente pode interpretar diferentes papéis, sendo que suas características (personalidade, humor, etc.) e objetivos são determinados, ou escolhidos, de acordo com o papel que interpretam, possibilitando que cada agente apresente diferentes comportamentos.

Finalmente, o objetivo dessa proposta está no projeto e implementação de uma aplicação de teatro virtual que, quando devidamente interpretada e avaliada por educadores e psicólogos, possa ser utilizada como recurso pedagógico nas escolas ou até mesmo em ambientes educacionais informatizados. Entretanto, independentemente de sua aplicação na educação, o teatro virtual é facilmente considerado uma atividade de recreação estimulante da criatividade.

No contexto da computação, a utilização do recurso de áudio associados às imagens e à movimentação do cenário incorpora o dinamismo necessário para tornar a ferramenta mais atrativa e interessante aos aprendizes assim como também facilita nos processo de conhecimento e compreensão. Além disso, é uma ferramenta que valoriza a expressão escrita e pode ser utilizada para direcionar as mais diversas questões no ramo da computação: ética, algoritmos, temas da computação nas disciplinas introdutórias onde o aluno possui pouco ou nenhum conhecimento sobre o currículo.

Finalmente, o potencial pedagógico firma-se no fato de que esta ferramenta proporciona a adaptação às preferências dos aprendizes através das diversas escolhas que fornece aos aprendizes, como as opções de cenários e as escolhas dos comportamentos dos agentes. Esperam-se desenvolver mecanismos para que esse recurso melhore o grau de interatividade e envolvimento dos aprendizes (permitindo a construção cooperativa de scripts). Esse parece ser o caminho para aumentar a efetividade dos ambientes de ensino-aprendizagem e promover maior envolvimento dos aprendizes com os diversos aspectos da computação.

REQUISITOS DE UMA INTERFACE PARA APOIO À APLICACÇÃO DA REVISÃO PELOS PARES NA APRENDIZAGEM

Álvaro Sampaio Corrêa Neto[1], Vinícius Medina Kern[2]

Resumo— O controle de qualidade da ciência, o processo de revisão pelos pares, vem sendo aplicado no escopo da aprendizagem visando promover à melhoria da expressão escrita, pensamento crítico e responsabilidade profissional. Resultados publicados sugerem avanços significativos na busca por uma mudança de paradigma: da aprendizagem passiva e dependente para a aprendizagem pró-ativa, independente e responsável. A aplicação do processo envolve extraordinário trabalho administrativo, dificultando a utilização em uma sala de aula por um único instrutor. Um sistema computacional de auxílio à aplicação do processo de revisão em sala de aula é de grande valia na sua difusão. Este artigo revisa os conceitos básicos da revisão pelos pares, e apresenta a análise de requisitos para uma interface de suporte a aplicação do processo de revisão pelos pares em sala de aula. Recomendações para trabalhos futuros são aventadas.

Palavras Chaves — Revisão pelos pares na aprendizagem, Engenharia de Requisitos, Informática na Educação.

1. INTRODUÇÃO

Os profissionais recém formados encontram um mercado de trabalho cada vez mais exigente e seletivo. Além de uma boa formação acadêmica, diversas habilidades pessoais são indispensáveis em um mundo cada vez mais competitivo. Prática na expressão escrita e falada, senso de responsabilidade profissional e pensamento crítico são algumas das qualidades exigidas para a boa colocação no mercado. Mas, como auxiliar o aperfeiçoamento destas características em um ambiente de aprendizagem?

A aplicação do processo de revisão pelos pares no meio acadêmico auxilia o desenvolvimento destas habilidades [1]-[4]. Entretanto, a burocracia envolvida no processo dificulta sua utilização em uma sala de aula brasileira, na qual o professor é responsável por orientar e organizar todo o processo. A disponibilidade de uma ferramenta de auxílio à aplicação da sistemática de revisão pelos pares em sala de aula é fundamental para sua plena realização.

O presente artigo apresenta um estudo sobre requisitos desejáveis de uma ferramenta de apoio à aplicação da revisão pelos pares na aprendizagem. A seção 2 apresenta a revisão pelos pares, sistema de controle de qualidade da ciência – seus primórdios e evolução. A seção 3 aborda a sistemática aplicada à aprendizagem, complementada pela seção 4, que apresenta as etapas envolvidas neste processo. A seção 5 lista os requisitos desejáveis de uma ferramenta de apoio à aplicação pelos pares, sendo as considerações finais apresentadas na seção 6.

2. REVISÃO PELOS PARES

Antigamente os cientistas trocavam cartas entre si para comunicar os resultados de suas pesquisas. Na idade moderna surgiram as primeiras revistas científicas, e a troca de correspondência foi substituída por publicações nestas revistas especializadas. Segundo [5], a Royal Society of London, em 1753, começou a utilizar o Conselho da Sociedade como avaliador do material a ser publicado em sua revista, marcando o início oficial da aplicação da revisão pelos pares.

A revisão pelos pares surgiu da necessidade de avaliar a produção científica. Conforme [5], a sistemática não surgiu de forma acabada e vem sofrendo alterações face a uma série de críticas motivadas principalmente por distorções no uso.

Através da revisão pelos pares os congressos científicos avaliam a conveniência de aceitar um artigo para publicação [6]. Os responsáveis pela organização do evento recorrem a pares do autor (pesquisadores cuja especialidade relaciona-se ao tópico do artigo) e solicitam seus pareceres para subsidiar a decisão.

O sucesso da sistemática de revisão pelos pares baseia-se fortemente no compromisso que assumem autor, revisor e editor com a qualidade do trabalho publicado. A próxima seção discute a potencialidade desta sistemática aplicada à aprendizagem, para estimular entre aprendizes um alto nível de comprometimento com a qualidade do que produzem enquanto aprendem.

3. REVISÃO PELOS PARES NA EDUCAÇÃO

Códigos de ética e conduta profissional apontam a habilidade de oferecer e receber crítica como fundamentais para profissionais de Computação. O código de ética da Association for Computing Machinery (ACM) [7], por exemplo, requer dos membros a busca por crítica ao próprio trabalho, e o oferecimento de crítica documentada ao trabalho de terceiros. Currículos de Computação [8]-[10], entretanto, não contemplam o desenvolvimento destas

Programa de Pós-graduação em Engenharia de Produção, Universidade Federal de Santa Catarina, Rua Lauro Linhares, 2123-B, s. 201-205,88036 002, 48 331-7016, Florianópolis, SC, Brazil
[1] Álvaro Sampaio Corrêa Neto, alvaro@callisto.com.br
[2] Vinícius Kern Medina, kern@eps.ufsc.br

habilidades compatível com a importância sugerida pelo código de ética da ACM.

Desde 1997, a revisão pelos pares vem sendo aplicada na UNIVALI por [11], buscando o rompimento com o paradigma tradicional de aprendizagem e desestabilizando o papel tradicional do aluno, de forma que este assuma responsabilidade por sua aprendizagem. Outras experiências da aplicação da sistemática na educação podem ser encontradas em [1]-[2].

Na abordagem utilizada por [11], acontece a simulação de um congresso em sala de aula com a participação de alunos e professor, cada qual desempenhando determinados papéis, e ao final da experiência são produzidos diversos artigos, resultantes do trabalho colaborativo entre os participantes. A tabela 1 resume os principais papéis e responsabilidades assumidas pelos envolvidos.

TABELA 1
PAPÉIS DESEMPENHADOS PELOS PARTICIPANTES DO CONGRESSO EM CLASSE

Papel	Desempenhado por	Principal atribuição
Organizador e editor	Professor	Orientar e coordenar atividades, caderno técnico
Autor	Aluno	Pesquisar e escrever artigo
Revisor	Aluno	Avaliar artigo

O professor orienta e coordena os trabalhos, publica a convocatória de artigos, o formulário de revisão e o caderno técnico do congresso. Define as datas limites para as etapas do processo, diretrizes para pesquisa em grupo, redação, estilo e formatação.

Nesta aplicação da revisão pelos pares no meio acadêmico, os alunos desempenham dois papéis: autor e revisor. Como autores, sua principal atribuição e a realização da pesquisa e a redação do artigo. Na situação de revisores, devem avaliar artigos dos colegas de maneira crítica e responsável.

4. ETAPAS PARA APLICAÇÃO DA REVISÃO PELOS PARES NA EDUCAÇÃO

A aplicação do processo de revisão pelos pares, conforme a abordagem utilizada por [11], envolve extraordinário trabalho administrativo, dificultando a aplicação em sala de aula por um único instrutor, que deve ser responsável por toda a organização.

A figura 1 apresenta tarefas, responsabilidades e fluxo de documentos envolvidos na aplicação da sistemática em sala de aula. As tarefas são listadas a seguir.

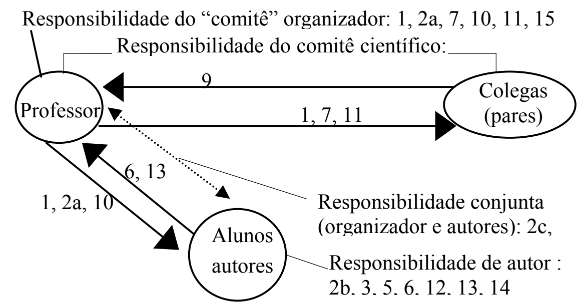

FIGURA 1
RESPONSABILIDADES E FLUXO DE DOCUMENTOS NA REVISÃO PELOS PARES APLICADA À APRENDIZAGEM [7].

1. Proposta;
2. Preparação: (a) Sugestão, (b) Seleção, (c) Aprovação do tema;
3. Esboço;
4. Apreciação do esboço;
5. Redação;
6. Submissão de originais;
7. Alocação e distribuição dos originais;
8. Revisão pelos pares;
9. Submissão de revisões;
10. Distribuição das revisões;
11. Feedback sobre revisões;
12. Apropriação do feedback;
13. Submissão final;
14. Apresentação;
15. Edição do caderno técnico;

Visando a facilitar a aplicação do processo em sala de aula, torna-se indispensável a utilização de um software capaz de facilitar a execução das etapas envolvidas no processo, minimizando o trabalho administrativo. A próxima seção discute os requisitos desejáveis a uma ferramenta desta espécie, utilizando a abordagem definida em [11].

5. PRINCIPAIS REQUISITOS DE UMA FERRAMENTA DE SUPORTE À APLICAÇÃO DA REVISÃO PELOS PARES NA EDUCAÇÃO

Uma ferramenta de suporte a aplicação da revisão pelos pares na educação tem como principal objetivo permitir aos envolvidos a simulação de um fórum científico sem sobrecarregar o organizador do evento com trabalho burocrático. Existem algumas ferramentas disponíveis na Internet que implementam algumas das funcionalidades necessárias, inclusive algumas gratuitas [12], mas a aplicação do processo no meio acadêmico possui requisitos específicos não completamente atendidos por tais ferramentas.

Os requisitos são as definições que delineiam as funções e características que um produto deverá possuir, depois de construído, sem referir-se ao modo utilizado na resolução. Ou, conforme [13], requisitos são características e propriedades que um produto deve apresentar para a resolução de um problema específico do mundo real.

O levantamento de requisitos, ou análise de requisitos, é vital para qualquer projeto de software e deve ser coerente com a real necessidade dos clientes e usuários. Os requisitos podem ser documentados de várias maneiras, usando métodos e linguagens.

A referência [13] apresenta o template Volere para a especificação de requisitos e restrições, estabelecendo um arcabouço para redação. Segundo os autores, existem 26 tipos de requisitos agrupados em quatro categorias:

Restrições: limitações e restrições aplicáveis ao projeto e ao produto

Requisitos funcionais: funcionalidade do produto

Requisitos não funcionais: qualidades do produto

Questões de projeto: questões aplicáveis ao projeto para a construção do produto

As quatro sub-seções a seguir detalham cada uma das categorias definidas, bem como apresentam os requisitos de uma ferramenta de suporte à aplicação da revisão pelos pares na aprendizagem, classificado-os segundo os tipos definidos no template Volere.

5.1 Restrições e limitações do produto

Para [13], encontram-se nesta classe os tipos de requisitos que definem como o produto resultante se adequará ao mundo. São os requisitos que definem, por exemplo, o propósito do produto, seus clientes, usuários, suposições e fatos relevantes. A seguir detalham-se requisitos deste tipo.

1. Propósito do produto: o principal foco da ferramenta é fornecer meios que facilitem a simulação de um congresso em sala de aula. O produto deve, entre outras funcionalidades, auxiliar a formação dos grupos de autores, a publicação de material bibliográfico de apoio, a submissão dos artigos, a alocação dos artigos a seus revisores, e o trâmite de documentos.

2. Freguês, clientes e interessados (stakeholders): os potenciais fregueses (aqueles que poderão adquirir o produto) são professores interessados em aplicar a revisão pelos pares na aprendizagem. O cliente (aquele para quem o produto está sendo desenvolvido) são gestores de ensino e pesquisa, pedagogos, alunos e outros que desejem conhecer a sistemática.

3. Usuários: os usuários são professores e alunos que participam da aplicação da revisão pelos pares na aprendizagem, segundo os papéis descritos na seção 3.

Enquanto as restrições, recém descritas, dão forma geral ao produto, as coisas que o produto faz são documentadas como requisitos funcionais, detalhados a seguir.

5.2 Requisitos funcionais

Requisitos funcionais são, conforme [13], necessidades de ações que o produto executa com a devida funcionalidade para o usuário. A complexidade de um projeto de software, segundo [14], é determinada parcialmente por suas funcionalidades. Existem dois tipos de requisitos nesta classe, conforme afirma **Erro! A origem da referência não foi encontrada.**:

Escopo do produto: limites e conexões com sistemas adjacentes.

Requisitos de dados e funções: coisas que o produto deve fazer e os dados manipulados pelas funções.

A tabela 2 apresenta a correspondência entre a lista de tarefas envolvidas na aplicação da revisão pelos pares na aprendizagem, esquematizadas na figura 1, e os índices dos principais requisitos funcionais identificados. Na seqüência, listam-se estes requisitos funcionais seguidos de uma explicação resumida:

TABELA 2

Correspondência entre as tarefas apresentadas na figura 1 e os requisitos funcionais identificados.

Tarefas da revisão pelos pares aplicada à aprendizagem	Requisito funcional
1. Proposta	1,2,3,4,5
2. Preparação: sugestão, seleção e aprovação de tema	6,7,9
3. Esboço	8
4. Apreciação do esboço	8
5. Redação	-
6. Submissão de originais	12
7. Alocação e distribuição dos originais	10,11
8. Revisão pelos pares	13
9. Submissão de revisões	13
10. Distribuição das revisões	18
11. Feedback sobre revisões	16
12. Apropriação do feedback	14
13. Submissão final	12
14. Apresentação	19
15. Edição do caderno técnico	20

1. Preparação do congresso: o software deve permitir ao editor-organizador a criação de uma edição de congresso na qual acontece a aplicação do processo de revisão pelos pares. Deve permitir diversas edições ocorrendo simultaneamente, sem restrição de participação em vários papéis e vários eventos.

2. Definição de proposta: o software deve permitir ao organizador a definição da proposta de trabalho com a anexação de um arquivo eletrônico (meta-artigo) contendo a descrição detalhada sobre formatação dos artigos a serem submetidos e outras orientações aos autores.

3. Publicação de ficha de avaliação: **Erro! A origem da referência não foi encontrada.** afirma que uma das formas de minimizar os erros de julgamento da revisão pelos pares é a utilização de questionários de revisão com critérios norteadores. Portanto, cada edição de congresso deve possuir seus próprios quesitos de avaliação. 4. Definição de prazos: o processo de revisão pelos pares subdivide-se em várias etapas (formação de equipes, submissão do esboço, etc) cada qual com sua data limite. O organizador deve informar estas datas ao futuro sistema, que enviará um lembrete aos participantes sobre a proximidade de uma data limite.

5. Inscrição de participantes: o futuro sistema deve permitir a inscrição e suspensão de participantes. Cada autor realiza sua própria inscrição e o organizador deve manter as informações.

6. Formação de grupos: o software deve facilitar a formação de grupos de autores, permitindo a inclusão e consulta das áreas de interesse de pesquisa.

7. Publicação de temas: o organizador deve poder incluir diversos temas que podem ser abordados pelos artigos a serem escritos. Os autores podem consultar as publicações para auxiliar na definição do tema a abordar.

8. Apreciação de esboço: o sistema deve oferecer meios para que o autor possa realizar a submissão do esboço do artigo e o organizador possa apreciar e comentá-lo.

9. Cadastro de fontes de referência: permitir ao organizador e autores a publicação de informações de apoio. Endereços de Internet que possuam algum material relevante para o congresso e bibliografias. O sistema deve comunicar aos participantes a inclusão de novas fontes de referências, permitindo a consulta.

10. Levantamento de intenção em revisar: após os grupos estarem com os temas dos artigos definidos, pode existir um interesse, por parte de determinado revisor, em revisar um artigo específico. Portanto, a futura ferramenta deve permitir ao revisor informar esta intenção. Esta indicação pode auxiliar o organizador no momento da alocação dos revisores.

11. Alocação de artigos: deve haver mecanismos que facilitem o trabalho de associação dos artigos a seus revisores. Este requisito é de suma importância para facilitar o trabalho do organizador, portanto deve ser simples e prático, de preferência de forma gráfica. Também deve permitir a consulta das alocações já realizadas, com possibilidade de alterações.

12. Submissão dos artigos: os autores devem poder transferir os artigos originais para que sejam armazenados pela ferramenta. Podem ser submetidas diversas versões de um mesmo artigo, desde que respeitadas as datas limites.

13. Preenchimento das revisões: os revisores devem possuir meios para preencher e submeter a ficha de avaliação de cada artigo alocado para receber o seu parecer.

14. Refutar / aceitar revisão: o sistema, após receber revisões sobre um determinado artigo, deve permitir aos autores a concordância ou discordância sobre determinados pontos das revisões. As partes da revisão onde houver divergência de opinião poderão ser refutadas com a devida justificativa.

15. Protocolo de envio / recebimento: o sistema de suporte à revisão pelos pares trabalha com trâmite de arquivos eletrônicos. Estas operações estão sujeitas à qualidade dos meios de transmissão. Uma forma de minimizar os problemas decorridos dos erros de transmissão é o fornecimento de um número de transação como garantia de que a operação foi realizada.

16. Revisões dos outros pares: após o término do prazo para o preenchimento das fichas de avaliação, os revisores podem consultar as revisões dos outros pares para avaliar e refletir sobre o conteúdo das demais avaliações.

17. Submissão final: após realizar todas as correções cabíveis, a equipe de autores deve realizar a submissão da versão final de seu artigo.

18. Distribuir revisões: a qualquer momento o organizador pode selecionar um ou todos os artigos para enviar as revisões recebidas.

19. Escalonamento de apresentações: o futuro sistema deve possuir uma espécie de agenda eletrônica onde cada grupo deve agendar uma data e horário para apresentação do seu artigo.

20. Publicação do caderno técnico: o software deve permitir ao editor publicar, em mídia impressa ou digital, os artigos resultantes do congresso. Opcionalmente, poderia ocorrer a publicação dos artigos originais (primeira submissão) juntamente com as revisões (anônimas) para reforçar o caráter reflexivo da experiência.

Para que a análise de requisitos esteja completa, os requisitos funcionais devem ser complementados com as questões de qualidade do produto, os requisitos não funcionais, que serão detalhados na próxima seção.

5.3 Requisitos não funcionais

Uma vez conhecido o que o produto deve fazer, devem-se detalhar questões de qualidade e desempenho através dos requisitos não-funcionais [13]. Estes requisitos tratam das questões de qualidade do software, especificam características relacionadas a aparência, usabilidade, desempenho, manutenibilidade e portabilidade, segurança, fatores humanos e questões legais. Normalmente, os requisitos não-funcionais estão vinculados aos requisitos funcionais e são críticos para o sucesso do projeto. A seguir detalham-se requisitos não funcionais:

1. Aparência: preferencialmente, o software deve oferecer uma interface gráfica que permita a utilização do mouse.

2. Usabilidade: a ferramenta tem potencial para utilização em ambiente de ensino a distância [11], deve haver meios para acesso remoto, não-presencial e assíncrono.

4. Manutenibilidade e portabilidade: a futura plataforma terá a maioria dos acessos remotos. Não há como determinar qual a plataforma operacional de cada cliente, portanto este projeto deve considerar a utilização da tecnologia menos restritiva possível.

5. Segurança: para que o objetivo da revisão pelos pares seja alcançado com êxito, o caráter confidencial do processo deve ser mantido. Ou seja, é preciso manter o anonimato de revisor e autor.

6. Questões legais: participantes do processo devem estar de acordo sobre as questões de direito autorais envolvidas na construção de seus artigos e na publicação do caderno técnico em meio digital.

7. Suporte multilingüe: necessidade da interface do software em múltiplas línguas permitindo a quebra de fronteiras geográficas ou institucionais.

Além de restrições e requisitos funcionais e não funcionais, há requisitos chamados por [13] de "questões de projeto". São questões alheias às características específicas do projeto e do desenvolvimento, mas podem influenciar decisões de projeto, portanto são discutidas a seguir.

5.4 QUESTÕES DE PROJETO

Algumas questões são fundamentais para o sucesso ou fracasso em um projeto de desenvolvimento de software. Diversas questões de projeto podem afetar o sucesso do produto, dentre elas: os custos e riscos envolvidos na construção, a existência de soluções prontas e o surgimento de novos problemas a partir da introdução do produto e a documentação para usuários [13].

Ainda, pode haver requisitos do tipo "sala de espera", cujo cumprimento não é urgente, mas que justificam a inclusão na documentação para desenvolvimento futuro. A seguir detalham-se as questões de projeto identificadas até o momento:

Questão aberta: Considerando a publicação dos artigos em meio digital, uma questão a ser abordada é o direito autoral sobre artigos originais, avaliações e versões finais, bem como o direito de cópia sobre o caderno de anais como um todo.

Sala de espera: algumas características avançadas já foram aventadas [11] e podem ficar em uma lista de requisitos futuros, como por exemplo: detecção de plágio, verificação automática de citações e referências, verificação automática de gramática e estilo.

6. CONCLUSÕES E RECOMENDAÇÕES

Este artigo discutiu brevemente a revisão pelos pares como sistema de controle de qualidade da produção científica, esboçou argumentos para evidenciar vantagens de sua aplicação na aprendizagem, e listou iniciativas pioneiras. As etapas da aplicação na aprendizagem, conforme propostas por [11], foram listadas. Uma série de requisitos para a construção de uma interface de apoio à aplicação foi detalhada.

A disponibilidade de uma interface com as características discutidas neste artigo viabilizará a dedicação do professor interessado em aplicar a revisão pelos pares a questões importantes de orientação e avaliação da experiência. Sem a interface, a experiência fica bastante limitada pela quantidade de trabalho burocrático envolvido.

O detalhamento dos requisitos baseado na abordagem de [13] permite sistematizar a busca de requisitos. A inclusão de requisitos do tipo "sala de espera" permite antever as possibilidades de extensão da ferramenta, que está em fase inicial de construção.

Em especial, a automatização da verificação metodológica e da detecção de plágio permitem vislumbrar oportunidades de desenvolvimento e pesquisa envolvendo processamento de linguagem natural e inteligência artificial. Além de tópicos específicos de Computação, vislumbram-se oportunidades de desenvolvimento e pesquisa voltados ao desenvolvimento de tecnologia educacional para educação a distância, avaliação acadêmica e trabalho colaborativo.

FERRAMENTAS COLABORATIVAS VOLTADAS PARA A APRENDIZAGEM ATRAVÉS DA INTERNET

Ivan Carlos Alcântara de Oliveira[1] *e José Roberto de Almeida Amazonas*[2]

Resumo — *Este trabalho tem por objetivo apresentar a construção de um protótipo para aprendizagem colaborativa baseada na Internet do tipo CSCL (Computer Supported Collaborative Learning) chamado CTELCS (Collaborative Training Environment of the Laboratory of Communications and Signals) englobando uma ferramenta para a disponibilização de conteúdo, uma aplicação colaborativa assíncrona parecida com um FAQ (Frequently Asked Questions) com algumas funcionalidades adicionais, uma ferramenta de exercícios síncrona que possibilita o trabalho em grupo com chat, vídeo e o exercício agregado e a modelagem do conteúdo de um curso dentro do ambiente. Na implementação do protótipo foi utilizado o modelo de arquitetura MVC (Model-View-Controller) com tecnologias independentes de plataforma baseada em XML, Applets Java, Java Media Framework, JSP/Servlets e MySQL.*

Palavras Chaves — aprendizagem colaborativa, CSCL, Java, MVC.

1. INTRODUÇÃO

No cenário global da educação observa-se atualmente uma grande procura por parte de instituições acadêmicas, empresas e até mesmo usuários por treinamento a distância através da Internet. Nesse tipo de treinamento pessoas em lugares e em tempos distintos podem fazer cursos utilizando ambientes de aprendizagem com ferramentas de administração de usuários e cursos, de inserção de conteúdos, comunicação e de controle do progresso dos estudantes. Essas ferramentas trabalham com diversos tipos de mídias (texto, áudio e vídeo), animações, simulações e exemplos na tentativa de auxiliar a aprendizagem. Também pode-se combinar uma abordagem individual com atividades colaborativas. Ambientes CSCL (*Computer Supported Collaborative Learning*) com algumas ferramentas que atuam como mediadoras do processo de ensino-aprendizagem podem ser utilizadas para prover a aprendizagem colaborativa [1][2].

Este trabalho propõe o desenvolvimento de um protótipo de ambiente CSCL chamado CTELCS (*Collaborative Training Environment of the Laboratory of Communications and Signals*) implementado sobre uma arquitetura MVC (*Model-View-Controller*) constituindo-se de [3]:

- Um módulo para inserção de conteúdo onde são colocados os textos, imagens, animações com uma interface simples e padronizada deixando o curso modelado mais atraente e motivador do ponto de vista do estudante. O curso Voz sobre IP foi escolhido para testar a modelagem dentro desta ferramenta.
- Uma ferramenta síncrona de aprendizagem com suporte ao trabalho cooperativo, voltada para a solução de exercícios relacionados ao conteúdo como uma forma de aumentar a interação entre os participantes e, permitir que as atividades em grupo contribuam para o aprendizado individual de cada aluno minimizando o aspecto de complexidade do assunto.
- Uma ferramenta de dúvidas e respostas estilo um FAQ modificado com esquema de busca interna por palavras chaves para facilitar a procura de informações por parte do aluno e professor. Esta facilidade, normalmente, não é encontrada em ambientes de aprendizagem com este tipo de aplicação. O módulo de conteúdo está internamente ligado ao FAQ pois cada parte de um curso é associada automaticamente, pelo ambiente, a um conjunto de suas palavras chaves.

Este artigo está organizado em seções conforme descrição abaixo:

- Na seção 2 são introduzidos os conceitos de ambientes CSCL e as tecnologias que podem ser utilizadas no desenvolvimento de ferramentas colaborativas.
- As propostas e os resultados obtidos com a implementação deste protótipo são descritos na seção 3.
- As conclusões e as propostas de trabalhos futuros foram colocadas na seção 4.

2. CSCL E TECNOLOGIAS: CONCEITOS E ESTADO ATUAL

2.1 CSCL (*Computer Supported Collaborative Learning*)

CSCL pode ser definida como uma estratégia relacionada a educação onde dois ou mais participantes constróem seu conhecimento através da discussão, reflexão e tomada de decisões por meio de recursos computacionais servindo como mediadores do processo de ensino-aprendizagem [1]. A CSCL surgiu a partir da CSCW (*Computer Supported Collaborative Work*) que também suporta trabalho em grupo

mas com tarefas não relacionadas a educação, como por exemplo, um editor de texto compartilhado onde um grupo de pessoas trabalham para escrever um determinado documento. As principais diferenças entre a CSCL e a CSCW são ilustradas na Tabela I [2].

TABELA I
PRINCIPAIS DIFERENÇAS ENTRE A CSCL E A CSCW. ADAPTADA DE [2]

CSCW	CSCL
Focaliza sua atenção nas técnicas de comunicação.	Concentra sua atenção no que está sendo comunicado.
É mais usado principalmente no meio empresarial.	É normalmente explorado em ambientes relacionados a educação.
Tem como finalidade facilitar a comunicação e a produtividade do grupo.	A finalidade é prover uma aprendizagem eficaz em grupo.

O objetivo principal da CSCL é a aprendizagem, mais especificamente a colaborativa, e como ela pode ser facilitada com a ajuda do computador.

Do ponto de vista tecnológico, a colaboração entre usuários depende de duas tarefas: 1) a definição de um grupo e 2) o estabelecimento (síncrono ou assíncrono) de sessões de comunicação. Um outro ponto igualmente importante que deve ser tratado por aplicações colaborativas é a coordenação das interdependências entre as atividades que podem ser realizadas pelo grupo [4]. Alguns ambientes conhecidos contendo aplicações colaborativas são o JETS (*Java-Enabled Telecollaboration System*) e o JASMINE (*Java Application Sharing in Multiuser Interactive Environments*) [5]. Ambientes de aprendizagem, bastante conhecidos, que possuem algumas ferramentas colaborativas como *chat* e *whiteboard* é o WebCT (*World-Wide-Web Course Tools*) e o *Blackboard Learning System*^{TM} [6][7]. Um diferencial do protótipo CTELCS é a proposta de ferramentas colaborativas não encontrada em outros sistemas de aprendizagem [8].

2.1 Tecnologias para desenvolvimento de ferramentas Web

O desenvolvimento de aplicações de aprendizagem baseados na Internet pode ser realizado utilizando vários tipos de tecnologias. Pode-se gerar páginas estáticas com HTML puro até poderosas aplicações dinâmicas com CGI (*Common Gateway Interface*) e Servlets (*Dynamic WebPages in Java*) do lado servidor com a inclusão de Applets Java e JavaScript/CSS (*Cascading Styles Sheets*) do lado cliente permitindo a modificação ou adaptação do conteúdo a ser apresentado ao aluno dependendo de suas ações. XML/ XSL(eXtensible StyleSheet Language) que separa o conteúdo da apresentação também pode ser utilizado.

Qualquer linguagem pode ser utilizada na criação de programas CGI desde que o formato seja seguido. Exemplos de linguagens são PHP (*Personal Home Page*) e Perl (*Pratical Extraction and Report Language*). Apesar da transparência e uniformidade de busca à informação através da Web, CGI possui problemas de ineficiência ocasionados pelo alto *overhead* em servidores com muito acesso pois a cada requisição uma cópia do programa é disparada. Java Servlets é uma alternativa eficiente ao CGI. Um Servlet é uma classe Java que implementa uma interface de análise, execução e resposta ao cliente. Por ser Java os Servlets fazem uso de suas vantagens como portabilidade, poder, capacidade e produtividade e apresentam melhor desempenho do que CGI pois utilizam *threads* para processamento de requisições simultâneas e a exclusão de linguagens puramente interpretadas [9].

Applets Java são pequenos programas inseridos em páginas HTML que podem ser executados no cliente a partir de sua solicitação. Tem como vantagens criação de interfaces mais complexas, a independência de plataforma, sem necessidade de instalação e atualização pelo aluno além de ser removido depois do término do seu processamento. Há algumas restrições de segurança que impedem ler ou escrever arquivos no disco local e a comunicação fica restrita somente ao servidor de origem do Applet. Uma forma de contornar esta restrição é modificar a política de segurança da JVM (*Java Virtual Machine*) ou realizar autenticação do Applet. Pode-se também utilizar a plataforma de objetos distribuídos RMI (*Remote Method Invocation*) como uma forma eficiente de comunicação entre os clientes e servidores e JMF (*Java Media Framework*) para desenvolvimento de aplicativos de vídeo[10].

JavaScript é uma linguagem interpretada que associada ao CSS possibilita desenvolver páginas dinâmicas com maior interação permitindo a criação de interfaces mais atraentes que podem motivar o aprendizado e prender a atenção do aluno [11][12].

XML é uma metalinguagem para a criação de novas linguagens de marcação, definindo a forma de descrever a informação para uma classe de documentos. A definição do tipo de "conteúdo" e dos marcadores é feito utilizando-se um DTD (*Document Type Definition*). O formato de apresentação dos dados é realizado utilizando-se CSS ou XSL[11].

O desenvolvimento deste protótipo e seus módulos (*groupwares)* são baseados em Servlets, HTML e JavaScript/CSS para a interface de conteúdo de um curso, Servlets e XML/XSL para o módulo do FAQ e Applet/RMI na criação da ferramenta colaborativa de projeto.

O servidor de banco de dados escolhido para armazenamento das informações foi o MySql por possuir suporte a um grande número de plataformas e múltiplas linguagens, confiabilidade, velocidade e controle de acesso [10].

3. PROPOSTAS E RESULTADOS

3.1 Descrição Geral do Ambiente CTELCS

A proposta do ambiente CTELCS é ser um ambiente de aprendizagem colaborativo (CSCL) para treinamento através da Internet com alta escalabilidade, onde o objetivo principal é prover a colaboração entre os usuários com o intuito de realizar um melhor aprendizado com o uso de duas ferramentas colaborativas[1][2][8].

Um ponto a ser observado é que nenhum software adicional é instalado na máquina do aluno.

Para atender tais objetivos foi selecionada a disciplina de pós-graduação denominada Voz sobre IP com conteúdo totalmente disponível e utilizado de forma presencial.

3.2 Arquitetura do ambiente CTELCS

A arquitetura elaborada para o desenvolvimento do protótipo CSCL segue o modelo em três camadas MVC (*Model View Controller*) como uma tentativa de produzir uma boa modularização e alto nível de abstração com ganhos certos em manutenções futuras [3].

A Fig. 2 ilustra as partes da arquitetura da aplicação. Nesta figura observa-se a camada de apresentação onde foi incluído os elementos de exibição no cliente como HTML, XML, JSP ou *applets* Java, a camada de controle que é a camada intermediária entre a apresentação e a lógica da aplicação agindo como controladora, fornecendo o modelo para a visualização e regulando a comunicação entre as outras duas camada e a camada de lógica de aplicação, onde é realizado efetivamente o processamento, armazenando e gerando dados, cuidando dos aspectos de encapsulamento e comportamento, por exemplo, ela se encarrega de realizar consultas em banco de dados, efetuar cálculos e processamentos gerais. Assim sendo, ela pode ser reposicionada fora das aplicações *web*, já que seu processamento não é centrado na *web*.

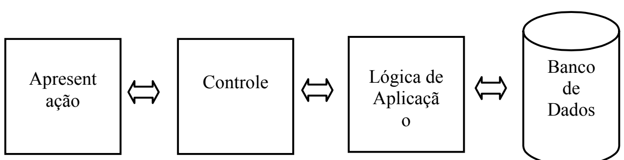

FIGURA. 2
ARQUITETURA DO DESENVOLVIMENTO DO PROTÓTIPO DE AMBIENTE CSCL

3.3 Módulos do Protótipo Desenvolvido

O protótipo é subdivido em 4 módulos distintos, conforme Fig. 3.

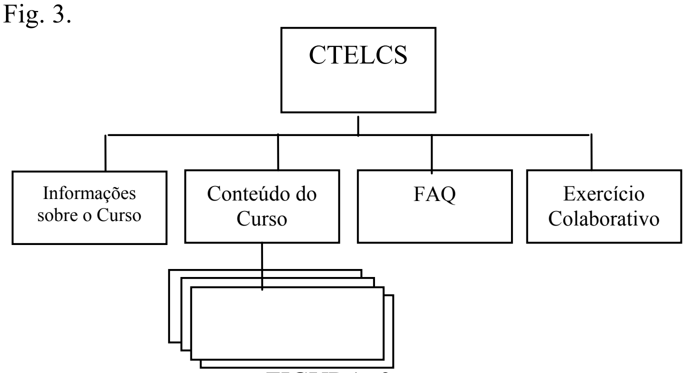

FIGURA. 3
MÓDULOS DO AMBIENTE CTELCS

Da Fig. 3 observa-se um módulo contendo informações gerais sobre o programa do curso, um módulo de conteúdo dividido em partes com animações, acesso a exercícios e a ferramenta de dúvidas e dois módulos colaborativos, o FAQ e o exercício.

Os dados necessários para a geração da interface e desenvolvimento dos módulos foram modelados com um diagrama entidade relacionamento (DER) que forneceu as tabelas necessárias. A criação destas tabelas possibilita o uso genérico do ambiente em qualquer curso bastando para isto modelar e inserir os dados relativos ao curso. A Fig. 4 ilustra o DER desenvolvido.

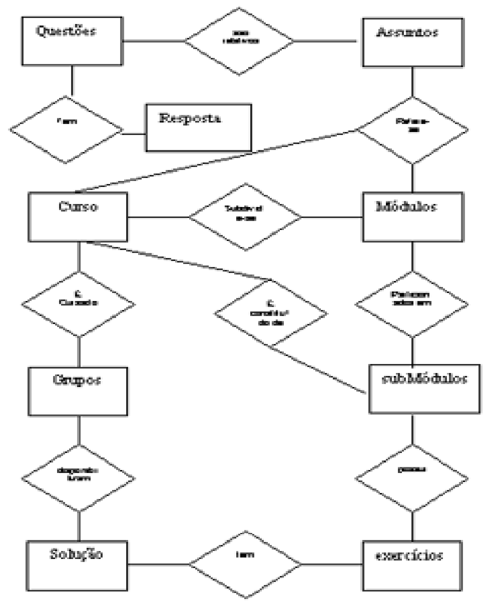

FIGURA. 4
DER PARA O PROTÓTIPO DE AMBIENTE CTELCS

3.4 Resultados Obtidos

Na montagem do protótipo foi criada uma interface inicial (Fig. 5) que fornece o acesso ao material modelado e aos módulos colaborativos.

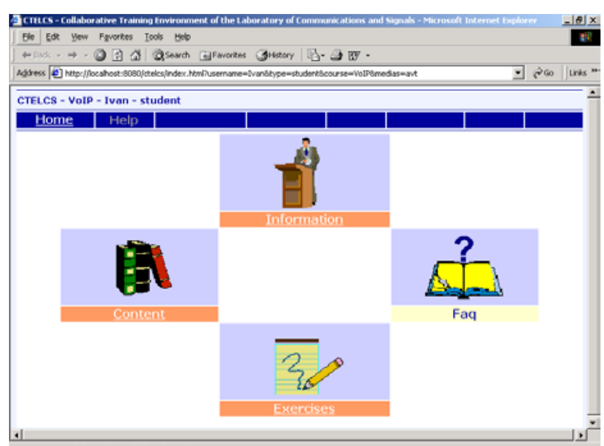

FIGURA. 5
TELA DE ENTRADA NO CTELCS

A primeira das opções, denominada *Information*, permite ao aluno visualizar dados gerais como o título do curso, data de início e término, requisitos, conteúdo programático a ser abordado no curso e observações gerais (Fig. 6).

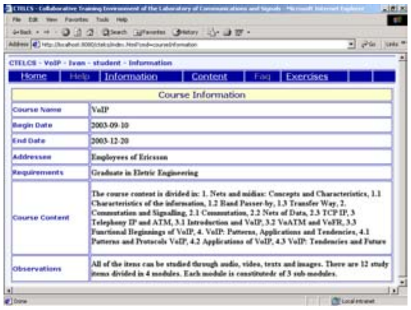

FIGURA. 6
INTERFACE CONTENDO INFORMAÇÕES GERAIS SOBRE O CURSO MODELADO

A opção *Content* exibe a interface que ilustra a modelagem realizada para um curso com as divisões em módulos e sub-módulos. Associado a cada item de conteúdo há um *link* que dá acesso ao conteúdo modelado. Há também palavras chaves associadas a cada conteúdo que possibilita ao aluno solicitar as dúvidas e respostas da ferramenta de FAQ. Na modelagem deste módulo e do seu conteúdo foram analisados critérios de usabilidade e comunicabilidade tentando-se criar uma interface e conteúdo mais agradáveis e motivadores [13]. Exemplos de interface do conteúdo e de sua modelagem podem ser visualizados na Fig. 7.

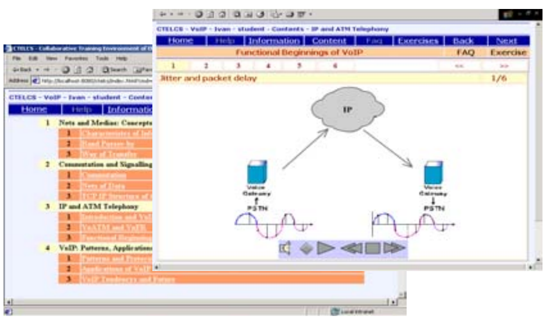

FIGURA. 7
INTERFACE CONTENDO A MODELAGEM DOS MÓDULOS, SUAS DIVISÕES E UMA TELA DE CONTEÚDO COM IMAGENS, ANIMAÇÃO E SOM.

O processo de geração das interfaces de conteúdo e de informações de um curso são obtidas através da solicitação do usuário a um *link* de uma página HTML. Esta solicitação é enviada ao Servlet no servidor de aplicações que trata e devolve a página resultante. As páginas possuem JavaScript/CSS como uma forma de tentar melhorar aspectos de navegação e interação do usuário com o conteúdo (Fig. 8)[10].

Para a opção FAQ a proposta é a construção de uma ferramenta assíncrona não presencial, onde o aluno pode colocar e responder dúvidas no momento do estudo de algum tópico do curso. As respostas às dúvidas podem ser realizadas de maneira cooperativa por qualquer integrante do curso. É importante observar que este módulo diferencia-se dos FAQs conhecidos por permitir ao aluno/professor inserir palavras chaves associadas à questão/resposta. Estas palavras chaves, como citado anteriormente, são ligadas diretamente ao módulo de conteúdo fazendo com que o aluno ao selecionar o FAQ acesse diretamente as dúvidas e respostas já inseridas, que se relacionam ao assunto do conteúdo.

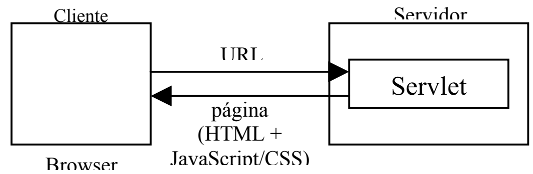

FIGURA. 8
PROCESSO DE GERAÇÃO DAS INTERFACES DE CONTEÚDO E DE INFORMAÇÕES DA DISCIPLINA

Quando o usuário faz uma solicitação do FAQ em algum ponto do conteúdo dentro do CTELCS, são enviados ao servlet as palavras chaves onde são obtidos do banco de dados as dúvidas e respostas relacionadas e montado um documento XML[11]. Este é processado e agregado ao correspondente XSL e devolvido para o cliente que visualiza o conteúdo.

O FAQ é uma ferramenta colaborativa assíncrona com compartilhamento de informações. Tanto professor quanto aluno podem estar interagindo com a ferramenta, por isso há uma interface diferenciada para professor e aluno permitindo um maior controle por parte do professor (Fig. 9)

A opção *Exercises* permite o acesso ao conjunto de exercícios colaborativos ou não que foram elaborados para o curso (Fig. 10). Um exemplo de exercício é o aplicativo síncrono não presencial que possibilita o trabalho cooperativo para a sua solução em grupo de 3 pessoas previamente definidas. Vale ressaltar que este tipo de ferramenta é interessante para o processo de aprendizagem, principalmente quando aborda assuntos com alto grau de complexidade. Por outro lado são relativamente dependentes do tipo de curso que estão inseridas. Tentando minimizar este problema foram desenvolvidos três *applets* agregados em uma única página HTML que são um *applet* para exibição de vídeo, um *chat* e um outro para o desenvolvimento da solução do exercício. Dessa maneira, para um reaproveitamento desta ferramenta basta inserir um *applet* contendo o novo exercício que a ferramenta já estará pronta. (Fig. 10).

FIGURA. 9
MÓDULO DE FAQ: A INTERFACE DO ALUNO (Á ESQUERDA) E A INTERFACE DO PROFESSOR (A DIREITA)

O tratamento da interdependência das atividades em grupo é tratada de forma simples. Somente um dos integrantes do grupo estará trabalhando na interface colaborativa, assumindo o papel de coordenador de atividades e os outros integrantes, denominados colaboradores, estarão sugerindo abordagens de solução e visualizando o resultado. A troca de papel entre os participantes do evento é de total responsabilidade do coordenador, podendo trocar de função se for solicitado por algum integrante ou se assim desejar.

A proposta da implementação da ferramenta como um Applet evita a necessidade de instalação de alguma aplicação na máquina do cliente e possibilita a criação de uma interface mais elaborada.

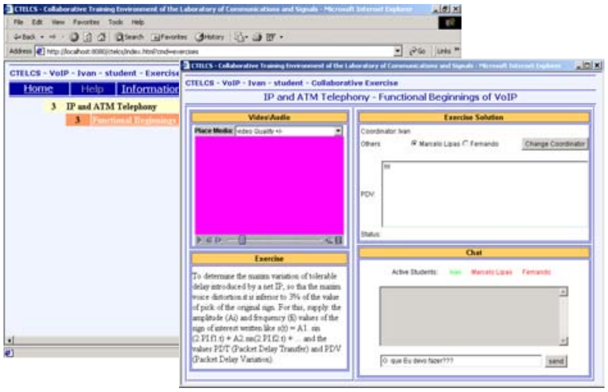

FIGURA. 10
INTERFACE DE ACESSO AOS EXERCÍCIOS PROPOSTOS E UM MODELO DE TELA DE EXERCÍCIO COLABORATIVO

4. Conclusões e Trabalhos Futuros

Os critérios de *design* e a modelagem aplicados tanto ao módulo de conteúdo como ao texto do curso escolhido permitiram obter uma interface de navegação simples e fácil, com uma estrutura robusta e padronizada, constituindo-se de animação e elementos interativos dentro do curso que certamente são um fator de atração e motivação aos usuários deste ambiente CSCL.

O módulo de FAQ associado ao módulo de conteúdo possibilita que o aluno acesse diretamente dúvidas e respostas com palavras chaves previamente inseridas dentro do módulo e, também possibilita ao professor realizar uma análise das dúvidas mais comuns e quais são os assuntos do módulo considerados mais complexos por parte dos alunos.

O módulo de exercícios foi desenvolvido com alto grau de modularidade entre seus miniaplicativos facilitando a alteração e/ou inclusão de novos exercícios colaborativos .

Como trabalhos futuros podem ser citados:

- A criação de mecanismos que automatizem a criação de grupos conforme as afinidades dos estudantes com o uso da tecnologia de agentes inteligentes.
- Desenvolver outros módulos como, por exemplo, um módulo de *login* e senha possibilitando um controle de acesso mais adequando ao ambiente e a possibilidade de realizar estatísticas de acesso e uso dos módulos.
- Desenvolver um esquema de tratamento das interdependências mais elaborado.

Agradecimentos

À *Ericsson Telecommunications* pelo financiamento deste projeto de pesquisa sob o contrato Ericsson/FDTE-EPUSP No.TC-790.

O USO DA INTERNET COMO FERRAMENTA DE APOIO AO PROCESSO DE ENSINO-APRENDIZAGEM: ESTUDO DE CASO COM BASE NO SITE ESCOLA24HORAS

Regiane Rodrigues da Silva[1], *Juliano Schimiguel*[2]

***Resumo** – A Internet é um recurso muito benéfico para o ensino em geral. Ela permite o acesso fácil de professores e alunos a uma infinidade de material informativo sobre grande parte dos assuntos da cultura alvo. Além de dar muitos exemplos concretos e de mostrar as possibilidades de usar a rede para projetos interativos e para a formação e capacitação de professores, este trabalho dá um resumo da história e do funcionamento dos procedimentos básicos da Internet como ferramenta de aprendizagem.*

Palavras-chave: Internet, Ensino-Aprendizagem, Escola 24Horas

***Abstract** – The Internet is a very beneficial resource for education in general. It allows to the easy access of teachers and pupils to a infinity of informative material on great part of the subjects of the white culture. Besides giving many concrete examples and showing the possibilities to use the net for interactive projects and the formation and qualification of teachers, this work gives a history summary and the functioning of the basic procedures of the Internet as learning tool.*

Index-Terms: Internet, Learning-Education, 24Horas School

INTRODUÇÃO

A Internet nos oferece inúmeros recursos para estudo, avaliação e sua utilização. Há muitos sites web didáticos, preocupados em disponibilizar aulas gratuitamente. Há cursos que exigem uma inscrição, mas que oferecem aulas demonstrativas gratuitamente. Além destes, há vários sites web que são úteis para formar a opinião do usuário, pois servem como fontes de consulta na internet.

O assunto tem merecido a atenção da imprensa brasileira. A Folha de São Paulo, por exemplo, trouxe uma seleção de 110 sites educacionais em janeiro de 1999 e um enorme Guia da Internet em outubro do mesmo ano [9].

Na atual situação do ensino virtual temos, de um lado, o problema da transmissão de dados, que é considerada lenta, e do outro, o fato de os professores terem que se acostumar com as novas tecnologias. O que temos visto é o desenvolvimento de uma série de sites web educacionais, que visam facilitar a vida dos professores, pesquisadores e alunos [13].

Com a utilização desta nova ferramenta de trabalho, surge no mercado a necessidade de um novo tipo de profissional. Como os alunos tem acesso a várias fontes de informação através da Internet, o professor será considerado muito mais um "maestro" e deverá estar apto para atender as expectativas e responder a dúvidas-questões dos alunos. Além disso, a cobrança para os professores será maior, se considerarmos a interação professor-aluno [11].

Muitos alunos não têm coragem de fazer perguntas ao professor em público, o que pode ser contribuído através do uso do bate-papo on-line, por exemplo, que é um dos recursos disponibilizados por sites web educacionais. Acredita-se, então, que o mercado de trabalho abrirá portas para novos profissionais. Serão indivíduos com especialização em recursos tecnológicos, não apenas o uso do computador, mas qualquer ferramenta tecnológica que dê às suas aulas um toque diferencial.

REFERENCIAL TEÓRICO

Segundo Lévy [13] os sistemas de educação estão sofrendo hoje novas obrigações de quantidade, diversidade e velocidade de evolução dos saberes. Num plano puramente quantitativo, jamais foi tão maciça a demanda por formação. Os dispositivos de formação profissional e contínua estão saturados. A título de ilustração, dir-se-á que metade da sociedade está, ou gostaria de estar, na escola.

Será impossível aumentar o número de professores proporcionalmente à demanda de formação que é, em todos os países do mundo, cada vez mais diversa e maciça [13]. A questão do custo do ensino surge mais especialmente nos países pobres. Ou seja, será necessário decidir-se a encontrar soluções que apelem para técnicas capazes de multiplicar o esforço pedagógico dos professores e dos formadores.

Audiovisual, multimídia interativa, ensino assistido por computador, televisão educativa, cabo, técnicas clássicas de ensino à distância fundamentadas essencialmente na escrita, monitorado por telefone, fax ou internet… todas essas possibilidades técnicas, de uma maior ou menor pertinência,

[1] Regiane Rodrigues da Silva, Universidade Cruzeiro do Sul, Centro de Pós Graduação, Especialização Latu Sensu em Informática na Educação, Av. Dr. Ussiel Cirilo, 204, 08060-070, São Paulo, SP, Brazil, reggyany@hotmail.com
2 Juliano Schimiguel, Universidade Cruzeiro do Sul, Professor Adjunto III (Orientador), Av. Dr. Ussiel Cirilo, 225, 08060-070, São Paulo, SP, Brazil, juliano.schimiguel@ic.unicamp.br

conforme seu conteúdo, a situação, as necessidades do aprendiz, podem ser consideradas e já têm sido amplamente testadas e experimentadas. Tanto no plano das infra-estruturas materiais quanto no dos custos de operação, escolas e universidades virtuais custam menos do que as escolas e universidades que ministram aulas presenciais [13].

A demanda por formação não só está passando por um enorme crescimento quantitativo, como também está sofrendo uma profunda mutação qualitativa, no sentido de uma crescente necessidade de diversificação e personalização. Campbell [3] afirma que os indivíduos suportam cada vez menos acompanhar cursos uniformes ou rígidos que não correspondem às suas reais necessidades e à especificidade de seus trajetos de vida. Uma resposta ao crescimento da demanda por uma massificação da oferta (mas, da mesma coisa, com o fim de alcançar economias de escala) seria uma resposta «industrialista» à antiga, inadaptada à flexibilidade e à diversidade futuramente requeridas.

Vê-se como o novo paradigma de navegação, que está se desenvolvendo nas práticas de coleta de informação e de aprendizado cooperativo no seio do ciberespaço; mostra a via de um acesso ao mesmo tempo maciço e personalizado ao conhecimento [3].

As universidades e, cada vez mais, as escolas de primeiro e segundo graus oferecem aos estudantes a possibilidade de navegar sobre o oceano de informação e conhecimento acessível pela internet. Programas educativos podem ser seguidos à distância pela World Wide Web (WWW). Os correios e as conferências eletrônicas servem para a monitoração inteligente e são postos ao serviço de dispositivos de aprendizado cooperativo. Os suportes hipermídia (CD-ROM, bancos de dados multimídia interativos) permitem acessos intuitivos rápidos e atrativos a grandes conjuntos de informação. Sistemas de simulação permitem que os aprendizes se familiarizem de maneira prática e barata com objetos ou fenômenos complexos sem, por isso, sujeitarem-se a situações perigosas ou difíceis de controlar [4, 5, 6, 7].

Os especialistas da área reconhecem que a distinção entre ensino em presencial e ensino à distância será cada vez menos pertinente, pois o uso das redes de telecomunicação e dos suportes multimídia interativos está integrando-se progressivamente às formas de ensino mais clássicas [9].

O aprendizado cooperativo e o novo papel dos docentes

O ponto essencial aqui é a mudança qualitativa nos processos de aprendizado. Procura-se muito menos transferir cursos clássicos em formatos hipermídia interativos ou "abolir a distância" do que implementar novos paradigmas de aquisição dos conhecimentos e de constituição dos saberes [3]. A direção mais promissora, que aliás traduz a perspectiva da inteligência coletiva no campo educativo, é a do aprendizado cooperativo.

Certos dispositivos de aprendizado em grupo foram especialmente concebidos para a partilha de diversos bancos de dados e o uso de conferências e mensagens eletrônicas. Fala-se, então, em aprendizado cooperativo assistido por computador (em inglês: Computer Supported Cooperative Learning ou CSCL).

Nos novos campos virtuais, professores e estudantes põem em comum os recursos materiais e informacionais à sua disposição. Os professores aprendem ao mesmo tempo que os estudantes atualizam continuamente tanto seus saberes disciplinares, quanto suas competências pedagógicas. A formação contínua dos docentes é uma das aplicações mais evidentes dos métodos do aprendizado aberto e à distância [1].

Os estudantes podem participar de conferências eletrônicas desterritorializadas, nas quais intervêm os melhores pesquisadores de sua disciplina. Assim sendo, a função-mor do docente não pode mais ser uma difusão dos conhecimentos, executada doravante com uma eficácia maior por outros meios. Sua competência deve deslocar-se para o lado do incentivo para aprender e pensar. O docente torna-se um animador da inteligência coletiva dos grupos dos quais se encarregou. Sua atividade terá como centro o acompanhamento e o gerenciamento dos aprendizados: incitação ao intercâmbio dos saberes, mediação relacional e simbólica, pilotagem personalizada dos percursos de aprendizado, etc [2].

Rumo a uma regulação pública da economia do conhecimento

As reflexões e as práticas sobre a incidência das novas tecnologias na educação têm-se desenvolvido em diversos eixos. Temos exemplos de trabalhos que foram realizados sobre a multimídia, enquanto suporte6 de ensino, ou sobre os computadores (ensino assistido por computador ou EAC).

Nessa visão — extremamente clássica — a informática oferece máquinas para auxiliar a ensinar. Seguindo outra abordagem, os computadores são considerados como instrumentos de comunicação, de pesquisa, de informação, de cálculo, de produção de mensagens (textos, imagens ou som) a serem postos nas mãos dos aprendizes [1].

Ao prolongar certas capacidades cognitivas humanas (memória, imaginação, percepção), as tecnologias intelectuais com suporte digital estão redefinindo seu alcance, seu significado, às vezes até sua natureza [14].

As novas possibilidades de criação coletiva distribuída, de aprendizado cooperativo e de colaboração em rede propiciada pelo ciberespaço estão questionando o funcionamento das instituições e os modos habituais de divisão do trabalho, tanto nas empresas quanto nas escolas.

O que está em jogo na cybercultura, tanto no plano da redução dos custos como no do acesso de todos à educação, não é a passagem do presencial para a distância e, tampouco, da escrita e do oral tradicionais para a multimídia. Mas sim a transição entre uma educação e uma formação estritamente institucionalizada (escola, universidade) e uma situação de intercâmbio generalizado dos saberes, de ensino da sociedade por ela mesma, de reconhecimento autogerido, móvel e contextual das competências [14].

Nesse quadro, o papel do poder público haveria de ser [11]:

1. Garantir a cada pessoa uma formação de qualidade;

2. Permitir um acesso aberto e gratuito, à centros de orientação, documentação e autoformação, a pontos de entrada no ciberespaço, sem negligenciar a indispensável mediação humana do acesso ao conhecimento;

3. Regular e animar uma nova economia do conhecimento, na qual cada indivíduo, cada grupo , cada organização sejam considerados como recursos potenciais de aprendizado ao serviço de formação contínuo e personalizado.

Evidentemente, é para esse novo universo que a educação deve preparar. Simetricamente, no entanto, deve-se admitir também o caráter educativo ou formador de muitas atividades econômicas e sociais, o que levanta evidentemente o problema de seu reconhecimento ou validação oficial, sendo que o sistema de diplomas parece cada vez menos adequado. Por outro lado, o tempo necessário para a homologação de novos diplomas e para a constituição dos currículos que levam a eles não está mais em fase com o ritmo de evolução dos conhecimentos [14].

Um grande número de processos vigentes em curso, por meio de dispositivos formais de formação contínua, para falarmos apenas das competências adquiridas durante as experiências sociais e profissionais dos indivíduos, não geram hoje nenhuma qualificação. A relação com o saber emergente, cujas grandes linhas foram esboçadas, trazem o questionamento da estreita associação entre duas funções dos sistemas educativos: o ensino e o reconhecimento dos saberes. Como os indivíduos aprendem cada vez mais fora das fileiras acadêmicas, cabe aos sistemas de educação implantarem procedimentos de reconhecimento dos saberes e *know-how* adquiridos na vida social e profissional. Para esse fim, serviços públicos que explorassem em grande escala as tecnologias da multimídia (testes automatizados, exames em simuladores) e da rede interativa (possibilidade de fazer testes ou fazer reconhecer suas aquisições com a ajuda de orientadores, monitores e examinadores em linha) poderiam aliviar os docentes e as instituições educacionais clássicas de uma tarefa de controle e validação menos “nobre” — mas ainda necessária — do que o acompanhamento dos aprendizados.

A evolução do sistema de formação não pode ser dissociada da evolução do sistema de reconhecimento dos saberes que o acompanha. Utilizar todas as novas tecnologias na educação, sem nada mudar os mecanismos de validação dos aprendizados equivale, ao mesmo tempo, a aumentar os músculos da instituição escolar e a bloquear o desenvolvimento de seus sentidos e cérebro [8].

Uma desregulação controlada do atual sistema de reconhecimento dos saberes poderia favorecer o desenvolvimento das formações alternadas e de todas as formações que conferissem um lugar importante à experiência profissional. Ao autorizar a invenção de modos originais de validação, tal desregulação encorajaria também as pedagogias pela exploração coletiva e todas as formas de iniciativas a meia distância entre a experimentação social e a formação explícita [8].

Semelhante evolução não deixaria de gerar interessantes retroefeitos para certos modos de formação de tipo escolar, freqüentemente bloqueados em estilos de pedagogia pouco aptos para mobilizar a iniciativa, por orientar-se apenas pela sanção final do diploma. Numa perspectiva ainda mais ampla, a desregulação controlada do reconhecimento dos saberes aqui referida estimularia uma socialização das funções públicas da escola. Com efeito, ela permitiria que todas as forças disponíveis concorressem ao acompanhamento de trajetos de aprendizados personalizados, adaptados aos objetivos e às diversas necessidades dos indivíduos e das comunidades implicadas [14].

Segundo Erickson [8], os desempenhos industriais e comerciais das empresas, das regiões, das grandes zonas geopolíticas estão em estreita correlação com políticas de gestão do saber. Conhecimentos, know-how, competências são hoje a principal fonte da riqueza das empresas, das grandes metrópoles, das nações. Existem grandes dificuldades na gestão dessas competências, tanto no nível de pequenas comunidades como no das regiões. Do lado da demanda, observa-se uma inadequação crescente entre as competências disponíveis e a demanda econômica. Do lado da oferta, um grande número de competências não são nem reconhecidas, nem identificadas, mais especialmente entre os que não possuem um diploma. Esses fenômenos são particularmente sensíveis nas situações de reconversões industriais ou de atraso de desenvolvimento de regiões inteiras [10].

Deve-se, paralelamente aos diplomas, imaginar modos de reconhecimento dos saberes, que possam prestar-se para uma visualização em rede, da oferta de competência e a uma “pilotagem” dinâmica retroativa da oferta pela demanda. Para tanto, a comunicação através do ciberespaço pode ser uma grande ajuda.

Uma vez aceito o princípio segundo o qual toda e qualquer aquisição de competência deve poder dar lugar a um explícito reconhecimento social, os problemas da gestão das competências, tanto na empresa como no nível das coletividades locais, estarão a caminho, se não de sua solução, ao menos de sua mitigação [12].

MÉTODOS E FONTES

A pesquisa proposta será desenvolvida através da aplicação de um estudo de caso com foco em contextos e processos, pelos quais está ocorrendo a introdução de novas tecnologias, particularmente, a informática, em escolas de ensino médio e fundamental. A preocupação central é construir um corpo teórico a partir de estudos de caso e contribuir para avançar na construção do campo de pesquisa, identificando problemas e formulando hipóteses que, por sua vez, sejam geradoras de conhecimento e, portanto, de novas interrogações.

Não se trata de pesquisa de avaliação, mas sim de pesquisa explicativa, com recurso à análise documental, à observação direta e participante, nas modalidades livre e sistemática, à obtenção de depoimentos por meio de entrevistas.

As fontes para obtenção de dados para elaboração deste trabalho serão coordenadores, professores e alunos envolvidos na utilização da ferramenta "Internet" no processo de ensino-aprendizagem. Tem-se como pretensão entrevistar cinco indivíduos de cada categoria.

Para o desenvolvimento deste trabalho, estaremos aplicando uma pesquisa descritiva e outra explanatória [16]. A pesquisa descritiva busca associações entre variáveis de caráter quantitativo; e a explanatória diz que, em virtude de se obter os fatos de um caso avaliado, realiza-se explicações alternativas sobre esse caso, gerando-se, dessa forma, uma conclusão baseada na explicação mais coerente com os fatos.

Estaremos trabalhando sobre um estudo de caso – o Portal Educacional da Escola24Horas (Figura 1) – como ferramenta de apoio ao processo de ensino-aprendizagem. Os dados serão coletados através de entrevista e observação. A observação será não participativa, devido ao fato de não interferir no desempenho das atividades, tendo uma interação com os usuários do site. A entrevista será feita através de questionários com perguntas abertas, para efetuar o diagnóstico de falhas, entraves ou problemas que dificultam o atual acesso e utilização do site.

ESTUDO DE CASO

O estudo de caso que estaremos adotando diz respeito ao portal educacional da Escola24Horas (Figura 1), que possui atualmente cerca de dez mil usuários cadastrados. Este trabalho terá como objetivo utilizar uma parcela do potencial da Internet como ferramenta de apoio ao desenvolvimento do processo de ensino-aprendizagem, através do emprego efetivo de alguns de seus recursos, além disso, avaliar como se processa a ação de professores-alunos-pesquisadores diante dos recursos da informática e de que forma será utilizada no processo de aprendizagem, na concretização do saber, que é um dos objetivos da escola.

O uso de um portal educacional trás todo um contexto diferenciado da linguagem visual e textual, e tomadas de decisão no acesso e seleção desse material, que são de suma importância, além de um acesso ilimitado a todo tipo de informação e áreas de conhecimento.

FIGURA.1
TELA PRINCIPAL DO PORTAL EDUCACIONAL ESCOLA24HORAS [15]

CONTRIBUIÇÕES E CONCLUSÕES

Ensinar sem os recursos da Internet não faz sentido nos nossos dias, uma vez que lidamos com a "Geração Net" (crianças que crescem utilizando e compartilhando o computador); ativa na revolução científica e tecnológica em curso, e, sendo assim, este é o recurso mais eficaz para motivar a atual geração.

Ao aproveitar o potencial da Internet, professores sentem-se mais motivados para ensinar-formar cidadãos dotados de conhecimentos, competências, comportamentos e atitudes adequados. Para que os alunos sintam-se realizados a nível pessoal e, também posteriormente, a nível profissional; a que os levar a procederem a uma análise e a uma síntese da imensa massa de dados disponíveis; a que os levar a dominar as tecnologias da informação e comunicação. Contribuir para a formação de indivíduos capazes de efetuarem uma inserção crítica e criativa no mundo atual, deve ser um imperativo de atuação do sistema educativo.

Não se pode esquecer que professores estão a ensinar-formar uma geração que já nasceu e está a crescer rodeada de mídias digitais. A tecnologia para os jovens de hoje é como o "ar que se respira"; por isso, professores-formadores só terão sucesso (no sentido de aproveitar todas as virtualidades que a Internet pode trazer à formação pessoal e social dos alunos) se freqüentarem cursos de formação e utilizarem websites educacionais como ferramentas de trabalho.

AGRADECIMENTOS

Nossos agradecimentos à Coordenadoria de Informática da UNICSUL, pelo apoio dado para o desenvolvimento do trabalho. A enorme contribuição de nosso professor Juliano Schimiguel, pois sem sua insistência e contribuição, nossa participação não teria ocorrido. Também gostaríamos de agradecer ao Centro de Pós-Graduação da UNICSUL, pois este deu apoio financeiro para o desenvolvimento do trabalho.

E-VALUATION: A AVALIAÇÃO ELETRÔNICA COMO INSTRUMENTO DE ACOMPANHAMENTO DE APRENDIZAGEM

Ismar Frango Silveira[1], Carlos Fernando Araújo Jr. [2], Ivan Carlos Alcântara de Oliveira[3]

Abstract *— This paper shows a proposal of architecture for implementing electronic evaluation processes into a distance learning context, specifically inside the WEL (Web Engineering for Learning) Project. WEL's main purpose is to establish a generic, reusable framework for developing learning objects for distance learning programs. A sort of these learning objects is named e-valuations, which are electronic exercises that are used in formative evaluation. These exercises are built according to the topics of the curriculum that are being studied, and they are randomly assigned to the students for each topic that is covered on the content. Every student's behavior when doing an e-valuation is meant to be stored and after used in order to evaluate not only students' performance, but also the efficacy of the learning objects that were used by them, thus contributing to courses' optimization.*

Index Terms — Distance Learning, Electronic Evaluation, Learning Objects, Formative Evaluation.

INTRODUÇÃO

A expansão do uso das novas tecnologias da informação e comunicão (TICs) traz junto consigo um conjunto de novos paradigmas a serem analisados, ao mesmo tempo em que força a reflexão sobre antigas e bem estabelecidas estratégias que podem ou não se adequarem a esses novos paradigmas.

Em relação ao processo de avaliação, muito pouca coisa se alterou em relação a modelos pedagógicos clássicos de uso da avaliação, que a encaram como um acontecimento pontual dentro de um dado contexto contínuo de aprendizagem, onde as respostas dadas em um certo momento são decisivas na progressão ou não do aprendiz no processo.

Mesmo com o uso das TICs como apoio ao processo de ensino-aprendizagem a distância, é bastante comum se presenciar a implementação de modelos avaliativos antigos utilizando novas tecnologias, incorrendo no erro de propor, em um contexto de educação a distância, formas de avaliação talvez mais adequadas para situações presenciais.

No que se refere aos sistemas de suporte ao ensino-aprendizagem a distância, o processo de avaliação nem sempre é contemplado satisfatoriamente pelas ferramentas hoje disponíveis, quer seja pela limitação no que tange aos tipos possíveis de questões, ou no que diz respeito à complexidade em elaborá-las, ou mesmo à inexistência de algoritmos eficientes de processamento de linguagem natural para a análise de respostas discursivas.

Neste artigo será apresentada uma proposta de uso de ferramentas avaliativas no contexto de uma avaliação continuada e progressiva da aquisição de competências por parte do aprendiz. Este trabalho é parte de um projeto temático sendo desenvolvido pelo Núcleo de Pesquisa em Computação e Tecnologia da Informação (NCTI) da UNICSUL (Universidade Cruzeiro do Sul), em São Paulo. Tal projeto denomina-se WEL (*Web Engineering for Learning*) que visa à produção de objetos de aprendizagem [7] como apoio ao processo de ensino-aprendizagem [1][2].

O presente trabalho encontra-se organizado como segue: no próximo item, serão analisadas e classificadas algumas estratégias de avaliação. Apresenta-se depois uma proposta de um sistema de suporte ao processo de avaliação eletrônica (WEL *e-valuation*), seguida de uma discussão técnica a respeito da arquitetura do sistema proposto. Por fim, são apresentadas algumas conclusões e perspectivas de trabalhos futuros.

FORMAS DE AVALIAÇÃO

É ponto pacífico a necessidade de um processo de avaliação em um contexto de ensino-aprendizagem, seja este presencial ou a distância. Deve-se discutir, todavia, uma série de pontos essenciais à definição do tipo de avaliação que se pretende estabelecer.

Uma decisão é crucial no processo de introdução do mecanismo de *e-valuation* em um contexto de ensino-aprendizagem: deve-se estabelecer qual o objetivo primordial da avaliação dentro desse contexto, ou seja, se a mesma será utilizada como mero instrumento de medida ou como referência para contribuir em futuras aprendizagens. A partir dessa análise, escolhas adequadas podem ser feitas de acordo com o critério de avaliação estabelecido.

Claramente, o que está sendo decidido é a opção pela avaliação somativa ou formativa, respectivamente [4][10]. A

[3] Ivan Carlos Alcântara de Oliveira., Universidade Cruzeiro do Sul, Av. Dr. Ussiel Cirilo, 225, 08060-070, Sao Paulo, Brasil, icalcan@dglnet.com.br

opção pela primeira traz para um âmbito de educação a distância uma estratégia que por sua vez é caracterizada pela necessidade de aplicação presencial, já que se tratam de eventos pontuais com o propósito de estabelecer uma medida para o conhecimento acumulado. Já a segunda orpção parte do pressuposto que através da análise de resultados de um certo aprendiz podem ser traçadas novas estratégias de ensino que o conduzam a novos caminhos de aprendizagem, de maneira individualizada, servindo também como instrumento para a aprimoração do próprio curso, de forma que favoreça a reprodução de operações bem sucedidas e a reflexão sobre as que não o foram. Conclui-se então que trata-se um processo em andamento a ser considerado em todos os estágios da instrução que permite o aprimoraento do curso, facilitando a adaptação dos objetos de aprendizagem às necessidades individuais e identificando falhas no planejamento e necessidade de ajustes [9].

Piaget e Vigotsky [5][6] estabeleceram as bases para o construtivismo partindo do princípio de que o conhecimento é construído a partir do desenvolvimento cognitivo, o que leva a uma conclusão bastante óbvia: se o aprendizado depende mais do agente do que do objeto, logo é necessário fazer com que o objeto adeque-se ao agente, e não o contrário.

Assim sendo, o papel da avaliação formativa é o de adaptar o dispositivo pedagógico à realidade das aprendizagens dos alunos, estando presente de forma ubíqua em todos os pontos do processo de ensino e aprendizagem, pois torna-se parte do processo, e não mecanismo de medida de qualidade deste [4][8][9]. Além disso, também serve como uma medida de qualidade em se tratando de avaliar os objetos – e não somente os agentes – de aprendizagem, de maneira singular, identificando, através do desempenho dos alunos, quais objetos são ou não eficazes na construção do conhecimento, indicando possíveis substituições, melhorias ou mudanças de estratégia pedagógica.

Ao contrário da avaliação formativa, a somativa tem como característica básica o foco no impacto pedagógico dos objetos nos agentes, geralmente através de medidas numéricas tomadas ao final de um ciclo de aprendizagem ou ao se completar um subconjunto do currículo em estudo. Assim, da mesma forma que se pode utilizá-la como uma maneira de medir o desempenho dos aprendizes, também pode servir como uma medida dos resultados obtidos – e não do processo como um todo.

Em termos de implementação das supracitadas estratégias de avaliação em um processo de ensino-aprendizagem a distância, o que ocorre é que, apesar de serem de mais rápido e fácil desenvolvimento, estratégias de avaliação somativa sofrem o problema estrutural de, na maioria das vezes, dependerem de um *momentum* de avaliação presencial, por se tratar de um ou mais eventos pontuais em um determinado espaço de tempo que servirão como medida da eficácia de todo um processo de ensino-aprendizagem. Logo, sua aplicação a distância incorre nas inúmeras possibilidades abertas por métodos não-lícitos que porventura possam vir a ser aplicados para tal.

Apesar desse risco não ser completamente extirpado em situações onde se aplica o processo de avaliação formativa, seu impacto é diminuído, uma vez que não são somente incursões pontuais que determinam a competência adquirida pelo aluno durante o processo, mas sim o que é avaliado a partir do acompanhamento do processo em si, o que se torna o principal instrumento de avaliação.

O item a seguir demonstra uma propsta de arquitetura para a implantação de estratégias de *e-valuation* em um contexto de ensino-aprendizagem a distância.

UMA ARQUITETURA PARA E-VALUATION

Um dos pontos específicos dentro do Projeto WEL é a elaboração de *e-valuations*, que são exercícios em caráter de avaliação formativa,. Cada exercício, por sua vez, é um objeto de aprendizagem pertencente a um *framework* genérico e reutilizável definido em [3], sendo utilizado em todo o Projeto WEL. A arquitetura implementada é cliente-servidor, utilizando ferramentas de autoria na elaboração de interfaces para os exercícios. A mesma é mostrada na Figura 1, a seguir.

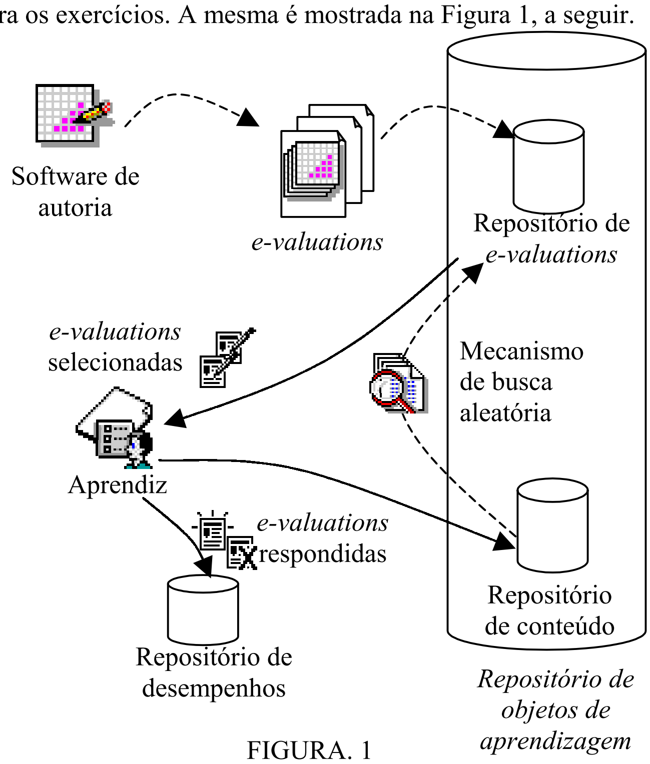

FIGURA. 1
ARQUITETURA DO WEL E-VALUATION

Conforme pode ser observado na Figura 1, o processo inicia-se pela criação de *e-valuations* e sua organização em um Repositório de *e-valuations*, que por sua vez é parte de um repositório maior, o Repositório de Objetos de Aprendizagem.

Ao acessar um determinado conteúdo, um mecanismo de busca aleatória fornece ao aluno um conjunto de *e-valuations* extraído do Repositório de *e-valuations*. A Figura 2 demonstra dois possíveis *e-valuations* para um mesmo conteúdo, relativo à ementa de árvores, no contexto de uma disciplina introdutória de Estruturas de Dados, e que poderiam ser atribuídos a alunos diferentes em um mesmo contexto de aprendizagem, ou ao mesmo aluno, em momentos distintos.

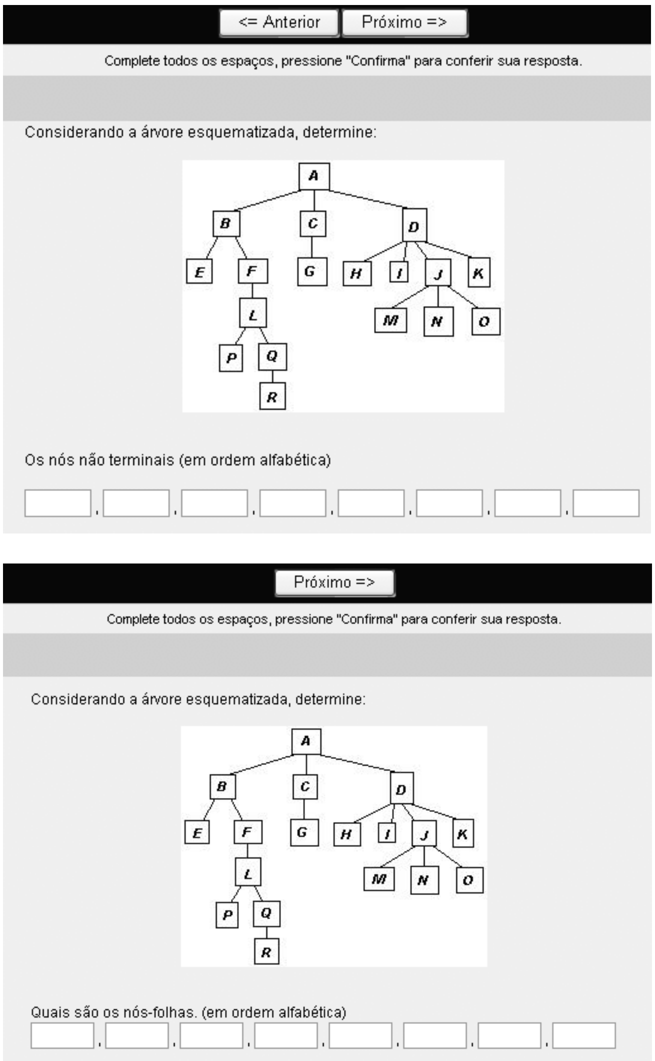

FIGURA. 2
DUAS POSSÍVEIS E-EVALUATIONS PARA UM MESMO CONTEÚDO

Caso o aluno se proponha a solucionar as *e-valuations* a ele atribuídas , seu desempenho, bem como seu comportamento (número de tentativas, o tempo gasto para elaborar uma resposta, etc.) são armazenados de forma a servirem para uma análise bilateral, envolvendo tanto o processo de construção do conhecimento do aluno quanto a eficiência dos objetos de aprendizagem aos quais o mesmo foi submetido. Tais dados podem ser utilizados em conjunto com demais dados comportamentais, como o percurso realizado pelos alunos, uso de chat, quantidade e qualidade de contribuições nos fóruns, por exemplo, de forma a obter mais dados, quantitativos e qualitativos, a respeito do processo de aprendizado [4].

DETALHAMENTO DA ARQUITETURA

A Arquitetura proposta é implementada através uma solução 100% Java, cujo projeto organiza-se em camadas com baixo grau de acoplamento, permitindo maior flexibilidade e manutenibilidade. A Figura 3 mostra a divisão em camadas da solução proposta.

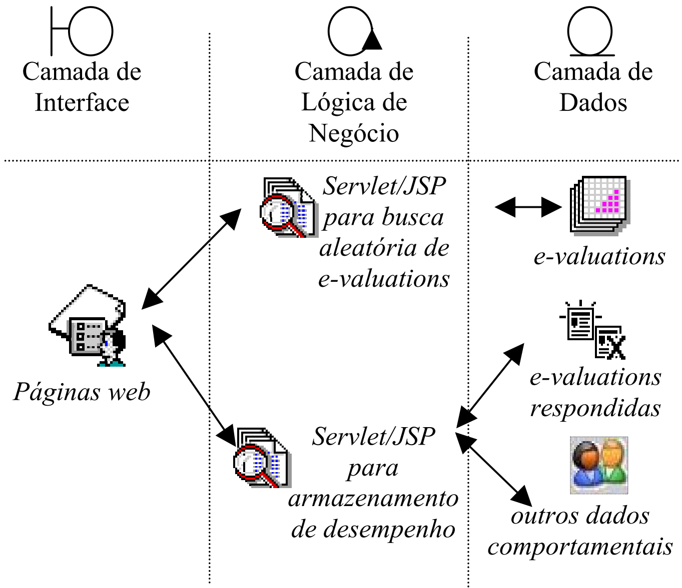

FIGURA. 3
ARQUITETURA EM TRÊS CAMADAS

Há que se notar, em relação à arquitetura, que a mesma denota tão somente uma camada de abstração lógica, não havendo qualquer pressuposição em relação à distribuição dfísica da mesma, de forma que se pode, por exemplo, distribuir fisicamente os repositórios segundo algum critério de distribuição, como por exemplo o tipo de objeto de aprendizagem armazenado. Da mesma maneira, não há nenhum empecilho, a não ser os relativos a custo e performance, para sua implementação de forma centralizada.

Um outro ponto a ser ressaltado é o de que, apesar de o sistema estar sendo utilizado principalmente na realização de avaliação formativa, sua arquitetura é flexível o bastante para adaptar-se a esquemas de avaliação distintos, como a somativa ou mesmo a diagnóstica [4].

CONCLUSÕES

Os processos avaliativos, enquanto ferramenta de acompanhamento da construção do conhecimento por parte do aprendiza e da eficácia dos objetos de aprendizagem nessa construção, desempenha um papel extremamente importante no processo de ensino-aprendizagem como um todo.

O presente trabalho procurou demonstrar a necessidade de utilização de estratégias de avaliação formativa em um contexto de educação à distância, de forma a obter uma avaliação mais adequada ao novo paradigma de aprendizagem em questão.

Deve-se ressaltar que a proposta da arquitetura, por integrar-se ao *framework* genérico do WEL, pode ser reutilizada em virtualmente qualquer área do conhecimento.

Trabalhos futuros apontam para a realização de experiências em outros cursos, além de uma análise estatística para fins de validação da proposta junto a alunos em situações reais de aprendizagem.

DESIGN DE UM GERENCIADOR DE FLUXO DE TAREFAS NO CONTEXTO DE APRENDIZADO EM MANUFATURA

Sofia Mara de Souza [1], Rodrigo Bonacin [2] e M. Cecília C. Baranauskas [3]

Resumo *— O objetivo deste trabalho é apresentar uma abordagem para design de um gerenciador de fluxo de tarefas, que será integrado ao sistema Pokayoke, um sistema de CSCW para suporte à discussão e resolução de problemas de forma cooperativa no contexto de manufatura. Pokayoke aborda a questão da resolução de problemas, porém não dá suporte ao controle do fluxo das informações e nem à documentação deste fluxo durante as fases da resolução. A abordagem adotada propõe a utilização de técnicas e metodologias de IHC, CSCW e Workflow no design do ambiente, bem como para lidar com o impacto que estes sistemas causam nas organizações. O CSCW objetiva dar suporte a grupos de usuários em trabalho cooperativo/colaborativo. A tecnologia Workflow será usada visando que a integração do sistema ao Pokayoke proporcione o controle e a documentação dos processos, agilizando e tornando o processo de resolução de problemas mais eficiente. Neste trabalho ilustraremos o uso da abordagem com o design do Pokayoke-Flow.*

Palavras chaves — CSCW , IHC, Workflow.

INTRODUÇÃO

Com as mudanças de paradigmas ocorridas nos sistemas produtivos nos últimos anos, as indústrias ocidentais têm procurado se enquadrar nas novas tendências do mercado mundial. O avanço tecnológico dos últimos anos traz consigo a globalização do mercado que se caracteriza por forte competição e requer melhoria no desempenho empresarial.

Cada vez mais as empresas estão fazendo uso de sistemas de comunicação interna, ou *groupware*, integrando-os à Internet e a bases de dados corporativos para gerenciar um dos mais importantes ativos das companhias: o conhecimento. A gestão eficiente desse recurso pode significar não só a solução de problemas como também redução de custos, melhoria nos serviços e aumento da produtividade [1]. O sucesso de sistemas para apoio ao trabalho cooperativo está diretamente ligado à facilidade de uso e adequação de sua interface ao contexto de trabalho. A área de IHC (Interação Humano-Computador) propõe métodos e técnicas de design para sistemas computacionais voltadas às necessidades das pessoas, de forma que estas possam executar suas atividades produtivamente e com segurança. Como tal, mostra-se essencial à proposta de abordagens ao design de tais sistemas.

Este trabalho se insere na continuidade de um projeto de parceria entre o Núcleo de Informática Aplicada à Educação (NIED-Unicamp) e a Delphi-Automotive Systems. Neste projeto a aprendizagem é entendida em um contexto mais amplo do que a aprendizagem que se refere a atividades de treinamento com o uso do computador. A aprendizagem auxiliada por sistemas computacionais a que nos referimos neste projeto não se limita ao objetivo intencional de formação, mas é contextualizada no dia-a-dia de trabalho (mediado por sistemas computacionais) dos funcionários.

Dentro deste escopo está sendo desenvolvido o sistema *Pokayoke*. Este sistema dá suporte para que a resolução de problemas e tomada de decisão ocorra de forma colaborativa/cooperativa. Neste sistema, os trabalhadores envolvidos na resolução tem a oportunidade de discutir e refletir sobre ações tomadas para solucionar problemas passados e para o problema atual desencadeando um processo de aprimoramento contínuo. Entretanto este sistema não possui um mecanismo para controle do fluxo das tarefas desenvolvidas durante a resolução do problema. Este mecanismo é importante para que os trabalhadores tenham a real dimensão sobre o impacto das ações tomadas e também das dificuldades na sua implementação. Isso possibilitará uma discussão e reflexão mais aprofundada.

Este trabalho apresenta e discute uma abordagem ao design de ferramentas de apoio ao gerenciamento do fluxo de tarefas em um sistema voltado à resolução de problemas no contexto de uma organização de manufatura.

A estrutura do trabalho está organizada da seguinte maneira: na segunda seção apresentamos o contexto de trabalho envolvido no estudo, na terceira seção apresentamos o referencial teórico usado no desenvolvimento da pesquisa, na quarta seção apresentamos os modelos de design de workflow comumente praticados, na quinta seção apresentamos os resultados preliminares do trabalho e por fim uma conclusão.

O CONTEXTO ENVOLVIDO NO TRABALHO

Novas técnicas de manufatura levaram as organizações industriais para uma nova filosofia de produção chamada "produção enxuta". Colocada como evolução do sistema de produção em massa, o desafio deste tipo de produção

[1] Sofia Mara de Souza, Instituto de Computação - Universidade Estadual de Campinas, Caixa Postal 6176, 13.083-970, Campinas, SP, Brasil, sofia.souza@ic.unicamp.br
[2] Rodrigo Bonacin, Instituto de Computação - Universidade Estadual de Campinas, Caixa Postal 6176, 13.083-970, Campinas, SP, Brasil, rodrigo.bonacin@ic.unicamp.br
[3] M.Cecilia C. Baranauskas, Instituto de Computação - Universidade Estadual de Campinas, Caixa Postal 6176, 13.083-970, Campinas, SP, Brasil, cecilia@ic.unicamp.br

é otimizar a utilização de todos os recursos, visando um produto com maior qualidade e menor preço. Nestas organizações os funcionários devem ser flexíveis; suas habilidades vão além de suas funções particulares, devem possuir senso crítico e um bom desempenho no trabalho em grupo.

Assim, estas novas indústrias privilegiam programas de educação continuada a seus funcionários e projetos que possibilitem a aprendizagem e o entendimento do processo global de produção de onde trabalham. Estes funcionários devem aprender enquanto trabalham, para estarem aptos a evoluir junto à organização [2].

A Delphi-Automotive Systems, que possui parceria com o NIED-Unicamp no contexto deste projeto, é uma indústria que pratica idéias da produção enxuta e produz componentes para a indústria automotiva. Esse projeto de parceria envolve o design de ambientes de aprendizagem onde o foco da atividade do aprendiz é a resolução de problemas de forma colaborativa/cooperativa e contextualizada na sua realidade de trabalho, por intermédio de sistemas computacionais.

Rotineiramente as organizações enfrentam inúmeros problemas que exigem discussão e colaboração entre indivíduos de um grupo para resolvê-los. Estes problemas, sejam administrativos, gerenciais ou de produção, necessitam que conhecimentos especializados, simulação de resultados, geração de idéias, sugestões e críticas sejam inseridos no tratamento do problema, tornando importante a integração e coordenação de esforços para tomadas de decisão dentro da organização.

Nesse contexto está sendo construído o sistema *Pokayoke*, um sistema de CSCW (Computer Supported Cooperative Work), nome que se dá as atividades de trabalho cooperativo auxiliadas por computador. Este sistema dá suporte a resolução de problemas e a tomada de decisão no contexto de uma organização de manufatura que adota o paradigma de "produção enxuta". Ele inclui algumas das principais ferramentas para a resolução de problemas que era utilizada previamente pelo departamento de qualidade, em papel.

O *Pokayoke* é baseado em um procedimento existente na fábrica para analisar e implementar ações corretivas, preventivas, de segurança e saúde, conhecida como "cinco passos". O objetivo deste procedimento é sistematizar o processo da fábrica em lidar com problemas que ocorrem na rotina da produção. Toda vez que uma não conformidade é identificada, uma ação deve ser tomada para corrigi-la e dificultar que exista uma nova ocorrência. Também toda vez que uma situação potencial de não conformidade é indicada, uma ação de caráter error proofing (Poka Yoke) deve ser realizada.

Ferramentas para dar suporte a resolução de problemas são distribuídas em diferentes fases do processo, por exemplo: diagramas de *Ishikawa* são utilizados durante o passo III, *Brainstorming* no passo II e IV, e "5-porquês" no passo III. Esta ferramentas estão embutidas no sistema e são combinadas com artefatos de comunicação assíncrona que permitem que estas sejam utilizadas por grupos de pessoas de maneira cooperativa [3].

O sistema *Pokayoke* também inclui uma ferramenta para a "gerencia de conhecimento" a qual facilita a recuperação e a manipulação de problemas já solucionados na empresa. O suporte a tomada a decisão é realizado por agentes artificiais que atuam propondo soluções para o problema e analisando as ações tomadas pelos usuários.

O sistema *Pokayoke* aborda a questão da resolução de problemas, porém não dá suporte ao controle do fluxo das informações e nem à documentação deste fluxo durante as fases da resolução. O sistema proposto neste trabalho é uma extensão ao sistema *Pokayoke*, objetivando o controle e a documentação dos processos, através do gerenciamento do fluxo de tarefas e acompanhamento das soluções de problemas, com base no conceito de workflow. Com estas ferramentas o usuário pode gerenciar as ações tomadas para solucionar o problema, sabendo exatamente qual é o estágio de desenvolvimento destas ações.

O Referencial Teórico: IHC, CSCW e Workflow

A área de IHC tem papel no desenvolvimento de todo tipo de sistema [4]. Conforme Thives Jr.(2000) o termo 'sistema' adotado se refere não somente ao hardware e ao software mas a todo o ambiente que usa ou é afetado pelo uso da tecnologia computacional.

As metodologias de design da interação humano-computador foram desenvolvidas focando tipicamente o trabalho individual do usuário; porém, com as redes de computadores conectando mais e mais usuários, tornam-se fundamentais abordagens à interação de pessoas trabalhando em grupo. CSCW, objetiva estudar e desenvolver sistemas para dar suporte a grupos de usuários em trabalho cooperativo/colaborativo [5].

Suporte à interação em CSCW envolve amplamente o projeto da interface de usuário. Dois aspectos devem ser considerados: o desenvolvimento de sistemas que suportam troca de informações entre grupos de usuários e sistemas que possibilitam o compartilhamento de informações, permitindo cooperação entre indivíduos do grupo [6].

O ambiente de trabalho organizacional requer ferramentas que facilitem o trabalho em grupo. CSCW possibilita a colaboração entre múltiplos usuários [7] através de um conjunto de ferramentas de software, chamados groupware. A tecnologia de groupware apresenta componentes que têm como objetivo a comunicação (sistema de mensagens), a colaboração (compartilhamento de informações) e a coordenação (tecnologia de workflow).

Dentre os componentes da tecnologia de groupware, os sistemas de workflow, que permitem automatizar e controlar o fluxo de tarefas necessárias para realizar um trabalho, têm recebido atenção e aceitação nas organizações nos últimos anos [8].

Modelos de Design de Workflows

A tecnologia de workflow pode ser implementada na arquitetura cliente servidor ou para utilização em Intranets e na Internet [7]. Neste trabalho estamos considerando a implementação em Intranets, dado o contexto de fábrica que nos servirá de laboratório para este trabalho.

No aspecto de software, além do gerenciamento do ambiente de rede propriamente dito, a comunicação entre usuários do workflow deve ser gerenciada.

Os sistemas SGWFs atuais são baseados em determinados conceitos anteriormente chamados de: automação de escritórios, gerenciamento de banco de dados, e-mail, gerenciamento de documentos, aplicação de groupware.

Com o crescimento da tecnologia workflow no decorrer dos anos, diversas técnicas e modelos para modelagem de sistemas workflows foram propostos. No entanto, a maioria destes modelos utilizam a estrutura organizacional apenas para obter informações sobre os participantes do processo, como o Meta-Modelo proposto pela WfMC. Nestes modelos propostos até então apenas parte do conhecimento da organização é utilizado na modelagem. Este trabalho busca uma nova abordagem para design de sistemas SGWFs, utilizando conceitos de IHC,CSCW e Workflow

Propomos este referencial buscando suprir todas as necessidades do sistema proposto. Tal sistema engloba o fluxo das tarefas em um processo de solução de problemas de forma cooperativa em um sistema de CSCW, através de e-mail. Para tal os conceitos de CSCW e Workflow se adequam a estas necessidades, porém alguns problemas relacionados a resistências humanas, influem no desenvolvimento da implantação de workflow.

Os problemas citados envolvem dificuldades técnicas e informais. As dificuldades técnicas surgem em virtude das limitações da própria tecnologia e, possivelmente, podem ser sanadas conforme seu avanço e aperfeiçoamento. Já as dificuldades informais são resultado do impacto que o workflow causa no trabalho e nas pessoas que compõem a organização [8].

Neste trabalho propomos lidar com esse impacto utilizando metodologias e técnicas de IHC e CSCW no design do gerenciador de fluxo de tarefas.

ABORDAGEM PROPOSTA

Alguns problemas citados na literatura que certamente influem no desenvolvimento da implantação de workflow envolvem dificuldades técnicas e informais. As dificuldades técnicas surgem em virtude das limitações da própria tecnologia e, possivelmente, podem ser sanadas conforme seu avanço e aperfeiçoamento. Já as dificuldades informais são resultado do impacto que o workflow causa no trabalho e nas pessoas que compõem a organização [9].

O objetivo deste trabalho é utilizar técnicas e metodologias de IHC para lidar com este impacto. O propósito é criar um gerenciador de fluxos baseado no referencial apresentado (Workflow, CSCW, IHC), e integrá-lo ao sistema *Pokayoke*.

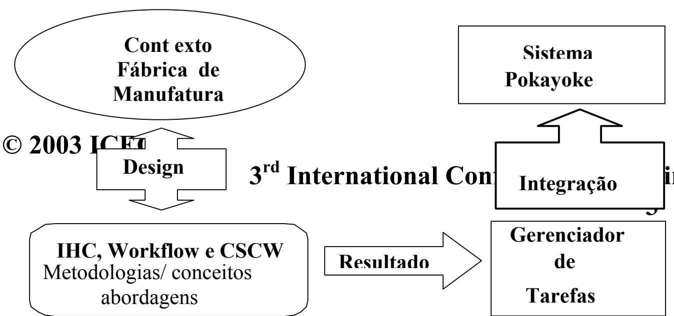

FIGURA. 1
ABORDAGEM PROPOSTA

A Figura 1 apresenta a abordagem proposta para a implementação do gerenciador de tarefas. O design do ambiente proposto envolveu a aplicação de técnicas de design participativo (DP) junto à organização. Este gerenciador de tarefas é resultado da aplicação destas técnicas e será integrado ao sistema *Pokayoke*, que adotou a mesma abordagem metodológica.

O DP emprega várias técnicas para conduzir o design "com" o usuário, e não "para" o usuário. Estas técnicas possibilitam que designers e usuários possam discutir o impacto que o workflow causaria no ambiente de trabalho, durante o design do sistema, construindo assim soluções mais apropriadas através de um entendimento comum entre designers e usuários.

O ambiente gerado a partir da abordagem proposta irá integrar o *Pokayoke* agregando ao mesmo funcionalidades que acarretarão na eficácia do processo de resolução de problemas proposto pelo mesmo. A Figura 2 apresenta a arquitetura do sistema *Pokayoke* com a integração do gerenciador de tarefas (em tom escuro), que passa a se chamar *Pokayoke-Flow*.

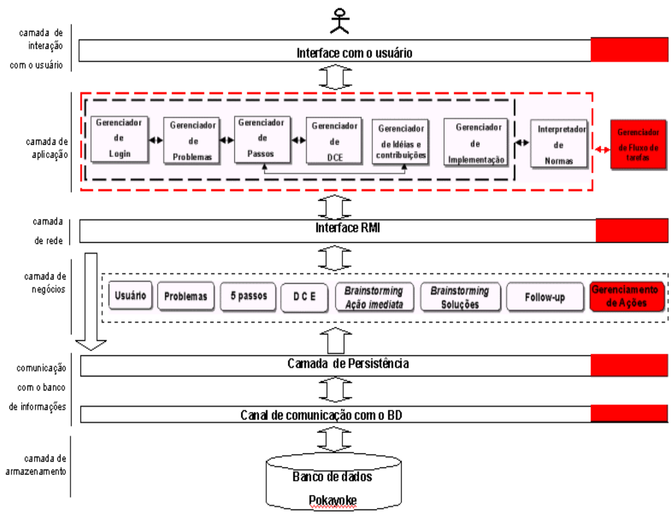

FIGURA. 2
ARQUITETURA *POKAYOKE* COM INTEGRAÇÃO DO GERENCIADOR DE TAREFAS

Ao ser integrado ao *Pokayoke* este sistema deverá prover o gerenciamento e documentação do fluxo de tarefas decorrente da resolução de problemas no ambiente, tendo em vista o controle sobre o estado do problema e sobre a solução proposta.

Um exemplo do uso integrado do gerenciador no *Pokayoke*: no passo 2 (plano de ação imediata) acompanhar o desenvolvimento das ações propostas para a solução imediata do problema e no passo 4 (plano de ação corretiva) acompanhar a implementação das ações adotadas para a solução definitiva do problema. Com o uso do gerenciador de fluxos será possível gerenciar e documentar o andamento de cada ação, informando o seu estado (em execução, parado, etc.) aos respectivos responsáveis, através de ferramentas de comunicação [3].

Uma vez que o gerenciador de fluxo se encontre em funcionamento os responsáveis por determinada ação terão controle sobre "o que", "quando" e "quem" deverá executar cada tarefa na busca pela resolução do problema. Isso possibilitará "lembrar" ou mesmo "cobrar" o(s) responsável(s) por uma tarefa que não foi cumprida dentro do prazo estipulado, assim agilizando e tornando o processo de resolução de problemas mais eficiente. O aspecto de controle do processo através das ações dos usuários no sistema envolvem relações entre as pessoas da organização que podem tornar crítica a aceitação do sistema, se essas ações forem distantes da prática de trabalho.

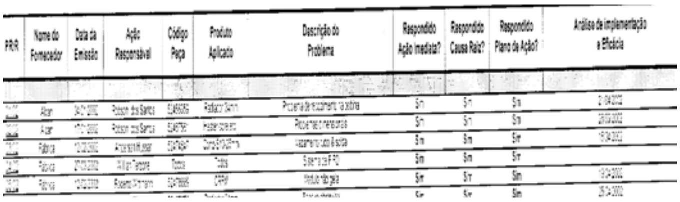
RESULTADOS PRELIMINARES

No sistema *Pokayoke-Flow* o gerenciamento do fluxo decorrente da solução do problema foi integrado ao *Pokayoke*, por ser de grande importância na fábrica. Através do gerenciamento das tarefas obtém-se o controle sobre o estado do problema e da solução proposta para este, ou seja, quem é o responsável e em qual estado se encontra. Se por algum motivo a solução estiver parada, é necessário o controle sobre onde está parada, qual o motivo da parada e quem é o responsável no determinado ponto para que os problemas sejam resolvidos com maior agilidade e eficiência.

O objetivo do sistema proposto vai além do gerenciamento de fluxos no processo de resolução de problemas, buscando também facilitar a documentação do problema, apoiar resoluções de problemas semelhantes; gerar maior eficiência no processo, lidar com as resistências causadas por este tipo de sistemas às organizações, ser um ambiente de workflow menos competitivo e mais colaborativo.

Para o desenvolvimento deste sistema usamos a abordagem proposta (Figura 1). Usando técnicas participativas contextualizadas no dia-a-dia dos funcionários modelamos o gerenciamento das ações corretivas dentro da fabrica a partir de uma planilha eletrônica, conforme ilustrado parcialmente na Figura 3.

Os dados da planilha são preenchidos por um funcionário, e nem sempre atualizados, o que compromete a eficiência do processo de resolução.



PRR	Nome do Fornecedor	Data da Emissão	Ação Responsável	Código Peça	Produto Aplicado	Descrição do Problema	Respondido Ação Imediata?	Respondido Causa Raiz?	Respondido Plano de Ação?	Análise de implementação e Eficácia

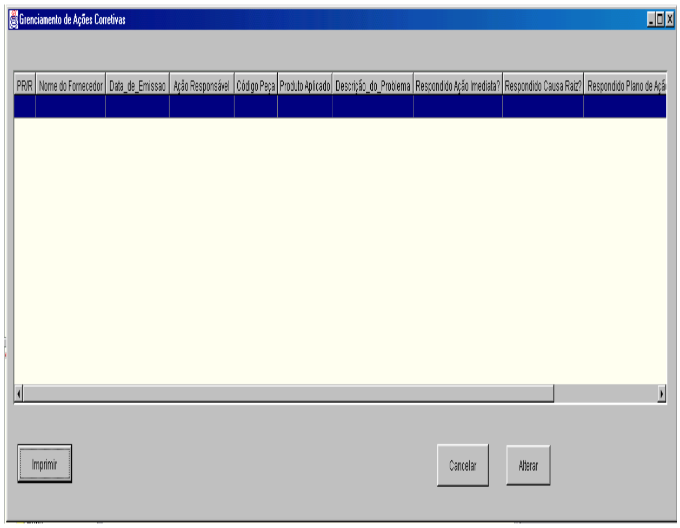
FIGURA. 3
PARTE DA PLANILHA ELETRÔNICA USADA NA ORGANIZAÇÃO

No *Pokayoke-Flow* a planilha foi implementada de maneira que os dados são alimentados a partir de informações do banco de dados. Isso garante estar sempre atualizada e consistente. Através desta planilha é possível no decorrer do processo rastrear o *status* de cada ação, obtendo quais ações estão paradas, e verificar o motivo através de uma consulta a determinada ação. A interface em questão oferece ainda a funcionalidade de impressão, conforme Figura 4.

FIGURA. 4
GERENCIAMENTO DE AÇÕES CORRETIVAS



Folow-up uma outra funcionalidade que está sendo implementada no *Pokayoke-Flow*. Através desta interface o responsável ao entrar no sistema é informado sobre quais ações estão pendentes e suas informações relevantes. Com isso o responsável tem a opção de cobrar ou mesmo lembrar via e-mail o(s) respectivo(s) responsável(s), evitando assim atraso na execução das atividades, e promovendo um processo mais eficiente.

O fluxo das atividades dentro do sistema, é resultado de técnicas participativas no com os usuários e é ilustrado na Figura 5. Esta figura mostra todos os 5 passos para resolução de problemas e o fluxo durante o processo de resolução no *Pokayoke.*

Dentro das atividades integradas ao *Pokayoke* citamos ainda, o "lembrar ". Definidas as ações no passo II o responsável pelo passo "lembra" aos responsáveis a ação e o período de tempo para execução da mesma, através de e-mail contendo as informações de cada ação bem como um texto detalhando a(s) atividade(s) a ser executada(s), conforme ilustra a Figura 6.

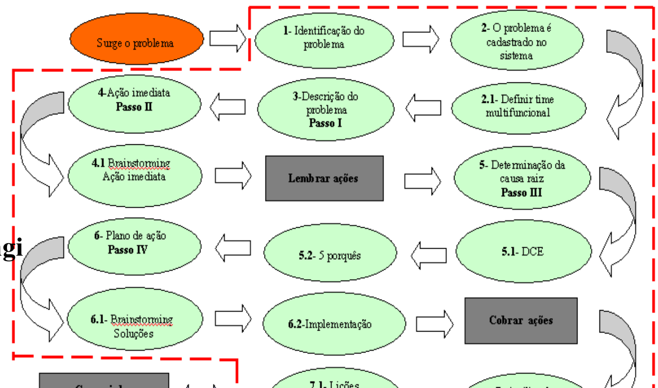


FIGURA. 5
FLUXO DAS ATIVIDADES NO SISTEMA *POKAYOKE*

No passo IV do *Pokayoke* são definidas as ações corretivas que serão implementadas para solução definitiva do problema. Implementado no *Pokayoke-Flow* a funcionalidade "cobrar", objetiva que a ação seja implementada dentro do prazo, assegurando assim a eficiência no processo de resolução. O responsável é avisado a medida que uma ação está se aproximando do prazo determinado para execução e não foi concluída, e cobra do responsável enviando-lhe um e-mail, contendo as informações da ação. A Figura 7 ilustra o acesso a essa funcionalidade.

O gerenciador de tarefas no *Pokayoke-Flow* é resultado de atividades participativas onde foram levantados os requisitos para o sistema e o fluxo decorrente da resolução de problemas. Como resultado destas atividades podemos citar: o que deve ser gerenciado, como é feito no contexto real, e como deve ser feito. Também a definição das características do sistema de workflow a ser implementado, como por exemplo as informações sobre o envio de e-mail alertando sobre ações, quem deve receber estes e-mails e quando devem recebê-los.

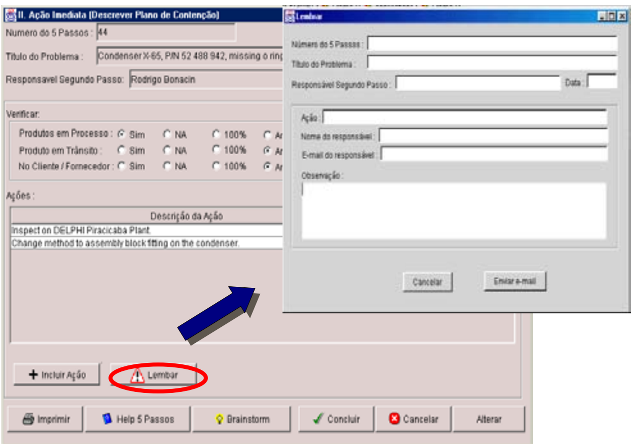

FIGURA. 6
LEMBRAR AÇÃO

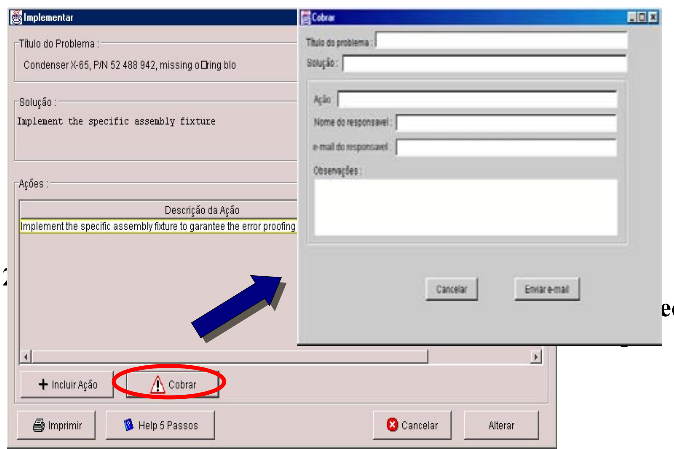

FIGURA. 7
COBRAR AÇÃO

Conclusão

O gerenciador de fluxo de tarefas é um sistema em desenvolvimento que integrará o sistema *Pokayoke*. O design da interface para o ambiente proposto utilizou técnicas de IHC, em especial metodologias participativas, visando capturar o fluxo de tarefas no cotidiano da prática do trabalho e potencialmente conseguir a aceitação do sistema no ambiente. Os próximos passos envolvem o acompanhamento da implantação do *Pokayoke* na organização citada para futura integração do sistema de controle de fluxo do processo de resolução de problemas.

ESTÍMULO AO ESTUDO ESPONTÂNEO DESAFIOS E PROPOSTAS

C.A. Tassinari [(1,2)], B.F. Giannetti [(1)]

Abstract *– O processo descrito tem o intuito de motivar os alunos desenvolver tarefas semanais que compõem a nota bimestral, juntamente com as provas oficiais. Cada tarefa aceita recebe uma nota de avaliação. Os trabalhos são divididos em obrigatórios e espontâneos, devendo o aluno "administrar" sua situação na disciplina. A lista de trabalhos espontâneos é conhecida, mas não há previsão de quando serão solicitados, nem garantias de que haverá a solicitação. Porém, quando tal solicitação ocorre, não há prazo, a entrega tem que ser imediata. Além de estimular a assiduidade do aluno às aulas, o processo objetiva o desenvolvimento do hábito da busca de informações em literatura e o de estudar de forma espontânea, por meio da preparação de trabalhos, que podem até não ser solicitados. Os resultados mostram eficácia e suprem deficiências apresentadas pelos calouros, especialmente quando não houve contato anterior com a disciplina.*

Índice de Termos – estímulo e motivação, estudo espontâneo, sistema de avaliação, superação de deficiências.

Atualmente, o Ensino Público brasileiro é muito discutido e criticado pelo baixo rendimento apresentado pelos alunos. Da Escola Fundamental ao Ensino Médio o fracasso é indiscutível [1].O processo de avaliação continuada que aboliu a reprovação, permitiu o agravou a situação formando alunos sem os conhecimentos básicos necessários [1]. A este contexto, acrescentam-se os salários inadequados que tornaram os professores desinteressados e desmotivados; o baixo aproveitamento escolar das crianças mais pobres, [2]–[3]; condições precárias das escolas, defasadas tanto na estrutura física com também em relação ao material pedagógico, bibliotecas e outros requisitos inerentes ao ensino de boa qualidade [1]. Agravando esta situação, constantes greves de professores comprometem o planejamento das disciplinas pela não reposição das aulas perdidas. A partir daí, a formação do aluno fica comprometida e as deficiências do processo podem ser constatadas pela análise dos resultados do Exame Nacional de Cursos do Ensino Médio – ENEM, amplamente divulgadas pela mídia.

Tais fatores acabam criando barreiras praticamente intransponíveis para os que ingressam nos cursos superiores de graduação.

Os efeitos das deficiências do Ensino Médio se mostram com maior intensidade no Ensino Superior privado. Tal fato é de fácil explicação pois é nas escolas particulares que ingressa a maior parte dos alunos egressos das escolas públicas e de cursos técnicos profissionalizantes alternativos, ministrados em Instituições como o SENAI e outras.

A experiência tem mostrado que a necessidade de conhecimentos sólidos em Física, Matemática, Química, Desenho, dentre outros, que constituem os pré-requisitos para os cursos de Engenharia, acentua os efeitos das lacunas de conhecimento. As dificuldades a serem enfrentadas são tão grandes que transformam-se em fatores de desmotivação que têm como conseqüência níveis altos de desistência nos primeiros anos dos cursos.

A perda irrecuperável de tempo, o prejuízo financeiro e a frustração do aluno, bem como as distorções nas previsões de Receitas e a impossibilidade de planejamento de investimentos por parte das Instituições de Ensino, são danos incalculáveis decorrentes do processo.

Nesse contexto, formas de orientação de estudo e de ajuda ao aluno para superar suas dificuldades devem ser buscadas, a fim de capacitá-lo ao aprendizado dos conhecimentos ministrados nas diferentes disciplinas dos cursos de graduação.

Tendo em vista que o preenchimento das lacunas de conhecimento não pode ficar a cargo do curso de graduação somente, devem ser encontrados caminhos que estimulem a busca espontânea de conhecimentos pelo aluno, fazendo com que o mesmo participe do processo de forma pró-ativa.

Algumas etapas importantes desse processo podem ser descritas como:

- o estímulo à busca de informações em bibliotecas e a consulta a outros livros diferentes do texto adotado;
- o desenvolvimento da percepção do aluno quanto às diferentes formas de abordagem usadas pelos diversos autores para descrever o mesmo fenômeno, ou o mesmo problema;
- o cultivo do hábito do estudo espontâneo, mostrando que esse caminho permite

[1] Universidade Paulista – UNIP, R. Dr. Bacelar, 1212, São Paulo, SP, Brasil
[2] Centro Universitário da FEI, Av. Humberto de Alencar Castelo Branco, 3972, São Bernardo do Campo, SP, Brasil.

encontrar as respostas dos problemas que estão por surgir.

O sistema de avaliação pode ser transformado em importante recurso para tal fim.

Experiências têm sido realizadas desde 1996 no primeiro e segundos semestres dos cursos de Engenharia da Universidade Paulista – UNIP, na disciplina Química Geral. Após diversas tentativas, correções e adaptações no que era praticado anteriormente, desenvolveu-se um sistema que contempla, pelo menos em parte, os objetivos pretendidos.

O sistema de avaliação aplicado na disciplina antes do início desse processo era constituído por:

- 4 provas bimestrais;
- 1 prova substitutiva;
- Exame Final
- Exame de segunda época, aplicado quando necessário.

O cálculo da Média de Aproveitamento baseava-se na média aritmética das notas obtidas pelo aluno nas provas bimestrais, conforme a seguir:

$$A = \frac{B_1 + B_2 + B_3 + B_4}{4}$$

De acordo com o Regimento da Universidade, o aluno é aprovado sem exame se alcançar pelo menos 7 (sete) na Média de Aproveitamento. Caso contrário, deve submeter-se ao Exame no qual deve obter uma nota tal que somada à Media de Aproveitamento totalize 10 (dez) pontos.

Na primeira tentativa, ao sistema descrito, foram acrescentados:

a) um conjunto de 20 trabalhos obrigatórios; e

b) um fator que multiplica a média aritmética das notas obtidas nas provas bimestrais pelo aluno, cujo valor dependia da quantidade e qualidade dos trabalhos do aluno.

Os trabalhos foram elaborados de forma a exigir na sua execução a aplicação dos conceitos apresentados em aula. O prazo máximo estabelecido para a entrega de cada trabalho foi fixado em uma semana, de forma a exigir que a aplicação dos conceitos vistos fosse praticamente imediata. Dessa forma, o aluno era obrigado a estudar os conceitos logo a seguir, facilitando a memorização dos mesmos.

O intervalo de variação do fator foi fixado em 0,7 a 1,3 de acordo com o número de trabalhos entregues e pelo aluno e aceitos pelo professor.

A aceitação foi vinculada à qualidade do trabalho no que diz respeito ao seu conteúdo, desenvolvimento e consistência e entrega no prazo estipulado.

Vencido o prazo de entrega, um gabarito do trabalho era colocado à disposição do aluno no setor de cópias da Universidade, para que o mesmo pudesse comparar com o trabalho entregue e buscar orientação quanto às divergências verificadas.

Desta forma, a Media de Aproveitamento passou a ser assim calculada:

$$A = \frac{B_1 + B_2 + B_3 + B_4}{4} \times \text{fator}$$

onde: B_i são as notas obtidas pelo aluno nas provas bimestrais.

Os resultados obtidos deixaram muito a desejar e a principal falha que pode ser notada foi o valor mínimo de 0,7 para o fator, que tornou-se cômodo demais para o aluno. A maior parte dos alunos optava por fazer um número mínimo de trabalhos, apenas suficiente para elevar para 1,0 o valor do fator.

A fim de melhorar a eficiência do processo, nova tentativa foi realizada diminuindo o valor mínimo do fator de multiplicação da média das provas bimestrais, o qual passou a variar de 0,3 a 1,3.

Para tanto, introduziu-se no critério de avaliação, uma nota complementar (NC) a qual deveria ser "construída" pelo aluno ao longo do ano letivo. A cada trabalho semanal entregue pelo aluno e aceito pelo professor, somava-se 0,5 pontos à nota complementar do aluno.

Levando em conta este critério, para que o aluno elevasse para 1,0 o valor do fator, deveria conseguir a aceitação de pelo menos 14 trabalhos ao longo do ano. Se o número de trabalhos entregues e aceitos fosse maior, passaria a ter vantagens no cálculo da Media de Aproveitamento, cujo cálculo passou a ser feito de acordo com a fórmula abaixo:

$$A = \frac{B_1 + B_2 + B_3 + B_4}{4} \times \left(0{,}3 + \frac{NC}{10}\right)$$

onde NC é a Nota Complementar do aluno calculada por:

NC = 0,5 x número de trabalhos entregues pelo aluno e aceitos pelo professor.

Esperava-se que a necessidade de maior número de trabalhos alcançar o valor 1,0 no fator trouxesse algum progresso. Mas o que se notou é que a dificuldade na execução dos trabalhos era grande e fazia-se necessário tanto auxílio como acompanhamento para o aluno. Diante disso, monitores foram colocados à disposição dos alunos diariamente, em horários fixos e previamente informados. Muitos alunos passaram

[1] Universidade Paulista – UNIP, R. Dr. Bacelar, 1212, São Paulo, SP, Brasil
[2] Centro Universitário da FEI, Av. Humberto de Alencar Castelo Branco, 3972, São Bernardo do Campo, SP, Brasil.

a usar de forma sistemática esse recurso. Para outros, especialmente nos cursos noturnos, era difícil adequar seu horário de chegada à Universidade à disponibilidade dos monitores. Boa parte porém ignorou a ajuda.

Uma análise dos resultados mostrou que o sistema ainda apresentava falhas, dentre as quais podem ser citadas:

- o prazo de um ano letivo para que o aluno "construísse" sua Nota Complementar mostrou-se demasiado longo. Pouca atenção era dada à execução e ao prazo de entrega dos trabalhos. Muitas vezes, quando o aluno percebia que sua situação estava se tornando insustentável, tentava entregar um grande número de trabalhos atrasados, os quais não passavam de cópias dos gabaritos obtidos no setor de cópias da Universidade. A aceitação dos trabalhos nessas condições, constituiria uma negação aos objetivos que se pretendia alcançar, razão pela qual os mesmos eram rejeitados;
- a exigência de busca de informações pelo aluno tinha que ser restrita àquelas que o mesmo podia encontrar no livro texto adotado;
- o monitor funcionava como fonte de auxílio, mas de alguma forma o aluno tinha ser direcionado para uma fonte de conhecimentos, como uma biblioteca e estimulado a consultar outros livros;
- a busca de informações e conhecimentos não deveria restringir-se à revisão dos conceitos apresentados nas aulas, deveria funcionar também como forma de suprir deficiências de conhecimentos que seriam necessários para o perfeito entendimento de conceitos ainda não estudados no curso.

Foram então feitas as seguintes modificações no sistema de avaliação:

a) a fim de tornar o aluno mais atento aos trabalhos obrigatórios e aos prazos de entrega, foi abolida a Nota Complementar. A mesma foi substituída por um fator bimestral que varia de 0 (zero) a 1,25 e multiplica a nota de cada prova do aluno.

Tal fator é calculado com base na entrega e aceitação dos trabalhos obrigatórios, os quais foram divididos em 4 grupos de 5 trabalhos, sendo um grupo para cada bimestre. A cada trabalho entregue pelo aluno e aceito pelo professor soma-se 0,25 ao valor do fator bimestral. A Média de Aproveitamento do aluno passou a ser calculada da seguinte forma:

$$A = \frac{B1 \times f1 + B2 \times f2 + B3 \times f3 + B4 \times f4}{4}$$

onde: B_i são as notas das provas bimestrais obtidas pelo aluno; e

f_i são os fatores bimestrais

b) além dos trabalhos obrigatórios, um novo conjunto contendo 18 trabalhos foi criado. Cada um desses trabalhos foi elaborado de forma que a sua execução exige consultas em literatura. Os conhecimentos que devem ser buscados servem como suporte para o entendimento de tópicos que serão apresentados no desenvolvimento do curso. Desta forma as deficiências básicas que o aluno possui podem ser sanadas previamente, diminuindo o grau de dificuldade para assimilar os novos conhecimentos.

A lista dos trabalhos com os respectivos temas abordados são divulgados no início do período letivo, possibilitando a sua execução antecipada, que é o principal objetivo da proposta.

Tais trabalhos foram chamados e tratados como espontâneos. Não são obrigatórios, e a não entrega do mesmo em nada prejudica o aluno. Esses trabalhos são solicitados nas aulas, sem prévio aviso e concede-se um prazo máximo de dois minutos para a entrega do mesmo. Cada aluno pode entregar somente o próprio trabalho, não são aceitos trabalhos de alunos ausentes. Toda vez que um trabalho espontâneo é aceito soma-se 0,5 pontos à nota da prova bimestral do aluno. A cada bimestre são feitas até 4 solicitações, o que eqüivale a um acréscimo de 2,0 (dois) pontos na nota da prova bimestral.

Em situações especiais, quando se nota que determinados conceitos não estão bem sedimentados, são criados trabalhos extras abordando os temas necessários para superar as deficiências. Nessa situação, embora aumente o número de trabalhos espontâneos no bimestre, mantém-se o acréscimo máximo de 2,0 (dois) pontos na nota de prova, a qual recebe a devida compensação quanto à sua nota máxima.

Os resultados obtidos superaram as expectativas. Tudo leva a crer que a garantia de 2,5 pontos como nota mínima de prova (resultantes da entrega de todos os trabalhos do bimestre, tanto espontâneos como obrigatórios) despertou grande interesse no aluno. Tal fato pode ser constatado pelo número de alunos que sistematicamente entrega os trabalhos espontâneos (cerca de 90 %).

Como conseqüência o andamento do curso tem ocorrido de forma mais tranqüila, o que é notado pelo maior rendimento em cada aula. A assiduidade às aulas aumentou além do que o aluno evita de deixar a sala de aula (já que o

[2] Centro Universitário da FEI, Av. Humberto de Alencar Castelo Branco, 3972, São Bernardo do Campo, SP, Brasil.

trabalho pode ser solicitado enquanto ele estiver fora da sala).
No ano em curso (2002) o estágio atual do processo está sendo aplicado pela segunda vez. Criteriosa avaliação continuada do processo tem sido realizada, a fim de introduzir eventuais novas correções.

AGRADECIMENTOS

Os autores agradecem o apoio da Universidade Paulista, do Centro Universitário da FEI e a colaboração da Profa Dra Cecilia M. Villas Bôas de Almeida.

A PESQUISA COMO FATOR MOTIVADOR DA APRENDIZAGEM: RENOVAÇÃO DO ENSINO E OTIMIZAÇÃO DE COMPETÊNCIAS

Ari Antonio da Rocha[1] *e Carlos Alberto Inácio Alexandre*[2]

Resumo *— A renovação do ensino tecnológico é uma condição que se impõe, como conseqüência da velocidade das transformações decorrentes dos avanços tecnológicos. que tornam o conhecimento rapidamente obsoleto. Os conceitos de "diploma" e "educação terminal" estão em declínio, obrigando a formação de um "novo profissional": empreendedor e com atitude pró-ativa. Isso vai exigir um esforço crescente das instituições de ensino, obrigadas a promover uma contínua revisão metodológica e de conteúdo dos cursos, além da requalificação de seu corpo docente, para que possam cumprir com suas responsabilidades de formar cidadãos aptos a exercer as funções que se configuram relevantes neste início de milênio. A forma mais efetiva de fazê-lo é através de ambientes colaborativos, vinculados a redes de conhecimento e que utilizem a pesquisa como fator motivador das atividades acadêmicas. Entretanto, a partir de meados da década de 1990, com o elevado número de aposentadorias precoces provocadas pela adoção de políticas equivocadas do ministério responsável pela reforma do Estado, as universidades perderam seus docentes mais qualificados. Desse modo, com apoio das agências federais de fomento e órgãos estaduais de amparo à pesquisa, a criação de Comitês de Consultores Sênior, de âmbito nacional e orientados para as diversas áreas do conhecimento, permitirá o aproveitamento de parcela expressiva dessa força de trabalho disponível, suprindo a carência atual de pessoal de alta qualificação.*

Palavras-chave — Renovação da Educação Tecnológica, Construção do Conhecimento, Pesquisa Científica e Tecnológica, Comitê de Consultores Sênior.

INTRODUÇÃO

> "Os alunos trazem uma cultura que valoriza muito mais o conhecimento prático - a fórmula matemática, a dica profissional - do que o aprender a conhecer, o processo real de aprendizagem e construção de conhecimento. (...) É preciso incomodar, desestabilizar, provocar e motivar o aluno, para que desenvolva a curiosidade, a iniciativa, o senso crítico e a criatividade"
>
> **Walter Antonio Bazzo** [1]

No ICECE – 1999, no Rio de Janeiro, foi apresentado um trabalho científico, liderado por BRITO [2], referindo a experiência realizada no curso de Engenharia da Universidade Católica de Santos, em que a pesquisa foi fortemente estimulada e passou a fazer parte das atividades cotidianas dos alunos, de modo a gerar conhecimento novo. Como conseqüência desse fato, foi possível trabalhar de forma mais aderente à realidade, propondo problemas concretos e soluções igualmente concretas, tornando-se um dos principais fatores de motivação da aprendizagem e de estímulo ao interesse dos alunos pela iniciação científica.

É preciso ter presente o fato de que, nos tempos atuais, o mundo atravessa uma fase de transição caracterizada pela velocidade das transformações, decorrentes da incorporação dos avanços tecnológicos ao cotidiano das pessoas, em escala global. Nesse contexto, são adotados novos conceitos de riqueza dos povos, em que se abandonam os antigos referenciais de posse da terra e dos meios de produção, provocando a mudança de paradigmas da sociedade, que passa a atribuir valor ao conhecimento.

É preciso, portanto, estar preparados para fazer frente ao cenário competitivo que se instalou em escala mundial. O País terá que implantar um processo permanente de qualificação de pessoal, o que aumenta de forma expressiva a responsabilidade das instituições de ensino, sobretudo nas áreas tecnológicas e afins, que deverão desenvolver esforços efetivos de reestruturação e adequação ao novo modelo, para poderem vencer esse tipo de desafio.

As ações propostas neste ensaio, dizem respeito à necessidade de superar diversos problemas que ocorreram de forma quase simultânea, comprometendo a capacidade das universidades, principalmente as públicas. Destacamos a seguir as duas principais dificuldades constatadas:

- perda de professores e pesquisadores de elevada qualificação, aposentados precocemente, em virtude da desastrada política de pessoal adotada pelo Ministério da Administração Federal e Reforma do Estado;
- redução no montante de recursos financeiros tanto para o ensino quanto para a pesquisa, que comprometeu em qualidade e quantidade a produção científica do país, bem como alguns avanços que haviam sido alcançados em nível nacional e internacional.

Em nosso país, os ambientes acadêmicos e centros de pesquisa vêm sendo responsáveis pela qualificação de pessoal de alto nível, bem como pela geração de novas tecnologias, transformando informação em conhecimento e este em inovação. Essas condições precisam ser preservadas, para garantir o crescimento econômico com produtos mais competitivos e, conseqüentemente a estabilidade social pelo crescimento dos níveis de emprego.

O CONTEXTO NACIONAL

A globalização não é fato recente, como muitos imaginam, pois a própria nação brasileira se formou como conseqüência da experiência 'globalizante' do Ciclo das Grandes Navegações (a partir do Século XV), com a capacidade de comunicação eficiente e em tempo real, esse processo que abrange as atividades econômicas, comerciais, produtivas e até as idéias, tornando-se uma realidade marcante e inevitável. Do mesmo modo que ocorreu em épocas anteriores, no entanto, a simples contemporaneidade não vai garantir a todos os países um crescimento econômico compatível, nem na mesma escala do crescimento global.

O conhecimento passou a representar grande valor econômico, exigindo esforços na formação de recursos humanos, em particular na área técnico-científica, passando a ser fator fundamental para garantir maior competitividade para o País. A economia nacional depende de forma crescente da capacidade de exportar produtos com alto valor agregado e, como conhecimento é um importante valor agregado nos produtos atuais, as instituições de ensino tecnológico assumem uma decisiva responsabilidade no processo de desenvolvimento.

Mas para isso, terão que se adequar aos novos tempos, promovendo a formação de uma nova geração, de um novo tipo de profissionais. Terão ainda que apoiar as cadeias produtivas da sociedade do conhecimento, pois, somente que tiver maior qualificação estará apto a exercer funções relevantes neste início de milênio. Desse modo, destaca-se o papel da tecnologia como um dos fatores mais importantes para o desenvolvimento, principalmente para o Brasil, que já conta com um produtivo contingente de pesquisadores, além de um parque industrial moderno.

Os países mais desenvolvidos, rapidamente perceberam que a capacidade tecnológica era fator estratégico central, não somente em termos do poderio militar, mas também para o desenvolvimento econômico, social e político, adotando medidas para garantir seu poder hegemônico. A rapidez com que passaram a transformar informação em conhecimento, este em invenção e, a seguir, em inovação, permitiu a disseminação do seu uso prático e mudou de forma expressiva a visão que o homem tinha de si mesmo e a sua maneira de viver.

Esse cenário reforça a responsabilidade do Estado para criar programas estratégicos e iniciativas para a formação de um novo tipo de profissional. Só desse modo, será possível garantir o domínio dos conhecimentos científicos e tecnológicos indispensáveis para a consolidação da soberania da nação.

A responsabilidade para sua concretização, no entanto, terá que ser compartilhada com as instituições de ensino superior, a quem corresponde a formação dos recursos humanos que deverão implementar esse processo. Em sua longa existência, a universidade representa muito mais que mero conglomerado de escolas profissionalizantes, em contínua evolução, para cumprir seu papel num mundo em constante transformação.

No mundo contemporâneo, as instituições de ensino são fator importante na geração e difusão do conhecimento, além de terem a missão primordial de preparar os cidadãos para a vida, ensinando-lhes, entre outras coisas, uma profissão. Seu compromisso, portanto, precisa ser bem mais amplo que a mera reprodução do saber já dominado e consagrado nos livros, mas, principalmente, com a pesquisa, para a geração de novos conhecimentos e sua aplicação.

Para isso, torna-se indispensável a urgente reposição do pessoal de alta qualificação, que se aposentou precocemente em instituições públicas de ensino, principais geradoras de tecnologia que, como citado acima, ocorreu principalmente a partir de 1995.

Mas a dificuldade maior para que isso possa acontecer, diz respeito ao fato que esse tipo de recursos humanos não é facilmente substituível, sobretudo quando são exigidos fatores importantes como a experiência e a competência, que freqüentemente se apresentam associados a professores e pesquisadores portadores de titulação mais elevada. Será necessário encontrar uma solução alternativa, mesmo que temporária, para atenuar esse problema, pois, com a velocidade das transformações provocadas pelos avanços tecnológicos, qualquer atraso pode representar uma perda irrecuperável.

A QUESTÃO DO ENSINO

O ensino superior tardou a ser implantado no país. Por primeira vez aconteceu com a criação da Universidade do Paraná, em 1912.

Entretanto, consta que antes disso, no Brasil Imperial, mesmo que formalmente, teria ocorrido a criação de uma universidade que durou o tempo suficiente para que o Imperador pudesse conceder um título honorífico a um visitante estrangeiro ilustre.

Apesar de não se dispor de registros históricos desse fato, sua simples referência já é emblemática, porque reflete alguns dos problemas que seguem estigmatizando nossa cultura ao longo dos anos:

- entendimento da universidade como mera instituição burocrática, submetendo-a aos interesses do poder central em prejuízo das ações de ensino e pesquisa;
- valorização do aspecto institucional meramente formal, supervalorizando a concessão de títulos e honrarias;
- caracterização da instituição como simples referencial de ostentação e poder, não necessariamente sustentados por atividades efetivamente acadêmicas;
- predomínio de referenciais quantitativos em relação aos qualitativos, que hoje se reflete nos modelos de medição de desempenho, produção científica, etc.

No contexto atual, os desafios que se colocam para o setor acadêmico aumentam a importância da evolução do ensino e da pesquisa, particularmente para as áreas mais diretamente afetadas pelo avanço tecnológico, para poder transformar as idéias e inventos oriundos de qualquer área do conhecimento, em bens e serviços.

A área tecnológica assume um importante papel de transformar o conhecimento em produto, inventando ou mesmo inovando melhor, mais rápido e mais barato.

De uma maneira geral, nos países em desenvolvimento os investimentos na geração de conhecimento costumam ser pequenos e pouco valorizados. Esse é um panorama que precisa ser mudado, porque esse tipo de ação representa a única forma de tornar a indústria local mais apta a enfrentar os desafios hoje caracterizados pela competitividade dos mercados internacionalizados.

Os fatos recentes demonstram que a alternativa política, mesmo quando acompanhada da formação de um bloco econômico regional, não é suficiente para garantir os avanços da economia dos países que não investem no desenvolvimento tecnológico autóctone. Esse tipo de ação é o instrumento adequado para garantir a conquista de "nichos de mercado" para seus produtos e serviços.

Engenharia e Design sofrem as conseqüências da rápida obsolescência do conhecimento, obrigando as instituições de ensino a adotarem um processo de constante atualização e reciclagem, para evitar que os profissionais se transformem naquilo LONGO [3] define como "analfabeto tecnológico".

Para se manterem em sintonia com a dinâmica das exigências do mercado de trabalho, é indispensável adotar ações de Educação Continuada. Desse modo, poderão atender à forte demanda, até o presente ainda reprimida, para Cursos de Mestrado Profissional, de Especialização ou mesmo atividades de curta duração, como treinamentos e workshops, principalmente nos setores mais competitivos atendidos por nosso parque industrial.

Está cada vez mais evidente que não haverá mais formação profissional terminal, e que o conceito de "diploma" já perdeu seu antigo significado de símbolo de conhecimento. Hoje é preciso preparar o "novo estudante", consciente da necessidade de renovar permanentemente seus conhecimentos, principalmente depois da conclusão de seus estudos convencionais, tornando-se um "aprendiz vitalício".

Situação semelhante enfrenta o professor, que apesar de desfrutar de uma situação privilegiada por ser habilitado para a pesquisa e para a inovação, torna-se também um aprendiz. Desse modo será capaz de acompanhar a completa revisão metodológica e de conteúdo nos cursos que a universidade será obrigada a promover, pois nas últimas décadas as exigências sobre os profissionais dessa área evoluíram mais rapidamente do que a capacidade de adaptação do sistema educacional para poder atendê-las.

Em paralelo devem ser promovidas outras atividades cooperativas, visando a melhoria da qualificação do pessoal ligado ao setor produtivo, contribuindo assim para a indispensável capacitação tecnológica das empresas.

Para que as instituições de ensino possam adequar-se a essas novas exigências, é preciso desenvolver um intenso trabalho que crie as condições e a garantia de sua efetiva reestruturação. Essa atividade deve estar focada na própria capacitação institucional para o conveniente desempenho desse papel, de modo a tornarem-se aptas a atender tanto à crescente demanda de novos estudantes interessados em ingressar na carreira. Simultaneamente à necessidade de oferecer alternativas ao já expressivo número, não atendido, de profissionais interessados em reciclar conhecimentos e/ou ampliar sua qualificação.

RESPONSABILIDADE DO ESTADO

A política estratégica do Estado tem que prever futuras mudanças e antecipar soluções, de modo a consolidar a posição destacada que a ciência brasileira vem conquistando, graças aos esforços que permitiram um crescimento da produção científica a taxas superiores ao restante do mundo, garantindo sua liderança na América do Sul.

Há que ter presente, no entanto, que o cenário nacional não reflete a mesma situação dos países desenvolvidos, principalmente pela falta de regularidade dos investimentos públicos no setor, refletindo sobretudo a utilização de um artifício contábil. Adota-se o chamado contingenciamento dos recursos financeiros que, na prática caracterizam o não cumprimento dos orçamentos programados, como pode ser percebido pelas previsões contidas na Figura 1.

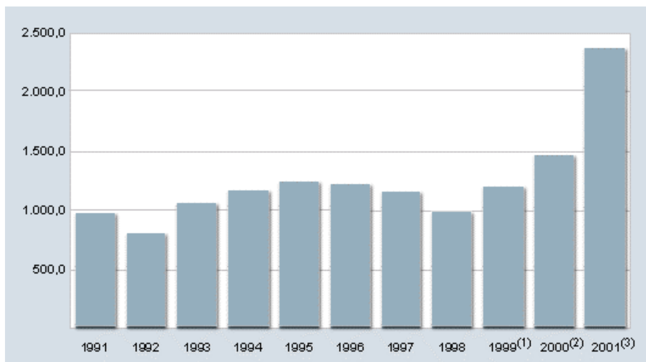

FIGURA 1 *fonte CNPq*

No ano de 2002 o problema ficou ainda mais agravado, levando as agências de fomento a situações dramáticas para honrar o pagamento de bolsas e apoios já concedidos, fato que afetou a ampliação do âmbito de ações anunciadas. Novos projetos, mesmo quando considerados meritórios acabaram não sendo contemplados, pela inexistência de recursos disponíveis para atender sua implementação, com evidentes prejuízos para a comunidade acadêmico-científica.

Por outro lado, essa situação reforça uma tendência preocupante, no que se refere ao atendimento da demanda por bolsas de Iniciação Científica, cuja oferta se encontra levemente superior aos níveis de 1995, mas principalmente nas de Pós-graduação "stricto sensu". No que se refere ao Mestrado, mantendo como referencial dos índices de 1995, o problema se configura como muito grave, porque hoje está sendo atendido um número equivalente a pouco mais que metade daquele ano. No Doutorado, que sofreu incremento da demanda para poder atender ao contingente de Mestres que se formou em período recente, o problema também é preocupante porque, na média de bolsas concedidas no país e no exterior, o número permaneceu praticamente invariável, frustrando expressivo número de interessados.

Por outro lado, programas como o Prodenge/REENGE, ao invés de serem ampliados para outras áreas, como Design, foram interrompidos comprometendo o estimulante processo de melhoria e renovação do ensino tecnológico no país. As instituições de ensino da área de Engenharia, lideradas pela ABENGE, vêm trabalhando para a retomada desse esforço, através de um novo programa, o PAEPE-Programa de Apoio ao Ensino e à Pesquisa em Engenharia.

O CENÁRIO BRASILEIRO

Os dados indicam uma evidente fragilidade dos esforços para a qualificação de pessoal na área tecnológica, fato que se constitui, no entanto, num desafio que indica algumas interessantes possibilidades a serem exploradas na superação dessas dificuldades.

Sem esse esforço, corre-se o risco de comprometer um fator de vitral importância para superar os problemas da competitividade de nossos produtos e serviços. Uma ação efetiva para vencer esses problemas poderá dotar o Brasil de uma estrutura tecnológica consistente, criando fatores diferenciadores que permitam fazer frente aos desafios do mercado internacional.

Os programas oficiais de âmbito nacional, criados com a finalidade de promover os produtos e desenvolver novas tecnologias, pelo tipo de escolha (política e não técnica) dos dirigentes, têm redundado em fracasso, até mesmo pela carência de dados e de informações sistematizadas.

Entretanto, casos de sucesso como calçados e mobiliário produzidos no país, mas principalmente os excelentes resultados recentemente alcançados pela Embraer, atestam claramente os resultados que esse tipo de estratégia pode trazer, favorecendo a melhoria de nossos produtos e a geração de novos empregos.

O parque industrial brasileiro tem se modernizado constantemente e alguns de seus produtos já começam a participar da disputa de mercados internacionais. Há um grande espaço para as empresas brasileiras, não somente nos países tradicionalmente consumidores, que atualmente ingressam num processo de dificuldades, mas no conjunto das economias emergentes, que podem representar a chance de novas parcerias, não somente comerciais, mas em vários campos de atividade.

O progresso técnico-científico provocou mudanças expressivas nos modos de produção, na distribuição e na qualificação da força de trabalho, demandando assim novas estratégias de capacitação tecnológica das empresas. Para torná-las mais competitivas no contexto internacional, é preciso disseminar, com urgência, um processo de melhoria da qualidade, que começa pela formação de um novo tipo de profissional, capaz de identificar problemas, propor soluções e enfrentar cada novo desafio que se apresente na vida profissional.

Essa necessidade vincula o sucesso das empresas à capacidade das instituições de ensino, que terão que iniciar um processo de mudanças. Uma das necessidades será a de introduzir a pesquisa como prática cotidiana, gerando subsídios para as atividades didáticas a partir de propostas integradas e baseadas em necessidades concretas.

Esta é uma interessante possibilidade de conferir melhor qualificação aos egressos, atendendo aos reclamos do setor produtivo por profissionais mais adequados às demandas do mercado de trabalho. Ao mesmo tempo, pode motivar tanto o corpo docente quanto o alunado, a desenvolver um trabalho mais criativo e eficaz, identificando problemas reais e gerando novos conhecimentos e propostas que permitam soluções viáveis e concretas.

A formação profissional ganha assim um novo impulso, porque não se conclui mais com a "formatura". Passa a constituir-se no estágio inicial indispensável, que tem como objetivo não somente formar, mas preparar o profissional para um contexto de constantes mudanças, apto a renovar continuamente seus conhecimentos. O egresso precisará incorporar novas habilidades na aprendizagem e ao longo de toda a vida profissional.

A produção de conhecimentos e geração de tecnologia deverá garantir maior autonomia à área acadêmica e afastar eventuais temores no relacionamento com o setor produtivo. Essa maior confiança dará novo sentido aos projetos de Interação Universidade/Empresa, cujo significado ainda pouco valorizado em nosso País. Nos países desenvolvidos esse relacionamento fortalece a ambos setores, permitindo que maior evolução das empresas com o aproveitamento dos avanços tecnológicos e modernização do parque industrial.

O APROVEITAMENTO DE COMPETÊNCIAS

A crescente velocidade dos avanços tecnológicos, sujeita as profissões vinculadas a suas aplicações a uma dinâmica de transformações, obrigando as instituições de ensino a realizarem uma revisão metodológica e de conteúdo dos cursos, para atender a essas novas demandas da sociedade. Os egressos também têm consciência da urgência em renovar/reciclar continuamente seus conhecimentos, estejam eles envolvidos com projetos de pesquisa de caráter acadêmico ou vinculados à atividade industrial.

Hoje, mesmo fora dos ambientes voltados à inovação, há consenso sobre a importância estratégica da educação tecnológica, frente à nova realidade baseada em informação e conhecimento. Além de mudarem os símbolos de riqueza dos povos, esses novos referenciais provocaram uma verdadeira revolução social, que colocou em evidência uma situação inusitada, que ROCHA [4] assim refere: "nunca, ao longo da história da humanidade, a academia e o setor produtivo foram tão próximos, nem estiveram tão identificados e com interesses tão convergentes".

As instituições de ensino terão que promover uma abertura no sentido da celebração de convênios e parcerias com suas similares, bem como com os centros de pesquisa tecnológica e com os grupos de P&D atuantes nas empresas. Esse tipo de aproximação deverá permitir um processo de ampliação da colaboração, que poderá se rebater em benefício das atividades acadêmicas e favorecer a formação de futuros profissionais.

Hoje, no entanto, com os prejuízos que a evasão dos professores e pesquisadores mais qualificados, afastados em função de aposentadorias precoces, as universidades públicas, responsáveis pela quase totalidade da pesquisa e geração de tecnologia no país, não têm como responder às exigências que precisará atender.

Parcela expressiva desses docentes se deslocou para as instituições privadas de ensino, apesar destas não favorecem o desenvolvimento de suas pesquisas, mesmo as já em andamento, provocando a descontinuidade da produção científica, em sua maior parte relatando ou apresentando reflexões sobre os resultados dessas atividades de pesquisa.

Isso deverá a médio/longo prazo provocar prejuízos no que se refere ao posicionamento do país no panorama da pesquisa em termos internacionais, além de comprometer sua atual liderança latino-americana, com conseqüências imprevisíveis em termos de geração de conhecimento.

Por outro lado, um expressivo contingente desses ex-docentes, deixou de lecionar e orientar estudantes tanto em nível de graduação, como (o que é mais grave e danoso) na pós-graduação e nos projetos de pesquisa. Diversos deles ainda prestam consultorias a escolas e/ou empresas mas, em sua maioria, tendem a se tornar improdutivos, o que representa um imperdoável desperdício de competências, para um país que tenha pretensões de assumir papeis mais importantes no cenário regional e internacional.

A Proposta

O aproveitamento desse contingente de pesquisadores afastados de suas atividades habituais, pode ser promovido por meio de ações simples como a criação de um quadro permanente de consultores sênior, com custos bem contidos, se tivermos em conta os resultados que podem gerar.

As instituições de ensino deverão estruturar propostas nos mais diversos níveis; desde a melhoria do ensino e qualificação de pessoal, de modo a promover a renovação dos conteúdos programáticos de seus cursos, até projetos de pesquisa mais alentados, que seriam avaliados por seus méritos, mas sempre incorporando a experiência desses consultores de alto nível que, por essas atividades, receberiam bolsas de pesquisa das agências de fomento ou entidades estaduais (ou municipais) de amparo à pesquisa.

Conclusões e Recomendações

Graças ao fomento à pesquisa e apoio a qualificação de pessoal, o Brasil conquistou significativa importância no novo contexto mundial em que o conhecimento é fator decisivo para o progresso sócio-econômico das nações.

No entanto, tendo presentes as questões sociais e a sociedade da informação, colocam-se hoje expressivos desafios para nossa ciência. O trabalho já realizado, que favoreceu a inserção de nosso País na estratégia global de desenvolvimento, permitindo que assumisse uma condição de liderança regional, mas gerando a urgente necessidade de novas iniciativas no campo científico, que possam contribuir para consolidar e ampliar os programas que conduziram o Brasil à sua posição atual como produtor de ciência.

Será indispensável promover uma revisão metodológica e de conteúdos, para adequação das instituições de ensino aos novos tempos e formação de recursos humanos que REICH [5] define como capazes de conceituar problemas e soluções, através de quatro aptidões básicas: abstração; raciocínio sistêmico; experimentação; colaboração.

Os estudantes deverão estar preparados para entender que sua atividade profissional faz parte e interage com os demais setores, tendo que atuar de forma transdisciplinar, o que exige a incorporação de um conjunto de competências que NICOLESCU [6] assim refere: aprender a aprender; aprender a fazer; aprender a conviver; aprender a ser.

É preciso uma revisão conceitual das instituições de ensino, incluindo a necessidade de investimentos em infra-estrutura, para adequar o ensino às novas condições de experimentação e participação, além de uma ação corajosa de, simultaneamente, promova a requalificação do quadro de docentes para atuar no âmbito dessa nova realidade.

Um importante passo nesse sentido é enfatizar a pesquisa como prática cotidiana, gerando conhecimentos para as atividades acadêmicas, de modo que o alunado possa incorporar esse novo tipo atuação, que deverá fazer parte de seu cotidiano ao longo de toda a vida profissional. Para isso deverão contar com programas especiais das instituições de ensino, apoiadas por quadros de professores/pesquisadores de alto nível, atuando com apoio (bolsas) das agências federais de fomento ou entidades locais de apoio à pesquisa.

ADMINISTRACIÓN DE REDES CON ENFOQUE DE INGENIERÍA SOCIAL

José Gpe. Vargas Hernández[1]

Abstract *— Se revisan en esté trabajo, algunos de los métodos con la que los administradores de redes pueden defender sus sistemas de los principales ataques de seguridad existentes. En el presente documento se dan algunos consejos de cómo poder lograrlo. Principalmente esta enfocado a los ataques a la seguridad, denominados: Ingeniería Social, es decir los que se logran con errores y /o exceso de confianza del factor humano. Se realizó parte de la presente investigación con algunas encuestas dirigidas a algunos administradores de redes elegidos al azar, de una base de datos de empresas e instituciones de educación de México. Entre los resultados obtenidos destaca que la un buen porcentaje de nuestros administradores de redes, no tienen respaldado de manera correcta y eficiente sus sistemas.*

Index Terms — Administración de redes, Confidencialidad , Ingeniería social, Seguridad.

INTRODUCIÓN

En este siglo de grandes avances tecnológicos, en donde el uso de la computadoras ha sido generalizado. Las redes de computadoras han tenido un crecimiento sostenido en los últimos años, en donde cada vez un mayor numero de empresas e instituciones educativas, dependen gran numero de sus procesos y operatividad a estas.

Esta creciente expansión de las redes de comunicaciones ha hecho necesario la adopción y el desarrollo de herramientas de seguridad que protejan tanto los datos transmitidos como el acceso a los elementos de la red de los posibles ataques que pueda sufrir.Pero en las empresas e instituciones educativas este crecimiento en muchas ocasiones va mas a allá de la asimilación de la tecnología por sus usuarios y administradores; ya que muchos de los problemas de seguridad que se presentan en una organización esta fuertemente ligada, al facto humano: la famosa ingeniería social. La cual si nos remontamos a los años, en los que se desarrollo la Segunda Guerra Mundial, donde los Alemanes e Italianos tuvieron un mismo grado de confiabilidad al obtener secretos militares, pero uno con sofisticados métodos matemáticos, mientras el otro con el chantaje, robo y el encanto de sus mujeres.

Hoy en día existe la tendencia en el aumento de uso de sistemas Linux, aunque no ha bajado el porcentaje de uso de los sistemas UNIX, contrario a una tendencia a la baja de Novel, y la estabilidad en el uso de Windows es uno de lo aspectos sacados de las encuestas realizadas a administradores de redes, escogidos al azar de los institutos tecnológicos y algunas empresas privadas.

SEGURIDAD

Las normas sobre seguridad empezaron su desarrollo a finales de los años 70, cuando surgió la necesidad de proteger ciertas comunicaciones. Han surgidos diversos organismos que las regulan, como ISO(Organización de estándares Internacionales), ITU (Unión Internacional de Telecomunicaciones) y SC27 (Subcomité 27).

Podemos mencionar de una manera general que mantener un sistema seguro(o fiable) consiste básicamente en garantizar tres aspectos: confidencialidad, integridad y disponibilidad.

- **Confidenciabilidad**: Nos indica que los objetos de un sistema han de ser accedidos únicamente por elementos autorizados a ello y que esos elementos autorizados no van a convertir esa información en disponible para otras entidades.
- **Integridad**: Significa que los elementos solo pueden ser modificados por elementos autorizados, y de una manera controlada.
- **Disponibilidad**: Indica que los objetos del sistema tienen que permanecer accesibles a elementos autorizados; es el contrario de la negación de servicio.

Entre las cosas que debemos tener en mente al realizar un diseño de seguridad para establecer las politicas de seguridad de nuestra organización, es que queremos proteger ya sea el Software, el hardware y/o los datos.

Entre los puntos que debemos tener en cuantas como un buen administrador de red, son los tipos de amenazas contra la que necesitamos proteger nuestra información.

- **Interrupción de servicio.** Que por ninguna circunstancia se deje de ofrecer un servicio.
- **Interceptación de datos.** Los datos en un sistema solo podrán tener acceso los usuarios autorizados.
- **Modificación de nuestros datos.** Los datos solo serán modificados por usuarios validos.
- **Fabricación de nuevos datos o suplantación de identidad.** Que no existan formas no autorizadas para tener acceso a los datos, o que no se creen usuarios no autorizados.

Cuando se recibe alguno de los ataques anteriores, se pudieron realizar de cualquiera de las dos formas siguientes:

[1] José Gpe. Vargas Hernández. Centro Universitario del Sur, Universidad de Guadalajara, Prol. Colón SN, Cd. Guzmán, Jalisco, 49000, México. Telefax: +52 34141 25189, jvargas@cusur.udg.mx

- **Activos**: Ataques que se hacen de forma directa a los datos y/o equipos.
- **Pasivos**: Ataques que se realizan de forma indirecta a los datos y/o equipos.

El lograr tener una buena política de seguridad, se logra manteniendo mecanismos de seguridad fiables como por ejemplo :

- **Prevención.** Verificando con anterioridad posibles problemas de seguridad.
- **Detección**. Realizando una chequeo en línea de los ataques a la seguridad.
- **Recuperación.** Después de un problema recuperar las fallas ocurridas.

Para este ultimo podemos mencionar que las copias de seguridad del sistema son con frecuencia el único mecanismo de recuperación que poseen los administradores para restaurar una máquina que por cualquier motivo (no siempre se ha de tratar de un pirata que borra los discos), ha perdido los datos. Asociado a las copias de seguridad suelen existir unos problemas de seguridad típicos, p.e. la no verificación del contenido. Otro problema clásico de las copias de seguridad es la política de etiquetado, etc.

Para prevenir la entrada de usuario no validos se han establecido métodos de autenticación se suelen dividir en tres grandes categorías, en función de lo que utilizan para la verificación de identidad:

- **Algo que el usuario sabe**
- **Algo que éste posee**
- **una característica física del usuario o un acto involuntario del mismo.**

Esta última categoría se conoce con el nombre de autenticación biomética.

Pero podrán existir los mejores métodos, el equipo mas sofisticado, pero si los usuarios y/o administradores no llevan orden, y son descuidados con las políticas de seguridad establecidas. Se tendrá un sistema inseguro. En encuestas realizadas a un grupo elegido al azar de administradores de redes de las principales empresas e instituciones de educación superior de México.

Podemos establecer que uno de los ataques mas peligrosos y que dan origen a mayores riesgos son los denominados de ingeniería social, es decir los ocasionados por el factor humano. Ya sea por un descuido del administrador, por que el usuario sea malintencionado, o por descuido del usuario se obtenga, pierda o cambie información.

Por otro lado ocasionado por el factor humano es la resistencia al cambio por parte de miembros de nuestra organización, como lo descuido ocasionado por ello.

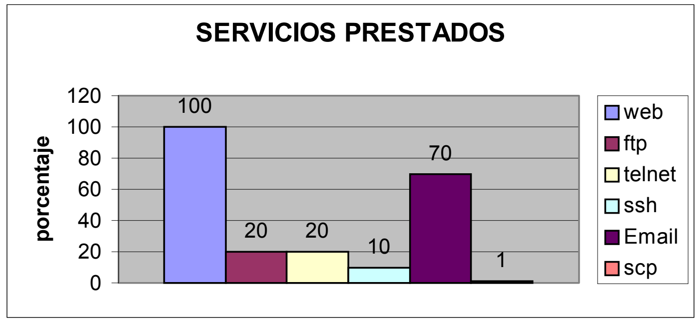

FIGURA. 1
SERVICIOS PRESTADOS

El 100% de los encuestados dan en cierta medida, acceso a Internet a sus usuarios, convirtiéndose esto en un problema de seguridad, ya que la mayoría de sus usuarios, utiliza servicio de Internet inseguros, como es el ftp, telnet, y www.

En la gran mayoría de las empresas e instituciones de educación no existen políticas, bien definidas de autoridad, y canales de mando en muchas de estas organización, en gran porcentaje de ellas el único que conoce las claves de administración, es el encargado. Esto mientras no exista mucha rotación de personal, es adecuado. ¿ Pero que pasaría si el encargado de la red, cambia de empresa?

Entonces podemos visualizar que lo anterior es uno de los principales problemas que se puede enfrentar, los administradores de la empresa. Y por lo que se debe tener un buen control del personal, capacitación al mismo y que estos quieran a la empresa, así como "amor a camiseta".

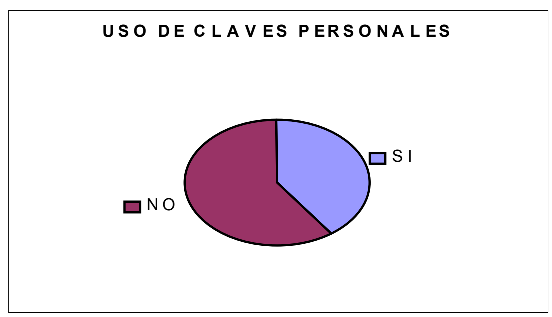

FIGURA. 2
USO DE CLAVES PERSONALES

Uno de los problemas mas graves que enfrenta un administrador de redes, es el descuido de sus usuarios al asignar sus contraseñas. Ya que muchas veces la clave que le asigna son muy sencillas. Así como del descuido de los mismos al no darle la seriedad que se merece al uso de las contraseñas, ya que piensa "..No tengo nada importante...", pero lo que no sabe es que puede usar su cuenta o equipo de pasarela, para atacar otros equipos que tengan información valiosa, aunque no este en la misma red. Aquí el inconveniente es que el prestigio de la institución a la pertenece o donde fue dirigido el ataque, es el que queda en entredicho.

Al no darle la importancia debida, y pensando que no existe nada que una persona curiosa quiera, se dejan muchos sistemas, completamente sin restricciones para un usuario curioso o con iniciativa. Con esto no se le da el valor que se debe al prestigio de la organización, y existen comentarios como: "... ellos siempre tienen virus..", "... hasta mi hermano de secundaria ha entrado a ese sistema...", etc

Ya que es posible que no se pierda información en ese punto, pero prestigió SI. En este punto un vandalo informatico, puede suplantar la identidad de alguien, y mandar por ejemplo un correo a un usuario pensando que lo manda un tercero.

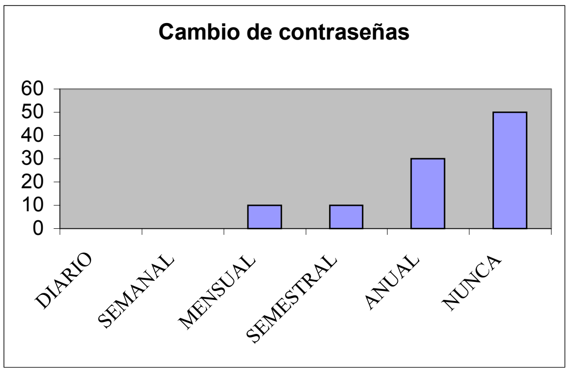

FIGURE 3
FRECUENCIA EN EL CAMBIO DE CONTRASEÑA

CONCLUSIONES

Cuando queremos proteger la información de nuestra organización, y por tanto tener nuestros sistemas confiables y seguros. No requerimos en la mayoría de los casos, conocer todos los huecos o fallas de seguridad de un sistema operativo, y demás programas que se requieren en una organización. Se necesita mas que nada la construcción de sistemas de autenticación fiables y baratos y/o el diseño de nuevos criptosistemas seguros.

Pero es preferible utilizar los existentes como DES, RSA o Kerberos que no tener ninguno como protección en la distribución y autentificación de claves. Otros de los puntos que podemos concluir es que existen en las diversas redes de nuestro país un uso generalizado de mas de dos sistemas operativos, conviviendo por recursos. Siendo este un punto débil en la seguridad de los sistemas, ya que por lo regular es un punto de "quiebra" de la seguridad, si no se tienen los conocimientos del funcionamiento de ambos a nivel de seguridad..

Eso aunado que en muchas instituciones de educación, por falta de recursos humanos, tienen a sus alumnos a cargo de muchos de los procesos informáticos dentro de ella, principalmente de telecomunicaciones.

Actualmente, casi cualquier sistema en Internet es vulnerable, y los problemas de seguridad causan grandes inquietudes en las industrias de ordenadores de comunicaciones. Las preocupaciones sobre los problemas de seguridad incluso han empezado a enfriar las sobrecalentadas esperanzas acerca de la capacidad de Internet para servir de soporte para las actividades comerciales.

EVALUACIÓN DE LAS EXPERIENCIAS PARA MEJORAMIENTO DEL PROCESO DE APRENDIZAJE EN ASIGNATURA INICIAL DE LA CARRERA INGENIERÍA INFORMÁTICA.

Nancy N. Figueroa [1], Fernando J. Lage[2], Zulma Cataldi[3] and Julia M. Denazis [4]

Abstract — *En comunicaciones previas se han descripto los resultados de las experiencias de aprendizaje basado en problemas (ABP) utilizando software para groupware, con estudiantes de cursos iniciales de Algoritmos y Programación. Las experiencias se llevaron a cabo usando el protocolo genérico de trabajo cuyo diseño se describe en Lage, Cataldi [12] y que se ha ajustado a este caso particular.*
En esta comunicación se presentan los resultados de los diferentes tipos de evaluaciones efectuadas para detectar si hubo un mejoramiento de los aprendizajes durante el 2000. A tal efecto se efectuó el análisis cualitativo y cuantitativo de los diferentes tipos de la micro interacciones producidas a través de los mensajes intercambiados por los estudiantes en forma asincrónica tal como se describe en Lage, Cataldi (2002) y efectuando las evaluaciones que aquí se describen.

Index Terms — *Aprendizaje basado en problemas, Mediación tecnológica Trabajo cooperativo–colaborativo,.*

INTRODUCCIÓN

En este trabajo se relata una experiencia realizada en la Facultad de Ingeniería de la Universidad de Buenos Aires, en la asignatura Algoritmos y Programación de la carrera de Ingeniería en Informática. En nuestra perspectiva confluyen las corrientes teóricas del aprendizaje colaborativo, el aprendizaje mediado y el acercamiento metodológico de micro-análisis de las interacciones. Estas corrientes permiten poner en práctica *principios pedagógicos que suponen que el estudiante es el principal actor en la construcción de sus conocimientos,* con base en situaciones (diseñadas y desarrolladas por el docente) que le ayudan a aprender mejor en el marco de una acción concreta y significante y, al mismo tiempo, colectiva.

La resolución de problemas en el marco del trabajo en grupos cooperantes y colaborativos a través de la mediación tecnológica permite a los estudiantes la construcción de sus aprendizajes estimulando su creatividad. De este modo se pretende formar sujetos capaces de desarrollar proyectos y por consiguiente de investigar, de evaluar y de resolver problemas.

Cuando se habla de *aprendizaje colaborativo* se hace referencia a la formación de grupos de trabajo con objetivos de aprendizaje determinados, y donde *cada participante del grupo interviene en todas y en cada una de las partes del proyecto o problema*. Para el caso del *aprendizaje cooperativo*, cada uno de los integrantes del grupo, tiene asignada *una tarea específica dentro del proyecto o problema a resolver.*

De este modo se puede decir que cada participante realiza una tarea más individual como parte del trabajo total.

El trabajo *cooperativo* aplicado a la resolución de problemas sigue la operatoria que se describe: dado un cierto problema, el mismo se debe completar *dividiendo las tareas* entre los agentes cooperantes. Cada uno es responsable de su parte para la resolución del problema en su totalidad. La *colaboración* en cambio incluye el compromiso mutuo de los participantes en un *esfuerzo coordinado para resolver los problemas juntos*. No es sólo un tratamiento de las tareas que causa efectos positivos en los participantes, sino que es una estructura social en la cual dos o más personas interactúan entre sí, bajo determinadas circunstancias siendo estas interacciones las que tienen y producen un efecto positivo. [6,7]

Tanto la cooperación como la colaboración son modalidades de interacción que se potencian cuando se las aplica en ambientes ricos en materiales y herramientas tales como los que proveen las nuevas tecnologías de la información y de la comunicación. [12,13,14]. Así, la colaboración, que puede ser definida como un *proceso de participación en comunidades de conocimiento*, aprovecha las posibilidades que ofrece el entorno material para facilitar el monitoreo y la comprensión mutua. Las computadoras, especialmente, pueden ofrecer un amplio repertorio de anclajes referenciales y de puntos de relación compartidos

Las NTIC (Nuevas Tecnologías de Información y Comunicación) en el ámbito educativo son un recurso que busca favorecer los aprendizajes de los estudiantes y constituyen una valiosa herramienta por la incidencia que tienen sobre la motivación de los alumnos, los que crecieron en un ambiente de transformaciones tecnológicas importantes que afectaron, cada una a su tiempo, las estructuras de comunicación dentro de la sociedad. De este modo, las generaciones jóvenes, tienen expectativas y necesidades nuevas que se manifiestan dentro de los variados ambientes de enseñanza, entre ellos la universidad. El impacto que las NTIC tienen en nuestra cultura, nos lleva a afirmar que hoy la realidad se construye mediáticamente. Las nuevas tecnologías de la información y de la comunicación son buenas aliadas para construir y aprender

[4] Julia M. Denazis, Secretaría Académica, Facultad de Ingeniería, Universidad de Buenos Aires. juliamd@movi.com.ar

pero sus efectos no están relacionados con su naturaleza, sino, con la manera en que se las utilice. Es necesario entonces que los estudiantes y los docentes al involucrarse en experiencias de este tipo, asuman una postura crítica e identifiquen las ventajas y desventajas que ofrece su uso, evitando caer en el tecnocentrismo de sustituir el fin: ***el aprendizaje del alumno***, por el medio: ***la tecnología***. [25].

A partir del marco teórico descrito nos interesamos principalmente, en determinar: 1) cómo el aprendizaje colaborativo asistido por las tecnologías puede mejorar la interacción entre pares y el trabajo en equipos, y 2) cómo la colaboración, así como la tecnología facilitan el conocimiento compartido, además del desarrollo de habilidades y destrezas entre los miembros de la comunidad.

METODOLOGÍA

Se describe una de las experiencias de ABP, con un grupo de 60 alumnos de primer cuatrimestre de la carrera de grado Ingeniería Informática, utilizando el software explicado en trabajos anteriores [16,17]. El programa tiene las opciones básicas del software para groupware: navegador, correo electrónico, chat y pizarra de mensajes.

Durante la experiencia de resolución de problemas se usó el modelo de trabajo que se ha descrito en experiencias anteriores pero simplificado en tres etapas: cooperativa pura, colaborativa pura, y cooperativa–colaborativa, ya que el modelo completo estaba diseñado para otros criterios de uso. [19]

Considerando la colaboración como una forma especial de interacción entre los componentes del acto pedagógico, es decir entre el docente, el alumno, los contenidos y el medio tecnológico, tomamos como unidad de análisis para nuestro estudio *los niveles de interactividad en las comunicaciones entre los pares intervinientes*: Alumno–Alumno (AA), Alumno-Docente (AD), Alumno–Contenido (AC), Alumno–Medio (AM).

Los datos obtenidos surgieron a través del análisis de los mensajes electrónicos enviados por los grupos de los alumnos que participaron en el estudio, como también de la "trascripción" de conversaciones electrónicas, bajo la modalidad sincronizada (chat). Todas las interacciones entre los participantes fueron registradas. En una primera etapa se analizarán las intervenciones a través del correo electrónico para luego analizar los protocolos de las sesiones de chat. La información obtenida proveerá datos acerca de los tipos de interacciones: alumno-alumno (AA), alumno-docente (AD), alumno-contenido (AC) y alumno-medio (AM). A fin de sistematizar las relaciones entre el docente, los alumnos, los contenidos y el medio, se definieron algunas categorías de análisis tales como las de Gairín [4].

LA EXPERIENCIA

La necesidad de trabajar con ABP utilizando software para groupware se inició al detectar una serie problemas relacionados al bajo rendimiento de los estudiantes en un curso inicial de algoritmia. A partir de este dato sumado a la información provista por encuestas[5] que responden los estudiantes al aprobar la asignatura. Se indagó cómo los estudiantes preparaban sus exámenes y se descubrieron algunas evidencias tales como: la falta de consultas a bibliografía, poco de tiempo dedicado al estudio, la falta de metodologías de estudio, la ausencia de estrategias para la resolución de problemas [11]. Se observó que la mayor parte de los estudiantes no lee correctamente los enunciados y las consignas o las interpretan en forma errónea y que tienen dificultades para diferenciar la información relevante de la que no lo es. Esto revela problemas tales como la falta de atención y el conocimiento frágil de los estudiantes [23]. Centrados en estos cinco indicadores buscamos y diseñamos estrategias de estudio que a través de la tecnología favorezcan el trabajo colectivo, la modificación de actitudes hacia el estudio, la modificación de concepciones erróneas y de procesos cognitivos. [14,15]

Pensamos que con la incorporación de entornos tecnológicamente enriquecidos además de aprovechar el efecto *novedad* [1,2], podíamos introducir en nuestra tarea docente contenidos actitudinales y procedimentales, tales como el respeto al otro, la tolerancia y la solidaridad, dados por las ventajas que ofrece el trabajo en grupos cooperativos y colaborativos.

Con los objetivos de desarrollar un curso que fuera cautivante, estimulante, con aplicaciones tecnológicas que respondieran a las demandas crecientes de los alumnos del sistema, sin que por ello el medio de enseñanza prevaleciera sobre el mensaje transmitido y evaluar su impacto en los aprendizajes de los estudiantes, como profesores a cargo cumplimos con el doble rol de formador e investigador, documentando cuidadosamente cada una de las etapas del curso en proceso.

Desarrollo de la experiencia

Para la experiencia se siguieron las siguientes reglas básicas:

- Se conformaron grupos de trabajo de tres alumnos a los que les entregó el Trabajo Práctico a resolver.
- El tiempo entre la entrega del Trabajo Práctico y su devolución fue de 15 días.
- El mismo grupo se encargó de subdividir el trabajo de manera que cada integrante elaborara una parte.
- Cuando un alumno cooperante tenía una duda, esta se publicaba en la pizarra para que todos pudieran colaborar en la obtención de la solución.
- El proceso de negociación de las comunicaciones estuvo siempre supervisado por al menos un docente coordinador.
- Cuando se llegaba a un resultado correcto o factible, este se publicaba a fin de que el grupo pudiera seguir con su trabajo.

[5] Se hace referencia a las encuestas implementadas por la Facultad, que responden obligatoriamente los estudiantes de grado una vez que aprobaron la asignatura.

– Para este trabajo sólo se analizaron los registros de los mensajes del foro de discusión cerrado exclusivamente para los participantes del curso.
– Se llevó un registro de la cantidad y calidad de las intervenciones de cada uno de los alumnos colaborando con aquellos que tuviesen problemas, ya que se requiere de un mínimo de tres intervenciones para ser tenidas en cuenta como un porcentaje de la calificación final.
– Un 20 % de la calificación final estaba destinada a la colaboración con el resto, lo que beneficiaba al alumno que colaboraba y al alumno o grupo que tenía el problema.Como se ha planteado en los trabajos previos, [12] el procedimiento a seguir consta de los tres momentos que se describen a continuación:

1. Diseño de los problemas
2. Período de entrega del trabajo y desarrollo
3. Evaluación

En cada uno de estos momentos, se deben tomar diferentes decisiones que determinan el protocolo del trabajo, por lo que cada momento se puede desglosar como se describe a continuación:

Primer momento: diseño de los problemas

Los problemas a realizar por los alumnos en forma grupal, corresponden a los contenidos de la asignatura Algoritmos y Programación de la carrera de Ingeniería Informática de la Facultad de Ingeniería de la Universidad de Buenos Aires, y fueron confeccionados siguiendo los requerimientos dados [11] para poder efectuar un trabajo cooperativo y/o colaborativo.

Los problemas se concibieron en forma modular, cada módulo de actividades está limitado en tiempo, espacio y extensión. Los módulos están concebidos para favorecer la integración significativa de los temas y la construcción colectiva del conocimiento a través del intercambio efectivo de información y de la comunicación para poder resolver los problemas planteados. Para la solución de los mismos los estudiantes debieron reagrupar las actividades en subtemas de la temática general para concluir con el módulo en el tiempo estimado.

Segundo momento: los procesos interactivos

Se puede pensar en el ambiente de aprendizaje como un *ecosistema de aprendizaje* [22] en el cual todos participan con determinadas tareas específicas y realizan una serie de acciones (plantean preguntas, emiten respuestas, solicitan ayuda, información, etc.). De este modo se establece entre los estudiantes y el docente relaciones que producen retroalimentaciones, por lo que se puede definir a la ***interacción electrónica*** como el intercambio de mensajes electrónicos que tienen lugar entre dos o más personas que se influyen mutuamente enviando y recibiendo información, y produciendo resultados que probablemente ninguno de los actores hubiera producido por separado.

El seguimiento de las interacciones a través del tiempo de duración de las experiencias, del tipo de interacción, y de la calidad de las mismas permitirá dar a luz el impacto que el *ABL en grupos cooperantes y colaborativos a través de la mediación tecnológica* produce en la construcción de conocimientos y en la mejora de las estrategias de estudio usadas por el estudiante.

Tercer momento: La evaluación de los estudiantes y de la experiencia.

Las etapas seguidas fueron:
– Se realizaron evaluaciones parciales y evaluaciones integradoras en los temas tratados para la resolución del Trabajo Práctico y se los comparó con el rendimiento de los grupos de los períodos anteriores.
– Se comparó la eficiencia de los grupos en cuanto a la realización de los trabajos prácticos en los períodos en estudio.

Se hizo el seguimiento de la participación de los alumnos en la realización de los trabajos prácticos.

LAS EVALUACIONES

Para esta serie de experiencias se han tenido en cuenta tres tipos de evaluaciones inherentes a los sujetos: del desempeño grupal, de los aprendizajes, las autoevaluaciones individuales y grupales, y se ha efectuado una evaluación de la aplicación utilizada. También se ha tenido en cuenta cómo los estudiantes han recibido la experiencia a través de una encuesta que se describe en el apartado 4 donde se presentan algunos datos estadísticos relevantes.

A través de la bibliografía se ha observado que los procesos grupales se pueden estudiar a través de tres corrientes: la dinamista o lewiniana, la interaccionista o la psicoanalítica según Maissonaive [21]. Para éste análisis se adoptó la corriente interaccionista que se basa en la investigación a través de la observación sistemática de los procesos de interacción grupal. Para llevar a cabo la observación se tomaron las doce categorías que presenta Bales [21].

TABLA 1:
LAS CATEGORÍAS DE BALES [21]

Area socioafectiva positiva	Da muestras de solidaridad	
	Se muestra moderado	
	Aprueba	
Area de las tareas	Ofrece orientación o sugestión	
	Da una opinión	
	Da una información	
	Pide información	
	Pide opinión	
	Pide orientación	
Area sociofectiva negativa	Manifiesta molestia	
	Manifiesta agresividad	

La categorías se agrupan en tres grandes áreas: la socioafectiva positiva, la de las tareas y la socioafectiva negativa tal como se aprecia en la Tabla 1. Estas categorías son importantes en el momento de la evaluación ya que permiten focalizar en qué aspectos se centran las interacciones. Esta herramienta no es única, ya que se puede señalar otra tal como el formulario de observación estructurada, propuesto por Johnson, Johnson y Holubec [8] que se muestra en la Tabla 2. El mismo se puede ampliar incorporando otros tipos de observaciones que puedieran surgir de acuerdo a las características de las interacciones grupales, ya que se podría desplegar en el ítem denominado otros.

TABLA 2:
FORMULARIO DE OBSERVACIÓN ESTRUCTURADA DE JOHNSON, JOHNSON Y HOLUBEC [8]

Observador:			***Fecha:***	
Actores	***Alumno 1***	***Alumno 2***	***Alumno n***	***TOTAL***
Aporta ideas				
Estimula la participación				
Verifica la comprensión				
Orienta la grupo				
Otros:				
TOTAL				

La aplicación de este formulario (durante las prácticas, en este caso) consiste en tildar en las casillas correspondientes para obtener los datos iniciales y observar cómo van evolucionando a lo largo de la experiencia verificando el surgimiento y la persistencia de las *conductas positivas* a lo largo del tiempo, en la medida que el grupo o el individuo adquiera mayores competencias cooperativas y/o interactivas.

Considerando a los aprendizajes individuales, las evaluaciones se orientaron a fin de determinar el grado de *transferencia* adquirido por cada uno de los participantes. Es decir la capacidad de resolver situaciones problemáticas nuevas e integradoras a partir de los conocimientos y habilidades adquiridos, por reacomodación de las estructuras cognitivas. Para ello, se diseñan situaciones problemáticas a fin de establecer si los participantes pueden o no transferir lo aprendido.

Se dice que existe *transferencia* siempre que algo que se aprendió antes influye en el aprendizaje actual o cuando la forma de resolver un problema dicta la forma en que se resuelve uno nuevo. [20]. La transferencia puede ser general o específica. Es específica cuando lo aprendido se aplica a situaciones muy parecidas y es general cuando supone la aplicación de lo aprendido a situaciones nuevas y supone el uso de métodos heurísticos para resolución de problemas. [27]. Solomon y Perkins [26] descubrieron la existencia de dos tipos de transferencia: la cercana y la lejana. La primera es espontánea y automática de destrezas muy practicadas con poca necesidad de pensamiento reflexivo. La lejana es una aplicación consciente de los conocimientos aprendidos en una situación diferente y su clave principal reside en la abstracción consciente o identificación de principios generales o estrategias más allá del problema mismo, siendo esta abstracción parte del conocimiento metacognitivo que puede dirigir el aprendizaje y la solución de problemas futuros.

TABLA 3:
ENCUESTA DE EVALUACIÓN DE LA APLICACIÓN.

Evaluación de la aplicación (Marque con una X o responda)		
	Si	**No**
¿Es su primera experiencia de trabajo en la red?		
¿Accede con equipo propio a la red?		
¿Tuvo inconvenientes de tipo técnico para trabajar? ¿Cuáles?..		
¿Cuándo tuvo problemas consultó? Siempre....... a veces .... nunca........		
¿Obtuvo a tiempo la respuesta del docente?		
Sugerencias		

Finalmente, para conocer la opinión de todos los usuarios, se implementó una encuesta de evaluación de la aplicación para los alumnos como la que se muestra en la Tabla 3, se piensa que al analizar los resultados aparecerían aquellas categorías que consideren las interacciones AM (alumno–medio) y DM (docente–medio) que permitieran dilucidar algunos aspectos operativos acerca del funcionamiento de la aplicación.

LOS RESULTADOS DE LAS EVALUACIONES

La evaluación del desempeño grupal

Para la evaluación grupal se tuvieron en cuenta las interacciones de tipo AA (alumno–alumno), AD (alumno–docente) y DA (docente–alumno) descriptas en trabajos previos [19]. Para las interacciones de los tipos AD y DA, las categorías que aparecen están dentro del área de las tareas de acuerdo a la clasificación de Bales, tal como se describe en Maissonaive [21], siendo éstas casi exclusivamente referidas a la categoría de la gestión (da opinión, pide opinión, pide orientación, etc.). Esto permite obtener algunas pautas acerca del grado de independencia del alumno en el proceso grupal interactivo. En cuanto al análisis de la interacción AA aparecen las siguientes categorías referidas al también al área de las tareas:

Solicita aclaración
Clarifica
Aporta bibliografía
Pide información
Da información

La relación entre *Clarifican y Solicitan Aclaración* como medida de la *"actividad"*[6] está en el orden de 0,57, respecto de los valores entre los que este índice se mueve que son 0 y 1 y se pued edecir que es buena, ya que registra un mayor nievel de respuestas que de solicitudes..

La relación entre las categorías *Dan información y Piden información* es de 0,83, lo que representa una notable mejoría respecto de la relación anterior, deduciendose que la diferencia se da porque en éstas últimas categorías no están en juego directamente los contenidos.

También aparecen las categorías *Valoran y Ayudan a la Gestión*, que están referidas al área socioafectiva positiva y representan un 8,2% del total. Aunque se podría pensar que este valor es bajo respecto del que corresponde a otras categorías, se debe notar que no han aparecido categorías del área socioafectivas negativas y, que por el hecho de ser un grupo formado para llevar a cabo una tarea puede tomarse como medida de la interacción positiva del grupo la relación entre las categorías donde hay requerimientos tales como: *Solicita Aclaraciones o Pide Información*, respecto de las que satisfacen tales requerimientos tales como: *Clarifican, Dan información*, etc. Esto arroja un índice de 0,7, el cual se considera muy bueno respecto del óptimo que es 1. por este motivo se puede decir que la evaluación grupal ha sido positiva.

La evaluación de los aprendizajes

De los 60 estudiantes que iniciaron la experiencia hubo un desgranamiento del 10% y los abandonos se debieron a problemas laborales o económicos. Del total de las interacciones sólo el 60% fueron positivas ya que el resto fueron neutras.

A fin de tener referencias se comparó el resultado del examen Parcial (con iguales contenidos) de este grupo respecto de uno que no trabajó en la red y hubo un 5% más de alumnos aprobados en el primero que en el segundo.

No se utilizó la instancia del examen final integrador para la comparación pues los alumnos no asisten a la evaluación en forma conjunta sino que, en forma individual, optan por presentarse a lo largo de un periodo que excedía los límites de este trabajo. En una primera instancia, y sujeta a réplicas de la experiencia, se puede decir que la aplicación de esta metodología jugó un rol positivo favoreciendo los aprendizajes.

Se indagó cuál fue el nivel de *transferencia* cercana o próxima se construyó una tabla como la que se observa en la Tabla 4. Se uso una escala de calificaciones como la siguiente: *Notable (N), Bueno (B) y Reprobado (R).* Para dejar constancia de los conocimientos previos la escala fue *Tiene (T), Algunos (A), No Tiene (NT).* Las calificaciones se obtuvieron a partir de varias instancias de seguimiento para cada uno de los participantes a través del análisis de cada una de sus intervenciones y de las evaluaciones parcial y final integrador.

TABLA 4:
TABLA DE SEGUIMIENTO DEL ALUMNO.

Alumno	**Evaluación Diagnóstica**	**Instancias de Seguimiento**			**Evaluaciones**		**Estado Final**
					Parcial	**Final**	
A1							
A2							
....							
....							
An							

A partir de la Tabla 4, se efectuó el seguimiento de 10 alumnos elegidos al azar, a fin de obtener datos respecto de la transferencia. Se obtuvo un estado final con una capacidad de transferencia más que aceptable sujeto a la brevedada del período en estudio.

La autoevaluación individual y grupal

Se considera muy importante llevar a cabo las autoevaluaciones, puesto que ellas aportan información respecto de las habilidades de un individuo capaz de autogestionarse. Las autoevaluaciones se realizaron apuntando a dos aspectos: la autoevaluación acerca de la intervención en el ámbito grupal y la autoevaluación de los aprendizajes individuales.

Para la primera, cada alumno contó con un formulario como el mostrado en la Tabla 2, donde volcaron las impresiones respecto de su propia actuación. Durante las clases presenciales, los docentes pudieron confrontar los resultados con aquellos obtenidos por los alumnos. La segunda autoevaluación se llevó a cabo dando la oportunidad a los estudiantes de realizar las autocorrecciones de sus evaluaviones parciales.

Las dos autoevaluaciones se llevaron a cabo coincidentemente con las entregas de los Trabajos Prácticos y sus defensas. La autoevaluación de los aprendizajes individuales resultó positiva y no mostró mayores diferencias con las evaluaciones docentes; se piensa que la naturaleza lógico-matemática de los contenidos ayudó en este sentido. La autoevaluación grupal mostró mayor dispersión, lo que se atribuye a las dificultades por parte de los alumnos para la autoobservación conductual. Tanto para la autoevaluación de los aprendizajes individuales y como para la grupal, se observó una mayor coincidencia para el segundo Trabajo Práctico, realizado de este modo.

La evaluación de la aplicación

Para efectuar dicha evaluación se tuvieron en cuenta las interacciones AM (alumno-medio), DM (docente-medio) junto con las opiniones vertidas por los alumnos y docentes

[6] Definimos "*actividad*" como el cociente entre "dar ..." y "pedir ...", coeficiente que varía ente 0 y 1, a modo de rendimiento.

en la encuesta de evaluación diseñada para la aplicación. (ver Tabla 3)

El análisis de las interacciones mostró que el uso de la aplicación se presentó como un inconveniente de pocana incidencia en el trabajo. De la encuesta surge que los problemas básicamente derivaron de factores propios del sistema como problemas en la conexión, factores propios de la gestión como el retardo en las respuestas por parte del docente y otros factores concernientes a los alumnos, tales como la falta de experiencia en la operación de la aplicación en forma dinámica e interactiva.

Por otro lado, hubo encuestas en las que los individuos expresaron que el trabajo a través de la aplicación les resultó *"agradable"* y que la comunicación extra-clase los predisponía en forma favorable en la relación con sus compañeros y con el docente. Se puede decir que, si bien es perfectible, la aplicación es buena.

La Encuesta a los Estudiantes

Finalmente se efectuaron encuestas a los estudiantes a fin de revelar el grado de interés por este tipo de trabajo. Algunas de las preguntas fueron tomadas de la encuesta a estudiantes que efectúa la Facultad al aprobar cada asignatura, otras fueron pensadas para obtener información acerca de la modalidad de trabajo. Se pensó en efectuar tan sólo 12 preguntas abiertas, cerradas y de opción múltiple a fin de agilizar el tiempo de llenado de la misma, ya que se ha observado que requiere de un tiempo promedio de unos 5 minutos y que un número excesivo de preguntas agobia al encuestado. (según Kraus, [10] y Hernández Sampieri, [5]).

A continuación se transcribe el instrumento utilizado para recoger la información:

El Instrumento

1. ¿Qué modalidad de dictado de clases le fue más útil o efectiva?: Clases teórico-prácticas □ clases teóricas y prácticas por separado □ consultas personales/grupales □ otras □ Cuáles?.............
2. Indique cuáles clases le fueron más útiles o efectivas. Las que se dedicaron a:
   Manejo de información □ Comprensión de bibliografía □
   Conceptualización de temas □ Integración de contenidos □
   Resolución de problemas□
3. De acuerdo al programa de la materia: ¿Piensa que los temas fueron desarrollados con profundidad?.
   Ninguno □ algunos □ todos □ no sabe □
4. Para Ud. el tiempo de clases fue: escaso □ suficiente □ excesivo □ no sabe/nc □

5: Señale qué temas le parecieron difíciles:

....

6. El uso del foro de discusión le pareció una propuesta:
   mala □ buena □ innovadora □ no sabe/nc □
7. Pudo autoevaluar lo aprendido? Si □ Cuándo y cómo?
   .... No □ ns/nc □
8. Los trabajos en grupo le resultaron: útiles □ poco útiles □ para nada útiles □ no sabe/nc □
9. Considera justo el criterio de evaluación? Si □ No □ Por qué?
   ....
10. Cómo calificaría a sus docentes: (Escala: Excelente: 10, Muy Bueno: 8-9, Bueno 6-7 Regular: 4-5, Malo:1-3)

Docente __ Ayudante 1 __ Ayudante 2__ Ayudante 3 __

Comentarios al respecto:

....

....

11. Los docentes fomentaron el interés por la materia? Si □ No □ Explique

....

12. Indique los inconvenientes y/o problemas que tuvo durante el curso.

....

....(siga al dorso).

Sugerencias:...

.. (siga al dorso)

Justificación de las preguntas de la encuesta

Preguntas de 1 a 5: Fueron tomadas para indagar y saber efectivamente de acuerdo a las características de la asignatura qué requieren los estudiantes.

Las mismas se centran en la modalidad de dictado del curso si la preferencia se centra en clases teórico–prácticas o por separado, qué tipo de clases fueron más útiles en razón del tipo de tareas que efectuaron los estudiantes durante el curso, ya que no siempre todos los docentes estuvieron en la totalidad de las clases ya que hubo desdoblamiento de actividades y trabajo en simultáneo en el aula y en el laboratorio de PC.

La pregunta más importante es quizás la referida al tiempo de las clases, a pesar que durante los períodos en estudio docentes a cargo no perdieron más clases que las debidas a feriados nacionales previstas en el calendario, se desea saber si debería haber un reajuste del tiempo dedicado a algún tema en particular. En la pregunta 5 donde se pide saber qué temas les parecieron más difíciles permitirá efectuar dicho ajuste y planificar más tiempo dedicado a la ejercitación para el desarrollo de dichos temas.

Pregunta 6: Se refiere específicamente a la propuesta bajo análisis: a fin de indagar si el trabajo a través del foro de discusión les pareció un aporte innovador.

Pregunta 7: Apunta a la autoevaluación de los aprendizajes y se efectuó para saber si los estudiantes se pudieron autoevaluar en alguna instancia a fin de poner a prueba los nuevos conceptos que había incorporado y las habilidades que habían adquirido.

Pregunta 8: Se refiere al trabajo grupal y a través de ella se quieren obtener datos para saber si el trabajo en forma grupal les aportó beneficios o no.

Pregunta 9: Se les solicita que indiquen si el criterio seguido para la evaluación les parece justo a fin de saber si se adecua al cambio de paradigma de trabajo.

Pregunta 10: Se les pide la evaluación de la actuación de los docentes según la escala que se provee. Se deja un item abierto para comentarios a fin de saber qué docente quieren los estudiantes. Dicho de otro modo qué cualidades destacan y que modalidades los pueden perturbar.

Pregunta 11: Se desea saber si los docentes fomentaron en interés por la materia y que expliquen a través de que actitudes lo recibieron.

Pregunta 12: Se requieren los inconvenientes y problemas que tuvieron durante el curso a fin de cautelar esas cuestiones para los períodos siguientes si estuvieran al alcance de los docentes.

Luego, se dejó un item abierto para sugerencias de cualquier tipo y que pudieran expresar sus puntos de vista como sujetos activos en el proceso con voz para las propuestas factibles.

RESULTADOS OBTENIDOS Y ANÁLISIS ESTADÍSTICO

Se encuestó a una muestra de 56 estudiantes para los dos períodos consecutivos estudiados divididos en 36 y 20 cada uno respecto una la población total de 60 en cada caso. No se encuestó a la totalidad de los cursantes ya que no se pensó en utilizar los resultados estadísticos de la misma en su momento, sino tan sólo en llevar un registro de los cambios eventuales sugeridos por los estudiantes a modo cualitativo para estudiar la factibilidad de implementación. Debido a que la misma se la puede encuadrar como estratificada [9] según el ítem: estudiante que rinde en primera fecha de final integrador se tomó la decisión de relevar las preguntas que pudieran dar mayor información a fin de efectuar el análisis de los resultados.

En la pregunta 1 el 71% respondió que las clases teórico-prácticas les fue más útiles con sólo un 22% que respondió clases teórico-prácticas por separado. Respecto de las actividades (pregunta 2) un 33% señaló la resolución de problemas y un 27% la integración de contenidos, con un 14% tanto para la conceptualización de temas como para la comprensión de bibliografía.

La pregunta 3 no fue relevada en su sentido explícito, sino que la intención subyacente a ella es conocer si los alumnos han logrado percibir la importancia jerárquica entre los contenidos y las aplicaciones futuras en la realidad relacionadas con la transferencia lejana, ya que se piensa que en esta instancia de ingresantes a la carrera los alumnos no están capacitados para responder acerca de la profundidad explícita de los contenidos que requieren ya que a través de entrevistas se ha notado que confunden profundidad con exigencia.

Para la pregunta 4, el 83% piensa que el tiempo fue suficiente y que los temas más difíciles (pregunta 5) éstos fueron; archivos, arreglos, recursividad, validación y funciones. Los datos son tan sólo orientativos, a fin de saber cuál es el tema que les resulta más difícil, ya que se debe considerar el caso en que un mismo alumno tuvo dificultades en dos o más temas. En la pregunta 6, un 595 piensa que la propuesta es buena y un 29% que es innovadora.

Respecto de la autoevaluación (pregunta 7) un 89% ha podido llegar a su autoevaluación en las siguientes instancias: durante los trabajos prácticos, al estudiar en la casa, después de finalizar la evaluación parcial.

Según la pregunta 8, a un 88% los trabajos prácticos les fueron útiles, ya que les permitió autoevaluarse antes del final integrador, aunque hubo un 7% de ns/nc.

Un 85% opinó que el criterio de valuación le pareció justo (pregunta 9)sosteniendo que los docentes le dedican tiempo, son exigentes, permiten explicar los algoritmos oralmente, la idea de un promedio ponderado de las evaluaciones.

La pregunta 10 se relevó sólo para el docente a cargo de la materia, ya que los ayudantes rotaron en el curso, con un promedio estimado de 7.2 y 7.6 para cada uno de los dos grupos respectivamente.

En pregunta 11 un 84% respondió que se fomentó el interés por la materia ya que: hubo comprensión de casos laborales, se habló del aspecto laboral posterior al cursado, se mandó a investigar algunos temas, se enviaban tips de los temas vistos, se recomendaba bibliografía, incentivaban constantemente, se preocupaban si uno se atrasaba, hubo clases de consulta cuando fue necesario, tenían interés por que el alumno aprenda.

GRÁFICO 1:
ACTIVIDADES MÁS ÚTILES.

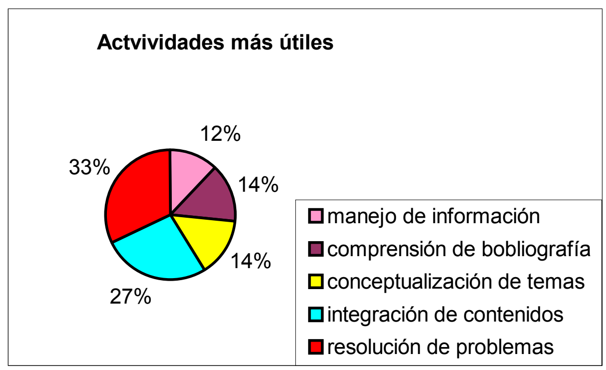

GRAFICO 2:
AUTOEVALUACIÓN DE LO APRENDIDO

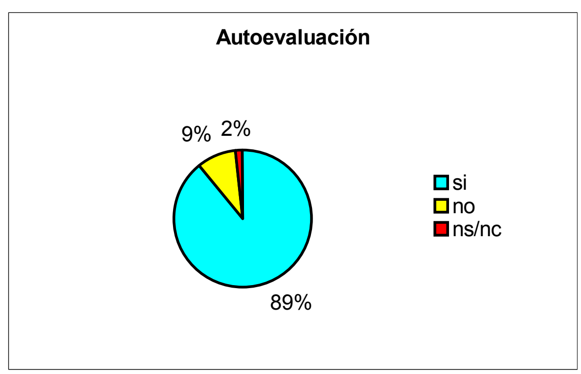

GRAFICO 3.
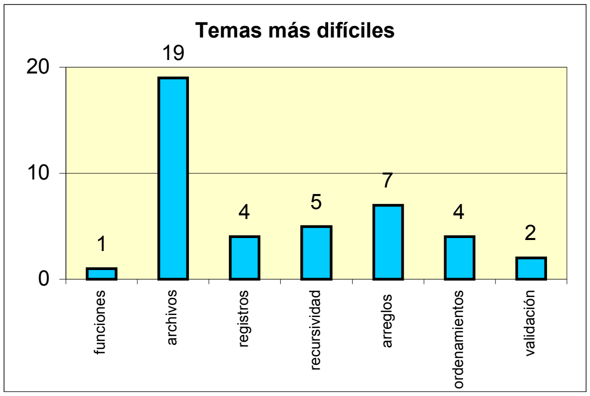
TEMAS QUE LES PARECIÓ MÁS DIFÍCILES.



A partir del Gráfico 1 se puede decir que la actividad que más útil les resultó a su parecer es la resolución de problemas y la integración de contenidos. En el Grafico 2 se observa que un 9% no se ha podido autoevaluar en ninguna de las instancias y un 2% de ns/nc que prefiere no responder.

En el Gráfico 3 se observa que tienen más dificultades con el tema final del período que es *archivos*, por lo que se puede señalar que esta altura del cuatrimestre se suman los examenes recuperatorios y las entregas de trabajos prácticos finales con lo que decae la atención y el rendimiento, y se incrementan las inasistencias que trae consigo la falta de continuidad en las clases.

Se ha observado que en la aplicación del instrumento se debería usar una terminología más sencilla, ya que a través de indagaciones se observó que la mayoría de los alumnos no diferencian entre *"integración de contenidos"* y *"conceptualización de temas",* por ejemplo. El ítem donde deben calificar a sus docentes también se presta a cuestionamiento, ya qué deberían comentar qué aspectos califican del mismo. Por otra parte a través de un instrumento con datos obtenidos en forma anónima, la evaluación final con la correspondiente calificación, se presta a un premio o castigo hacia el docente que evaluó. Por ello, luego de estas consideraciones se piensa que sería aconsejable una encuesta personalizada con resguardo de la identidad a fin cada uno de los comentarios emitidos por los alumnos fuera un dato fidedigno. En este caso, la aplicación de la encuesta apuntó tan sólo a la toma de datos para saber qué aspectos de la experiencia les resultaron más útiles, que temas les resultaron más difíciles y qué cualidades básicas demandan de los coordinadores.

CONCLUSIONES

Las evaluaciones permiten efectuar ajustes en el diseño de experiencias futuras tendientes a la mejora del rendimiento de los estudiantes. Se ha considerado de especial interés el estudio, y el análisis de las interacciones grupales que crean un ambiente de trabajo centrado en un ecosistema tecnológico que permite llevar a cabo los procesos de búsqueda y negociación de los significados.

En este contexto, se ha observado que para las interacciones de tipo AD y DA, aparecen categorías referidas al área de las tareas de acuerdo a la clasificación de Bales `21], es decir centradas en la de gestión. Es en este aspecto el que se desea subrayar ya que se pretende que los sujetos de la experiencia adquieran la habilidad de la autogestión siendo sujetos activos del proceso de aprendizaje. En cuanto al estudio de las interacciones del tipo AA aparecen también algunas categorías referidas al área de las tareas tales como: solicitar aclaraciones, clarificar, aportar bibliografía, pedir y dar información, lo que da idea de evolución del grupo, ya que se ha observado en los trabajos previos [11] justamente falta de metodología de estudio y falta de uso de materiales bibliográficos.

Respecto de la evaluación de los aprendizajes se ha podido hacer sólo un estudio de la transferencia cercana, ya que otro tipo de evaluaciones como el de la persistencia en el tiempo va más allá del alcance de esta experiencia.

Las autoevaluaciones individuales y grupales le permitieron a los estudiantes ponerse en contacto con sus errores y darse cuenta de las posibles formas de atacar el mismo problema para llegar a una solución factible.

Tanto para llevar a cabo las experiencias y como los procesos de evaluación descriptos se ha invertido más del doble del tiempo requerido para el dictado normal de la asignatura. Esto significa que durante un curso dictado en forma tradicional el tiempo disponible no alcanzaría para ir más allá de las evaluaciones tradicionales y de un simple análisis estadístico. Otra de las cuestiones que se ha observado es que el grupo de trabajo fue de unos 60 alumnos y que este número requirió de un trabajo exhaustivo.

Para grupos más numerosos como los que se ha observado se han constituido por política educativa en el último año, esta metodología podría ser poco eficiente desde el punto de vista que demandaría mucho más tiempo a los docentes. La relación entre los coordinadores y los estudiantes durante la experiencia estuvo en 1/15 aproximadamente dependiente del número de estudiantes por cada grupo. Una relación mayor demandaría tiempo adicional a los coordinadores. Salvando estás relaciones tiempo/esfuerzo/salario de los coordinadores los resultados son positivos.

AGRADECIMIENTOS

Los autores agradecen al grupo de docentes-alumnos que han colaborado en todo lo correspondiente al soporte de la investigación y a los alumnos en general por haber participado en la misma

EL ESTADO ACTUAL DEL PLANTEL DOCENTE EN INGENIERÍA ANTE EL CAMBIO DE MODALIDAD DE PRESENCIAL A DISTANCIA

Germán Kraus[1], Fernando J. Lage[2] and Zulma Cataldi[3]

Abstract — *Esta investigación permitirá determinar el estado del plantel docente que dicta sus asignaturas en modo presencial si las universidades decidieran implementar asignaturas de las carreras de ingeniería a través de la modalidad a distancia en un futuro cercano.*
Por este motivo surgió la pregunta que dio marco a la investigación: ***¿Están los actuales profesores presenciales de las carreras de ingeniería preparados para trabajar en la modalidad de educación a distancia?***
A fin de obtener los datos se indagó sobre los antecedentes, los conocimientos y las prácticas de los profesores presenciales de las carreras de ingeniería de diferentes universidades de "área metropolitana" de la República Argentina para poder compararlas con la preparación que debería tener un profesor tutor de educación a distancia.
Durante el año 2000, se encuestó a una muestra estratificada de 60 docentes de ingeniería, elegidos al azar, quienes debieron responder un cuestionario de 37 preguntas. A partir de los resultados obtenidos se elaboró un diagnóstico que permitirá efectuar las previsiones pertinentes.

Index Terms — Educación a distancia, Educación mediada, Profesor tutor.

INTRODUCCIÓN

Ante los acelerados cambios que está sufriendo actualmente el mundo, la universidad tradicional debe realizar una profunda reformulación de sus formas de enseñanza y aprendizaje. Para lo cual debe tener muy en cuenta los sistemas de educación no presencial utilizados cada vez más a nivel mundial.

Este trabajo de investigación pretende determinar el grado de adaptabilidad de los actuales docentes de las carreras de ingeniería al nuevo paradigma de la educación no presencial para poder elaborar, de ser necesario, un plan de reconversión de dichos docentes.

La rapidez de los cambios científico-tecnológicos y su incidencia en los modos de producción, en los hábitos culturales y en la vida cotidiana dejan definitivamente atrás el concepto de educación tradicional concebido como una etapa de la vida. Hoy, la educación constituye un proceso de aprendizaje permanente. Junto a los niveles tradicionales de la educación primaria, secundaria y universitaria, surge con creciente intensidad la necesidad de impulsar un "cuarto nivel" educativo, de características no formales, para garantizar la incorporación constante de conocimientos y capacidades nueva a lo largo de toda la vida. [5]

En el mundo de hoy, la posibilidad de trabajo está cada vez más vinculada con la educación, la formación y la capacitación profesional.

A mediano y largo plazo, la única respuesta de fondo al drama del desempleo pasa por la necesaria calificación de los recursos humanos para adecuarlos a las exigencias de un sistema económico signado por la incesante incorporación de nuevas tecnologías.

La recapacitación laboral, el reciclaje y la formación profesional constituyen herramientas insustituibles para el mejoramiento del capital humano, factor esencial en una economía cada vez más compleja y sofisticada. La vinculación entre el sistema educativo y el mundo laboral es una necesidad imperiosa en todas partes del mundo. Es la única forma eficaz de reducir las desigualdades sociales y de garantizar una auténtica igualdad de oportunidades para todos.

En la actualidad existe una creciente demanda de estudios conducentes a una formación profesional por parte de personas adultas que trabajan, pero dadas sus características no les es posible satisfacerla a través de los medios formales de educación, ya sea por obligaciones laborales, impedimentos geográficos, responsabilidades domésticas u otras. Se trata de personas excluidas de los sistemas de enseñanza tradicional, pero dispuestas a estudiar simultáneamente con la actividad laboral, por la necesidad de aprender y actualizar sus conocimientos, o bien, por el imperativo de tener que reinsertarse en una nueva fuente laboral.

Ante este contexto la educación a distancia constituye una alternativa viable.

Dentro de las formas y modalidades de educación sistemática vigentes en el mundo, la educación a distancia es la que ofrece mejores condiciones de flexibilidad para hacer procesos de integración socio-cultural a escala planetaria. Esta manera de enseñar y aprender ha incorporado

progresivamente tecnologías informáticas y comunicacionales

Las experiencias en educación a distancia de distintos países dan cuenta de un alto porcentaje de alumnos cuya meta es obtener un título profesional, sin tener que desplazarse de su hogar la posibilidad de seguir un ritmo propio de trabajo; predilección por el estudio individual; actualizar y mejorar los conocimientos, satisfacción por el logro personal en el ejercicio de una profesión, reciclarse en una nueva fuente laboral un nuevo desafío en la vida y ser más culto. [4]

La educación a distancia implica la utilización de diversos medios individuales o colectivos, que facilitan la instrucción en situaciones donde no existe la contigüidad física de alumnos y docentes.

De esta manera, la diferencia fundamental con la enseñanza presencial se materializa en el modo *de tutela y entrega del* conocimiento. Sin embargo, la educación a distancia no puede considerarse sólo como una estrategia de expandir los conocimientos a más gente, ya que esto limitaría las posibilidades de este sistema. [8]

En un mundo en estado de revolución cultural, la institución oficialmente encargada de la tarea de transmisión cultural la educación escolarizada condensa el impacto de la crisis que se forma en la confrontación entre lo viejo y lo nuevo. Existen pocas instituciones tan conservadoras y tradicionalistas como la educación escolarizada. Su forma básica ha permanecido fundamentalmente sin cambios por no menos de dos siglos y su concepción básica ha resistido a todas las variaciones de regímenes económicos y políticos.

Es precisamente esta institución la que se ve particularmente envuelta en el torbellino de las actuales transformaciones que están alterando profundamente nuestro entorno cultural y social: en la economía y en la naturaleza de la organización del trabajo; en las relaciones entre naciones; en la tecnología, sobre todo en las comunicaciones y en los transportes; en la naturaleza, producción, almacenamiento y difusión del conocimiento y de la información; en el proceso de formación de la identidad cultural y social. [25].

Es por los motivos citados anteriormente, que en este trabajo de investigación se pretende determinar el grado de adaptación de los actuales docentes de las carreras de ingeniería al nuevo paradigma de la educación no presencial.

Características del Profesor de Educación a Distancia

Los rasgos propios de la educación a distancia se asientan en los procesos de autogestión del aprendizaje a partir de soportes tecnológicos y dirigidos a una población estudiantil predominantemente adulta y relativamente dispersa. [24]

Frente a esto se tiene al profesor universitario típico como un profesional (ingeniero, médico, contador, abogado, etc.), que brinda por razones de prestigio, en muchos casos, algunas horas de su tiempo activo para formar a las nuevas generaciones. Y, para enseñar, él se vale de los conocimientos teóricos que ha obtenido durante sus estudios profesionales previos y de la experiencia acumulada a través de su ejercicio profesional, que ocupa la mayoría de su tiempo. Su actividad docente se expresa principalmente mediante clases teóricas del tipo magistrales y unas pocas actividades prácticas, ejercitación, laboratorios o pasantías. La bibliografía de apoyo que leen los estudiantes está constituida principalmente por los apuntes tomados en clase. [6]

Y citando textualmente a Casas Armengol [6]:

…"para este "profesional-profesor", las teorías de aprendizaje y evaluación resultaban irrelevantes y generalmente poco conocidas."

Miguel Fernández Pérez [10] escribe:

"El sistema de selección y promoción vigente hasta ahora para los profesores de universidad no valora prácticamente la dimensión pedagógica de su puesto de trabajo, por más que la denominación del mismo sea en cualquiera de las facultades/escuelas y especialidades, la de "profesor de..." de manera que los profesores entienden su desempeño laboral ceñido más bien al contenido de sus mensajes didácticos (perfectamente rutinizable en la mayoría de las ramas del saber, aparte de copiable), ignorando olímpica e incomprensiblemente los aspectos del "cómo", de ese mensaje: atención hipertrófica (en el sentido de exclusiva, no en si misma, por supuesto) al contenido de la transmisión, por un lado, y descuido e ignorancia supina, por otro, de la transmisión que del contenido hay que hacer.

Se sigue de ello una esquizofrenia profesional muy objetiva: los Profesores se autoestiman por la temática científica a la que se dedican, no por la profesión que ejercen. Agotan toda su inteligencia (sin duda superior) y toda su moral profesional (que debe concederse, al menos, como normal) en el cuidado de "su" temática, degenerando, a la hora de su intervención profesional como docentes, en anacronismos insostenibles que rayan el ridículo tecnológico-social, tal y como denuncian los millares de estudiantes encuestados en nuestra investigación."

Ante un sistema social cambiante, sólo cabe un profesorado flexible y con la capacidad de ir incorporando en sus actuaciones personales y profesionales los diferentes sentidos que pueden adoptar la construcción del conocimiento y las formas de saber contemporáneos. [13]

Entre las variadas influencias que justifican y permiten transformar el rol del docente universitario, se destacan ahora por su extraordinaria y creciente importancia, un conjunto de tecnologías novedosas, principalmente las relativas a informática y telemática.

Las nuevas tecnologías cuentan con dos potencialidades a saber [14]:

– Una gran capacidad para socializar el conocimiento, ya que gracias a ellas se puede difundir información y capacidad de saber a muchas personas, con gran rapidez, con un alto nivel de interactividad y participación activa en un propio proceso de autoaprendizaje con gran

velocidad de transmisión y de posibilidades de aplicación.
– Una importante posibilidad es la de socializar el uso de nuevas tecnologías. Los programas de educación y formación tienden a la extensión social y a la democratización: si usan nuevas tecnologías, éstas van a ser accesibles para amplios sectores sociales que, si no fuera por estos programas, tendrían limitaciones o dificultades en ese sentido.

En el contexto actual se tiende cada vez más a que el estudiante pueda realizar estudios a través de sistemas no presenciales, lo que lleva a que el rol del docente cambie, así como también las características y aptitudes que debe tener quien se dedique a enseñar.

El rol que debe asumir un profesor es el de facilitador del aprendizaje para lo cual debe procurar una capacitación y actualización en los ejes en que se basan los procesos de enseñanza y aprendizaje [1]:

1. **El qué**. Los conocimientos que tienen que aprender y desarrollar los estudiantes.
2. **El cómo.** Las técnicas y métodos de enseñanza, materiales más idóneos e innovadores.
3. **A quién.** El conocimiento global del alumno que va a aprender, mental, física, emocionalmente, etc.
4. **El para qué.** Claridad en los objetivos que desea alcanzar y en el sistema de evaluación que va a aplicar.
5. **El por qué.** Tener siempre presente por qué se enseña esta asignatura y para qué va a valerles a los alumnos en el futuro.
6. **El cuánto y el dónde.** El tiempo y espacio precisos y más idóneos, para aplicar y desarrollar cada uno de los procesos educativos.

Ya que una de las principales características de la educación a distancia es que no exige la presencia física constante del profesor tutor y del estudiante ni un trabajo grupal permanente, cobra relevancia que los contenidos educativos se aborden a través de diferentes medios, en particular impresos, recurriéndose cada vez con mayor frecuencia a la utilización del audio, computadora o vídeo, por citar a los más comunes, cuyos contenidos son cuidadosamente diseñados con un carácter didáctico para facilitar el aprendizaje del estudiante.

Es entonces, que una formación autodidacta representa un reto para el estudiante y para las instituciones, por lo que el empleo de los medios de comunicación incluso los masivos juegan un importante papel. [2]

Además, se debe señalar que los principios pedagógicos y didácticos que sustentan los procesos educativos deben brindar el espacio necesario para incorporar "las herramientas poderosas" que la tecnología aporta, puestos al servicio de mejores formas de enseñar y aprender. [3]

Pero, conseguir profesores con una adecuada formación es una preocupación generalizada en las instituciones y sistemas educativos, tanto por sus repercusiones económicas, como por la preparación en avanzados recursos pedagógicos y en las nuevas tecnologías de apoyo. [7]

Se puede concluir que, las funciones que debe cumplir un profesor no presencial son entre otras, de acuerdo con los siguientes autores: Alonso García y Gallego Gil, [1]; Casas Armengol, [6]; Fainholc, [9]; González Pineda, y Jara Arancibia, [10]; Gutiérrez Pérez. y Prieto Castillo, [12]; Julia y Nitri [15]; Martínez Mediano [17,18]; Marturet [19]; Mena [20]; Mora y Tristán, [21]; Pérez Serrano y Sevillano García [22] y Rivera y Van Rafelghem [23].

– sugerir cursos de acción en función del proceso individual de capacitación;
– estimular la participación y el compromiso de cada destinatario;
– fomentar el autodidactismo
– detectar las problemáticas que surjan durante la capacitación;

Para lo cual el profesor debe tener:

– un conocimiento profundo, actualizado y teórico-práctico de su disciplina.
– dominio de teorías y metodologías de enseñanza y aprendizaje, en esencial de educación no presencial.
– manejo de las nuevas tecnologías informáticas y de comunicación y de su utilización en el proceso de aprendizaje.
– conocimiento de las características, necesidades y hábitos de los destinatarios del programa.
– buena relación con los alumnos

DESCRIPCIÓN DE LA PROBLEMÁTICA

Ante el avance que está adquiriendo a nivel mundial la implementación de estudios de todo tipo a través del sistema de educación a distancia, es probable que en un futuro cercano se inicien cursos de las carreras de ingeniería a través de esta modalidad. De ahí es que surge la siguiente pregunta:

¿Están los actuales profesores presenciales de las carreras de ingeniería preparados para trabajar en la modalidad de educación a distancia?

Es como consecuencia de esta pregunta que se ha realizado el presente trabajo de investigación que pretende recoger información sobre los antecedentes, conocimientos y prácticas de profesores presenciales de las carreras de ingeniería de diferentes universidades ubicadas en la zona definida como "área metropolitana" por el Ministerio de Educación de la República Argentina a fin de comparar dicha información con la preparación que debería tener un profesor tutor de educación a distancia.

SOLUCIÓN PROPUESTA

Para poder comparar las funciones que debe cumplir el profesor de enseñanza a distancia mencionados más arriba con las funciones que están cumpliendo hoy los profesores presenciales se diseñó una encuesta que gira en torno de los siguientes aspectos:

- Los datos personales, académicos y profesionales tales como: edad, estado civil, sexo, títulos de grado y postgrado, investigaciones, cursos de perfeccionamiento docente y de actualización profesional.
- Situación como profesor: materias en las que da clase, horas, cantidad de alumnos por clase.
- Su vinculación con los alumnos: evaluación de niveles de conocimiento previos, espacios de consulta fuera de la clase, si trata de enterarse de la situación particular de sus alumnos.
- Utilización de bibliografía y materiales didácticos: cómo se compone la bibliografía. Si es autosuficiente para el estudio de la asignatura, si usa elementos de apoyo en la clase como retroproyectores, computadoras, etc.
- Utilización de tecnología informática, si tiene correo electrónico, si usa Internet, cuáles son los programas que más utiliza

Para realizar la encuesta se utilizó una muestra de 60 profesores universitarios utilizando, para su selección, la técnica de muestreo accidental o casual. Se tuvo la precaución de que la muestra fuese lo más representativa posible y que estuvieran cautelados la mayoría de los centros educativos que cuentan con carreras de ingeniería ubicados en el área metropolitana (según Resolución 1618 del Ministerio de Cultura y Educación) [6]. Llegando a obtener muestras de 19 de las 21 Universidades e Institutos Universitarios ubicados en el área.

Se trata de una investigación de características sincrónicas y se realizó entre fines del año 2000 y fines del 2001.

El método de recogida de datos, para obtener información acerca de la práctica docente, ha sido una encuesta. Se consideró que era el instrumento más adecuado, puesto que se trata de un estudio descriptivo que busca conocer el trabajo que realizan los profesores presenciales y los aspectos de su práctica que puedan servir para la educación a distancia.

A fin de tomar los datos de confeccionó un cuestionario con preguntas cerradas y abiertas. El estilo de preguntas pretende ser concreto y claro; predominan las preguntas de opción múltiple, en general referidas a aspectos objetivos. Las respuestas están estructuradas con una opción libre.

La interacción entre el investigador y los profesores posibles tutores ha sido totalmente impersonal, ya que todas las encuestas fueron realizadas por un encuestador sin la presencia del investigador.

La extensión de la encuesta fue de 37 preguntas.

Como el número de preguntas es elevado, esto dificultó en su momento la devolución rápida, pero como contrapartida posibilitó la recogida de gran cantidad de información.

La estructuración del modelo de instrumento sigue un orden en función de las características que debe tener un profesor tutor de acuerdo a las condiciones señaladas anteriormente.

El criterio elegido para evaluar la validez de la encuesta ha sido el externo, a través de la opinión de expertos en investigación. Se pidió a 4 expertos de diferentes áreas (Ciencias Sociales, Inteligencia Artificial, Educación e Historia) que colaboraron en la evaluación del instrumento usado en la encuesta. Las sugerencias de los mismos se incorporaron en la versión final de la encuesta.

Una vez realizada la encuesta se procedió a la clasificación, análisis y evaluación de la información recibida a fin de redactar el informe final.

ANÁLISIS DE LOS DATOS

Al analizar los datos obtenidos de la encuesta se tiene que el profesor de ingeniería típico es de sexo masculino (81,7%), lo que demuestra que hay un condicionante de género. De 50 años o más (33,3%), ingeniero (56,7%), recibido en la década de los 80 (36,7%), dedicado a la docencia desde la misma época (33,3%), con estudios de posgrado (76,7%), realiza trabajos de investigación (51,7%), dicta entre 1 y 2 materias (58,3%) en una sola universidad (58,3%), no ha realizado cursos de perfeccionamiento docente en los últimos 3 años (65,0%) y tampoco cursos de perfeccionamiento en su especialidad en el mismo período (57,4%)

Si bien un 63,3% de los encuestados posee correo electrónico, sólo un 13,3% lo usa como herramienta de comunicación con sus alumnos.

Por el año en que se recibió se tiene que el 77,4% sería del grupo denominado “anterior a la PC” y el 73,0% ingresó a la docencia en la antes de la parición de la PC.

A pesar de que un 71,7% de los encuestados cree necesario evaluar el nivel de conocimientos previos de sus alumnos, sólo lo hace un 65,1%

El 75,0% tiene previsto un espacio para consulta de los alumnos fuera del horario de la clase, pero sólo el 31,1% tiene días y horarios determinados.

El 61,6% de los profesores considera que le da más importancia en las evaluaciones a los contenidos dados en clase, sólo el 25,0% considera como lo más importante los contenidos de la bibliografía obligatoria.

La bibliografía principal utilizada corresponde a libros de texto (71,6%) y material elaborado por la cátedra (63,3%), en cambio como bibliografía complementaria se tiene fundamentalmente libros de texto (66,7%)

El 63,3% utiliza algún material didáctico como ayuda para el desarrollo de la clase, de los cuales el más utilizado es el retroproyector (31,0%) seguido por la computadora (21,1%)

El 56,7% trata de enterarse de la situación particular de cada alumno y entre los que consideran que no necesitan mejorar su relación con los alumnos o no contestan se tiene 55,0%

El 63,3% tiene dirección electrónica y el 81,3% utiliza un procesador de textos, pero el tiempo de conexión a Internet para el 30,0% no pasa de 5 horas semanales.

CONCLUSIONES

Se pueden comparar las características que debe tener un profesor de educación a distancia respecto de las un profesor de ingeniería presencial típico, obteniéndose la Tabla 1:

TABLA 1
CARACTERÍSTICAS DEL PROFESOR DE EDUCACIÓN A DISTANCIA VERSUS EL PROFESOR PRESENCIAL

Características del profesor de educación a distancia	Características del profesor de ingeniería presencial típico de acuerdo a los resultados de la encuesta.
Un conocimiento profundo, actualizado y teórico -práctico de su disciplina.	A pesar de que el 76,7% de los profesores tienen estudios de posgrado y el 51,7% realiza trabajos de investigación, el 57,4% no ha realizado cursos de perfeccionamiento en su especialidad en los últimos 3 años
Dominio de teorías y metodologías de enseñanza y aprendizaje, en esencial de educación no presencial	El 65,0% no ha realizado cursos de perfeccionamiento docente en los últimos 3 años
Manejo de las nuevas tecnologías informáticas y de comunicación y de su utilización en el proceso de aprendizaje.	Si bien un 63,3% de los encuestados posee correo electrónico, sólo un 13,3% lo usa como herramienta de comunicación con sus alumnos. Por el año en que se recibieron se tiene que el 77,4% pertenece a la era anterior a la PC y el 73,0% ingresó a la docencia en la antes de la parición de la PC. Si bien el 63,3% utiliza algún material didáctico como ayuda para el desarrollo de la clase, de los cuales el más utilizado es el retroproyector (31,0%) sólo el 21,1% utiliza la computadora El 81,3% de los profesores encuestados utiliza un procesador de textos, pero el tiempo de conexión a internet para el 30,0% no pasa de 5 horas semanales.
Conocimiento de las características, necesidades y hábitos de los destinatarios del programa.	A pesar de que un 71,7% de los encuestados cree necesario evaluar el nivel de conocimientos previos de sus alumnos, sólo lo hace un 65,1% Un 26,7% indican que no es necesario evaluar el nivel de conocimientos previos de los alumnos. El 75,0% tiene previsto un espacio para consulta de los alumnos fuera del horario de la clase, pero sólo el 31,1% tiene días y horarios determinados. El 61,6% de los profesores considera que le da más importancia en las evaluaciones a los contenidos dados en clase, sólo el 25,0% considera como lo más imporante los contenidos de la bibliografía obligatoria. La bibliografía principal utilizada corresponde a libros de texto (71,6%) y material elaborado por la cátedra (63,3%), en cambio como bibliografía complementaria se tiene fundamentalmente libros de texto (66,7%)
Buena relación con los alumnos	El 56,7% trata de enterarse de la situación particular de cada alumno y entre los que consideran que no necesitan mejorar su relación con los alumnos o no contestan se tiene 55,0%

A partir del análisis del cuadro anterior se tiene que: ***"En Argentina hay pocos profesores universitarios de las carreras de Ingeniería que puedan trabajar, sin necesidad de una capacitación especial, en la modalidad de enseñanza a distancia"*** con lo que se llega a la conclusión que el profesor de educación presencial que tenga que trabajar en educación a distancia deberá ser capacitado para tal fin.

Se sugiere, por lo tanto, que la capacitación a esos profesores se realice mediante un sistema a distancia a fin de que pueda vivir la experiencia personal de lo que sentirán sus futuros alumnos en la modalidad, también se sugiere que estos profesores, durante su capacitación, interactúen en la modalidad realizando trabajos prácticos y también como profesores tutores de los alumnos inscriptos en el sistema a fin de tomar contacto con sus necesidades y características específicas.

AGRADECIMIENTOS

El MDU. Lic. Germán Kraus agradece a las autoridades del Laboratorio de Informática Educativa (LIE) de la Facultad de Ingeniería del a Universidad de Buenos Aires por haber permitido la radicación y la dirección de este proyecto de investigación en dicho Laboratorio, el que le ha permitido la obtención del grado de Magíster en Docencia Universitaria.

USO DE SISTEMAS INTELIGENTES COMO ELEMENTO DIDACTICO INNOVADOR EN LA ENSEÑANZA DE INGENIERIA EN COMPUTACION

Luis A. Caro S.[1], *Oriel A. Herrera G.*[2]

Abstract — En el área de Ingeniería en Computación se están produciendo cambios y tendencias que obligan a los ingenieros a ser más creativos e innovadores. El mercado demanda ingenieros con mayor capacidad de análisis, con un perfil integrador y con capacidad de trabajo en equipos multidisciplinarios. La ciencia básica aporta a los estudiantes un fuerte componente teórico, el que, muchas veces, se encuentra alejado de una contextualización en aplicaciones útiles y prácticas. Hemos usado los Sistemas Inteligentes basados en robots y microcontroladores como un elemento didáctico de apoyo al proceso de enseñanza aprendizaje. El artículo presenta la experiencia de uso de esta didáctica y sus resultados en alumnos de ingeniería en informática. Los estudiantes han aplicado sus conocimientos de manera más creativa e innovadora potenciando su capacidad de trabajo en equipo. Como próximo paso, estamos trabajando en formalizar un modelo pedagógico de contextualización e integración de la ciencia básica con estos elementos.

Index Terms — Contextualización, Educación en Ingeniería, Elemento Innovador, Sistemas Inteligentes, Trabajo en Equipo.

1. INTRODUCCIÓN

¿Hasta dónde sirve un conocimiento? Cuando deja de ser útil. Esta es una afirmación que todo ingeniero la ha experimentado en cualquier actividad donde tenga que trabajar con elementos hardware y software. Es importante el conocimiento y la teoría que permiten modelar el mundo que nos rodea. Pero una teoría o conocimiento que no pueda ser aplicada a dar solución a problemas de ingeniería, de cualquier ámbito, no sirve de mucho. Esto es aún más valido en el área de la ingeniería en computación e informática, en donde se trabaja con lenguajes computacionales, dispositivos digitales, robótica, transmisión de datos, etc., que rápidamente se vuelven obsoletos y que obligan estar al día en los avances de nuevas herramientas.

Hoy en día el ingeniero no sólo debe dominar, comprender y entender distintas teorías y materias de su área, sino que debe tener la capacidad de aplicarlas para dar soluciones a problemas concretos. Al ingeniero se le mide por la capacidad de dar soluciones creativas/innovadoras eficientes a los problemas de su área. La capacidad de trabajo en equipo es un elemento clave que se espera posean los ingenieros.

Bajo este escenario, nos encontramos con el desafío de formar a ingenieros que sean más creativos, con una clara capacidad analítica en la búsqueda de soluciones a problemas de manera eficiente e innovadora y que cuenten con un perfil integrador junto a equipos de trabajo multidisciplinarios.

En la Escuela de Informática de la Universidad Católica de Temuco estamos formando a ingenieros en informática bajo un modelo pedagógico experimental que recién esta siendo aplicado en la asignatura de "Sistemas Inteligentes", la cual tiene una alta demanda por los alumnos de la carrera. A corto plazo queremos integrar en este modelo pedagógico a alumnos de otras áreas, los cuales actuando como un equipo de trabajo multidisciplinario enfrenten y apliquen sus conocimientos a la generación de soluciones creativas e innovadoras en la solución a problemas de ingeniería.

Así, el presente articulo describe nuestra experiencia en la aplicación de este modelo pedagógico experimental y en una primera conceptualización del modelo, el cual a corto plazo se integrará en la malla curricular de la carrera de Ingeniería Civil Informática de la Universidad Católica de Temuco en Chile [1].

2. PROBLEMÁTICA ACTUAL EN LA ENSEÑANZA DE INGENIERÍA

La educación superior en ingeniería se puede ver como un sistema complejo, que ha sido abordado por un modelo tradicional que presenta diversos problemas. Algunos autores resumen estos problemas en los siguientes [2]:

- Clases expositivas, en donde el profesor es el principal actor de la clase con poca o nula participación del alumno.
- Visión reduccionista en el planteamiento y solución de los problemas del área, en vez de una visión holística.
- Trabajo individual y ausencia de equipos multidisciplinarios.
- Actitud crítica y creativa mínima por parte de los alumnos.

Nuestra Universidad, Facultad y Escuela no están ajenos a esta desfavorable situación. Los problemas se manifiestan durante los años de estudios en donde los alumnos son sometidos a la clásica enseñanza de ciencias básicas y de ingeniería, con una clara ausencia de integración y contextualización de los contenidos de sus asignaturas. Situación por lo demás preocupante si consideramos que el

[1] Luis A. Caro S., Escuela de Informática, Universidad Católica de Temuco, lcaro@uct.cl
[2] Oriel A. Herrera G., Escuela de Informática, Universidad Católica de Temuco, oherrera@uct.cl

mercado profesional demanda profesionales con un perfil integrador y con capacidad de desarrollar trabajos en equipos multidisciplinarios.

3. MODELO PEDAGÓGICO

Una de las inquietudes que manifiestan los alumnos es la falta de aplicación real y práctica de los contenidos de sus asignaturas, los cuales no están contextualizados en un escenario adecuado, terminando el semestre sin vislumbrar el objetivo por el cual las cursaban.

Para satisfacer esta inquietud, hemos introducido un componente metodológico, el cual apoya la integración y contextualización de los contenidos de las asignaturas en proyectos concretos, que hace uso intensivo de elementos didácticos que apoyan el proceso de enseñanza aprendizaje. La figura 1 muestra de modo general el modelo utilizado.

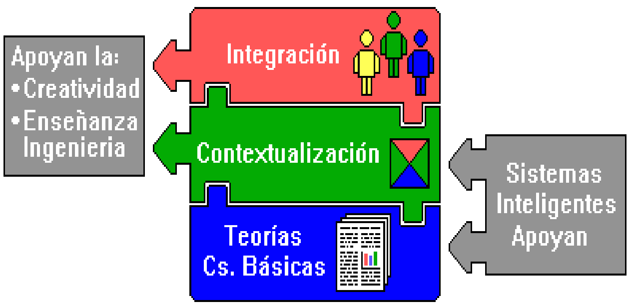

FIGURA 1.
MODELO DE USO DE LOS SISTEMAS INTELIGENTES COMO ELEMENTOS DIDÁCTICOS INNOVADORES EN LA ENSEÑANZA DE INGENIERÍA EN COMPUTACIÓN

Elemento clave en este modelo es el uso de los sistemas inteligentes basados en robots y microcontroladores. Estos elementos, que se orientan a didácticas netamente prácticas, aportan una riqueza conceptual teórica en diversos campos de la ingeniería.

El modelo pedagógico está compuesto por tres componentes: Teoría, Contextualización, Integración, los cuales interactúan entre sí. El componente teórico aporta los conocimientos desde una visión reduccionista, mediante el entendimiento y aplicación de las leyes globales que modelan y explican el mundo que los alumnos perciben. El componente Contextualizador permite aplicar estas leyes y conocimientos teóricos en un escenario real y tangible, el cual mediante el uso de robots, los alumnos adquieren una visión más holística del problema a solucionar. El componente Integrador incorpora en el análisis y diseño de la solución del problema un escenario de trabajo en equipo, en donde la interacción social, la cual facilita y apoya la especialización, permite una dinámica más rica en soluciones de equipo, más que soluciones individuales.

La dinámica que sustenta la aplicación del modelo se basa en nueve etapas:

- *Selección*: Antes de la inscripción de la asignatura, los alumnos son sometidos a una entrevista con el profesor para determinar sus reales motivaciones y si cumplen con los requisitos mínimos. Esta etapa es opcional, y aplicable sólo a cursos optativos.
- *Presentación metodológica*: Una vez que se han seleccionado los alumnos, se hace entrega del programa de la asignatura y se explican las reglas de trabajo, los proyectos y los criterios de evaluación. Se deja en claro la metodología de trabajo y la dinámica del curso.
- *Enseñanza de Herramientas*: Se capacita a los alumnos en el uso de los elementos de sistemas inteligentes que se aplicarán a la asignatura. En los proyectos a realizar se utilizan los lenguajes de programación NQC [3] y PBasic[4], los cuales se explican con ejemplos prácticos y aclarando dudas de configuración e instalación.
- *Conformación de Grupos*: Se motiva al curso en la creación de los grupos de trabajo de tres o cuatro integrantes como máximo. Los alumnos tienen plena libertad para integrarse según sus afinidades.
- *Asignación de Proyectos*: Cada grupo recibirá un proyecto a desarrollar, definido previamente por los profesores. Los proyecto contemplan dos aspectos básicos: hacen uso de sistemas inteligentes y tienen un fuerte componente teórico. Se hace entrega a los alumnos de los Kit de Robótica, Micro Controladores y Manuales que serán necesarios para cada proyecto en particular. Se establece también las fechas de inicio, término y avances de los proyectos.
- *División de tareas*: Los alumnos son motivados a trabajar en equipos y ellos mismos definen las distintas tareas a realizar para la implementación de los proyectos. Trabajan con una lista de tareas.
- *Asignación de Roles*: Los alumnos, según sus preferencias y habilidades, asumen los roles en el desarrollo de los proyectos. Tienen plena libertad en el accionar de esta actividad, siempre guiados por los profesores y monitores correspondientes.
- *Desarrollo del Proyecto*: Los alumnos asisten a los laboratorios en un horario flexible y trabajan en el desarrollo de los proyectos.
- *Presentación*: Los alumnos entregan el documento final, realizan la exposición del proyecto asignado y exponen sus conclusiones. Cada presentación debe incluir un desarrollo teórico y su contextualización en una situación real.

Para el éxito en el desarrollo de los proyectos, los alumnos están siempre apoyados por sus profesores y monitores, como se explica en la siguiente sección. Nos hemos dado cuenta que los alumnos, una vez comenzado los proyectos, empiezan a especializare en las áreas de su interés, sintiéndose muy motivados por aprender, asignándose roles bien definidos según sus cualidades y preferencias. El sentirse los principales actores de sus proyectos los hace entender y comprometerse de mejor manera en la búsqueda de soluciones más creativas.

4. ACTORES DEL MODELO

El modelo contempla la participación de diversos actores: los profesores, los alumnos, los monitores en el tema de sistemas inteligentes, los monitores en aspectos teóricos propios del curso. La figura 2 nos muestra la estructura e interacción de los actores del modelo.

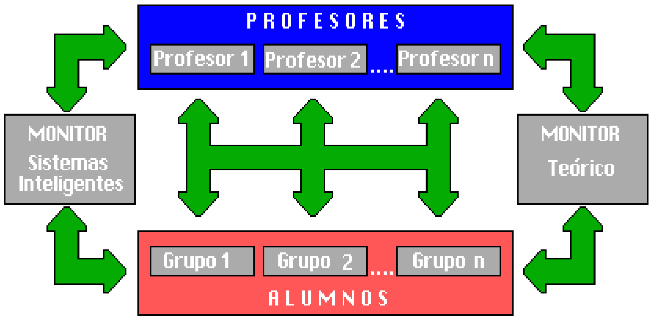

FIGURA 2
ESTRUCTURA E INTERACCIÓN DE LOS ACTORES DEL MODELO

Los *profesores* (que en la mayoría de los casos es sólo uno), son los responsables directos del curso. Estos deben planificar la introducción de los sistemas inteligentes al contexto propio del curso. Su participación más relevante y crítica es la definición de los proyectos grupales que contextualicen los contenidos teóricos del curso en elementos concretos.

El *monitor en sistemas inteligentes* juega un rol muy importante. Será el apoyo directo a los profesores cuando éstos no posean los conocimientos en el área de los sistemas inteligentes. Bajo este escenario, participará como apoyo a los profesores en la definición de los proyectos grupales. Además, tendrá participación directa en las instancias de capacitación de los alumnos en los temas de sistemas inteligentes. Cumple también una función de asistencia permanente a los grupos, en sus proyectos.

El *monitor en aspectos teóricos*, es el ayudante en las temáticas propias del curso. Es el clásico ayudante en los modelos tradicionales de enseñanza.

Para los *alumnos* se adopta la modalidad de trabajo grupal. Estos adquieren un rol protagónico siendo actores proactivos en el desarrollo e implementación de los proyectos asignados.

El modelo se puede extender a escenarios de trabajo multidisciplinarios, donde los grupos de trabajo tendrán participación de alumnos de distintas disciplinas. Para ello, es posible incorporar monitores para cada una de las disciplinas involucradas.

5. NUESTRA EXPERIENCIA

En el primer semestre del año 2001 se incorporó en la malla curricular de la carrera de Ingeniería de Ejecución en Informática la asignatura *Robótica e Interfaces Digitales con el Computador,* una asignatura de carácter electivo, la cual sería dictada a los alumnos de tercer año. Producto de esta nueva asignatura, se implementó un laboratorio de Robótica y MicroControladores, el cual cuenta con computadores actualizados, Kit de robótica Lego, de la línea MindStorms Robotic Systems, sistemas de desarrollo y experimentación de MicroControladores StampBasic 2SX, módulos de transmisión de datos, módulos de memorias, MicroControladores con Java embebido "Javelin" de Parallaxinc y un conjunto de elementos complementarios que permiten a los alumnos desarrollar y probar sus experimentos.

En el desarrollo de esta asignatura en el primer semestre del 2002, se aplicó el modelo antes planteado, siguiendo las distintas etapas antes señaladas:

- *Selección*: Muchos alumnos postularon a la asignatura, los cuales fueron entrevistados por el profesor, con dos propósitos. Primero, ver su motivación frente a un curso de estas características. Y segundo, verificar que cumplieran con los requisitos de formación; en este caso, poseer algún dominio de los lenguajes de programación clásicos, tales como Pascal y C/C++. Se seleccionaron doce alumnos.
- *Presentación metodológica*: Los alumnos seleccionados ya tenían un grado de acercamiento a la dinámica de funcionamiento del curso. Ahora, formalmente se les entregó el programa de la asignatura, explicando su contenido, aclarando todas las inquietudes planteadas, y dando a conocer los proyectos a realizar y la forma de evaluación. También se les dio a conocer el protocolo de trabajo e interacción con el profesor y los monitores.
- *Enseñanza de Herramientas*: Se asignaron los computadores y se instalaron las herramientas de desarrollo. Se hizo participe de esta actividad el monitor especialista, quien capacitó a los alumnos en el uso de la tecnología de sistemas inteligentes.
- *Conformación de Grupos*: Se conformaron cuatro grupos de tres alumnos cada uno. Su constitución se hizo sin la participación del profesor.
- *Asignación de Proyectos*: A cada grupo se le asignó un proyecto de las respectivas áreas: Robótica, Micro Controladores e Internet. El área de robótica contempló el diseño y programación de robots Lego, en su modalidad de robot sigue caminos, robot con sensores IR y de tacto, robot de combate *sumo*, robot busca objetos y soccer robot. La figura 3 muestra el diseño de soccer robots. En el área de MicroControladores se diseñaron y programaron microcontroladores conectados a interfaces analógicas/digitales con el computador, usando transmisión de datos por radio frecuencia Esta tecnología se muestra en la figura 4 Finalmente, en el área de MicroControladores e Internet se diseñaron robots usando microcontroladores controlados a través de Internet, mediante CGI en lenguaje C/C++ , y controlados también mediante PDA. La figura 5 muestra esta tecnología.

- *División de tareas*: Los alumnos tuvieron libertad de organizarse en la asignación de las tareas a realizar durante el desarrollo de los proyectos. El profesor y los monitores controlaban la equidad en cuanto a la carga e trabajo de cada alumno.

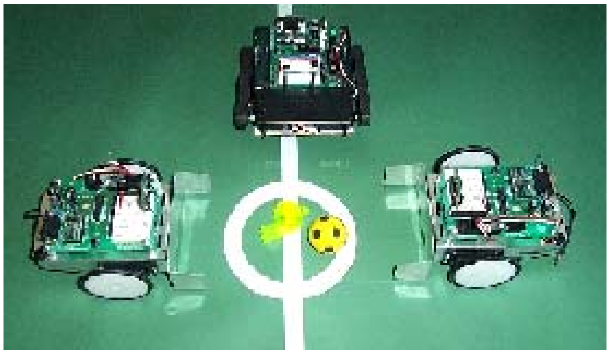

FIGURA 3.
PROYECTO DE SOCCER ROBOTS

FIGURA 4.
TECNOLOGÍA DE MICROCONTROLADORES CONECTADOS A INTERFACES ANALÓGICAS/DIGITALES CON EL COMPUTADOR, USANDO TRANSMISIÓN DE DATOS POR RADIO FRECUENCIA

FIGURA 5.
TECNOLOGÍA DE MICROCONTROLADORES CONTROLADOS POR INTERNET Y PDAS

- *Asignación de Roles*: Cada grupo definió y manejo de manera libre la asignación de los roles y las funciones de sus integrantes. Surgieron líderes naturales en cada grupo, quienes eran los interlocutores principales con los monitores y el profesor.
- *Desarrollo del Proyecto*: En el desarrollo de los proyectos los alumnos trabajaron con mucho entusiasmo y se vio una sana competencia entre los grupos, los cuales trabajaron con mucha creatividad. El profesor y los monitores guiaban el avance de los proyectos en base al cumplimiento de las fechas establecidas.
- *Presentación*: Los grupos realizaron durante el semestre tres presentaciones, en donde dieron a conocer cómo desarrollaron los proyectos, los problemas que se presentaron, la forma en que abordaron las soluciones a los problemas, además de las conclusiones finales contextualizadas a la teoría aplicada.

5. PRÓXIMOS PASOS

La aplicación de este modelo en la asignatura de 'Sistemas Inteligentes' se encuentra en una etapa experimental y de estudio. Nos hemos dado cuenta que los alumnos aprenden de mejor manera los contenidos y se motivan en la generación de soluciones más creativa. Actualmente estamos trabajando en formalizar la aplicación de este modelo pedagógico en otras asignaturas, en áreas no tan cercanas a la tecnología. Específicamente, se está trabajando en la implementación del modelo en asignaturas de las ciencias físicas. También, a mediano plazo, se explorará la aplicación del modelo a grupos interdisciplinarios. Por ejemplo, incorporar alumnos de áreas sociales, psicología, diseño, etc., cada uno aportando desde su perspectiva profesional.

6. CONCLUSIONES

En la aplicación de este modelo hemos percibido dos resultados concretos. Primero, el uso de Robot y MicroControladores (Sistemas Inteligentes) apoyan y facilitan la contextualización y refuerzan lo aprendido en la teoría, permitiendo a los alumnos una experimentación directa con estos elementos didácticos. Segundo, los proyectos asignados a los alumnos, desarrollados en equipos de trabajo y relacionados con problemas reales y específicos (escenario apropiado), apoyan la generación de nuevas ideas, la creatividad, la autocrítica y refuerzan el proceso de enseñanza aprendizaje.

Los alumnos logran terminar con éxito los proyectos asignados, aprenden a trabajar en equipos, comparten ideas, buscan y generan soluciones más creativas y se divierten al trabajar con Robot.

El hecho de que los alumnos planteen sus propias conclusiones, los hace más analíticos y defienden sus planteamientos con fundamentos teóricos prácticos, los cuales han sido contextualizados mediante una didáctica innovadora e integradora.

INGENIERÍA CIVIL INFORMÁTICA: BASES CONCEPTUALES DEL DISEÑO DE UN CURRICULUM DE CINCO AÑOS

Gustavo A. Donoso M.[1], Oriel A. Herrera G.[2]

Abstract — El diseño de una carrera de Ingeniería Civil Informática hoy en día, debe sustentarse en visiones que orienten el profundo y acelerado proceso de transformación que vive la educación, la tecnología y el campo laboral. Este escenario incierto requiere de un especial esfuerzo de conceptualización, de modo tal que se pueda articular en un conjunto reducido de conceptos los principales aspectos a través de los cuales el diseño curricular reduce la incertidumbre en la formación. Formulamos una base conceptual de seis visiones que permiten reducir la complejidad y orientar el desarrollo. Estas visiones son: progresiva, productiva, conceptual, metodológica, profesional y cristiana del mundo. Este artículo describe cada una de las visiones conceptuales que dan origen a un curriculum de cinco años de Ingeniería Civil Informática en la Universidad Católica de Temuco en Chile. La propuesta permite minimizar los efectos negativos producidos por las circunstancias inciertas que rodean el diseño de un currículum de esta naturaleza.

Index Terms — Educación en Ingeniería, Currículum, Ingeniería Informática.

1. INTRODUCCIÓN

El diseño de una carrera de Ingeniería Civil Informática y, eventualmente, de cualquier Ingeniería Civil, está marcado por la necesidad de reflejar una situación productiva que ocurrirá en cinco o más años. Si hace cinco o más años atrás estuviésemos diseñando una nueva carrera de Ingeniería Civil Informática, la situación educativa, el horizonte tecnológico y las expectativas de trabajo sobre las que ese diseño se basaría serían completamente distintas a las de hoy.

La principal característica que tiene el escenario actual es el de incertidumbre y riesgo en todas y cada una de las áreas que confluyen en el diseño curricular de una carrera de esta naturaleza. Por ejemplo, si actualmente observamos la situación educativa nacional para las Carreras de Ingeniería Civil vemos que ella está siendo afectada por una serie de factores inéditos como son: la proliferación, la masificación, la posibilidad de acreditación, el incremento de programas de postgrado y la educación continua, la complejidad creciente, los nuevos métodos de enseñanza y de aprendizaje, la discusión sobre la duración, entre otros.

Del mismo modo el horizonte tecnológico es sumamente complejo, las nuevas tecnologías tienen ciclos de producción de meses, la innovación es constante y eso hace imposible anticiparse a las características que la oferta tecnológica tendrá en un futuro aun cercano. Aspectos relevantes desde esta perspectiva son que existen, eso sí, áreas con un grado de consolidación en algunos aspectos como son el hardware y software, y también existe una claridad en relación a la importancia actual de las comunicaciones y, en forma más general, de las relaciones entre dispositivos y personas en el acontecer productivo. Del mismo modo, al ser la tecnología un constructo que se desarrolla en capas de funcionalidad, donde la más compleja se construye sobre la más simple; el tema de la complejidad y de la aproximación progresivo a ella es relevante, tanto desde esta perspectiva como desde una perspectiva educativa.

Otro factor relevante está dado por el mercado laboral que presenta el fenómeno de reducción del empleo y aumento de las posibilidades de trabajo. Estas posibilidades, para que se transformen en trabajo efectivo, deben ser aprovechadas y desarrolladas. Esto condiciona el perfil de egreso de un alumno de ingeniería a que posea las potencialidades para el emprendimiento, la gestión, la visión de nuevos negocios, etc.

Así, el presente trabajo describe cómo los elementos anteriores y sus relaciones se organizaron conceptualmente en el diseño curricular de la carrera de Ingeniería Civil Informática de la Universidad Católica de Temuco en Chile [1]. Se presentan las seis visiones que originan el currículum

2. DESCRIPCIÓN DE LAS VISIONES

La concepción del plan de estudios de la Carrera de Ingeniería Civil Informática de la Universidad Católica de Temuco, surge de un trabajo de reflexión profundo que se articula en torno al contexto educativo, disciplinar y productivo asociados a una carrera de esta naturaleza.

El diseño curricular, como se señala en la introducción, busca reducir la incertidumbre en la formación profesional. Así, la conceptualización que lo sustenta se organiza de manera tal que permita responder al escenario riesgoso predominante. Los conceptos claves se agrupan, a su vez, en visiones con objeto de reducir la complejidad y

[1] Gustavo A. Donoso M., Escuela de Informática, Universidad Católica de Temuco, gdonoso@uct.cl
[2] Oriel A. Herrera G., Escuela de Informática, Universidad Católica de Temuco, oherrera@uct.cl

transformarlos en elementos que sustenten y orienten la ejecución del proyecto. A continuación se presentan las visiones que orientan tal diseño.

2.1. Visión Progresiva

La Universidad Católica de Temuco, de acuerdo a su realidad estudiantil, capta alumnos que no están situados en los niveles más altos de rendimiento, motivo por el cual declara una preocupación especial por la calidad y oportunidad de la docencia. Estos alumnos, en gran medida, no presentan un adecuado nivel de desarrollo de la capacidad de abstracción requerida por una formación tradicional en ciencias básicas para carreras de ingeniería, motivo por el cual una estrategia importante para sortear esta dificultad está dada por la contextualización de la teoría y por la distribución gradual y sistemática de la complejidad a lo largo del curriculum. Junto a ello una visión progresiva permite incorporar, en magnitudes crecientes, el tema de la complejidad funcional de la tecnología.

Un esquema adecuado para desarrollar los niveles de abstracción está en ir logrando, progresivamente, tal capacidad en torno al aprendizaje contextualizado de las habilidades y conocimientos propios de la especialidad, lo que se completa al cabo de cinco años (ver Figura 1).

Vemos que el ámbito de conocimientos necesarios se va ampliando y haciendo más complejo en la medida que el alumno progresa en el curriculum. Cada año de formación tiene un objetivo claro que el alumno debe cumplir. Este objetivo media y permea la formación en ese año.

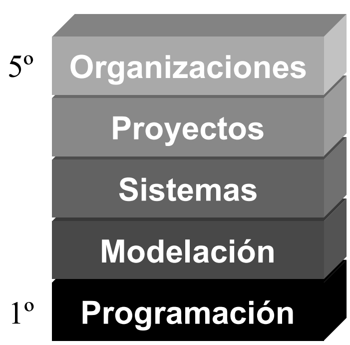

FIGURA 1.
VISION PROGRESIVA. DESCRIBE LOS AÑOS DE FORMACIÓN SEGÚN SU RANGO DISTINTIVO.

Esta visión va integrando en los últimos años los elementos de los años anteriores. Por ejemplo, el modelado de un programa de computador requiere que se haya experimentado previamente con la programación. Del mismo modo, un sistema -que corresponde a soluciones a problemas de ámbitos mucho más complejos que los que da cuenta la programación- no puede diseñarse si no se manejan nociones de abstracción en un cierto nivel. Estose logra teniendo medianamente desarrollada la habilidad de modelación.

Necesariamente los conceptos y habilidades que se adquieren en los primeros años van estableciendo el sustento de la formación en los años posteriores. Este diseño obliga, por lo mismo, a plantearse la posibilidad de exámenes de integración u otros que permitan evaluar el logro del objetivo anual si fuese necesario y factible.

2.2. Visión Productiva

La visión productiva busca interpretar el principal ámbito de trabajo en ingeniería: la toma de decisiones. El diseño en ingeniería, a diferencia de lo que ocurre en otros ámbitos, es un diseño de base científica: "Diseño, entendido como la concepción de un sistema o componente complejo que satisface necesidades dadas y cumple requisitos explícitos. Este diseño se realiza mediante decisiones justificadas científicamente".

Los ámbitos en que se da este diseño son coincidentes con la visión que una organización tiene con respecto a la toma de decisiones, la que se caracteriza por la complejidad y el alcance de ellas.

Así, los conceptos de operacional, táctico y estratégico sustentan la capacidad de diseño en ámbitos progresivamente más complejos.

En el currículum se insertan estos elementos comenzando con un fuerte enfoque en lo operacional. Luego, se enfatizan conceptos a nivel táctico, para trabajar en el último año con un enfoque mayormente estratégico (ver Figura 2).

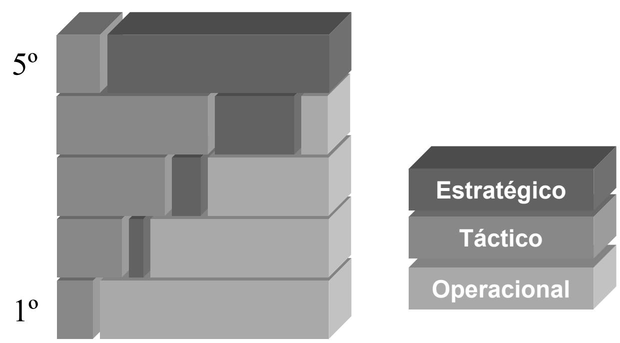

FIGURA 2.
VISION PRODUCTIVA. DISTRIBUYE LOS COMPONENTES DE FORMACIÓN EN LAS TRES ÁREAS DECISIONALES: OPERATIVA, TÁCTICA Y ESTRATÉGICA.

2.3. Visión Conceptual

La informática progresa a pasos inusuales. Desde una informática centrada en el desarrollo de computadoras en las décadas de 1950 y 1960, se pasó a una centrada en el desarrollo de software 1970-1990 para, actualmente, orientarse fuertemente sobre el tema de las comunicaciones, transformando las relaciones del mundo conocido y familiar en un espacio de posibilidades aún bastante inexplorado.

Estos tres ámbitos son los que deben estar presentes en la propuesta curricular, y por tanto en la formación de nuestros alumnos. De hecho, el aspecto incipiente de las redes de comunicación le hemos asignado el acrónimo de *Linkware* para integrarlo a los otros, actualmente conocidos como Hardware y Software.

Al ser las conceptualizaciones en el área Linkware de mayor complejidad, ellas requieren de una base bastante más desarrollada que los ámbitos de Software y Hardware. Estos últimos se trabajan más fuertemente en los primeros años de formación (ver Figura 3).

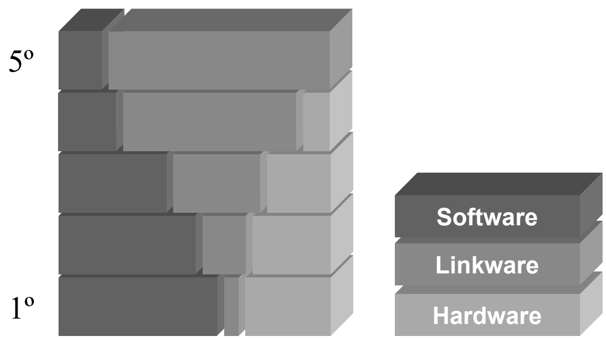

FIGURA 3.
VISION CONCEPTUAL. DISTRIBUYE LOS COMPONENTES DE FORMACIÓN EN LAS TRES ÁREAS CONCEPTUALIZADAS: HARDWARE, SOFTWARE Y LINKWARE.

2.4. Visión Metodológica

Al plantear un análisis macrocurricular, con una formación en cinco años, necesariamente se tiene que pensar que dicha propuesta tiene que ir acompañada de algunos elementos metodológicos transversales que la hagan viable.

Siguiendo con el mismo afán de reducir los conceptos claves a un subconjunto limitado, pensamos que desde el punto de vista metodológico existen dos orientaciones que son relevantes: integración y contextualización.

Integración: el modelo de formación tradicional de ingeniería, ve el curriculum dividido en tres tercios de dos años: ciencias básicas, ciencias de la ingeniería y formación de especialidad. Nuestra propuesta parte de la base del curriculum tradicional y busca su integración en lapso de tiempo más reducido y en un contexto también más próximo (ver Figura 4). A modo de ejemplos de esta integración podemos señalar los siguientes [2].

- Inducción seguida de derivación de algoritmos para ordenar números.
- Conjuntos seguidos de estructuras de datos para almacenarlos.
- Secuencias seguidas de recurrencias.
- Vectores seguidos de cinemática de dos o tres dimensiones.
- Matrices y resolución de ecuaciones seguidas de resolución numérica vía computador.

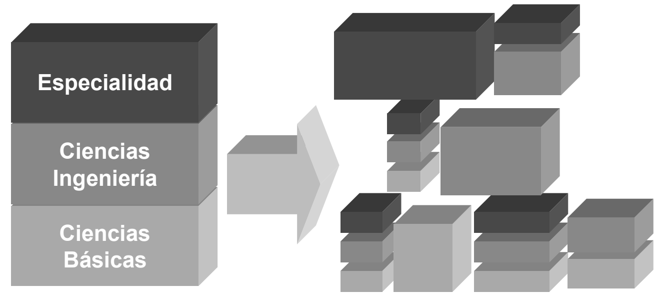

FIGURA 4
INCORPORACIÓN DE LA INTEGRACIÓN AL CURRICULUM TRADICIONAL DE INGENIERÍA

Contextualización: esto corresponde, básicamente, a que una misma situación problemática sea tratada por los diferentes puntos de vista que aportan las ciencias básicas, las ciencias de la ingeniería y los conocimientos de la especialidad. El objeto de lo anterior, del mismo modo que la integración, es abordar los elementos que confluyen en la resolución de un problema de ingeniería, y ver cómo los distintos niveles se mezclan en el diseño de la solución (ver Figura 5).

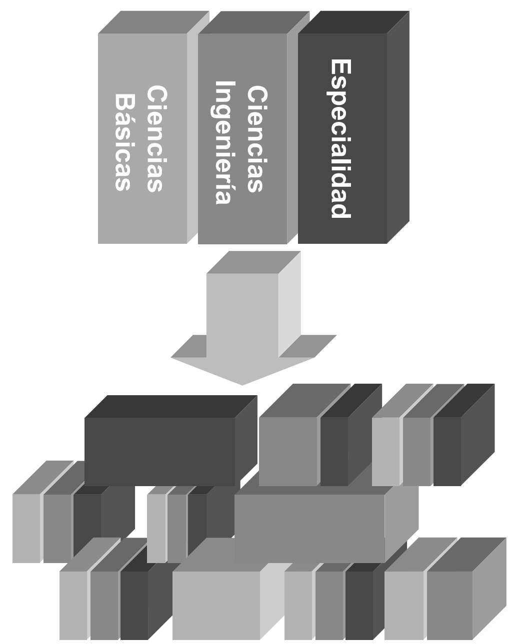

FIGURA 5
INCORPORACIÓN DE LA CONTEXTUALIZACION AL CURRICULUM TRADICIONAL DE INGENIERÍA

La integración y la contextualización en torno a la resolución de problemas que correspondan a situaciones generadoras de desafíos para el alumno, podrían darse, por ejemplo, en los siguientes núcleos temáticos:

- Algebra Booleana - Compuertas Electrónicas - Circuitos.
- Redes - Grafos - Estructuras de datos.

- Comunicaciones - Señales - Funciones sinusoidales.
- Vectores - cinemática - robots móviles.
- Álgebra - Lenguajes de Programación - Objetos.
- Cálculo - Computación de Computaciones - Programas.

Tanto la contextualización como la integración significan un esfuerzo de innovación metodológica que no resulta fácil proyectarlo al diseño en detalle. Esta visión metodológica se debe ir desarrollando paulatinamente, en la medida que las condiciones de entorno así lo permitan.

2.5. Visión Profesional

Esta visión describe los conceptos fundamentales que distinguen a un profesional de Ingeniería de otros profesionales. Se espera que el estudiante sea capaz de manejar conocimiento y demostrar habilidades que permitan, por una parte, el modelado de una realidad y por otra el diseño de soluciones en el área [3]. Estos conceptos se resumen en:

- *modelamiento científico*: Entendido como la concepción de modelos matemáticos y otros capaces de representar sistemas determinados. Se espera que el estudiante, a nivel de licenciatura, sea capaz de formular un modelo científico de una realidad que tenga una complejidad acorde a lo que se espera de él en ese nivel.
- *diseño*: Entendido como la concepción de un sistema o componente complejo que satisface necesidades dadas y cumple requisitos explícitos. Este diseño se realiza mediante decisiones justificadas científicamente. Bajo esta visión se espera que el estudiante, al egreso, sea capaz de formular y gestionar un proyecto de diseño que permita dar solución a un problema complejo de carácter organizacional y/o científico.

2.6. Visión Humanista-Cristiana del Mundo

Establece los conceptos básicos que la visión de la Universidad le entrega a los egresados. Se espera que el estudiante presente una actitud profesional y de vida acorde a los principios que sustenta nuestra Universidad. Esta visión se aprecia en dos dimensiones:

- *Dimensión Humana*: Entendida como el compromiso que cada uno tiene consigo mismo. Implica la formación de la autoestima y el carácter testimonial del ejemplo personal. Se espera, al egreso, que el profesional tenga una alta autoestima personal y profesional, autoestima tal que se traduzca en una disposición permanente de solidaridad y en una calidad humana sobresaliente.
- *Dimensión Social:* Entendida como la vinculación del hombre con su medio y el compromiso que aquello determina. Se espera que el egresado sea un aporte a la sociedad, tanto del punto de vista humano como profesional.

3. CONCLUSIONES

En el diseño curricular descrito se busca integrar las distintas visiones que, a nuestro entender, confluyen en la formación de un Ingeniero Civil Informático. Esto permite establecer una imagen general de la formación, lo que ayuda a quienes participan del proceso de enseñanza y aprendizaje, a tener mayor claridad en las características del proceso, tanto desde la perspectiva de la enseñanza como del aprendizaje.

Las definiciones asociadas a las seis visiones propuestas permiten que la claridad anterior pueda ser expresada en términos concretos. Así, los conceptos vertidos tienen un significado claro en todas las etapas de la formación.

Creemos que lo establecido, si bien es un resultado perfectible, permite evaluar y minimizar los efectos negativos producidos por las circunstancias inciertas que rodean el diseño de una carrera de esta naturaleza. Del mismo modo, a la luz de las necesidades educativas actuales, pensamos que visiones generales como éstas corresponden a un primer paso en la dirección que lleve a procesos educativos de mejor calidad.

PROYECTO COVIE: UN MODELO DISTRIBUIDO DE APRENDIZAJE DE LA PROGRAMACIÓN CON APOYO DE LA RED

Ana María Ferraro de Velo[1], Gloria Bianchi[2] y Juan Pablo Barani[3]

Resumen *- Las Tecnologías de la Información y la Comunicación integradas a la Educación permiten construir ambientes de aprendizaje enriquecidos. Esta integración contempla estilos de aprendizaje centrados en el estudiante más que en el profesor.*

En las aulas colaborativas e interactivas, las cuales se desarrollan según el espíritu de las altas tecnologías, se combinan el trabajo individualizado con el trabajo en equipo. Para ello, los docentes estimulan el desarrollo de aprendizajes investigativos y explorativos que permiten ubicar, seleccionar y procesar los conocimientos, de modo que los alumnos puedan pasar de lo factual al pensamiento crítico y a la toma de decisiones.

El proyecto CoViE se basa en la hipótesis que una educación semipresencial que combina la formación con apoyo de la red con la educación presencial, y además compagina la auto educación con la interacción grupal, es la más eficaz de las metodologías a nuestro alcance en el contexto dentro del cual nos desenvolvemos.

Términos de búsqueda *– Educación semipresencial, Internet, Programación, Proyecto educativo.*

INTRODUCCIÓN

Las Tecnologías de la Información y la Comunicación integradas a la Educación permiten construir ambientes de aprendizaje enriquecidos. Esta integración contempla estilos de aprendizaje centrados en el estudiante más que en el profesor. La información integrada y multidisciplinaria, a la que los estudiantes pueden acceder según su propio interés y motivación, en el marco de un modelo distribuido de aprendizaje, vincula las aulas con los centros de trabajo, con los negocios, los hogares, los espacios comunitarios y la "aldea global". El estudio autónomo y el autoaprendizaje ocupan un papel primordial.

En las aulas colaborativas e interactivas, las cuales se desarrollan según el espíritu de las altas tecnologías, se combinan el trabajo individualizado con el trabajo en equipo. Para ello, los docentes estimulan el desarrollo de aprendizajes investigativos y explorativos que permiten ubicar, seleccionar y procesar los conocimientos, de modo que los alumnos puedan pasar de lo factual al pensamiento crítico y a la toma de decisiones.

Al planificar las estrategias didácticas y actividades de aprendizaje se aplican criterios de selección de los medios según sus cualidades. La pauta recomendable es utilizar la combinación de los medios que permitan trabajar mejor las variadas facetas de cada tema, así como desarrollar una conciencia en los jóvenes sobre las potencialidades y convenciones de cada uno de ellos. Si bien los medios no se emplean para sustituir la experiencia directa, son el soporte óptimo de una metodología rediseñada acorde a las necesidades actuales.

El propósito de esta investigación es identificar las técnicas y herramientas óptimas que permitan acompañar al alumno en el proceso de organizar la realidad y la información que lo rodea, para lograr hacer un uso productivo de ellas y construir su propio conocimiento, siempre teniendo en cuenta que es tema de exploración permanente la incidencia de las TICs y el lenguaje virtual en la pedagogía y la psicología del aprendizaje, así como las posibilidades y limitaciones que acarrea el uso de determinadas tecnologías cuando se colocan al servicio de la educación.

Esto nos lleva al problema de la formación docente. Enseñar en un curso que utiliza la red es muy diferente a hacerlo en la forma tradicional. Implica un período de capacitación para lograr la suficiente aptitud que permita manejar el recurso y aprovechar las ventajas que el mismo brinda. En esta investigación, el punto de partida es combinar las características de la educación presencial con el apoyo de la red. Además, estimamos que se debe trabajar con las dimensiones afectivas de la enseñanza, las que se suelen pasar por alto en el momento en que se sobrevalora el aporte de la informática a la educación.

El proyecto se basa en la hipótesis de que una educación que combina la formación con apoyo de la red con la educación presencial, y además compagina la autoeducación con la interacción grupal, es la más eficaz de las metodologías a nuestro alcance en el contexto dentro del cual nos desenvolvemos.

Por otra parte, el trabajo educativo con apoyo de la red requiere de un gran esfuerzo de gestión y administración: calendario de actividades, preparación de materiales, conformación y dinámica de trabajo de los grupos, elección de temas para los proyectos y, sobre todo, formación de los profesores y nuevas competencias de los alumnos.

La función social y organizativa del docente es un elemento fundamental en su labor formativa y en algunos momentos del curso puede llegar a ser crucial para el éxito del mismo, puesto que los factores motivacionales están

jugando un papel decisivo en el desarrollo de este tipo de cursos.

PRINCIPIOS DIDÁCTICOS

Se plantean en el proyecto algunos principios didácticos que el docente, a través de la red, deberá tener en cuenta a la hora de proponer el trabajo en grupo:

- Diseñar actividades basadas en la cooperación, que favorezcan la interdependencia entre los participantes, desarrollando tanto la empatía como la autonomía.
- Favorecer la implicación activa de los participantes en su propio aprendizaje partiendo de sus conocimientos previos y mediante la autoevaluación como seguimiento de sus progresos y la búsqueda de nuevas estrategias de resolución de problemas.
- Desarrollar el pensamiento crítico, mediante el análisis crítico y creativo de la información.
- Aprovechar los recursos del medio, del entorno sociocultural, valorando como positiva la diversidad, sobre todo en el desarrollo de soluciones a los problemas planteados.
- Establecer procesos y espacios para la comunicación y el diálogo que permitan el contraste de ideas y actitudes y favorezca la construcción colectiva del conocimiento.

ACTIVIDADES

Es fundamental la planificación precisa y la programación previa de los cursos con esta modalidad, porque en estos no cabe la improvisación o, al menos, ésta tiene un espacio muy reducido si lo comparamos con el que puede admitirse en la formación presencial.

Una de las claves metodológicas de esta formación es el aprendizaje colaborativo, por lo que las actividades en grupos cooperativos son el punto central de un modelo formativo, interactivo, flexible y autónomo. El docente se convierte en facilitador y dinamizador y los participantes asumen la responsabilidad de su propio aprendizaje.

A lo largo del curso los alumnos tienen la posibilidad de valorar los contenidos y actividades que se van proponiendo, y se propician las actividades de autoevaluación individual y de equipo. Su objetivo fundamental es que cada uno pueda medir sus progresos y reconocer sus dificultades y posibilidades, permitiendo así una mejor autorregulación del aprendizaje.

Las actividades que se consideran relevantes dentro de este modelo son:

- Ambientación con el modelo
- Desarrollo evolutivo de grupos cooperativos
- Evaluación, autoevaluación y coevaluación
- Recuperación de información, y dentro de la misma
- Actividades de análisis crítico
- Debate
- Producción de materiales

EVALUACIÓN

La evaluación que se lleva a cabo durante el curso tiene las siguientes características:

- **Integral:** abarca conocimientos, habilidades, actitudes y valores.
- **Continua**: se realiza al iniciar el proceso, durante el mismo y al finalizar el curso.
- **Distribuida**: a cargo de todos los participantes de la experiencia: el profesor, los ayudantes de trabajos prácticos, los alumnos entre sí (coevaluación) y de sí mismos (autoevaluación).

Las actividades para evaluar en los alumnos sus habilidades y conocimientos son las siguientes:

- La participación activa en las sesiones de clase: En el curso los alumnos discuten los conceptos de la clase y se aclaran las dudas, con moderación del profesor. Posteriormente, el curso se divide en equipos de 3-4 participantes quienes discuten y resuelven los problemas que se les plantean, entregando su solución al final de la clase. Uno de los equipos se encarga de resolver los problemas frente a la clase.
- Resolución de problemas de tarea y cuestionarios ad-hoc previos a las clases, con entrega por escrito antes de la fecha establecida por el profesor, incluyendo la autoevaluación crítica de la misma. Se evalúa tanto el procedimiento aplicado como el resultado del problema.
- Trabajos en el laboratorio virtual: los alumnos tienen acceso a la dirección virtual del tema, resuelven los ejercicios y responden a las preguntas planteadas por el profesor. Las entregas son pautadas y puntuales a través de la red.
- Asistencia a los talleres de resolución de problemas, para resolver ejercicios sobre el tema y colaborar con sus compañeros de curso.
- Trabajos prácticos: Al iniciar el curso se conforman grupos de 4-5 alumnos que deben trabajar conjuntamente durante todo el cuatrimestre para producir un sistema con carácter real. El trabajo práctico se divide en dos etapas bien diferenciadas. En la primera, a cada grupo se le asigna la realización de un módulo específico que forma parte de un sistema de mayor escala. En la segunda etapa, el grupo debe tomar el resto de los módulos realizados por sus compañeros e integrarlos en el sistema final. Al finalizar cada etapa, el grupo deberá presentarse en las fechas preestablecidas a fin de evaluar el trabajo realizado hasta el momento.

EL AULA VIRTUAL

El aula virtual requiere la implementación de una comunidad virtual educativa a través de la cual es posible centralizar el aprendizaje en el alumno, reconociendo y estimulando su interacción con los demás integrantes de la misma.

El aula virtual nos provee los siguientes servicios:

- Brinda información administrativa y académica correspondiente a los cursos y aquella generada durante el desarrollo de los mismos.
- Proporciona servicios tecnológicos adecuados para la comunicación que permiten interactuar a los docentes con los alumnos y viceversa, proveyendo el medio para el acceso al software, las publicaciones, la ejercitación, el material didáctico, la bibliografía de referencia y los foros de discusión.
- Favorece y permite captar las respuestas y soluciones de los alumnos a las consultas y trabajos generados por los miembros de la comunidad.

Actualmente los integrantes de la Comunidad Virtual son:

- **Docentes:** Llevan adelante el control y la supervisión de sus cursos y mantienen contacto diario con sus alumnos.
- **Alumnos:** Tienen acceso a bibliografía, material didáctico, ejercitación obligatoria y adicional, enunciados de trabajos prácticos, software de distribución gratuita, etc.

LOS DIAGRAMAS Y MAPAS DE PROBLEMAS EN EL APRENDIZAJE DE LAS CIENCIAS BÁSICAS

J. Clemente Reza G.[1], *Víctor M. Feregrino H.*[2] *y Ma. Elena Navarro C.*[3]

Abstract — *En el ámbito de la formación y el ejercicio profesional de la ingeniería, las representaciones esquemáticas de cualquier índole constituyen una valiosa herramienta para la comprensión y aplicación de los principios fundamentales, por su característica de representar en forma gráfica un proceso simple o complejo, resumir información o plantear el algoritmo a seguir para un cálculo determinado. La resolución de problemas en las ciencias básicas constituye una efectiva estrategia didáctica, puesto que permite la integración de conocimientos, el desarrollo de habilidades y la adopción de actitudes, tales como la comprensión de la lectura, la interpretación de esquemas y la toma de decisiones, elementos indispensables para el desarrollo profesional de un ingeniero. En el presente trabajo se describen diferentes tablas, gráficas, diagramas de cálculo y esquemas de proceso utilizados en la interpretación y planteamiento de la resolución de problemas de química general por estudiantes de la carrera de ingeniería química en el Instituto Politécnico Nacional-México*.

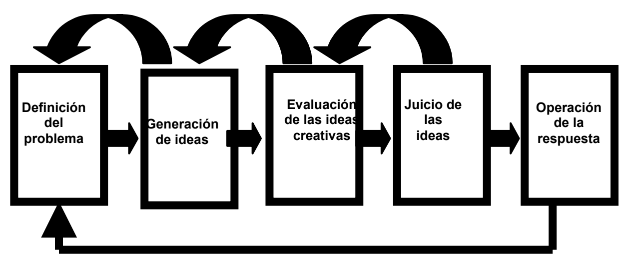
Index Terms — *Auxiliares didácticos, diagramas, esquemas, resolución de problemas.*

INTRODUCCIÓN

En el ámbito académico de las escuelas de ingeniería, la resolución de problemas se fundamenta en la comprensión de los conceptos involucrados para su aplicación efectiva en la búsqueda de respuestas, mediante ciertas habilidades que han sido desarrolladas y la actitud de superación del reto. De esta forma, el individuo memoriza información y acumula experiencia que le serán de utilidad para comprender y resolver futuros problemas, similares o relacionados. Así, la recuperación consciente y voluntaria de la experiencia del individuo se convierte en un factor determinante para la resolución eficaz de cualquier tipo de problema sea académico, técnico, científico, profesional, socioeconómico, etc.

En este contexto, la visualización y la esquematización son técnicas de representación gráfica que impactan positivamente en la memorización y otras habilidades superiores del pensamiento involucradas en el aprendizaje, generándose una relación directa entre visualización-memoria-razonamiento-aprendizaje-aplicación. Hoy en día, la visualización o razonamiento a través de imágenes está recibiendo atención como un método alternativo de pensamiento que permite practicar la imaginación, hacer imágenes mentales y representar nuestras ideas de manera gráfica. Así, el proceso de razonamiento se mejora cuando se esquematizan ideas y se elaboran diagramas respecto a relaciones entre ideas, datos y conceptos; de manera similar, la esquematización ayuda para comunicar ideas e información a otras personas [1].

Además de trazar objetos, imágenes mentales o conceptos, los esquemas y diagramas permiten resumir información, así como representar procesos y relaciones a través de diagramas de flujo y otros tipos de cartas; en muchos aspectos, elaborar un esquema ayuda al razonamiento para contestar una pregunta o prever una solución, lo cual es una herramienta esencial para todo ingeniero concebido como un eficiente resolvedor de problemas y eficaz tomador de decisiones. Un diagrama de flujo es un esquema que conecta ideas, conceptos y/o tareas de manera secuencial y opcional; de esta manera, el proceso mismo de resolución creativa de problemas puede visualizarse mediante el siguiente diagrama de flujo:



DESARROLLO

Con el propósito fundamental de promover la formación integral de los futuros profesionales de la ingeniería, en concordancia con el perfil demandado por el mercado ocupacional, las instituciones de educación superior han realizado reformas curriculares para privilegiar el desarrollo de las habilidades intelectuales y emocionales, así como la adopción de actitudes de valor, por encima de la simple

[1] J. Clemente Reza García, ESIQIE Instituto Politécnico Nacional, Edificio 7 UPALM, Zacatenco, México, 07738, D. F., México, lauroze@hotmail.com
[2] Víctor M. Feregrino Hernández, ESIQIE Instituto Politécnico Nacional, Edificio 7 UPALM, Zacatenco, México, 07738, D. F., México, vifehe@yahoo.com.mx
[3] Ma. Elena Navarro Clemente, ESIQIE Instituto Politécnico Nacional, Edificio 7 UPALM, Zacatenco, México, 07738, D. F., México, elnacle@yahoo.com.mx

asimilación de los conocimientos generales y particulares de cada especialidad.

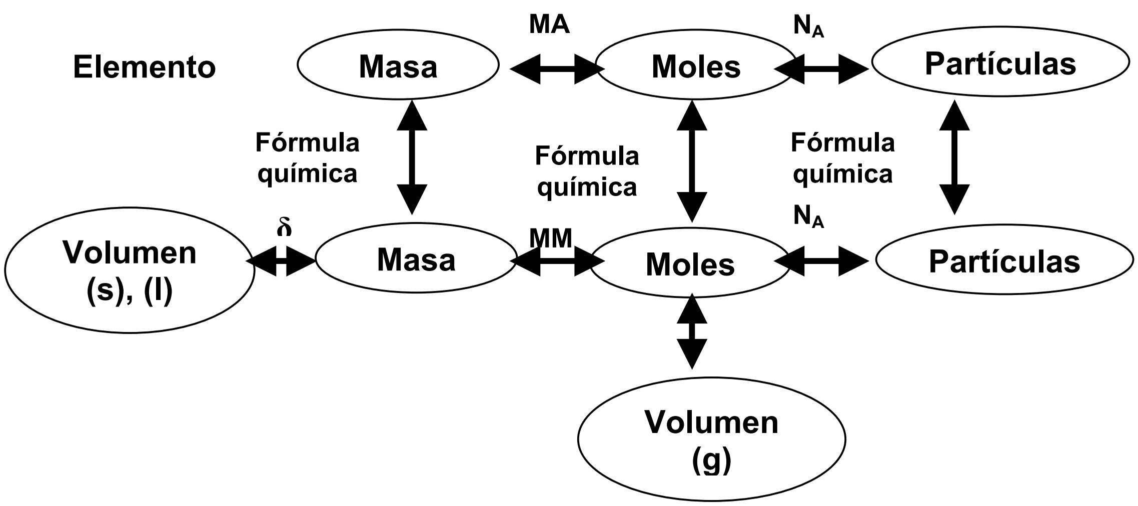
En este contexto, la resolución creativa de problemas ha demostrado ser una estrategia didáctica efectiva que permite la integración de conocimientos y el desarrollo de otras habilidades como la interpretación de esquemas y la toma de decisiones, indispensables para la formación integral y el ejercicio profesional del ingeniero. Así, la actividad tradicional de resolución de problemas en los diferentes cursos ha evolucionado para hacer énfasis en el proceso mismo de resolución, desde los aspectos de interpretación y validación de la información, hasta la verificación de la respuesta, pasando por el planteamiento previsto para la resolución [2].

En el caso particular de la asignatura de Química General correspondiente a los dos primeros semestres del plan de estudios de la carrera de Ingeniero Químico Industrial, impartida en la Escuela Superior de Ingeniería Química e Industrias Extractivas del Instituto Politécnico Nacional (ESIQIE-IPN) de México, los programas de estudio consideran los temas de Estequiometría, Reacciones en Solución y Equilibrio Químico, entre otros, los cuales permiten desarrollar las habilidades de:

- comprender e interpretar lo que se lee u observa,
- plantear **esquemas** que representen el problema planteado,
- establecer **diagramas de flujo y algoritmos** que correspondan a la secuencia de cálculos prevista para la resolución, así como
- diseñar **tablas y gráficas** que permitan validar la consistencia lógica de los resultados obtenidos.

Producto del trabajo cotidiano y la actualización académica, la experiencia docente ha permitido diseñar, recopilar, adaptar y recomendar la utilización de diferentes auxiliares didácticos como esquemas, mapas de problemas, diagramas de cálculo, tablas de datos y resultados, etc., que facilitan la traducción entre los lenguajes verbal, escrito, matemático, científico, coloquial y pictográfico, para su aplicación en la resolución creativa de problemas de química general.

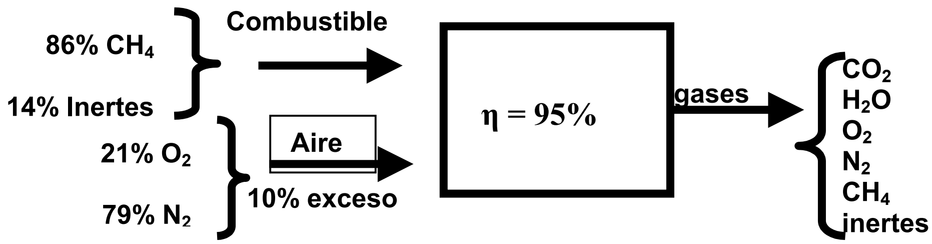
La metodología que se aplica está basada en el planteamiento, comprensión y resolución creativa y crítica de problemas paradigmáticos relacionados con los diferentes conceptos y aplicaciones de los temas señalados, realizando el análisis de las ventajas y limitaciones de utilizar los diferentes auxiliares didácticos mencionados y su posterior aplicación en problemas de reforzamiento, incluyendo problemas conceptuales e integradores de los diversos temas, mediante el trabajo individual o en equipo.



ESQUEMA 1
DIAGRAMA DE CÁLCULO PARA REALIZAR CONVERSIONES DE CANTIDADES DE SUSTANCIA

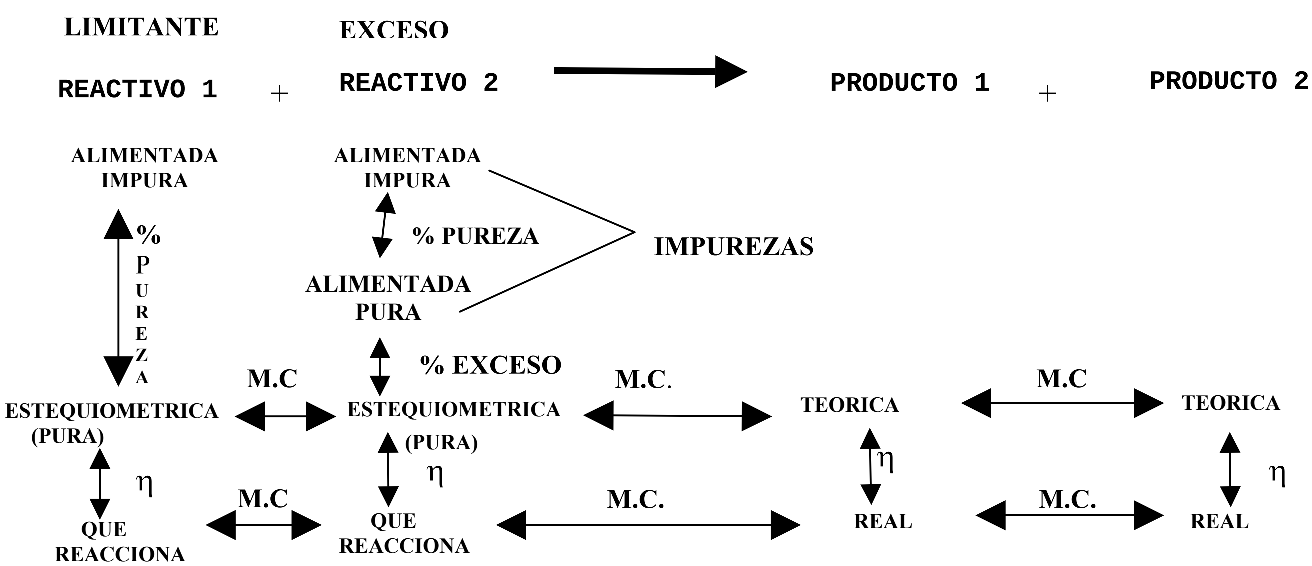
Este diagrama representa la relación entre diferentes conceptos fundamentales de la estequiometría y se puede utilizar para identificar los cálculos necesarios para expresar una cantidad de sustancia en diferentes unidades equivalentes entre sí, mediante la aplicación del método de los factores de conversión deducidos a partir de conceptos y/o el análisis de la información cualitativa y cuantitativa de la fórmula química de cada sustancia. Cabe reiterar que para realizar la conversión o "paso" entre cada concepto, se requiere un factor que modifique la unidad dimensional o la especie de la cantidad conocida.

$$CH_4 + 2\,O_2 \rightarrow CO_2 + 2\,H_2O$$



ESQUEMA 2
DIAGRAMA DE BLOQUES PARA UN PROCESO (REACTOR)

Este tipo de esquemas son convenientes para representar problemas que involucran diversos cálculos estequiométricos relacionados con las cantidades de reactivos y productos de una reacción, con base en los datos de composición, rendimiento y exceso de reactivo que se establezcan. Para esto, cada **bloque** representa a un equipo y mediante **líneas** con flechas se identifican cada una de las sustancias que intervienen en el proceso; también es recomendable la adopción de una **simbología** alfanumérica que identifique a los parámetros (masa, moles, volumen, temperatura, etc) de cada sustancia, así como indicar la composición porcentual que se conozca de las mezclas utilizadas (minerales, soluciones, residuos, etc.).[3]



ESQUEMA 3
DIAGRAMA DE CÁLCULOS ESTEQUIOMÉTRICOS PARA UN PROCESO

Este tipo de diagramas permite establecer o seleccionar el algoritmo de cálculo que debe seguirse con referencia a las cantidades de reactivos y productos de una reacción, de conformidad con los datos establecidos de composición, rendimiento y exceso de reactivo. Para esto, debe identificarse con antelación cuál es el reactivo limitante, puesto que a partir de la cantidad de sustancia de este reactivo se determinan las cantidades de reactivo en exceso necesario y de producto obtenido, así como las cantidades remanentes de cada sustancia por concepto de la correspondiente conversión de reacción.

$$CH_4 + 2\,O_2 \rightarrow CO_2 + 2\,H_2O$$

Sustancia	Alimentación	Reacción (-)	Producción (+)	Salida
CH_4			0	
Inertes		0	0	
O_2			0	
N_2		0	0	
CO_2	0	0		
H_2O	0	0		
Total	A	-B	+B	A

ESQUEMA 4
TABLA DE DATOS, CÁLCULOS Y RESULTADOS

Este tipo de auxiliar didáctico permite resumir los datos del problema, condiciones establecidas, cálculos realizados e incógnitas determinadas con relación a las cantidades de sustancias iniciales y finales de un proceso químico, facilitando la comprobación de los resultados así como la toma de decisiones o la realización de cálculos posteriores a partir de los mismos, tales como aspectos de impacto ambiental, economía, seguridad, disponibilidad, etc.

CONCLUSIONES Y RECOMENDACIONES

Cuando se trabaja con cantidades, el pensamiento verbal se vuelve complicado, mientras que el pensamiento matemático permite resolver con facilidad el problema. La visualización refuerza el pensamiento matemático, pues desarrolla un sentido para apreciar tamaños y cantidades, así como su relación entre ellos.

Se sabe que la mente recuerda mejor aquellas imágenes no usuales o acostumbradas, por lo cual es necesario diseñar y utilizar diferentes esquemas y diagramas recordables por los alumnos, de acuerdo a su propio estilo de aprendizaje.

Debido al manejo de símbolos codificados, la lectura de diagramas de proceso y planos de ingeniería está ligada de manera íntima con el análisis que realiza el hemisferio cerebral izquierdo, en tanto que la visualización y la esquematización involucran al pensamiento creativo que radica en el hemisferio cerebral derecho. Así, dichas actividades son necesarias y complementarias para el desarrollo de la habilidad de resolución de problemas y toma de decisiones, a efecto de promover la formación integral del futuro profesional de la ingeniería, en cualquier disciplina.

IMPACTO SOCIAL DEL INGENIERO QUÍMICO

J. Clemente Reza G.[1], *Víctor M. Feregrino H.*[2] *y Ma. Elena Navarro C.*[3]

Abstract — *Durante la última década, los planes de estudio de las carreras de ciencias e ingeniería han privilegiado el desarrollo de habilidades y la adopción de actitudes de valor por encima de la asimilación de los conocimientos. Uno de estos aspectos enfatizados es el relativo con el desarrollo de la habilidad para tomar decisiones en un contexto determinado, con el propósito de que esta capacidad pueda transferirse a la vida diaria profesional y formar así mejores ciudadanos. En este contexto, ha constituido un reto para profesores y estudiantes el diseño y selección de problemas y casos de estudio para la toma de decisiones en situaciones propias de la profesión en estudio. Los cursos de ciencias básicas en las carreras de ingeniería ofrecen excelentes oportunidades para desarrollar las habilidades de resolución de problemas y la toma de decisiones a través del análisis de los datos, condiciones y resultados de ejemplos y ejercicios relacionados con aspectos industriales, ambientales, sociales y económicos en los procesos químicos. Se describen los criterios empleados para la selección y diseño de problemas de química general relacionados con la toma de decisiones, utilizados en la formación integral de estudiantes de ingeniería química en la ESIQIE – IPN.*

Index Terms —.*Ingeniería química, química general, resolución de problemas, toma de decisiones.*

INTRODUCCIÓN

La ingeniería química se puede definir como la profesión técnica relacionada con la aplicación de las ciencias naturales para la producción de sustancias químicas a escala comercial y con los procesos industriales que convierten a las materias primas y la energía en productos con mayor valor económico, mediante cambios químicos, físicos y térmicos.

Con el objetivo de lograr el óptimo aprovechamiento de los recursos naturales, en beneficio de la sociedad y el desarrollo sustentable de la misma, la ingeniería química requiere la formación de profesionales con cultura científico-tecnológica y conciencia social que consideren la comprensión e integración de los conocimientos de la especialidad, el desarrollo de las habilidades intelectuales necesarias para aplicar dichos conocimientos, así como la adopción de actitudes para su interacción social y profesional.

En el contexto mundial actual de acelerado avance científico-tecnológico, libre mercado y economías globalizadas, los planes de estudio de las carreras de ciencias e ingeniería han privilegiado el desarrollo de las habilidades y la adopción de actitudes por encima de la asimilación de conocimientos, para formar profesionales calificados y dispuestos a asumir una amplia variedad de actividades interdisciplinarias involucradas en la elaboración de cualquier producto que haga mejor o más fácil nuestra vida cotidiana.

Se considera que las habilidades más necesarias para el quehacer diario del ingeniero en cualquier especialidad son aquellas que le permiten resolver problemas y tomas decisiones de manera eficiente, entendiendo por problema una situación novedosa que es necesario afrontar con base en el experiencia, para la cual no se tiene una solución o respuesta inmediata, en tanto que la toma de decisión puede definirse como el proceso sistémico cuyo objetivo es la validación de una respuesta o la definición de un curso de acción para alcanzar un propósito determinado.

En décadas pasadas, los ingenieros fundamentaban sus decisiones en consideraciones de carácter técnico y económico, conforme su experiencia profesional y los criterios establecidos por la economía y la administración industrial. Hoy en día, con base en la ética profesional y responsabilidad con la sociedad, las decisiones efectivas deben estar fundamentadas en aspectos sociales, económicos, políticos, ambientales y tecnológicos, procurando el mejor conjunto de ellos conforme la experiencia propia de cada profesional.

DESARROLLO

En los modelos educativos promovidos por organismos internacionales como la UNESCO, se enfatiza la necesidad de la formación integral de los futuros profesionales a través de los aprendizajes de conocer, hacer, convivir y ser. Así, en el aprender a hacer se plantea aplicar con eficiencia y eficacia los conocimientos para resolver problemas y tomar decisiones en el ámbito laboral, en tanto que en el aprender a ser se busca resolver los problemas propios, tomar decisiones y responsabilizarse de la vida propia en los ámbitos personal, familiar y social. [1]

Con el propósito de promover el desarrollo de la habilidad para tomar decisiones en un contexto determinado, a efecto de que esta capacidad pueda transferirse a la vida

[1] J. Clemente Reza G., ESIQIE-IPN, edificio 7 UPALM, Zacatenco, México, D. F., c.p. 07738, México, lauroze@hotmail.com
[2] Víctor M. Feregrino H., ESIQIE-IPN, edificio 7 UPALM, Zacatenco, México, D. F., c.p. 07738, México, vifehe@yahoo.com.mx
[3] Ma. Elena Navarro C., ESIQIE-IPN, edificio 7 UPALM, Zacatenco, México, D. F., c.p. 07738, México, elnacle@yahoo.com.mx

diaria y profesional, los cursos de ciencias básicas de las carreras de ingeniería ofrecen la oportunidad de practicarla a través del análisis y validación de los datos, condiciones y respuestas de problemas relacionados con aspectos sociales, industriales, ambientales y económicos.

Algunas de las técnicas recomendadas por las teorías administrativas para la toma de decisiones son realizadas por individuos y otras por equipos de trabajo; unas de ellas son idóneas para seleccionar ideas, instrumentar acciones o validar resultados.

En el caso de tener dos o más opciones en igualdad de características de los resultados, se recomienda seleccionar aquella opción menos problemática o riesgosa, sin ignorar las consecuencias a largo plazo; para este caso se recomienda la elaboración de una tabla que contenga los criterios mínimos que deben ser satisfechos por la mejor opción. De manera similar, la elaboración de una matriz de ventajas y desventajas constituye una herramienta útil para identificar las soluciones u opciones más promisorias [2].

Los cursos de Química General para la carrera de ingeniería química permiten ejercitar la toma de decisiones en la resolución de problemas y estudio de casos relacionados con la selección de materias primas y procesos industriales, así como cálculos estequiométricos relacionados con aplicaciones en contextos definidos, haciendo énfasis en las diferentes características de los problemas académicos y de la vida real en el ejercicio de la profesión [3]:

CARACTERÍSTICAS DE LAS DECISIONES

En el caso particular de la Escuela Superior de Ingeniería Química e Industrias Extractivas del Instituto Politécnico Nacional (ESIQIE-IPN) de México, que es la institución pública mexicana que atiende la mayor matrícula de ingeniería química en el nivel de licenciatura, los contenidos programáticos de Química General consideran los temas de Estequiometría, Reacciones en Solución y Equilibrio Químico, entre otros, los cuales ofrecen la oportunidad de diseñar y/o seleccionar problemas que involucren una toma de decisión basada en los cálculos realizados, la respuesta obtenida y el conjunto de criterios establecidos (económico, ambiental, social, etc.

Problema 1. Los líquidos blanqueadores de uso doméstico se preparan a partir de la disolución de hipocloritos, en los cuales el elemento activo es el cloro liberado. Si dispones de hipoclorito de sodio cuyo costo es \$18/kg y de hipoclorito de calcio cuyo costo es \$22/kg, determina cuál sustancia es la recomendable desde el punto de vista económico para preparar líquidos blanqueadores cuya concentración sea 6% de cloro libre.

Análisis.- Este tipo de problemas involucra una decisión de carácter económico, con base en la determinación del costo unitario óptimo determinado por la cantidad de reactivo necesario y el monto de la inversión económica que debería realizarse. La carencia de una base de cálculo determinada, permite utilizar las alternativas de una cantidad de producto a elaborar o un monto económico común para realizar la comparación y toma de decisión.

Problema 2. La dosis letal de HCN es 300mg/kg de aire inhalado. El acrilán tiene la fórmula empírica CH_2CHCN, donde el HCN representa el 50.9% en masa. Una oficina tiene una alfombra de acrilán que mide 12 por 15 pies, la cual contiene 30 oz. de acrilán/yarda^2. Considerando que un incendio provocara que se consumiese el 50% de la alfombra y que el rendimiento del HCN fuese del 20%, ¿se generará la dosis letal de HCN en dicha oficina?

Análisis.- Con base en los resultados numéricos derivados de los cálculos estequiométricos y el planteamiento de la pregunta **¿qué pasaría sí....?**, se puede realizar una discusión en el grupo respecto al concepto de dosis letal y la conveniencia de utilizar este tipo de materiales en el hogar, empleo de retardadores de fuego, extintores de incendio, etc.

Problema 3. La concentración de las bebidas alcohólicas se expresa en °G.L. que representa el % volumen de etanol en cada bebida. Una lata de cerveza contiene 355mL de bebida y reporta 6.0°G.L., en tanto que una "cuba libre" se prepara con una medida de 30mL de ron de 40.0°G.L. Determina en cuál bebida es menor la ingesta de alcohol.

Análisis.- La determinación de la cantidad real de etanol que se ingiere en cada medida de una bebida alcohólica, permitirá aclarar la falsedad del concepto de "bebida de moderación" que la mercadotecnia asigna a la cerveza, así como establecer el conjunto de características fisicoquímicas y biotecnológicas que servirían de base para establecer la dosis recomendada de una bebida alcohólica en particular.

Problema 4. Se sabe que las infusiones de café o té contienen 0.05mg/mL de cafeína, en tanto que las bebidas de chocolate y la coca-cola contienen 0.6mg y 5.0mg/oz fluida, respectivamente; el contenido de cafeína en el café "descafeinado" es equivalente al chocolate. Las dosis diarias superiores a 1.0g de cafeína pueden causar síntomas alarmantes en el ser humano. Determina las combinaciones posibles de tazas de café, vasos de chocolate y/o latas de coca-cola que pueden ingerirse diariamente sin rebasar la dosis permitida.

Análisis.- La búsqueda de la información necesaria, y los cálculos realizados, permitirá identificar diferentes opciones de respuesta para un mismo problema, cuya discusión en el grupo podría llevar a una recomendación consensuada o al enriquecimiento del problema por la inclusión de restricciones adicionales para la respuesta óptima.

Problema 5. Los solventes arrojados en operaciones industriales son contaminantes importantes si no se disponen en forma apropiada. El reporte del gas de desperdicio de una planta de fibras sintéticas indica 40%mol de CS_2, 10% de SO_2 y 50% de H_2O, sugiriéndose quemarlo con exceso de aire y cuyos gases de combustión serán arrojados por una chimenea. Si el reglamento local establece que ningún gas de combustión puede rebasar el 2%mol de SO_2 en base seca, calcula el % mínimo de aire en exceso. ¿Con esta medida se evitará la contaminación por lluvia ácida?

Análisis.- De manera independiente al resultado numérico que se obtenga en el proceso de resolución de este problema, la discusión en el grupo debería enfocarse en torno a problemática de la lluvia ácida por razón del SO_2 que se libera en algunos procesos industriales y la efectividad de este tipo de acciones de diluir los contaminantes, planteadas en algunos textos de ingeniería.

CONCLUSIONES Y RECOMENDACIONES

La efectividad de la respuesta a un problema de ingeniería y de la decisión correspondiente, dependerá de la calidad de la información suficiente, oportuna y relevante que se tenga, así como del conjunto de criterios o restricciones que se establezcan. Los criterios actuales de toma de decisiones en el ámbito de la ingeniería exigen considerar el contexto social, entendido como las implicaciones e impacto a los individuos y al medio ambiente.

La herencia cultural influye en el proceso de toma de decisión. Las civilizaciones occidentales son sistemas competitivos en los cuales se argumentan puntos de vista antagónicos en la vida diaria; en contraste, las sociedades orientales tiene larga tradición cultural de trabajo en equipo y colaboración.

Constituye un reto a resolver por los profesores de los cursos de ciencias básicas y ciencias de la ingeniería el diseño, selección y recopilación de problemas y casos de estudio que involucren la toma de decisión por parte de los estudiantes, en situaciones propias de la vida diaria y la profesión en estudio.

La mayoría de los problemas relacionados con los aspectos sociales y tecnológicos no tienen respuesta única, por lo cual es necesario evaluar las diversas soluciones y sus consecuencias para tomar la mejor decisión de acuerdo a los criterios y condiciones establecidos. Cada una de las etapas del proceso de resolución creativa de problemas involucra una toma de decisión en torno al objetivo de cada una de ellas.

EL TRABAJO EXPERIMENTAL Y LA FORMACIÓN CIENTÍFICA BÁSICA

Laura R. Ortiz E.[1], *Víctor M. Feregrino H.*[2] *y Ma. Elena Navarro C.*[3]

Abstract — *El aprendizaje de las ciencias en los diferentes niveles educativos del país, se ha caracterizado por ser principalmente memorístico y aunque algunos cursos son del tipo teórico/práctico, generalmente las clases de laboratorio están integradas por una serie de prácticas que se realizan como recetas, son rígidas y en muchas ocasiones no existe una continuidad entre ellas. Lo anterior trae como consecuencia que el proceso de enseñanza-aprendizaje no alcance sus objetivos porque resulta poco atractivo para los alumnos. Para contrarrestar esa inercia, en la formación en el área de ingeniería, es recomendable que desde los primeros cursos se cuente con laboratorios que les proporcionen a los estudiantes una formación sólida, con principios metodológicos que les ayuden a resolver problemas en su desarrollo profesional. En este trabajo se plantea un curso de laboratorio de ciencias, en el que los participantes desarrollen su capacidad de aprendizaje, adquiriendo a la vez una formación metodológica y crítica.*

Index Terms — *Asignaturas teórico-experimentales, formación científica, ingeniería química, trabajo experimental.*

INTRODUCCIÓN

En la actualización de los planes y programas de estudio de las carreras de ingeniería se debe contemplar la necesidad de proporcionar a los estudiantes una formación sólida en métodos y mediciones experimentales, ya que se espera que los egresados de esas áreas tengan la capacidad de resolver numerosos problemas.

En ese orden de ideas, los cursos de laboratorio pueden ser el medio para adquirir muchas de las habilidades relacionadas con su trabajo futuro.

Análisis del proceso de aprendizaje

Tradicionalmente en la enseñanza de la ingeniería al nivel de licenciatura o equivalente, primero se ofrece una sólida preparación en las ciencias básicas y de la ingeniería y posteriormente se incorporan cursos de especialidades complementarias.

Al tratar de actualizar la formación y conseguir una preparación más amplia para el educando se han incorporado asignaturas adicionales en el plan de estudios, para el tratamiento de diversos aspectos de actualidad que complementen su educación.

En otros planes de estudios se cuenta con varios módulos opcionales de aplicación, estructurados para una especialidad y orientados hacia determinada área de trabajo que el estudiante seleccione con base en su interés.

Ante estas posibilidades la mayoría de las instituciones relacionadas con la educación y el ejercicio de la ingeniería consideran que el primer enfoque es el que permite alcanzar mejores resultados, facilitando la vigencia de los conocimientos y la necesaria actualización profesional.

A pesar de las diferentes orientaciones, en todos los planes y programas de estudio de las carreras de ingeniería las asignaturas de carácter teórico-experimental ocupan un sitio preponderante, por ser éstas las que representan la interdependencia de las ciencias y la tecnología, misma que es uno de los objetivos de toda especialidad de ingeniería.

Generalmente los cursos experimentales de las materias teórico-prácticas están formadas por un conjunto de reglas que se utilizan como un medio para comprobar y reafirmar lo establecido por la teoría, sin considerar que puede ser un mecanismo para generar nuevos conocimientos, habilidades y actitudes mediante el trabajo metodológico de la experimentación.

En los primeros semestres de estudios de las carreras científico-tecnológicas se presenta además otra problemática, altos índices de reprobación y deserción. Analizar la razón de esto resulta complejo ya que inciden varios factores en ello.

Es conocido que cada vez hay más alumnos con falta de interés y vocación por las carreras científico-tecnológicas, y que tienen fuertes deficiencias metodológicas y conceptuales derivadas de los cursos de los anteriores niveles de educación. Por otro lado las asignaturas están elaboradas con contenidos programáticos excesivos y en ocasiones repetitivos en un bloque de asignaturas seriadas. Debido al calendario escolar y a la rigidez de los programas existe una desvinculación y/o desfasamiento entre los contenidos programáticos de la teoría y el laboratorio.

Por otro lado, la masificación de los procesos educativos en el nivel de referencia trae como consecuencia la escasez de recursos económicos y materiales en las instituciones.

En el primer semestre de estudios de las tres especialidades ofrecidas en la Escuela Superior de Ingeniería Química e Industrias Extractivas (ESIQIE) del Instituto Politécnico Nacional (IPN) se imparten tres asignaturas de carácter teórico-práctico, cuyos programas de prácticas de laboratorio se basan en el objetivo de comprobar y reafirmar

los conceptos y aplicaciones tratados en las sesiones de teoría, considerando un conjunto de experimentos guiados, en relación con algunos temas del programa de la asignatura..

DESARROLLO

El presente trabajo propone un programa de actividades para un *Laboratorio de Ciencias Básicas* para los estudiantes de primer semestre en la ESIQIE, sustentado en el hecho comprobado de que el trabajo en el laboratorio es un mecanismo idóneo para que el alumno adopte y desarrolle una metodología científica-básica.

Los objetivos generales del presente trabajo incluyen el dominio de diferentes tipos de lenguajes; matemático, gráfico, químico, escrito, se espera que genere interés y se adquiera la habilidad para consultar fuentes bibliográficas en otros idiomas y con la información recabada se tenga la capacidad para analizarla, discriminarla y sintetizarla.

Es importante que los estudiantes tengan criterio para ponderar la influencia de los factores (toxicidad, disponibilidad material, economía, tiempo, ecología) que intervienen en un fenómeno fisicoquímico en particular, y que utilicen su creatividad en el diseño de experimentos para fines específicos.

En el trabajo experimental se necesita la aplicación de criterios y habilidades para seleccionar y manipular equipo, instrumental y reactivos de laboratorio; se debe manifestar una actitud crítica para analizar, interpretar y comunicar resultados, así como adoptar hábitos de puntualidad, orden, limpieza y seguridad.

El programa de actividades del *Laboratorio de Ciencias Básicas* está diseñado considerando estos objetivos *y* el propósito de disminuir los efectos negativos de los factores que inciden en el aprovechamiento de los alumnos y en el problema de la deserción. Este se compone de seis sesiones de dos horas cada una, las cuales se describen enseguida.

La primera actividad a desarrollar tiene como objetivo adquirir dominio en el lenguaje químico. Se pretende que identifique las principales funciones químicas en el área de la Química Inorgánica, al mismo tiempo debe conocer los acuerdos internacionales sobre las reglas de nomenclatura de dichos compuestos aprobado por la UIPAC [1]. Además debe interpretar la información gravimétrica y molar que proporciona una fórmula química [2].

Las actividades que están vinculadas para el logro del objetivo anterior pueden ser la búsqueda del contenido de compuestos inorgánicos en las etiquetas de los productos de uso comercial, como medicamentos, limpiadores, artículos de belleza, alimentos, etc. y la clasificación de acuerdo a sus funciones químicas.

Las relaciones cuantitativas y cualitativas se pueden analizar en recetas de cocina.

En la segunda sesión se propone el desarrollo de lenguaje algebraico y gráfico [3]. Con datos experimentales se puede medir la incertidumbre, construir gráficas e interpretar los modelos matemáticos relacionados. En la resolución de problemas generales en la Ingeniería se pueden diseñar diagramas de flujo con simbología relacionada.

La experiencia propuesta es elaborar una estadística de consumo personal diario de agua por los integrantes de una familia. Con la información meteorológica obtenida de los diferentes medios de comunicación construir gráficas de la temperatura promedio en la zona durante un mes [4].

En la tercera sesión se desarrolla la habilidad de lectura de textos científicos en el área de la Química. El objetivo es clasificar las diferentes fuentes de información y encontrar la forma de acceso a las publicaciones periódicas, manuales y catálogos. Otro objetivo es leer, analizar y sintetizar el material de ciencias básicas e ingeniería de que se dispone en los idiomas español e inglés [5 y 6].

Para lo anterior se sugiere hacer la búsqueda de las propiedades físicas y químicas de algunas sustancias en manuales y catálogos, y consultar los artículos publicados en las revistas científicas de circulación nacional e internacional [7 y 8].

En la cuarta actividad se plantea la comunicación escrita. En este punto se tiene como objetivo analizar la estructura de reportes técnicos en cuanto a formato, sencillez, claridad, limpieza, lenguaje adecuado, etc. Es necesario también hacer una revisión de otros tipos de reportes escritos, como son las bitácoras de laboratorio y los informes técnicos.

Por lo que se proyecta una revisión y análisis de la estructura de las tesis de licenciatura de diferentes carreras y la realización de un ensayo para cada apartado en el formato de reporte técnico [9, 10 y 11].

El tema de la quinta sesión es el trabajo en el laboratorio de Química y los objetivos son que obtenga los hábitos generales de trabajo en un laboratorio como son puntualidad orden y limpieza, que conozca los riesgos que se presentan en esa área, así como las medidas de seguridad necesarias.

Se les pedirá que elaboren y presenten un programa audiovisual con notas relacionadas con los tópicos mencionados y que dramaticen una situación de emergencia en un laboratorio [4].

En la última sesión se propone como tema las técnicas de separación y purificación. En ésta se deberán establecer criterios para la composición de mezclas de sustancias líquidas y sólidas, se analizarán las propiedades físicas y químicas de las sustancias para seleccionar la técnica adecuada de separación o purificación, se diseñará el experimento apropiado para aplicar la técnica elegida y se seleccionará el equipo y reactivos necesarios para el experimento [12]. La experiencia sugerida para lograr los objetivos son; determinar el contenido de alcohol en una bebida alcohólica comercial y determinar la concentración de una solución desconocida a partir de soluciones patrón [13].

CONCLUSIONES

El diseño de las actividades se realizó con la idea de propiciar una formación integral de los estudiante al reforzar una actitud metodológica y critica, para que tengan un adecuado desempeño en todas las asignaturas teórico-experimentales. A su vez, se puede dar atención a un alto número de alumnos sin que esto represente una considerable inversión económica en reactivos.

Por otro lado, este programa es independiente y por lo tanto no se presenta desfasamiento con la teoría al no estar vinculado al avance programático de ésta en las diferentes asignaturas involucradas, sin embargo, muestra interdisciplinariedad lo cual fortalecerá las actitudes metodológicas del estudiante, reflejándose este aspecto en una reducción de la pérdida de recursos institucionales derivada de la deserción estudiantil por razones de irregularidad académica.

El trabajo de laboratorio es una actividad que se puede realizar con éxito cuando se ha tenido una formación metodológica sólida. Es necesario que el tiempo que emplean los estudiantes en las actividades experimentales sea de gran valor parar su formación y los prepare para resolver problemas en su futura vida profesional.

ESTRATEGIAS INTEGRADORAS PARA PROMOVER EL APRENDIZAJE DE LAS CIENCIAS

Laura R. Ortiz E.[1], Víctor M. Feregrino H.[2] y Ma. Elena Navarro C.[3]

Abstract *— La resolución de los problemas que plantea la sociedad, demanda la participación de profesionales que se desenvuelvan de manera interdisciplinaria y que estén inmersos en la dinámica del desarrollo acelerado del conocimiento. Las diversas áreas de la Ciencia, han visto disminuida su matrícula escolar en instituciones de educación superior por razones conocidas: aparente dificultad, desvinculación del contexto social, poco atractivo, etc. En la ESIQIE-IPN (México), se ofrecen licenciaturas del área tecnológica que demandan un alto desempeño en las asignaturas de Ciencias. Se presentan los resultados de una serie de estrategias desarrolladas por un grupo de profesores para los estudiantes del primer año, cuyo objetivo principal fue promover el acercamiento de los alumnos hacia las asignaturas menos atractivas para ellos y mejorar su desempeño académico.*

Index Terms — Aprendizaje de las ciencias básicas, desarrollo de habilidades, formación integral, ingeniería química

PRESENTACIÓN

Se sabe que la enseñanza de las Ciencias Básicas en los niveles del bachillerato y superior se realizó durante mucho tiempo con un enfoque centrado en el profesor, bajo el punto de vista de que es necesario presentar, como sinónimo de enseñar, la mayor cantidad posible de los conocimientos desarrollados en cada disciplina científica, como signo de buena calidad académica para la futura vida profesional.

De tal forma, el proceso favorecido es el de enseñaza y el alumno se limita a tomar apuntes y, esporádicamente, solicitar explicaciones de lo expuesto durante la clase.

Con el explosivo crecimiento del conocimiento científico y tecnológico, se ha observado que dicha práctica educativa no es operante por requerir un mayor número de horas–clase en todas y cada una de las asignaturas del plan de estudios, con el único propósito de poder exponer todos los conocimientos de frontera.

Esta situación ha propiciado que los alumnos encuentren poco atractivas las sesiones de clase, prejuzguen a muchos profesores y rechacen aprender los contenidos de las diferentes asignaturas, generándose sentimientos de malestar que se manifiestan a través de diversas actitudes y expresiones de disgusto, aburrimiento y desinterés que conducen a la falta de atención reprobación y por último a la deserción.:

Este conjunto de factores es característico, aunque no exclusivo, del proceso de enseñanza–aprendizaje de las Ciencias Básicas en las carreras del campo de la Ingeniería, a pesar de la importancia que representan como elemento fundamental para la comprensión, integración, dominio y aplicación de los conocimientos tecnológicos de cada especialidad [1].

Sin embargo, es necesario crear conciencia en los estudiantes sobre la importancia que las diferentes disciplinas de la Ingeniería tienen en la formación del profesional que atenderá los requerimientos de la sociedad relacionados con el uso adecuado de la energía y los recursos naturales, el desarrollo de nuevos materiales y la recuperación y conservación del medio ambiente.

Los nuevos procesos educativos de las Ciencias Básicas en las carreras de Ingeniería plantean opciones metodológicas para que el ejercicio de la docencia propicie el aumento del interés de los alumnos por dichas ciencias y la adopción consciente de su corresponsabilidad en su propia formación profesional.

Entre otras opciones, se ha encontrado que la interacción profesor-alumno, la asesoría personalizada, la resolución de problemas contextualizados al entorno [2], la participación en proyectos de investigación y la vinculación con personal académico de otras instituciones, permiten revertir la imagen distorsionada de las Ciencias Básicas y favorecer el aprendizaje significativo [3] y el desarrollo de habilidades y actitudes, elementos fundamentales de la formación integral [5]

Entre dichas habilidades y actitudes, reconocidas como elementos permanentes del desarrollo profesional, destacan la comunicación y el trabajo en equipo, la resolución de problemas y la toma de decisiones, el autoaprendizaje, la creatividad, la innovación y el liderazgo [4].

DESARROLLO

La Escuela Superior de Ingeniería Química e Industrias Extractivas (ESIQIE) del Instituto Politécnico Nacional (IPN) tiene como objetivo la formación de recursos humanos en las áreas de la Ingeniería Química y la Ingeniería Metalúrgica.

[1] Laura R. Ortiz E., ESIQIE-IPN, edificio 7 UPALM, Zacatenco, México, 07738, D. F., México, lauroze@hotmail.com
[2] Víctor M. Feregrino H. ESIQIE-IPN, edificio 7 UPALM, Zacatenco, México, 07738, D. F., México, vifehe@yahoo.com.mx
[3] Ma. Elena Navarro C., ESIQIE-IPN, edificio 7 UPALM, Zacatenco, México, 07738, D. F., México, elnacle@yahoo.com.mx

Los planes de estudio de sus carreras consideran dos semestres de tronco común, a cargo del Departamento de Ciencias Básicas (DCB).

El trabajo en este periodo tiene como objetivo el homogeneizar los conocimientos de los alumnos de nuevo ingreso y desarrollar metodologías de trabajo necesarias para el estudio de cada especialidad.

Como Departamento responsable de sentar las bases de la formación de los estudiantes, se requiere hacer énfasis en la educación integral y el desarrollo profesional, por lo que se considera la cobertura de los aspectos del ***saber*** (conocimientos), del ***hacer*** (habilidades) y del ***ser*** (actitudes).

De esta forma, toda actividad de enseñanza–aprendizaje debería involucrar la realización de esfuerzos mentales, físicos y actitudinales tanto para estudiantes como para profesores.

Al respecto, se han identificado algunas actividades auxiliares que requieran la realización de dichos esfuerzos, así, el *esfuerzo mental* predomina en acciones simples como: formular interrogantes, descifrar acertijos, encontrar elementos ocultos, realizar cálculos aproximados, inventar historias y problemas y modificar condiciones en problemas conocidos; el *esfuerzo físico* está presente y destaca en acciones como: leer en voz alta, escribir un texto, realizar búsquedas bibliográficas y realizar experimentos u observaciones. Por su parte, el *esfuerzo actitudinal* predomina al: participar en competencias y juegos y al trabajar en equipo.

En este contexto, las diferentes Academias del Departamento de Ciencias Básicas de la ESIQIE-IPN, han diseñado y ensayado diversas actividades curriculares y extracurriculares de apoyo al proceso de aprendizaje con el propósito fundamental de que los alumnos establezcan relaciones entre los contenidos de las asignaturas y su entorno, a la vez de desarrollar habilidades y actitudes que complementen su formación.

Con el propósito de establecer un vínculo entre los conocimientos teóricos y el entorno, se propicia la participación en proyectos de investigación bibliográfica y de campo en las diversas áreas de las Ciencias Básicas, Ingeniería y Educación, con la presentación de los resultados obtenidos en los foros académicos adecuados.

Para esto, los alumnos seleccionan un tema de su interés, realizan la correspondiente búsqueda de información bibliográfica, clasifican, analizan y reportan sus conclusiones mediante un informe escrito.

En el caso de investigaciones de campo, los alumnos diseñan además su instrumento de recolección de información, lo aplican, analizan los datos y exponen sus conclusiones en forma gráfica y/o escrita.

Debido al nivel de estudios en que se encuentra el DCB, a la fecha no se han realizado investigaciones experimentales, sin embargo, algunos temas tratados a nivel de investigación bibliográfica y de campo han servido como tema de Tesis profesional cuando los retoman en semestres avanzados.

Este tipo de actividades tiene por objetivo que los alumnos participantes observen cambios positivos en su autoestima, orientación vocacional, relaciones humanas y desempeño académico.

Otro conjunto de actividades extracurriculares para el desarrollo de habilidades, se realiza por sugerencia de los profesores y como elemento complementario de la evaluación.

Estas actividades se orientan a fortalecer la creatividad, capacidad de organización, trabajo en equipo y espíritu de competencia.

Entre ellas se encuentra el diseño de juegos académicos de destreza, armado de rompecabezas, resolución de acertijos lógicos, escritura de cuentos y ensayos, diseño y presentación de experiencias de cátedra, resolución de problemas integradores y la propuesta de usos alternativos de objetos comunes.

Con este conjunto de actividades, además de disfrutar su aspecto lúdico, los alumnos tienen la oportunidad de mejorar su capacidad de análisis y creatividad, al diseñar y proponer otras actividades similares.

El reconocimiento de las diferentes capacidades de los estudiantes, requiere de actividades que propicien su desarrollo, para esto se promueve su participación en exposiciones de profesiones y Ferias de Ciencias.

Los alumnos que deciden incorporarse en estas exposiciones, diseñan, ensayan y/o presentan actividades experimentales orientadas a despertar el interés vocacional, mejorar la imagen de las Ciencias, divulgar el conocimiento científico–tecnológico, destacar la importancia del quehacer científico y su impacto en la sociedad y facilitar el acercamiento de los niños a la Ciencia.

En el caso de la feria de carreras ofrecidas por el IPN, los alumnos realizan demostraciones recreativas para atraer la atención de los visitantes y mostrar aspectos agradables de las Ciencias y la Ingeniería.

En la Feria de Ciencias, orientada a rescatar el interés por las diferentes ramas del conocimiento científico entre la población de educación básica, los alumnos conducen la realización de actividades sencillas por parte de los niños visitantes, las cuales implican poner en juego los sentidos y el razonamiento.

Estas actividades de divulgación se presentan en festivales institucionales, durante la Semana Nacional de la Ciencia y la Tecnología, así como en los congresos nacionales de educación de la Sociedad Química de México.

Estas actividades están orientadas a mejorar la matrícula de nuevo ingreso a la Institución, la imagen de la misma ante la comunidad y a que los alumnos involucrados en estos eventos canalicen sinérgicamente su entusiasmo y disposición, mejorando su capacidad de organización, espíritu de responsabilidad, vocación profesional y habilidad de comunicación.

Con el propósito de mejorar la capacidad de organización, relaciones humanas y responsabilidad en el cumplimiento de las actividades comprometidas, se recomienda la participación en las secciones estudiantiles de las agrupaciones gremiales afines para que los estudiantes colaboren en la organización de las diferentes actividades académicas (congresos, cursos cortos, visitas industriales, conferencias técnicas, etc.) y sociales (conferencias culturales, excursiones) que realizan las secciones estudiantiles del Instituto Mexicano de Ingenieros Químicos (IMIQ), la Sociedad Química de México (SQM), la Sociedad de Ingenieros en Plásticos (SIP), la Sociedad Polimérica de México (SPM), la Sociedad Química Cosmetológica (SQC), etc.

El desempeño de los alumnos participantes, les permite ocupar cargos directivos a nivel institucional y nacional, facilitando su ingreso al mercado ocupacional por su interacción frecuente con los profesionales del ramo.

En otro bloque de actividades extracurriculares, se motiva a los estudiantes para que organicen eventos académicos y culturales como ciclos de conferencias y competencias académico–deportivas, dirigidas a la propia comunidad estudiantil.

En la realización de estas actividades, los estudiantes ponen en juego su capacidad de organización y corresponsabilidad, a la par de promover el espíritu de competencia entre los participantes.

CONCLUSIONES Y RECOMENDACIONES

El desarrollo de habilidades de los estudiantes de Ingeniería puede fomentarse a través de estrategias de enseñanza–aprendizaje, dentro y fuera del salón de clase, mediante actividades complejas (desarrollo de proyectos y organización de eventos) y puntuales (escritura de ensayos, diseño de juegos, resolución de problemas, participación en competencias, etc.). Para alcanzar una formación integral de los estudiantes de nivel superior, más que seguir incluyendo asignaturas que saturan los programas de estudio, es altamente recomendable instrumentar estrategias de enseñanza-aprendizaje que involucren la realización de actividades curriculares y extracurriculares orientadas al desarrollo de habilidades y actitudes. La experiencia ha mostrado excelentes resultados en la mejora de la autoestima de los estudiantes que han participado en las diferentes actividades, se han fortalecido los canales de comunicación entre profesores y alumnos y éstos se han percatado de que es posible establecerlos entre sus compañeros y con estudiantes más jóvenes. Ambas situaciones de mejora han permitido a los alumnos, sentirse menos presionados o agredidos en un ambiente al que han accedido por razones de estudio, en una época en que están sujetos a muchos cambios

La participación de los alumnos de nivel superior en eventos de difusión y divulgación dirigidos a jóvenes y niños ha mostrado excelentes resultados, en razón de la afinidad y confianza mutua que facilitan la comunicación entre ellos.

Es posible establecer vínculos de cooperación entre estudiantes de diversas instituciones educativas a través de la realización de conferencias, cursos, visitas, congresos, concursos, etc, organizados por ellos mismos.

La realización de algunas de estas actividades, permite consolidar la vocación de los estudiantes, sobre todo en momentos en que el exceso de información, hace más atractivas las licenciaturas relacionadas con la electrónica, las comunicaciones y la computación.

Con el propósito, entre otros, de hacer más atractivo el estudio de las Ciencias Básicas, es necesario que los profesores fortalezcan sus habilidades y actitudes para diseñar, seleccionar y asesorar aquellas actividades en que participarán los estudiantes.

Los profesores involucrados en el diseño de estas actividades, encontrarán un mayor número de elementos que permiten evaluar de forma integral el aprendizaje de sus estudiantes.

LO BLANCO Y LO NEGRO DEL PROCESO EDUCATIVO

Laura R. Ortiz E.[1]*, Víctor M. Feregrino H.*[2] *y Ma. Elena Navarro C.*[3]

Abstract — *Cuando se pretende realizar el análisis de los diferentes momentos, componentes o de todo el proceso educativo, resulta más fácil y conveniente enmarcarlo dentro de algún modelo educativo proporcionado u oficializado, pero es precisamente lo opuesto lo que permite cuestionar sobre los elementos que siempre están presentes y establecen los límites del análisis. En este trabajo se presenta una introspección de los límites de cinco elementos de dicho proceso: poder (autoridad-libertad), individuo (persona-sociedad), contenido (formación-información), trabajo (esfuerzo-interés) y contexto (idealidad-realidad), sin inducir o cuestionar el grado positivo o negativo de los mismos. Para sustentar lo anterior se citan diversos valores educativos que validan el principio axiológico del presente trabajo, así como la concepción de los actores principales alumno-profesor, como individuos con fortalezas y debilidades que se reflejan en su proceder y, por consecuencia, en el proceso educativo.*

Index Terms — *Actitudes, educación integral, educación superior, valores.*

DESARROLLO

Esta investigación cualitativa, expone las definiciones de los supuestos axiológicos que enmarcan a cinco antinomias en cualquier componente y momento del proceso educativo, permitiendo además definir una concepción sobre la participación de los dos actores principales en el mismo.

Conciencia Histórica.

Permite orientar acciones al aceptar la identidad y la unidad nacional, como parámetros de reflexión sobre la cultura, en un contexto específico, eliminado manifestaciones de xenofobia, patriotismo intolerante o nacionalismo a ultranza.

Conciencia moral.

Importancia de descubrir que la conducta es el producto de la reflexión y decisión personal, pero lo suficientemente clarificada para garantizar la base racional y evitar la anarquía y el autoritarismo.

Servicio.

Entrega que antepone interés o comodidades para hacer de la tarea un trabajo solidario y compromiso de colaboración.

Humanismo.

Perfeccionamiento del hombre al identificar sus alcances, contradicciones y absurdos en el respeto de las reglas de la naturaleza, al buscar el fin último de integrarse a la misma.

Apertura al cambio.

Ser más humano y plural en las relaciones sociales, a través de la reflexión y análisis de la existencia de nuevas formas de vida y pensamiento.

Vocación.

Inclinación, cauces técnicos, científicos y legales que permiten ejercer una profesión, entendida como el procedimiento que garantiza un desempeño más articulado.

Integración social.

Interpretación de la persona dentro de la totalidad, la cual se alcanza en la medida que se equilibran en sus justas relaciones lo personal y lo colectivo, en un clima de libertad y participación democrática.

Transmisión de cultura.

Se convierte en valor cuando como ciencia y técnica, con buen juicio, integra lo particular con lo general de nuestras raíces.

Tolerancia.

Entendida como el desarrollo del respeto en la convivencia con los otros que piensan, sienten y actúan de manera diferente a la propia.

Comunicación.

Llega a ser un valor cuando su manifestación es un dialogo abierto para comprender y escuchar a los demás, favoreciendo el encuentro entre los participantes.

Autoformación.

Implica continuar aprendiendo después de la permanencia en un sistema escolarizado y formal, a través de la preparación, reflexión e incorporación de saberes, valores y actitudes que favorezcan el desarrollo humano.

Si el planteamiento del análisis se realizara buscando solo el significado y la contraparte de estos valores, entonces estaríamos en una posición interpretativa. Por el contrario, la idea principal es presentar estos valores educativos como medidas de reflexión y sugerencias de resolución.

El reconocer alcances, recursos y sobre todo límites de acción, nos facilita la opción de decidir con firmeza y enfatizar una crítica que construya decisiones que favorezcan la educación, al permitir definir los procedimientos y/o características que deben prevalecer cuando nos enfrentamos a algún problema o disyuntiva de nuestro quehacer educativo.

En este encuadre las antinomias se expondrán comparativamente para reconocer su rango de acción entre cada par, sin embargo aunque el título del trabajo expresa un punto blanco y su extremo negro, en ningún momento se desean establecer como parámetros de consideración drástica, mucho menos dogmática.

Sociedad-persona

La primera nos fija patrones de comportamiento, ciertos códigos de valores, requerimientos que considera suficientes para el bien común o simplemente usos y costumbres que nos permiten ejercer acciones democráticas o solidarias; sin embargo cada uno de nosotros como persona tiene derechos sustentados en criterios, intereses y afanes, ponderables aún en contra de la misma colectividad.

Libertad-autoridad

Nacemos con la libertad de acción y son los factores condicionantes externos los que acotan esta facultad de decisión y acción, presentándose así un límite máximo que es la autoridad, la cual debe estar estructurada con fundamentos ontológicos, éticos y jurídicos que impliquen orden y mandato, mismos que, al no existir los anteriores fundamentos, se pueden convertir en abuso y arbitrariedad.

Idealidad-realidad

Al enfrentarse ambas como un dilema, se genera un conflicto de adecuación y confrontación de supuestos. Esto en razón de que la primera se manifiesta a través de un modelo único que rige el actuar en todos los rubros Institucionales, en tanto que la segunda se relaciona con la manifestación histórico-social de tal modelo, en un momento y espacio.

Formación-información

En referencia a la primera se define como el resultado de una experiencia vital y una orientación axiológica, que adecue los conocimientos en forma objetiva, sustentado en sus creencias y fines personales y sociales, cuidando de no caer en el adoctrinamiento o dogmatismo. Por el contrario, la segunda pretende crear un cientificismo intolerante al presuponer que el saturar de saberes es el objetivo principal, no importando la aportación o acercamiento de este conocimiento a la realidad social.

Esfuerzo-interés

Este último par antagónico se considera el más subjetivo de todos, puesto que involucra aspectos de motivación como elemento intrínseco de cada persona, hecho que ocasiona que sea la decisión del individuo el peso mayor al momento de sopesar sus metas, objetivos, simpatías y necesidades. Su selección estará enfocada a favorecer su entorno cultural, social y económico y en la mayoría de las veces será la que le represente menor esfuerzo.

ANÁLISIS

Si la referencia es una institución educativa, cómo responderíamos a la pregunta: ¿hasta dónde nuestra conducta es egoísta y hasta dónde es colectiva?. Está claro que existe todo un contexto personal y una formación que obligan a definir la respuesta con base en nuestra conciencia histórica y moral, además de otros valores como la apertura al cambio, la transmisión de cultura, etcétera.

Y el pensamiento trabajaría entonces entre un extremo personal y otro extremo social, efecto que como opuesto nos permitiría vislumbrar a cual le va a dar mayor importancia a satisfacer mis intereses, sin ponderarlos requerimientos como Institución, o es más significativo el sacrificar mi persona por el bien común.

También podríamos considerar que en el ámbito académico, se pueden presentar los extremos de una libertad excesiva que se puede convertir en libertinaje donde hago lo que quiero sin respeto ni tolerancia y una autoridad impuesta y sin valor alguno que pierde el control de las acciones. En cualquiera de estos casos, el compromiso social, la vocación de servicio y la apertura a los cambios están lejos de aparecer.

En cuanto a los contenidos, la referencia cotidiana sería el establecer un cúmulo de datos, teorías, etcétera, que yo Profesor vacié a los estudiantes para que la repitan como tal, es decir mi punto límite es la información; o mejor reflexiono sobre lo que le será significativo, lo que manejará y empleará en su formación, que es nuestro otro extremo, evidenciando los valores educativos, de transmisión de cultura, conciencia histórica, vocación, y sobretodo inculcando la autoformación y el humanismo.

El mismo efecto sucede cuando se revisa el modelo educativo de nuestra Institución que de manera ideal nos presenta la misión y la visión que se debe buscar y sucede que cuando observamos nuestra realidad, visualizamos una serie de incongruencias, carencias, ineficiencias, que además de desmerecer nuestro interés, desaniman en ocasiones nuestro esfuerzo. Pero esto es factible de acomodarse después de sopesarlos bajo los valores de tolerancia, servicio, vocación, comunicación y autoformación.

CONCLUSIONES

Sería interminable complejo y aparentemente indescifrable el analizar cada uno de los componentes y momentos del proceso educativo, lo que esta experiencia nos marca es un camino que nos permite, establecer que estos aspectos son factibles de resolverse; a través de la representación de una red de posibilidades, con la conciencia de los límites y niveles a los que nos enfrentamos.

Esta conciencia siempre deberá estar regida por principios axiológicos que facilitan nuestro actuar y encuadrada en principios pedagógicos señalados como antinomias por su antagonismo referencial, pero que nos permiten reconocer los límites de nuestra práctica.

En una revista llamada tiempo libre apareció un día del maestro un artículo titulado "hoy, educar es diferente", y que escribe: "Educar hoy es diferente, no porque halla cambiado el objetivo fundamental...........sino porque hay que tomar en cuenta los distintos elementos de nuestro tiempo, que antes no existían y que han venido a imponerse en el mundo de la modernidad"...... exige prepararse más y mejor, identificar una jerarquía de valores y –hacerlos valer- por la congruencia de la propia vida......." (Paz Fernández, 1998).

Por último "Educamos más por lo que somos que por lo que hacemos y decimos, porque la educación es una forma de vida, no sólo una profesión o actividad". (Blanco, 1997).

UNA METODOLOGIA PARA EL ANALISIS Y OPTIMIZACION DE MODELOS QUE EVALUAN LA CALIDAD DE LA ENSEÑANZA

Prof. Dr. –Ing. Francisco Alba Juez [1], Prof. Dr. –Ing. Francisco Aparicio Izquierdo[2].

Resumen-- *El presente trabajo está encuadrado dentro de los campos de la calidad total, y de la educación superior, y dentro de esta, específicamente en lo que hace a la formación de Ingenieros. Se ha diseñado una metodología que permite analizar y optimizar Modelos que Evalúan la Calidad de la Enseñanza. Dicha metodología, se ha aplicado al análisis y optimización del Sistema SECAI (Sistema de Evaluación de la Calidad de las Enseñanzas de la Ingeniería, desarrollado en el marco del Programa Columbus de la Comunidad Europea), utilizando los datos emergentes de la aplicación de SECAI a la evaluación de nueve Carreras de Ingeniería de cinco Universidades de diferentes países. La metodología diseñada se ha obtenido utilizando una estrategia de análisis mixta entre experimentación y métodos estadísticos, lo cual ha hecho posible definir criterios suficientemente científicos y estables, que han permitido obtener un Modelo Optimizado, cuya aplicación a las nueve Carreras de las cinco Universidades antes mencionadas, ha arrojado resultados análogos a los obtenidos con el Modelo SECAI Original, mejorando su eficiencia sin disminuir su eficacia.*

En este trabajo se ha diseñado una metodología para analizar y optimizar modelos que son utilizados para evaluar la calidad del proceso de enseñanza aprendizaje de Instituciones Universitarias, pero nada impide extender su aplicación a procesos o sistemas que no tengan nada que ver con la educación superior.

El modelo elegido para analizar y optimizar ha sido el Modelo SECAI (Sistema de Evaluación de la Calidad de la Enseñanza de Ingeniería) desarrollado en el marco del programa COLUMBUS DE LA COMUNIDAD EUROPEA. Por un grupo de expertos en evaluación de la enseñanza de la Ingeniería, procedente de los siguientes centros:

- IMPERIAL COLLEGE OF SCIENCE – INGLATERRA
- INSTITUTO TECNOLOGICO DE MONTERREY – MEXICO
- POLITÉCNICO DE TORINO – ITALIA
- PONTIFICIA UNIVERSIDAD JAVERIANA DE BOGOTA – COLOMBIA
- TESCHNISCHE HOCHSCHULE – DARMSTAD – ALEMANIA
- UNIVERSIDAD CATOLICA DE VALPARAISO – CHILE
- UNIVERSIDAD DE RIO DE JANEIRO – BRASIL
- UNIVERSIDAD POLITÉCNICA DE MADRID – ESPAÑA
- UNIVERSIDAD NACIONAL DE MAR DEL PLATA – ARGENTINA

Analizando los conceptos y fundamentos que han servido como base para el diseño y estructuración del Modelo SECAI, rápidamente se advierte que estos responden a los conceptos y fundamentos del Control de Calidad Total aplicado en la industria, naturalmente, con las adaptaciones pertinentes al campo de aplicación para el que ha sido diseñado, esto es, la enseñanza superior.

En este modelo se define Calidad de la Enseñanza de la siguiente manera:

"La enseñanza es de calidad en la medida en que se logran los objetivos previstos y estos son adecuados a las necesidades de la sociedad y de los individuos que se benefician de ella".

Esta definición nos conduce al diseño del plan de estudios y especialmente, a los objetivos formativos, su pertinencia y su realismo.

En función de esto, los expertos de SECAI han considerado como una buena base a la hora de establecer una estrategia de evaluación de la calidad de la enseñanza, centrar ésta, en la institución, que ofrece un programa de estudios, su misión, sus fines, el contexto social al que debe servir, el proceso interno de enseñanza - aprendizaje que desarrolla y la concordancia entre logros, objetivos previstos y recursos utilizados.

Con todo esto, llegamos al concepto de "Calidad Global de la Enseñanza", equivalente al de "Calidad Total" utilizado en las empresas industriales, puesto que se plantean, ahora, varios componentes de la calidad de la enseñanza:

- *Calidad del plan de estudios*
- *Calidad del proceso de enseñanza*
- *Calidad de resultados inmediatos*
- *Calidad de integración*
- *Calidad de servicio o de resultados a medio y largo plazo*

[1]Presidente de la Federación Iberoamericana de Ingeniería Mecánica – Director del Instituto de Mecánica Aplicada – Facultad de Ingeniería – Universidad Nacional de San Juan- Avenida Libertador 1109 – oeste – C.P. 5400 – Capital – San Juan – Argentina – Tel.-Fax: 0264-4210277 – E-mail: falba@unsj.edu.ar
[2]Vicepresidente de la Federación Iberoamericana de Ingeniería Mecánica-Catedrático de la Universidad Politécnica de Madrid – España – Escuela Superior de Ingenieros Industriales – José Gutiérrez Abascal Nº 2 – Tel.: 0034-91-3365304 – E-mail: faparicio@insia.upm.es

Para evaluar cada uno de los componentes de calidad antes definidos, se utilizan indicadores de calidad.

Estos indicadores deberán ser cuantitativos y cualitativos.

Es de destacar que si bien la utilización de Indicadores cualitativos es insoslayable, su valoración objetiva resulta extremadamente difícil.

El Modelo SECAI se estructura en un conjunto de 94 indicadores a través de los cuales se pretende evaluar los siguientes factores de calidad:

1. Plan de Estudios
2. Condiciones de ingreso de los estudiantes (entrada proceso)
3. Proceso de enseñanza – aprendizaje
4. Resultados inmediatos
5. Integración de los graduados

Cada indicador es valorado con una escala de 1 a 5, utilizándose el cero cuando no se puede valorar o calificar por falta de datos u otras razones, vale decir: 5 → MUY ALTA, 4 → ALTA, 3 → MEDIA, 2 → BAJA, 1 → MUY BAJA, 0 → SIN CALIFICACION POR FALTA DE DATOS U OTRAS RAZONES.

Además, con el objeto de que el auditor o evaluador pueda emitir un juicio globalizado acerca de cada factor o subfactor, se utilizan índices de calidad cuya valoración es también de 1 a 5, valoración que no tienen porqué coincidir con el valor medio de las valoraciones o calificaciones otorgadas a los indicadores de su grupo, ya que eso supondría atribuir el mismo peso a cada uno, lo cual no tiene ningún, fundamento, ni teórico, ni práctico.

En resumen, este Modelo en su versión original, está compuesto por cinco factores, 6 subfactores, 94 indicadores, 9 subindices de calidad y 5 índices de calidad.

A continuación se presenta una planilla resumen utilizadas para las evaluaciones internas y externas:

Cuadro I:

En función de lo expresado y dado que efectivamente, el Modelo SECAI ha sido diseñado teniendo en cuenta los conceptos y fundamentos del Control de Calidad Total en la Industria, se decidió tener en cuenta estos mismos fundamentos y conceptos para analizarlo y optimizarlo, por cuanto, en nuestra opinión, existía una súperabundancia de indicadores.

Básicamente el Control de Calidad Total en la Industria se define como:
"El conjunto de esfuerzos efectivos de los diferentes grupos de una organización para la integración del desarrollo, del mantenimiento y la superación de la calidad de un producto, con el fin de hacer posibles fabricación y servicio a satisfacción del consumidor y al nivel más económico".

Por otra parte, en el Control de Calidad Total se deben seguir los siguientes cuatro pasos:

1. *Control de Calidad en toda la organización, con la participación de todos los miembros de la misma.*
2. *Educación y capacitación en Control de Calidad para todo el personal*
3. *Auditoría de Control de Calidad Interna y externa.*
4. *Utilización de Métodos Estadísticos*

En función de todo esto, el fundamento del concepto de Calidad Total es que: *"el control debe iniciarse con el diseño del producto, y no termina sino cuando este llega a manos del consumidor y lo satisface".*

En la elaboración del Modelo SECAI se han tenido en cuenta todos estos pasos y fundamentos, excepto el 4, es decir, la utilización de métodos estadísticos, métodos que nosotros utilizaremos para analizar y optimizar el Modelo SECAI.

Veamos que es lo que se hace en la industria.

En primer lugar diremos que las características de calidad de un producto, proceso o sistema, cualesquiera sean estos, son dos:

- *Características de calidad reales*
- *Características de calidad sustitutas*

Por ejemplo, en un buen automóvil de turismo, las características de calidad reales o atributos que los consumidores exigen son los siguientes :

- *Buen diseño*
- *Facilidad de conducción*
- *Confort*
- *Buena aceleración*
- *Estabilidad a altas velocidades*
- *Durabilidad*
- *Seguridad*
- *Facilidad de reparación*

Como se puede ver, las características de calidad reales son generalmente subjetivas y por lo tanto muy difíciles de medir, y aquí surge el problema fundamental a resolver, que es: como lograr estas características, que son las que demanda el consumidor. Las empresas que mejor logran esto, son las que ganan el mercado.

Las características de calidad sustitutas son, en cambio, aquellas que se pueden medir y las que hay que definir para poder lograr las características de calidad reales.

En el caso del automóvil, las características de calidad sustitutas serían, por ejemplo :

- *las materias primas*
- *la resistencia de los materiales*
- *los procesos de fabricación y maquinado*
- *las tolerancias*
- *los tratamientos térmicos*
- *etc.*

Características éstas que rápidamente se advierte que son medibles, y por tanto, objetivas.

Ahora bien, el proceso a seguir para obtener las características reales a partir de las sustitutas, es el siguiente :

- *Definir las características de calidad reales para un producto dado.*
- *Resolver el problema de como medir tales características y como fijar las normas de calidad para el producto.*
- *Determinar las características de calidad sustitutas*
- *Establecer la relación entre las características de calidad reales y las sustitutas mediante estadísticas y análisis de calidad.*

En general, una vez definidas las características de calidad reales (mediante encuestas, estudios de mercado, etc.) y las posibles características de calidad sustitutas (mediante el concurso de especialistas) que nos permitirán alcanzar dichas características reales, se debe realizar un análisis de calidad estadístico para determinar cuales de estas características sustitutas seleccionadas, son las que nos permitirán alcanzar las reales, e incluso no habrá que extrañarse si algunas de ellas no tiene ninguna o escasa relación con las reales.

Para poder realizar este análisis, normalmente se diseña un modelo que recurre a indicadores de tipo cuantitativo y cualitativo, y en general, se puede decir que los indicadores cualitativos representarán características de calidad reales, mientras que los indicadores cuantitativos se referirán a características de calidad sustitutas, aunque alguno de ellos puede representar una característica de calidad real.

Por lo tanto el problema básico consiste en diseñar una metodología que nos permita determinar el grado de correlación que existe entre estos indicadores.

Diseñada esta metodología, estaremos en poder de una herramienta que nos permitirá, en primer lugar, optimizar el modelo, y en segundo lugar, efectuar su validación.

El problema ya complejo de determinar la calidad de un proceso, sistema o producto industrial, se vuelve – en el caso de una Universidad – altamente complejo, por cuanto el sistema universitario, es uno de los sistemas más complejos que existen, pues está sometido a una serie de condiciones y presiones a los que obviamente no está sometida una fabrica de automóviles y dado que en el caso de la Universidad, el producto son personas, el problema se vuelve más complejo aún, por cuanto las características de calidad reales, se hacen más difíciles de definir y naturalmente, mucho más difíciles de medir y objetivizar, y muchas de las que llamaríamos características de calidad sustitutas, definidas por indicadores cuantitativas que se utilizan normalmente a la hora de evaluar Instituciones Universitarias, ni tienen relación, ni presentan ayuda alguna para definir las características de calidad reales del "producto" ni del sistema, aunque puedan medir la eficiencia de este, que en última instancia podría considerarse como una características de calidad real de él, pero sin que tenga nada que ver en las características de calidad reales del "producto", que es lo que finalmente importa

METODOLOGÍA PARA EL ANÁLISIS Y OPTIMIZACIÓN DEL MODELO

La metodología de análisis y optimización se ha basado en la aplicación de dos métodos estadísticos en conjunción con el método de "juicio de expertos", habiéndose utilizado los resultados de la aplicación de SECAI a nueve carreras de cinco Universidades, que son las siguientes:

1. UNIVERSIDAD: P.J.B.C.
   CARRERA: Ingeniería Electrónica
2. UNIVERSIDAD: N.M.P.A.
   CARRERA: Ingeniería Eléctrica y Electrónica
3. ESCUELA: P.N.Q.E.
   CARRERA: Ingeniería Eléctrica y Electrónica
4. UNIVERSIDAD: P.M.E.
   CARRERA: Ingeniería Técnica Aeronáutica
5. UNIVERSIDAD: C.V.CH.
   CARRERA: Bioquímica
   CARRERA: Ingeniería Eléctrica
   CARRERA: Ingeniería Mecánica
   CARRERA: Ingeniería Química
   CARRERA: Ingeniería Industrial

OBJETIVO DE LA OPTIMIZACIÓN

El objetivo de la optimización es reducir el numero de indicadores sin que pierda eficacia el modelo en cuanto a los resultados de la evaluación y en lo que respecta a la información que suministra para abordar futuros procesos de mejoras de la calidad.

METODOLOGIA

Para lograr este objetivo se ha seguido un desarrollo metodológico basado en dos hipótesis fundamentales:

1. *El modelo original de 94 indicadores elaborado durante un largo periodo, en el que han intervenido un gran número de expertos y docentes, incluye la totalidad de los factores que influyen en la calidad de la enseñanza.*
2. *Es posible reducir el número de indicadores sin que exista perdida de información significativa para la evaluación de la calidad, mejorando la eficiencia del modelo sin pérdida de eficacia.*

Para realizar el análisis y optimización del modelo, se contó con las evaluaciones internas (CEI) y externas (CEE) de las nueve carreras, plasmadas en las respectivas Planillas Resumen. Además se contó con un análisis del modelo, efectuado por 40 expertos, docentes y Directivos de Centros Universitarios. Dicho análisis se había efectuado dos años después de haberse diseñado SECAI y habiéndose evaluado ya varias carreras de Ingeniería de distintas Universidades de varios países, con el objeto de reducir el número de indicadores.

Muchos de estos expertos habían actuado como evaluadores externos de SECAI, y por tanto conocían muy bien el modelo.

Como resultado de este análisis, los 40 expertos concluyeron en que, efectivamente, los indicadores eran demasiados y por tanto recomendaron reducirlos ya fuese eliminando algunos no demasiado importantes o agrupándolos en la forma más conveniente.

De esta acción surge una propuesta de modelo optimizado, basada exclusivamente en el juicio de expertos, que reduce los 94 indicadores a sólo 69.

En función de todo esto, el desarrollo metodológico y los instrumentos, para realizar el análisis y optimización, motivo de este trabajo, se representa en el siguiente esquema:

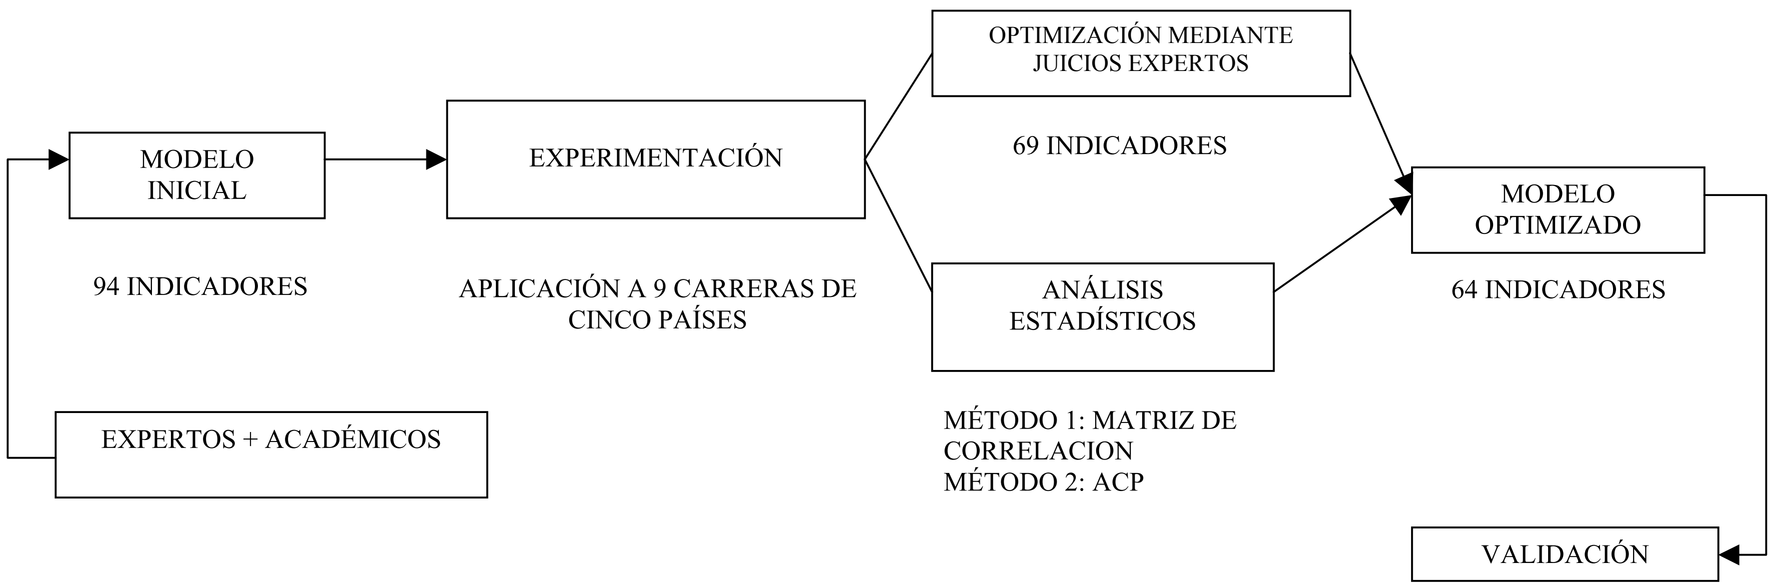

FIGURA I:
Desarrollo Metodológico e Instrumentos

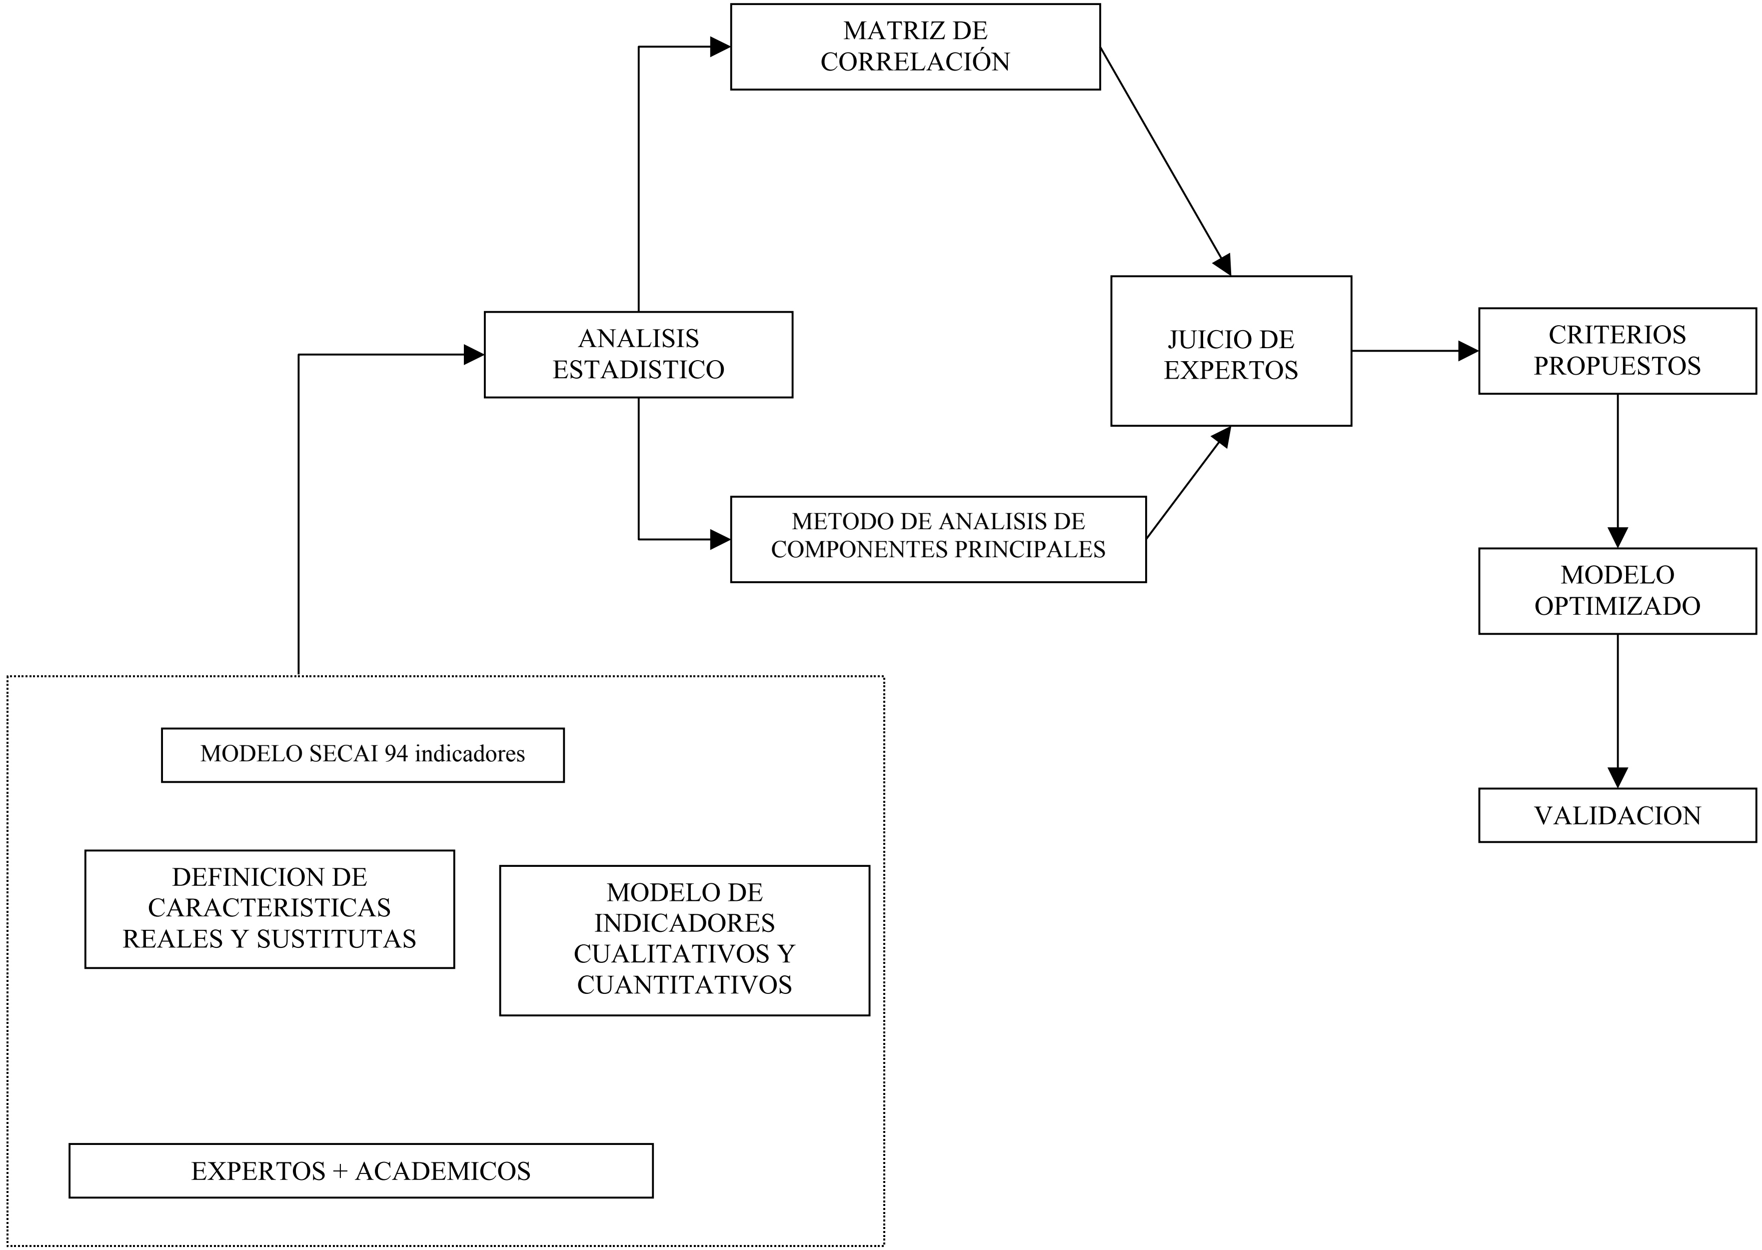

FIGURA II
Metodología seguida para la Optimización

ANÁLISIS ESTADÍSTICO

Si tanto una prueba paramétrica como una no – paramétrica son aplicables al mismo conjunto de datos, se debe evitar, la prueba no – paramétrica "rápida y fácil", y efectuar la técnica paramétrica más eficiente.

Teniendo en cuenta esto, en nuestro caso, dada la forma de calificación adoptada, si bien el nivel de medición es ordinal, los datos pueden ser procesados intervalarmente y se puede suponer un comportamiento paramétrico.

Este concepto es el que nos permite construir las matrices de correlación. Una con la valoración de los indicadores resultado de la evaluación interna y otra con la valoración de los indicadores resultado de la evaluación externa.

MATRIZ DE CORRELACIÓN

Como primer paso hacia la optimización del modelo, se analiza la correlación existente entre los 94 indicadores.

Construimos la matriz de correlación con todos los indicadores (94 x 94), cuyo fundamento es el siguiente:

Supongamos los indicadores x, y, z. La correlación entre los indicadores x e y se expresa como : r (x,y). Este coeficiente de correlación tomará valores entre 1 y -1. Si r (x,y) se acerca a cero, esto implica que ambos indicadores no están correlacionados. En cambio, si tiende a uno, la correlación es alta. Naturalmente r (x,x), r (y,y) y r (z,z) serán igual a 1.

	x	**y**	**Z**
x	1	ρ (x,y)	ρ (x,z)
y	ρ (y,x)	1	ρ (y,z)
z	ρ (z,x)	ρ (z,y)	1

Para determinar que indicadores están correlacionados se realiza un test de hipótesis. La hipótesis a probar es: "los indicadores no están correlacionados"

Esto es equivalente a decir que el coeficiente de correlación es igual a cero, vale decir, r = 0.

Se fija un nivel de significación "p" para la prueba de 5%.

El nivel de significación "p" es la probabilidad de rechazar la hipótesis propuesta siendo esta verdadera.

Si el nivel de significación "p" es menor o igual que 0,05, se rechaza la hipótesis. Lo cual implica que los indicadores están correlacionados.Por lo tanto, se adopta como primer criterio, trabajar con un nivel de confianza del 95% para seleccionar los indicadores que están correlacionados, lo cual, en primera instancia, nos permitiría eliminar todos aquellos indicadores que presentan una correlación con un nivel de confianza mayor o igual al 95%. A modo de ejemplo presentamos la primer página de la matriz de correlación resultado de evaluación interna:

Coefficient (sample size) significance level

A los efectos de dar una explicación rápida de lo que significa esta sucesión de números, tomemos por ejemplo, el indicador 12005 y el 11003 de la matriz de las evaluaciones internas. Debajo de éste, aparecen los siguientes valores:

0,9166 que es el factor o coeficiente de correlación
(9) que es el número de datos
0,0005 que es el nivel de significación

Por tanto, el propio programa, nos da el coeficiente de correlación, el nivel de significación y consecuentemente el nivel de confianza con que se trabaja, que para el caso elegido en el ejemplo será:

(100 x 1) – (0,0005 x 100) = 99,95%
100 – 0,05 = 99,95% que es el nivel de confianza.

Por otra parte, dado que la decisión ha sido trabajar con un nivel de confianza del 95%, esto implica (Loter Sachs: Estadística Aplicada, Tabla 5.13 pág. 358- Ed. Labor-1978) que para 9 datos corresponde un coeficiente o factor de correlación de 0,666. Por encima de este valor hay significación correlativa, por debajo no la hay. Por tanto, si se iguala o supera el valor tabulado (0,666), para 9 datos y test bilateral (que es nuestro caso), se rechaza la hipótesis nula y se acepta la alternativa.

En función de todo esto, de la matriz de correlación se seleccionaron todos aquellos indicadores con un nivel de significación menor o igual a 0,05 (nivel de confianza igual o mayor que el 95%) y con un factor de correlación igual o mayor a 0,666.

La ejecución de dicha matriz a través del software Statgraph Plus ha originado más de 100 páginas, para cada una de ellas (evaluación interna y externa). Del análisis de los resultados finales de la prueba de hipótesis, tanto para los valores correspondientes a las evaluaciones internas como para los correspondientes a las evaluaciones externas, surge -como era de esperar- que existe un excesivo número de correlaciones, cosa que hace casi imposible, en esta etapa, la definición de algún criterio coherente y estable para la eliminación y/o agrupación de los indicadores correlacionados. Por tanto, y a los efectos de lograr las condiciones necesarias para la toma de decisiones referente a la eliminación y agrupación de indicadores, que nos permita lograr la optimización buscada, hacemos ahora, un análisis estadístico utilizando el método de Análisis de Componentes Principales.

ANALISIS DE COMPONENTES PRINCIPALES (ACP)

A diferencia de los resultados obtenidos por la matriz de correlación en forma general, aplicamos ahora el método de ACP, donde los resultados se restringirán en forma individual a cada uno de los factores del Modelo SECAI.

La base de datos es la misma, es decir, la planilla resumen de evaluación de cada carrera.

El ACP es uno de los métodos más utilizados en el análisis multivariable. Consiste en una técnica de reducción de la información disponible sobre un conjunto de elementos, en los cuales se han tomado diversas observaciones. Condensa la matriz de correlación entre las variables, en unos "componentes principales" de la variabilidad total. Vale decir, el ACP es una técnica estadística que permite transformar un conjunto de variables intercorrelacionadas en otro conjunto de variables no correlacionadas, denominadas factores. Estos factores son combinación lineal de las variables originales.

Esta técnica se basa en el análisis de las matrices de varianza y covarianza con el fin de describir sus variables o componentes principales, es decir, las que tienen un mayor poder explicativo de la variación total del sistema.

Se fundamenta, según **C. Taylor**, en suponer que la matriz de varianza – covarianza es el reflejo de una estructura subyacente. De donde la variabilidad del sistema, puede ser explicada en su mayor parte por un número menor de variables componentes principales.

Según el procedimiento desarrollado por **Hotelling**, el primer componente principal que se extrae es el que resume lo mejor posible la información contenida en la matriz de datos original, vale decir, el que contribuye mejor a explicar la varianza total.

El segundo componente principal es el que resume lo mejor posible la información restante, es decir, el que aporta un máximo de la varianza residual resultante, siendo independiente del primero.

La secuencia puede continuar, extrayéndose factores hasta explicar la varianza total.

Algebraicamente las componentes principales (CP) son una aplicación de los autovalores y autovectores, vale decir, la varianza máxima explicada por cada indicador y los factores ortogonales de cada variable o indicador.

Los componentes principales (CP) presentan las siguientes propiedades matemáticas:

1- *Son ortogonales, es decir, no correlacionadas o independientes entre si.*
2- *Representan una transformación de las variables originales en las que se alcanza su máxima varianza posible.*

En función de todo esto, el ACP se utiliza para:

- *Reducir un conjunto de variables (o indicadores) a la síntesis de unas pocas destacadas.*
- *Mostrar que variables (indicadores) pueden ser omitidas en un sistema sin alterar la información básica.*

El cálculo de las componentes principales (CP) se realizó utilizando el Software estadístico MINITAB.

Para seleccionar los CP, se analiza la varianza acumulada y se considera el número de CP que explican, en nuestro caso, el 95% de la variación del sistema.

De esta manera, se pueden extraer indicadores posibles de ser eliminados o reagrupados, con el nivel de confianza que se desee.

A los efectos de dar una rápida explicación de la información suministrada por el software, veamos la primer página de la matriz de covarianza del Método de Análisis de Componentes Principales, factor por factor, de las Evaluaciones Internas.

12001	0.280	-0.300	0.490	0.415	0.494	0.394	-0.142
12002	0.572	0.122	-0.375	0.354	0.283	-0.463	0.311
12003	0.057	-0.544	0.477	0.028	-0.393	-0.475	0.303
12004	0.570	0.121	0.219	-0.736	0.073	0.169	0.192
12005	0.103	-0.293	-0.102	-0.274	0.231	-0.443	0.754
12006	0.505	0.042	-0.102	0.257	-0.680	0.245	0.380
12007	0.022	-0.705	-0.568	-0.133	0.018	0.347	0.204

Como se puede ver, en esta matriz aparecen tres valores:

- *Eingenvalue: que son los autovalores*
- *Proportion: que es la varianza proporcional*
- *Cumulative: que es la varianza acumulada*

El primer problema (cuántas variables se pueden eliminar) se resuelven mediante el Eingenanalisys de la matriz de covarianza. Por ejemplo: si analizamos los tres primeros indicadores, 11001, 11002 y 11003, vemos que el primer valor de varianza acumulada es 0,828; el segundo 0,964 = 0,828 + 0,136, y el tercero es 1 = 0,828 + 0,136 + 0,036. Por lo tanto entre el primer valor 0,828 y el segundo 0,136 tenemos el 96,4% de la varianza explicada.

Puesto que la decisión ha sido trabajar con un nivel de confianza del 95% (vale decir, tenemos que elegir la cantidad de componentes que expliquen el 95% de la varianza total de los datos), utilizando sólo dos componentes principales, ya tenemos explicada la mayor varianza o el mayor porcentaje de la variación de los datos deseado. Y por lo tanto, se puede eliminar una variable.

El segundo problema (cuáles son las variables que explican el mayor porcentaje de la varianza), se resuelve analizando las componentes principales (PC1, PC2 y PC3) de los indicadores bajo análisis, en este caso el 11001, 11002 y 11003, y seleccionando de cada columna el indicador que presente el mayor coeficiente en valor absoluto, que a su vez indica la mayor correlación.

Por ejemplo: en la columna de la componente principal 1 (PC1) vemos que el mayor coeficiente lo tiene el indicador 11001 (0,731). Ese indicador queda seleccionado. Pasamos ahora a la columna de la componente principal 2 (PC2) y vemos que el mayor coeficiente lo tiene el indicador 11002 (-0,718), por lo tanto este indicador queda seleccionado. Dado que se había determinado que con sólo dos indicadores tendríamos explicados el mayor porcentaje de los datos deseado, los indicadores 11001 y 11002 son los que quedan, pudiéndose eliminar o reagrupar el indicador 11003.

Si pasamos al grupo de indicadores del 12001 al 12007 y analizamos la varianza acumulada, vemos que con cuatro variables tendremos explicado el 95,7% de la varianza total, y por lo tanto, podremos eliminar o reagrupar tres indicadores.

Los que quedan son el 12001, 12002, 12004 y 12007, pudiéndose eliminar o reagrupar los indicadores 12003, 12005 y 12006.

Realizado este trabajo con cada uno de los factores del Modelo Original (94 indicadores) tanto para las evaluaciones internas como para las externas, resultó que en principio se podrían eliminar 36 indicadores en el caso de las evaluaciones internas y 34 indicadores en el caso de las evaluaciones externas.

Asimismo, entre las evaluaciones internas y externas, aparentemente, se podrían eliminar o reagrupar 51 indicadores, habiéndose reducido el Modelo de 94 indicadores, en tal caso, a sólo 43 indicadores, lo cual a primera vista no parece recomendable, puesto que una reducción tan significativa de indicadores redundaría en una pérdida de información demasiado importante.

A continuación se tratará de llegar a un Modelo Final Optimizado mediante la eliminación y agrupación de los indicadores originales (94), en función del trabajo estadístico realizado, de la experiencia, y del extraordinario marco de referencia y contrastación que representa el juicio de expertos de SECAI concretado en el modelo reducido de 69 indicadores.

De la comparación entre la Versión Reducida del Modelo SECAI (69 indicadores) y los resultados, consecuencia de la aplicación del Método de Análisis de Componentes Principales (ACP) al Modelo Original de SECAI (94 indicadores), surge claramente que existe una notable diferencia (como no podía ser de otra manera) entre la eliminación de indicadores propuesta por los expertos de SECAI y la propuesta por este Método Estadístico (ACP).

Por tanto, se hace necesario realizar el siguiente análisis de congruencia en base a conceptos técnicos y de experiencia, teniendo en cuenta las correlaciones establecidas por las matrices de correlación, por el Método de Análisis de Componentes Principales y por el juicio de expertos de SECAI.

ANÁLISIS EN BASE A CONCEPTOS TÉCNICOS Y EXPERIENCIA

Para realizar este análisis se tuvo en cuenta los siguientes elementos y criterios:

Elementos:

- *Eliminación de indicadores propuesta por el Método de ACP tanto en las evaluacines internas como en las externas.*
- *Correlación entre indicadores definida por la matriz de correlación (94 x 94) con un nivel de confianza del 95% para las evaluaciones internas y externas.*
- *Juicio de expertos de SECAI.*
- *La experiencia profesional*

Criterios:

Indicadores que se eliminan:

Todos aquellos Indicadores que por indicación del método de Análisis de Componentes Principales (ACP), aparezcan como susceptibles de ser eliminados, tanto en las evaluaciones internas como en las externas, y que además, así lo proponga el Juicio de Expertos de SECAI, serán eliminados.

También se eliminarán aquellos indicadores que aunque el Juicio de Expertos de SECAI no haya contemplado la posibilidad de eliminarlos, aparezcan como posibles de ser eliminados, por la aplicación del método de ACP, en ambas evaluaciones (Internas y Externas) y que la experiencia indique que pueden eliminarse sin distorsionar el modelo.

Indicadores que se agrupan:

Se agruparán todos aquellos Indicadores que presenten las condiciones de correlación establecidas, es decir: que estén correlacionados con un nivel de confianza igual o mayor al 95% en ambas evaluaciones (Matriz de Correlación. Evaluaciones Interna y Externa) y que además, así lo aconseje el Juicio de Expertos de SECAI.

También se agruparán aquellos Indicadores que, aunque el Juicio de Expertos de SECAI no haya contemplado la posibilidad de agruparlos, presenten las condiciones de correlación establecidas, y su agrupación, de acuerdo a la experiencia, parezca lógica y no distorsione la estructura del modelo.

Indicadores que se mantienen:

Se mantendrán todos aquellos Indicadores, que por la aplicación del método de Análisis de Componentes Principales (ACP), aparezcan como no eliminables en ambas evaluaciones, y así lo aconseje el Juicio de Expertos de SECAI.

También se mantendrán aquellos Indicadores, que apareciendo como susceptibles de ser eliminados, por la aplicación del método de ACP a una de las evaluaciones (Interna o Externa), aparezcan como no eliminables en la otra, y el Juicio de Expertos de SECAI aconseje mantenerlos.

En función de estos elementos y criterios se procedió al análisis de congruencia antes mencionado, indicador por indicador, llegándose a la versión optimizada, cuya estructura se presenta en el siguiente cuadro (Cuadro II) comparándola con la versión original del Modelo SECAI (94 indicadores).

Cuadro: II

Vemos que la versión optimizada comporta un modelo compuesto por 5 factores, 9 subfactores y 64 indicadores.

APLICACIÓN DEL MODELO OPTIMIZADO (64 INDICADORES) A LAS CARRERAS YA EVALUADAS CON EL MODELO ORIGINAL (94 INDICADORES)

Obtenido el Modelo Optimizado de Indicadores, aparentemente, lo que se debería hacer, es efectuar una nueva evaluación, tanto interna como externa, con este modelo optimizado. Pero en realidad esto no seria correcto, ya que una carrera o institución una vez evaluada, ya no es el misma, y por tanto, a los efectos de verificar si con el modelo optimizado se obtienen resultados equivalentes a los obtenidos con el modelo original, dicha nueva evaluación no seria de mucha utilidad.

Por tanto, la decisión tomada, fue la de evaluar cada una de las nueve carreras, con los nuevos indicadores, dándole a cada uno de ellos como calificación resultante, el promedio de las calificaciones de cada uno de los indicadores originales que se han agrupado en cada uno de los nuevos indicadores. De la misma manera, los índices de calidad finales de cada factor, se calificarán con el promedio de los valores correspondientes a los indicadores que califican a dicho factor.

A los efectos de poder realizar las comparaciones pertinentes, este trabajo se realizó con el modelo optimizado (64 indicadores) y con el modelo reducido de SECAI (69 indicadores).

A tal efecto se confeccionaron seis planillas resumen para cada una de las carreras evaluadas: Dos planillas correspondientes a la Evaluación Interna y a la Externa, efectuadas con el modelo original (94 indicadores) por los expertos designados por SECAI. Dos planillas correspondientes a la Evaluación Interna y Externa efectuadas con el modelo reducido de SECAI (69 indicadores) con la calificación de cada uno de los nuevos indicadores e índices obtenida como se indica más arriba. Dos planillas correspondientes a las Evaluaciones Internas y Externas efectuadas con el modelo optimizado (64 indicadores), con la calificación de cada uno de los nuevos indicadores e índices obtenida como se indica más arriba.

A modo de ejemplo y por razones de espacio, se presenta sólo la "Planilla Comparación de los Indices obtenidos con el modelo SECAI Original (94 indicadores) y los obtenidos con los Modelos SECAI Reducido (69 indicadores) y el Modelo Optimizado producto de este trabajo (64 indicadores), y los diagramas de barras representativos de las Evaluaciones Internas y Externas obtenidos con los tres modelos, exclusivamente para dos de las carreras evaluadas, de diferentes universidades.

Cuadro III:

Comparación de los índices obtenidos con el modelo SECAI (94 indicadores)
y los obtenidos con los modelos SECAI reducido (69 indicadores) y Optimizado (64 indicadores)

EVALUACION EXTERNA

COMPARACIÓN ENTRE LOS INDICES DE CALIDAD OBTENIDOS CON LA UTILIZACION DE LOS INDICADORES DEL MODELO ORIGINAL, LOS OBTENIDOS CON EL MODELO REDUCIDO Y LOS OBTENIDOS CON EL MODELO OPTIMIZADO

De la comparación de cada una de las planillas de evaluación generadas por el Comité de Evaluación Interna y el Comité de Evaluación Externa, con cada una de las planillas de evaluación generadas con los nuevos indicadores, se ve claramente que los valores correspondientes a cada uno de los índices tanto en la Evaluación Interna como en la Evaluación Externa, realizadas con el Modelo SECAI (94 indicadores), coinciden casi en forma exacta con los valores de los índices obtenidos tanto con el Modelo Reducido de SECAI (69 indicadores) como con el Modelo Optimizado (64 indicadores), producto de esta trabajo.

Por tanto, la decisión de asignar a cada uno de los nuevos indicadores el promedio del valor de los indicadores obtenidos con el Modelo Original de SECAI que los componen, parece ser aceptable.

En general las diferencias entre los índices de los dos Modelos SECAI y los del Modelo Optimizado no son sustantivas, salvo en algunos casos, y siempre localizadas en los índices I_{11}, I_{12} e I_{13}, puesto que al haberse modificado la estructura del Modelo Original, el Indice I_{11} tanto en el Modelo Reducido de SECAI como en el Modelo Optimizado producto de esta trabajo, califica al subfactor "Proceso de Elaboración", que es la conjunción de los subfactores: "Participación" (Indice I_{11}) y "Metodología" (Indice$_{12}$) del Modelo Original de SECAI.

Asimismo, en el Modelo Original de SECAI, los Indices I_{12} e I_{13}, califican a los subfactores "Metodología" y "Contenido" respectivamente, mientras que, tanto en el Modelo Reducido de SECAI como en el Modelo Optimizado, producto de este trabajo, califican a los subfactores "contenido" y "puesta en marcha" respectivamente.

El resto de las diferencias se deben, en general, a que tanto en el Modelo Reducido de SECAI como en el Modelo Optimizado, el índice de cada factor es el promedio de las calificaciones otorgadas a cada indicador perteneciente a dicho factor, mientras que en el Modelo Original de SECAI, el índice de cada factor no siempre coincide con el promedio de los valores asignados a los indicadores de ese factor, y cuanto más se aparta de éste, mayor es la diferencia.

CONCLUSIÓN

- No existen "indicadores de calidad" absolutos ni indiscutibles, y mucho menos un modelo de aplicación universal que pueda ser irrefutable.
- Tal como ocurre en todos los procesos para definir u obtener la calidad requerida de un producto final, conseguir ésta, es algo sumamente difícil, por cuanto las características de calidad reales – que son las que definen la calidad del producto, proceso o sistema – son altamente subjetivas y por tanto muy difíciles de medir.
- Se ha logrado desarrollar una metodología para el análisis y optimización de modelos para evaluar la calidad de las enseñanzas.
- Dicha metodología ha sido desarrollada teniendo como referencia los procedimientos – con las adaptaciones correspondientes al caso y ámbito de estudio – utilizados para determinar la calidad de productos, procesos y sistemas industriales, que en general, consiste en realizar un análisis estadístico de calidad utilizando métodos estadísticos que correlacionan y comparan las variables en juego.
- Se han utilizado dos métodos estadísticos (Matriz de Correlación y el Método de Análisis de Componentes Principales) y un Método basado en el Juicio de Expertos:
- Ha quedado puesto de manifiesto que, en este problema, la utilización de métodos estadísticos conjuntamente con el Método de Juicio de Expertos, se manifiesta como una estrategia muy adecuada para el análisis y optimización de modelos que evalúan la calidad de la enseñanza.
- En función de los resultados obtenidos y su comparación con los dos Modelos SECAI, el Modelo Optimizado desarrollado en este trabajo, facilita la aplicación de SECAI mejorando su: eficiencia sin disminuir su eficacia.

INFLUENCIA DE LA GLOBALIZACION EN EL MEJORAMIENTO DE LA CALIDAD DE LA ENSEÑANZA EN MEXICO EN EL AREA DE COMPUTO

Joaquín Flores Paredes, Masiel Estibalis Gutierrez Estrada y Antonio Trejo Lugo

RESUMEN

El contexto en el que se desarrolla actualmente la educación superior en general, está dominado por la competencia a escala mundial.

Esto se acentúa particularmente cuando se trata de carreras en el área de cómputo y similares, donde ser competitivo es una condición determinante para participar en el mercado laboral con mejores posibilidades de éxito. En esta área ser competitivo requiere el conocimiento de las nuevas tecnologías, del desarrollo de habilidades para el diseño, construcción, uso y mantenimiento de herramientas útiles para los servicios informáticos y de telecomunicaciones.

1.INTRODUCCION

Las comunicaciones entre personas tienden a hacerse cada día más independientes del lugar donde se encuentran las mismas. Con lo cual se nota una tendencia hacia accesos inalámbricos, hacia las redes que ofrecen los diferentes servicios. Probablemente seguirán proliferando estos sistemas con accesos que dan al usuario cada día una mayor movilidad.

La convergencia de la tecnología de la información y las comunicaciones es muy importante.

La tecnología de fibra óptica facilita las capacidades de transmisión de alto ancho de banda por tal motivo se puede decir que la informática del presente nada tiene que ver con la que llegara en u futuro muy cercano, ya que según estudios, en un corto periodo de tiempo nos comunicaremos como ordenadores; de hecho las telecomunicaciones y la informática estarán tan unidas que serán indistinguibles.

Joaquín Flores Paredes ***Universidad Nacional Autónoma de México, FES Cuautitlán***
Masiel Estibalis Gutierrez Estrada y Antonio Trejo Lugo ***Universidad de Cuautitlán Izcalli***
EM trelugo@hotmail.com, jfp1608@hotmail.com y masiel_gutierrez@yahoo.com.mx

Los avances en tecnologías digitales y en las transmisiones por fibra óptica permiten hablar ahora de velocidades de transmisión y de conmutación menores de una mil millonésima de segundo.

A través de estas redes de alta capacidad y los servicios que en ellas serán ofrecidos se estará en posibilidad de "integrar todos los servicios", de tener "transferencias de información totalmente digitales", de empezar a construir la "supercarretera de información y de que todo esto forme la base de la "sociedad de la información" del futuro.

Las comunicaciones a diferencia de otras disciplinas son por naturaleza de influencia global.

El mercado es claramente global y ahora vemos organizaciones cambiando la dirección de su mercado. Mucho se ha escrito de la estructura de las nuevas organizaciones, pero en esencia se puede decir que los términos globalización, virtualidad, movilidad y flexibilidad es la forma en que se definen las nuevas organizaciones.

Desde los inicios de la informática, los desarrollos y las nuevas tecnologías no ha parado de sucederse a un ritmo frenético, un ejemplo de ello, y tomándolo de forma comparativa, fue la introducción de la radio que le tomo 38 años llegar a 50 millones de usuarios; a la televisión 13 y a Internet 4 años, lo que nos da una idea, en cuanto a tiempo, de la forma en que llegan los avances.

Las necesidades fundamentales no han cambiado, sin embargo si lo han hecho los medios por los cuales se ofrecen productos y servicios porque las exigencias de los usuarios y sus comparaciones entre productos, han sido parte del impulso del avance tecnológico.

Las computadoras fueron creadas para la resolución rápida de centenares de tareas distintas.

Podemos asegurar que la informática ha

ayudado y ha participado en la evolución de prácticamente cualquier actividad profesional o domestico.

Y así, la información a traído consigo el Internet, que es una enorme red, donde puedes buscar información y algunas ventajas son:

En educación: hasta hace algunos años, la educación basada en sus conocimientos únicamente en los libros, Internet se ha convertido en el apoyo de todas las personas que se desenvuelven en el ámbito educativo.

En empresas: ahora con el Internet, puedes ingresar al sitio, buscar lo que necesitas, y si la pagina te lo permite organizar o hacer tratos, apartados, visitas, pagos, etc., creando lo que ahora llamamos comercio electrónico.

2.DESARROLLO

Los retos de la educación superior son numerosos y complejos, son derivados de las diversas demandas de la nueva sociedad, la cual no es ajena a la velocidad y el alcance de los avances de la ciencia y la tecnología en todas sus expresiones, pero principalmente en telecomunicaciones y la informática, que se han convertido en un poderoso motor que ha venido a transformar todo de una manera vertiginosa

México es el país que ha requerido por necesidad un acelerado desarrollo y fortalecimiento de la Educación Superior, pues hay que considerar que con el Tratado de Libre Comercio con Estados Unidos y Canadá se han fortalecido los intercambios de programas de estudios, se han celebrado convenios de vinculación, transferencia de tecnología educativa y científica entre las diversas Universidades e Instituciones de Educación Superior, por lo que los profesionistas de este país, nos veremos precisados a ingresar a la cultura de la actualización profesional, como medio de lograr la certificación profesional que se tendrá que exigir para el ejercicio de las profesiones.

En el Plan Nacional de Educación 2000–2006 se plantea, entre sus objetivos principales el de "impulsar el desarrollo con equidad de un sistema de Educación Superior de buena calidad" considerando las necesidades de transformar el actual sistema cerrado en uno abierto, flexible, innovador y dinámico, que permita la ampliación y diversificación de las oportunidades y oferta educativa, pues se requiere de nuevas estructuras para su planeación y coordinación a nivel nacional.

Se busca con ello que las acciones en materia de Educación Superior sean congruentes con el Plan Nacional de Educación del Gobierno Federal con las políticas y programas de desarrollo de los estados, a fin de conformar un sistema de Educación integrado y flexible que contribuya con mayor oportunidad y niveles crecientes de calidad al progreso económico, social, cultural, científico y tecnológico de cada estado y del conjunto del país.

La demanda de personal capacitado y entrenado está creciendo súbitamente, por lo que en la formación de los estudiantes se debe de lograr no solo transferir conocimientos y habilidades, sino lograr alcanzar las destrezas de competencia profesional, es decir, que el egresado sea capaz de responder a los retos laborales mediante la certificación de dichas competencias profesionales, por ello es necesario preparar el escenario para poder responder eficientemente a dichos retos, y buscar las causas y mecanismos que logren realizar una verdadera vinculación entre la Universidad y el aparato productivo, con mecanismos tales como la investigación científica y tecnológica.

En el área de cómputo la tecnología esta siendo ofrecida a los estudiantes universitarios por algunas grandes empresas líderes en su área respectiva a nivel mundial, quienes organizan concursos y ofrecen certificaciones con las cuales quieren incentivar la creatividad de los estudiantes en estas áreas. Algunas de ellas destinan una parte importante de su presupuesto a generar proyectos educativos en el área de cómputo, para beneficio de la misma empresa y de los estudiantes a quienes van dirigidos tales proyectos.

Lo anterior ha generado un gran cambio en instituciones universitarias privadas las cuales buscan ser competitivas y proporcionar a la vez a sus estudiantes una alta calidad educativa actualizada a la nueva tecnología, para ejemplificar lo anterior tomaremos como ejemplo a la universidad de Cuautitlan Izcalli que es una Universidad privada con apenas 10 años de haber sido fundada la cual se ubica en el municipio de Cuautitlan Izcalli en el Estado de México en la cual entre otras se ofrecen las licenciaturas de Ingeniero en Computación y Sistemas Digitales e Informática Administrativa la cual ha implementado diversos programas educativos.

Por todo esto es que desde sus inicios la Universidad de Cuautitlán Izcalli se ha caracterizado por realizar diversos esfuerzos con el fin de permanecer a la vanguardia de los cambios científicos tecnológicos, sociales y culturales establecidos en el entorno, tratando siempre de responder satisfactoriamente a las demandas que como institución de educación superior le competen. En estos esfuerzos, se ha distinguido por buscar permanentemente la calidad en la educación ofreciendo a los estudiantes todos los elementos que les permitan convertirse en profesionistas capaces de ser, hacer, convivir, pensar y transformar su realidad.

En este marco la Universidad de Cuautitlan Izcalli plantea la necesidad de construir métodos e instrumentos que le permitan dar respuesta con una mayor calidad y pertinencia a las exigencias del entorno, y asume el compromiso de incorporarse al esfuerzo de transformaciones y cambio que requiere el país. En este aspecto y para atender la creciente demanda de educación superior existente en el estado y en las entidades concurrentes ha venido ampliando su oferta educativa.

La Universidad de Cuautitlan Izcalli, consiente de su papel social, ha instrumentado una serie de mecanismos, tal es el caso del proyecto con la empresa de Cisco Systems que es líder mundial en redes para Internet con la cual el 29 de Enero del 2001 se firma el convenio para poder impartir el proyecto "CISCO NETWORKING ACADEMY PROGRAM" en base a los lineamientos establecidos por la empresa, a partir de ese día la Universidad forma parte como academia regional.

El 25 de Febrero del 2001, se seleccionan dos instructores: Ing. José Joaquín González Cedeño (Contacto Principal del Proyecto) e Ing. Norma Grajales Ojeda, quiénes fueron capacitados para poder impartir el proyecto en la Universidad de Cuautitlán Izcalli asistiendo a su capacitación con su "ACADEMIA REGIONAL".

El 26 de Febrero del 2001, la Coordinación de Ingeniería en Computación y Sistemas Digitales e Informática Administrativa a cargo del Ing. Antonio Trejo Lugo junto con los dos instructores seleccionados establecen las políticas para coordinar el proyecto "CNAP".

El 14 de mayo del 2001, se crean 5 grupos que incursionarán por primera vez en el proyecto, se dan de alta un total de 60 alumnos, de los cuales logran graduarse 52 alumnos quienes obtienen su constancia por haber aprobado el modulo I versión 2.1 en español.

El 17 de Septiembre del 2001, se crean 2 grupos que continúan con el Modulo II versión 2.1 en español, se dan de alta un total de 17 alumnos de los cuales logran graduarse 12 alumnos quienes obtienen su constancia por haber aprobado.

El 14 de Enero del 2002, a esta fecha se obtiene experiencia en la implantación del programa y se realizan los ajustes académicos para los siguientes grupos.

El 15 de Enero del 2002, se crean 4 grupos que empezarán con el Modulo I versión 2.1 en español, se dan de alta un total de 52 alumnos de los cuales logran graduarse 51 alumnos quienes obtienen su constancia por haber aprobado.

El 01 de Febrero del 2002, se crea 1 grupo que continua con el Modulo II versión 2.1 en español, se dan de alta un total de 13 alumnos de los cuales logran graduarse 12 alumnos quienes obtienen su constancia por haber aprobado.

El 01 de Febrero del 2002, en esta misma fecha se crea 1 grupo que continua con el modulo III versión 2.1 en español, se dan de alta un total de 7 alumnos de los cuales todos se gradúan obteniendo su constancia por haber aprobado.

El 01 de Mayo del 2002, se crean 2 grupos que empezarán con el Modulo I versión 2.12 en español, se dan de alta un total de 28 alumnos de los cuales 26 alumnos se gradúan obteniendo su constancia por haber aprobado.

El 01 de Mayo del 2002, en esta misma fecha se crean 4 grupos que continúan con el modulo II versión 2.12 en español, se dan de alta un total de 50 alumnos de los cuales 46 alumnos se gradúan obteniendo su constancia por haber aprobado.

El 24 de Mayo del 2002, se crea un 1 grupo que continua con el modulo IV versión 2.12 en español, se dan de alta un total de 7 alumnos de los cuales todos se gradúan en la fecha del "24 de Agosto del 2002" obteniendo su constancia por haber aprobado y formado La PRIMERA GENERACION del proyecto "CISCO NETWORKING ACADEMY PROGRAM", Felicidades.

El 06 de Junio del 2002, se crea 1 grupo que continua con el modulo III versión 2.12 en español, se dan de alta un total de 11 alumnos de los cuales todos se gradúan obteniendo su constancia por haber aprobado.

El 31 de Julio del 2002, la Universidad de Cuautitlán Izcalli es seleccionada entre varias instituciones de México por la International Youth Foundation y Cisco Learning Institute, para firmar un convenio en el cual otorga a 100 alumnos (75 mujeres y 25 hombres) beca para poder cursar el proyecto "CNAP" en el lapso de un año.

El 08 de Agosto del 2002, se seleccionan dos intructores: Ing. Sofía Chávez e Ing. Elva Bernal quienes serán capacitadas en la "ACADEMIA REGIONAL" para poder impartir el proyecto en la Universidad de Cuautitlán Izcalli y sumarse al grupo de instructores autorizados para dar dicho programa. Conformando el total de 4 instructores dentro de la Universidad de Cuautitlán Izcalli.

El 21 de Agosto del 2002, "CISCO LEARNING INSTITUTE" solicita la información de dos alumnas con mejor promedio para seleccionar a una sola e invitar al evento "CISCO Networkers 2002 " en septiembre GRATUITAMENTE.

El 24 de Agosto del 2002, se crea 1 grupo que continua con el modulo IV versión 2.12 en español, se dan de alta un total de 11 alumnos los cuales van en busca de aprobar y formar parte de la segunda generación.

El 01 de Septiembre del 2002, a esta fecha la Universidad de Cuautitlán Izcalli ha proporcionado el proyecto "CISCO NETWORKING ACADEMY PROGRAM" a 140 alumnos.

El 02 de Septiembre del 2002, la coordinación de Ingeniería en Computación y Sistemas Digitales e Informática Administrativa conjuntamente con los instructores del proyecto plantean propuestas y ajustes académicos para todo grupo que empiece y continúe con el programa.

El 05 de Septiembre del 2002, la Universidad de Cuautitlán Izcalli publica convocatoria de becas la cual podrás observar en la liga correspondiente.

Actualmente la Universidad de Cuautitlan Izcalli esta llevando acabo los convenios para Implementar el programa de Centro Educacional Académico Autorizado Sun (AASEC).

Debido a la transformación que la industria de tecnología vive día a día Sun Microsystems de México líder de tecnología, implementa un programa para compartir con la Academias Regionales y locales inscritas en el convenio Cisco Networking Academy.

En este programa, los estudiantes tienen la oportunidad de obtener entrenamiento certificado en tecnología Sun en la curricula de sus estudios universitario así como aprender a construir, diseñar y mantener las redes computacionales.

Logrando con esto proporcionar a los alumnos un nivel competitivo que los distinga y que sea acorde a las necesidades del mercado.

Sun proporcionará a las Instituciones académicas materiales de cursos desarrollados por Sun así como la capacitación de los maestros y planes de estudios de la más alta calidad. Creando con esto un conjunto de esfuerzos, dado que las escuelas proveerán una nueva área de estudio a sus alumnos y presentará tecnologías de última generación.

Fundamentos de Solaris 8 SA-118 (40 horas)
Administración 1 Solaris 8 SA-238 (40 horas)
Administración 11 Solaris 8 SA-288 (40 horas)

Programación Java para programadores SL-110 (40 horas)
Migración de programas orientados con tecnología Java SL-210 (40 horas)
Lenguaje de programación Java SL-275 (24 horas)

La intención de incorporar nuestros esfuerzos educacionales al proyecto de Cisco Networking Academy desempeña un papel importante en el suministro de educación que se dará de manera mas contundente a nivel nacional para el desarrollo social de México.

La iniciativa académica de conjuntar a Cisco & Sun, está diseñada para introducir a los alumnos a las tecnologías Sun así como enseñar a los estudiantes a diseñar, construir y mantener las redes computacionales. De esta forma se dotara de habilidades en los campos de estudio elegidos por ambas partes. Sun proporcionará a instituciones académicas seleccionadas materiales de cursos desarrollados por Sun para este propósito. Al establecer este contacto, Sun busca crear una sinergia con instituciones académicas, dado que las escuelas proveerán una nueva área de estudio a sus alumnos y Sun presentará tecnologías a la siguiente generación de usuarios.

El programa de Sun & Cisco mejoran las experiencias de los alumnos al:

- Dar acceso a los estudiantes a:

  Las tecnologías Sun más recientes

  Capacitación y planes de estudio de la más alta calidad

  Guías de curso tendientes a la certificación

  Cursos que pueden ser integrados a programas de obtención de grados post-universitarios.

Otro de las formas en que la institución está tratando de mantener preparados a sus alumnos en esta área es mediante la participación en eventos como los organizados por The Association for Computing Machinery
la cual tiene el objetivo de consolidar su crecimiento y difusión en México; este se ha dado gracias al surgimiento de otros capítulos en diversas sedes del país y a la cada vez más numerosa participación de la comunidad universitaria en los eventos que la sociedad auspicia, tales como el ACM Central American Programming Contest 2002, eliminatoria oficial del ACM Collegiate Programming Contest 2003, ambos concursos de programación con proyección mundial.

Los proyectos anteriores han traído como consecuencia una mayor demanda de alumnos hacia la institución.

MODELO DEL INSTRUCTOR EXPLICITO EN UN SISTEMA TUTORIAL INTELIGENTE

Constanza R. Huapaya[1], Graciela M. Arona[1] y Francisco A. Lizarralde[1]

Abstract *—Los Sistemas Tutoriales Inteligentes (STI) son uno de los resultados más importantes producidos por la Inteligencia Artificial en Educación. Su creación es de alta complejidad, tanto pedagógica como computacional. Las herramientas de autoría son una alternativa eficaz para su implementación. El objetivo de este trabajo es definir un modelo del instructor, a fin de acrecentar la eficacia del sistema. El autor, experto en teorías cognitivas y diseño instruccional crea un STI. Este producto puede ser utilizado por instructores de distintos niveles de experticia. Son ellos quienes efectivamente lo usan en un aula con un grupo de estudiantes en diferentes sesiones. Se ha estudiado la interacción sistema-instructor para abstraer las características más relevantes. En especial, un instructor de temas de ingeniería podría ser asistido por un STI a fin de establecer los objetivos instruccionales de una sesión, evaluar el estado de conocimiento de sus alumnos, y valorar el éxito de su gestión.*

Palabras clave — Inteligencia Artificial en Educación, Modelo del Instructor, Sistemas Tutoriales Inteligentes.

INTRODUCCION

La enseñanza puede ser entendida como un tipo especial de comunicación humana. Los maestros construyen la riqueza de esa comunicación a partir de su práctica cotidiana. A fin de mejorar la enseñanza, la comunidad de Inteligencia Artificial en Educación investiga teorías, metodologías y técnicas con la finalidad de construir herramientas que asistan al maestro en su actividad diaria. El principal foco de interés actual de esta investigación se basa en la imitación de la actividad adaptativa y comunicacional de un maestro humano.

SISTEMAS TUTORIALES INTELIGENTES

Para alcanzar el objetivo enunciado, se construyen ambientes de enseñanza, como los Sistemas Tutoriales Inteligentes [1]-[2], cuyo objetivo es transformarse en “maestros computacionales”. El término "inteligente" en STI se refiere a la habilidad del sistema para saber qué enseñar, cuándo enseñarlo, y cómo enseñarlo.

Un STI debe mostrar capacidad de entendimiento, aprendizaje, razonamiento y resolución de problemas. Además, debe ser capaz de identificar las fortalezas y debilidades de un aprendiz, y establecer un plan instruccional para adaptarse a cada estudiante real. Asimismo, manipula información sobre el proceso de aprendizaje de cada estudiante (como estilo de aprendizaje preferido y conceptos erróneos adquiridos). La instrucción debe ajustarse a las necesidades del estudiante, i.e., tiene que *adaptarse* a cada uno de ellos [3]. La capacidad de adaptarse diferencia a los STIs de las herramientas tradicionales como los CAIs (Computer Aided Instruction).

No obstante, la construcción de STIs reales todavía es ardua y costosa [4]. Es necesario profundizar el análisis del conocimiento experto involucrado en un STI a fin de ser capturado en un sistema computacional.

Durante los últimos veinte años se ha trabajado sobre la siguiente arquitectura básica (ver figura 1): un STI posee componentes para modelizar el conocimiento a enseñar (plasmado en el **modelo del dominio**), el seguimiento de la actividad del estudiante (o **modelo del estudiante**), el conocimiento pedagógico (que será plasmado en un **plan instruccional**), y la **interfaz** de comunicación (con el estudiante y con el profesor) .

Una vez elegido el tópico que un estudiante determinado debe aprender, comienza una sesión tutorial donde el STI entrega el material instruccional siguiendo los lineamientos que el modelo pedagógico y su instructor verdadero decidieron para él (ella). Asimismo el plan instruccional considera las características personales de la

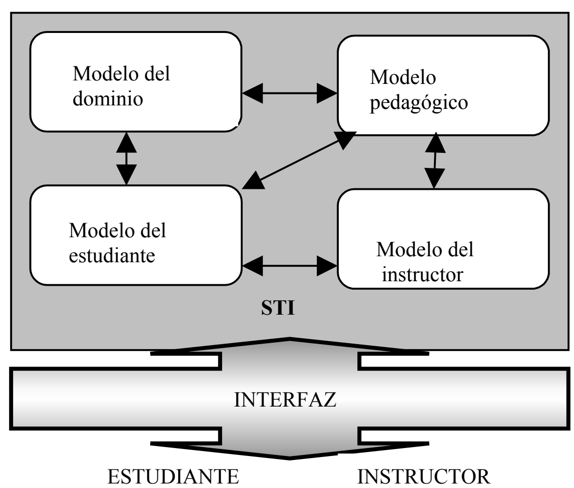

FIGURA. 1
ARQUITECTURA BASICA DE UN SISTEMA TUTORIAL INTELIGENTE.

[1] Constanza R. Huapaya, Graciela M. Arona y Francisco A. Lizarralde, Facultad de Ingenieria, Universidad Nacional de Mar del Plata, Juan B. Justo 4302 , 7600 Mar del Plata, Buenos Aires, Argentina, huapaya@fi.mdp.edu.ar, grarona@fi.mdp.edu.ar, flizarra@fi.mdp.edu.ar

estudiante a fin de adaptar apropiadamente la enseñanza del tópico a su perfil.

Antes de presentar el problema que nos preocupa, i.e., el modelo del instructor, mostramos someramente los modelos del dominio y del estudiante.

MODELO DEL DOMINIO

Un sistema tutorial es creado para enseñar un tema en particular, por lo tanto debe tener suficiente conocimiento del tema y además de la forma en que se enseña. Además este conocimiento debe estar estructurado de manera tal que el sistema pueda ser flexible. Los factores que hay que tener en cuenta son: cómo organizar los ítems; cómo relacionarlos con el avance del aprendizaje del alumno; cómo relacionarlos con el material de enseñanza.

La ontología propuesta en el ámbito conceptual se divide en dos estructuras la descripción del dominio y la organización del material de enseñanza.

La metodología de representación mediante mapas conceptuales, ha sido utilizada con éxito para el diseño instruccional [5]. Como descripción del dominio los nodos representan los tópicos a enseñar y los arcos las relaciones de precedencia, inclusión o pertenencia que se desee establecer entre tópicos. Esta estructura permite al sistema seleccionar el nodo a enseñar considerando el cumplimiento de los tópicos que lo preceden y según la estrategia de enseñanza que se quiera aplicar (de lo general a lo particular o viceversa)[6]. La enseñanza de distintos tipos de contenidos requiere distintas metodologias [7] [8], el sistema necesita reconocer estas diferencias. Se han establecido tres tipos de nodos: hecho, concepto y procedimiento [9], [10], [11]. La granularidad con que se defina este mapa conceptual esta directamente relacionado con la granularidad con que el sistema enseñará.

Relacionado con cada nodo del mapa de tópicos, el material de enseñanza se clasifica por el tipo de instrucción que brinda (explicación, ejemplo, ejercicio, test, ayuda) y por características propias (importancia, dificultad, tiempo). Es presentado al estudiante considerando su perfil y actuaciones anteriores representados en el modelo del estudiante [6].

MODELO DEL ESTUDIANTE

El modelo del estudiante es una descripción declarativa de las características de las actividades de aprendizaje de los estudiantes [12]. Por ejemplo, el sistema puede usar un *modelo overlay* básico en el cual se registra el entendimiento del sistema sobre el conocimiento del estudiante en un tópico determinado. En este modelo, la respuesta del estudiante es analizada para evaluarla convenientemente.

Nuestro modelo del estudiante trata la caracterización del estudiante (datos personales y perfil del estudiante), conocimiento (almacenamiento de los temas ya conocidos, objetivos instruccionales adquiridos, equivocaciones cometidas y material didáctico usado) e historia (información de la última sesión). El modelo se ha organizado en dos módulos principales: *característica del aprendiz* y *sesión del estudiante*, el primero se refiere a las características personales y la evolución del conocimiento del estudiante a largo plazo, el segundo considera a la sesión globalmente para terminar analizando el "camino" recorrido y el nivel de rendimiento alcanzado por el alumno. Los resultados de ese análisis actualizan su perfil y su evolución personal (ver figura 2).

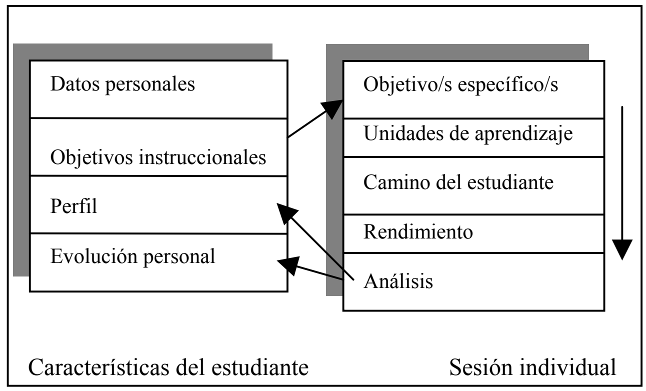

FIGURA 2
MODELO DEL ESTUDIANTE

El comportamiento del STI depende fuertemente del modelo del estudiante, sin embargo éste solo puede representar una serie de fotografías instantáneas de la actividad del alumno en determinados momentos. La consecuencia inmediata es el registro incompleto del proceso de aprendizaje individual de cada estudiante y por lo tanto solo disponer de modelos del estudiante inexactos.

EL PROBLEMA A TRATAR

La competencia en la enseñanza de un sistema tutor computacional es todavía un aspecto importante que ha tenido un desarrollo moderado. Una crítica centrada en este tema la dio Ohlsson [13] en los 80s donde pone de manifiesto el *rango limitado* y la poca *adaptabilidad* de las acciones tutoras en comparación con la riqueza de las tácticas de los maestros humanos.

La motivación de la crítica parece estar fundamentada en la pobre habilidad comunicacional de un STI. Esta es limitada, principalmente debida a los propios problemas de los sistemas computacionales. Actualmente existen pocos ejemplos de tutores computacionales que se "expresan" usando diálogos y gestos (como los usados por agentes pedagógicos animados) [14].

Asimismo, la tendencia actual sostiene que la manifestación de un sistema tutor no se debe reducir a la presentación de explicaciones o indicar cual es la respuesta correcta. Tanto el instructor como los estudiantes deberían co-construir las explicaciones y juntos seguir las mismas líneas de razonamiento. Los STIs deben ser lo suficientemente flexibles y adaptativos para manipular dificultades como *fallas* (el tutor no entiende una respuesta del estudiante, el estudiante puede responder a una pregunta de manera inesperada o la táctica tutorial no trabaja apropiadamente), *revisión de tácticas* (p.e. el comportamiento de los estudiantes indican que el tutor puede saltar pasos en la explicación) y tratar de manipular la *ambigüedad* que presentan las respuestas del estudiante en su significado.

Por otro lado, el sistema tutorial debe "interpretar" la respuesta del estudiante. Esta captación de la actividad del alumno opera con información incompleta y muy a menudo altamente incierta (inexactitud del modelo del estudiante). En consecuencia los tutores deberían poseer métodos fuertes para manipular la incertidumbre. Estos métodos, idealmente deberían ser óptimos, i.e., usando las observaciones sobre los estudiantes, los métodos tendrían que garantizar la ejecución óptima de las acciones tutoriales.

A fin de tratar, en parte, la problemática presentada, centrada en la relación comunicacional del STI con sus usuarios, se propone un modelo del instructor explícito.

MODELO DEL INSTRUCTOR

La enseñanza humano-a-humano raramente incorpora estrategias tutoriales ideales. Algunos de estos mecanismos pueden ser simulados en computadora, (como el método Socrático) mientras que otros, como aquellos donde intervienen el afecto o emoción, son muy difíciles de lograrlo considerando el actual desarrollo de la tecnología computacional.

La actividad pedagógica de un STI, hasta ahora, se ha traducido en colecciones de reglas que solo trabaja relativamente bien en la práctica. En parte, esto se debe a que no existe una enciclopedia científica donde consultar las mejores heurísticas tutoriales. En su lugar, se debe adoptar diferentes métodos de enseñanza porque diferentes estudiantes utilizan diferentes estilos de aprendizaje. La riqueza del conocimiento del instructor real se debe tomar como una de las fuentes más importantes donde extraer las líneas principales del conocimiento pedagógico de un STI.

Un autor, el creador de un STI específico en un dominio particular, suele encontrar varias dificultades cuando desarrolla un STI (por ejemplo, qué criterio usar para considerar que un tópico determinado ha sido aprendido o cuál es la granularidad apropiada de las estrategias tutoriales), en consecuencia puede dar información inconsistente a la herramienta que se traducirá en un comportamiento problemático del STI producido. En este punto se debe considerar como crucial el nivel de experticia del autor. Sin embargo, el problema principal aparece cuando un instructor debe interactuar con el STI producido por algún autor. Si el instructor real no lo acepta, no lo usará apropiadamente en una clase real. Esto nos lleva al problema de la adaptación las estrategias tutoriales incrustadas en la planificación instruccional y su asociación con las tácticas pedagógicas del instructor, i.e., como adaptar esas estrategias a los estudiantes reales.

En este punto debemos considerar *como* construir un STI. Esta tarea involucra el esfuerzo conjunto de expertos en ciencias cognitivas, tecnología instruccional y desarrollo de sistemas computacionales. Tanto el autor como el instructor (eventualmente puede ser la misma persona) generalmente no son expertos en informática. Por lo tanto es deseable disponer de sistemas computacionales que asistan amigablemente a los creadores del tutor computacional. Precisamente, las *herramientas de autoría* constituyen un tipo de sistema de adquisición de conocimiento a partir de autores/maestros/instructores/ entrenadores. A fin de asistir al autor, el sistema de autoría debería poseer conocimiento basado en diversas teorías generales, como las de diseño instruccional y psicología cognitiva.

Las herramientas de autoría actuales no son inteligentes. No poseen modelos de representación declarativa de su conocimiento sobre como construir STIs. Un ejemplo de los sistemas comerciales es Authoware v 4.0 de Macromedia. La inteligencia de las herramientas se manifiesta a través de la inspección dinámica de las descripciones declarativas de su conocimiento a fin de adaptar su comportamiento a las circunstancias bajo las cuales opera. La manipulación de ese conocimiento se hace a través de los modelos que posee el sistema.

En muchos STIs el *modelo del instructor* está implícitamente incluido y solo recientemente ha sido desarrollado explícitamente [13]. La actividad de un instructor involucra tanto conocimiento sobre el tema del dominio como sobre la pedagogía propia de esa área del conocimiento. A partir de la observación de la actividad de los instructores puede deducirse que la funcionalidad aportada por este modelo comprende los siguientes aspectos:

- Mejoramiento en la adaptación y realismo de las estrategias tutoriales.
- Provisión de ayuda inteligente individualizada para el autor/instructor.
- Refinamiento en el diseño de STIs particulares.
- Aliento a instructores novicios para que se involucren en el diseño de sistemas tutoriales
- Mejoramiento en la coordinación y cooperación entre varios instructores durante la creación del mismo STI.
- Registro de la actividad de cada instructor.

Con este modelo, los instructores de variado nivel de experiencia pueden interactuar con la herramienta de autoría a fin de diseñar e implementar sistemas tutoriales, asistido tanto por sus colegas a través del registro almacenado de su actividad como por la misma herramienta que, además puede usar teorías de diseño instruccional (como las de Gagné o Merril).

Para que el modelo alcance la funcionalidad enunciada (ver figura 3) debe capturar información sobre las preferencias del instructor en estrategias tutoriales, sus

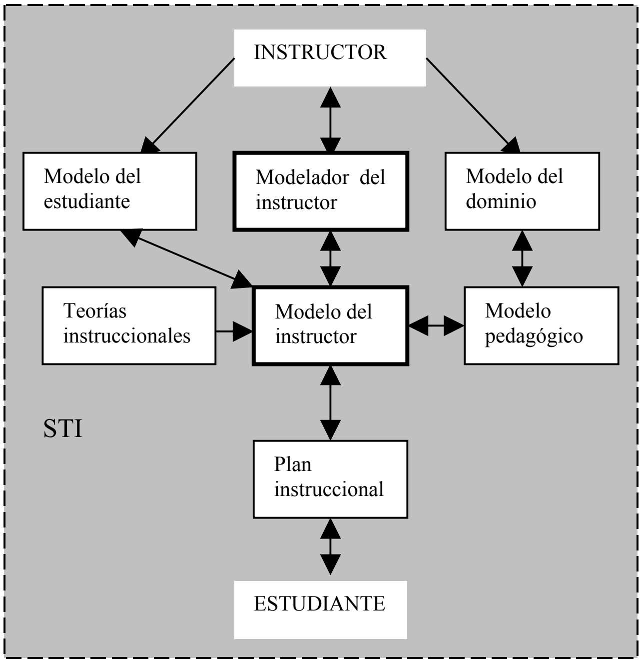

FIGURA 3
ARQUITECTURA DE STI, CON EL MODELO DEL INSTRUCTOR, CREADO POR LA HERRAMIENTA DE AUTORIA

intereses y actividades usuales con respecto a estilos de enseñanza preferidos por sus estudiantes, como su nivel de experticia ("experto", "principiante", etc.) tanto en la enseñanza en un dominio particular como en el proceso de creación de un STI.

Para que el modelo alcance la funcionalidad enunciada (ver figura 3) debe capturar información sobre las preferencias del instructor en estrategias tutoriales, sus intereses y actividades usuales con respecto a estilos de enseñanza preferidos por sus estudiantes, como su nivel de experticia ("experto", "principiante", etc.) tanto en la enseñanza en un dominio particular como en el proceso de creación de un STI.

Durante la etapa de creación del STI, los requerimientos pedidos por el sistema al autor (concretados a través de un modelador) pueden ser hechos siguiendo dos modalidades: a través de *preguntas directas* sobre sus preferencias personales y hábitos comunes (p.e. estilo de enseñanza o periodicidad de exámenes) o a través de la *observación de la actividad del intructor* registrando los cambios sobre el perfil del instructor.

Un autor/instructor, cuyo nivel de experiencia puede ser muy variado, puede comenzar proponiendo un curso inicial, donde inicializa las estructuras básicas de los modelos del *dominio* y el material instruccional asociado, *estudiante* (grupo de estudiantes que tomarán el curso), parámetros del *plan instruccional* (pedagogía del tema del curso). El curso resultante puede ser revisado posteriormente, tanto por el mismo instructor como por otros.

Si el nuevo instructor posee un nivel superior de experticia, puede mejorar el diseño del curso. Si por el contrario, su nivel es inferior, puede aprender sobre desarrollo de cursos tutoriales inteligentes. I.e., el diseño e implementación de un STI queda sometido a un proceso de *refinamiento iterativo*, cuyo resultado será alcanzar sistemas tutoriales de mayor calidad, incentivando la cooperación de los autores.

Cuando se considera que el curso posee un nivel de refinamiento global apropiado, este es llevado a las aulas para su utilización con estudiantes reales. En este punto, el STI debe ajustarse a las condiciones reales dentro de las cuales se activará como por ejemplo, nivel de conocimiento de los alumnos, preferencias del instructor en esa aula, características del aula de computación, cantidad de estudiantes, etc. De esto modo se acrecienta el nivel de adaptabilidad de las estrategias tutoriales.

Por otro lado, la asistencia al autor/instructor atiende dos aspectos:

Diseño instruccional: el modelo debe adquirir información sobre las habilidades individuales en el desarrollo de sistemas tutoriales de cada instructor a fin de proveerlo con ayuda específica en el diseño instruccional. Un instructor principiante necesita mas ayuda que uno experimentado.

Uso del software: a fin de ampliar la cantidad de instructores que se acercan a los instructores computacionales es importante que la interfaz sea muy amigable y brinde ayuda en cada paso del desarrollo.

El modelo del instructor examina la actividad de cada instructor así como la de los estudiantes a fin de verificar la eficacia de las estrategias tutoriales del plan instruccional. El resultado de ese análisis contribuye a mejorar el conocimiento pedagógico del sistema a través del modelo propuesto.

MODELO DEL INSTRUCTOR EN CARRERAS DE INGENIERIA

La enseñanza de la Ingeniería se puede beneficiar con la inclusión de este modelo. Uno de los aspectos más importantes es la diseminación de los STIs en las aulas fundamentada en el acercamiento de estos sistemas al instructor real y no al revés. La adaptación realista al estilo de trabajo de cada instructor hace a estos sistemas más atractivos.

Hay temas que se enseñan en las carreras de Ingeniería que pueden ser controversiales en su inclusión y/o nivel de profundidad, por ejemplo, para la enseñanza de la modelización de diversos fenómenos propios del área (p.e. funcionamiento de redes eléctricas o el envío de gas natural licuado en tanques refrigerados) conviene un análisis top-down o bottom-up?. Mediante el modelo del instructor diversos profesores pueden concordar sobre el tema. A su vez, los docentes auxiliares pueden intervenir, inspeccionando la implementación del curso y aportando su punto de vista. Asimismo, la adaptación al estilo de aprendizaje de cada estudiante será mas realista porque todos los docentes del curso aportarán a la mejora de la enseñanza en forma concordante.

CONCLUSION

La inclusión del modelo del instructor mejora el comportamiento global de un sistema tutorial. Se ha enriquecido la interacción con los usuarios del sistema y las relaciones con los otros modelos del STI. La inspección de la actividad detallada del estudiante por parte de su instructor agrega realismo a la actividad tutorial computacional y da lugar a una importante retroalimentación sobre las estrategias tutoriales. Asimismo el análisis detallado del dominio por varios instructores contribuye a su mejor construcción.

Sin embargo, falta evaluar mas fehacientemente el comportamiento de STIs con la nueva arquitectura. Esto se logrará cuando gran cantidad de estos sistemas funcionen en las aulas. Falta comprobar que el comportamiento instruccional mejora fuertemente con respecto a sistemas que no contienen el modelo explícitamente, i.e., verificar si el instructor computacional ha disminuido la brecha existente con el instructor real. Las pocas experiencias en este sentido así lo señalan.

ENSEÑANZA DE ADMINISTRACIÓN Y DESARROLLO DE PROYECTOS DE SOFTWARE BASADOS EN CMM/SEI ®, BAJO LA MODALIDAD DE TALLER.

María Inés Lund[1], Sergio Gustavo Zapata[2]

Abstract *— El objetivo de este trabajo es presentar la experiencia obtenida en el proceso de enseñanza – aprendizaje, de un estándar de calidad para administrar el proceso de desarrollo de software. Esta experiencia se realiza en un curso de grado, correspondiente al último año de la carrera de Licenciatura en Ciencias de la Información, de la Universidad Nacional de San Juan. Tradicionalmente la forma de impartir este tipo de curso se basa en clases teóricas expositivas. Esta forma de enseñanza dificulta el aprendizaje por parte del alumno, cuando, como en este caso, las temáticas son difíciles de asimilar sin una experiencia concreta Por lo anterior, presentamos una propuesta de un proceso de enseñanza - aprendizaje basado en la modalidad de Taller, en donde se organiza el grupo de alumnos como una empresa productora de software de nivel 2 de CMM/SEI (Capability Maturity Model/Software Engineering Institute) y se los guía en la administración y desarrollo de un proyecto de software para un cliente externo real.*

Index Terms *— Administración de Proyectos de Software, Desarrollo de Proyectos de Software, Estándar CMM, Ingeniería de Software.*

INTRODUCCIÓN

El software juega un rol cada vez más preponderante en nuestra sociedad, cada vez son más las situaciones de nuestra vida diaria en las que nos encontramos interactuando con software. El software día a día incrementa su participación en actividades cada vez más complejas e importantes de nuestra vida cotidiana. Esta rápida expansión de la industria del software se vincula con la necesidad creciente de ingenieros de software bien formados [3].

El software está creciendo fuertemente en tamaño, complejidad y dominios de aplicación, pero desafortunadamente hay problemas graves en el cumplimiento de planes de costo y tiempo, y en la calidad de desarrollo de la mayoría de los proyectos de software. La mayoría de los proyectos de software de gran envergadura nunca son terminados, y muchos de los terminados no satisfacen los requisitos del usuario y son de pobre calidad [5]. Esta situación incrementa la demanda de desarrolladores de software, no solo formados en los aspectos técnicos y científicos de la computación, sino también que tengan una preparación práctica en ingeniería de software [2]-[4].

La calidad del software depende de una adecuada oferta de profesionales actualizados y competitivos. Los desarrolladores de software han sido formados en la forma tradicional. Desafortunadamente esto no ha producido la oferta y calidad de desarrolladores necesarios para satisfacer esta creciente demanda de software [6].

Tradicionalmente, la forma de enseñar ingeniería de software está basada en clases expositivas en donde se exponen una gran cantidad de conceptos, en la mayoría de los casos en forma teórica, sin experiencias prácticas concretas. Aún en los casos en donde se realizan sesiones prácticas, estas son aplicadas a ejemplos no reales, acotados y ajustados a las necesidades del curso, es decir los llamados proyectos de software de "juguete".

La propia naturaleza de la ingeniería de software, en donde la capacidad de toma de decisiones en situaciones reales es una característica fundamental, hace que este enfoque tradicional pierda efectividad dejando incompleta la formación del alumno.

Para salvar estas deficiencias proponemos una metodología de enseñanza basada en la premisa que *todos los conceptos aportados en el curso se deben aplicar en un proyecto de software real*. Además, realizamos un seguimiento tanto de las opiniones de la industria como de los propios alumnos respecto del curso. Un elemento critico en el éxito de un curso de ingeniería de software es la participación de la industria y la interacción con los estudiantes para evaluar y analizar los distintos aspectos del mismo [1].

La presente propuesta ha sido probada en un curso de Administración de Proyectos de Software, utilizando CMM/SEI como modelo de proceso de software. Uno de los aspectos claves de la misma es la participación de un cliente-usuario real, el cual demanda, a los alumnos, un software basado en necesidades reales surgidas en su medio laboral o empresa. Esta participación externa trae al menos dos beneficios inmediatos:

Motivación del grupo de alumnos: el grupo de alumnos es motivado por el contacto con un medio real, en donde los requisitos, clientes, usuarios y tecnología tienen características reales y no surgidos de un ejemplo académico de libro. La adquisición de conocimiento no técnico (que excede al software) relativo al dominio de aplicación del proyecto también es de gran interés y a la vez motivador para los alumnos.

[1] María Inés Lund, Docente-Investigador del Instituto de Informática de la Universidad Nacional de San Juan. Rep.Argentina. mlund@iinfo.unsj.edu.ar
[2] Sergio Gustavo Zapata, Docente-Investigador del Instituto de Informática de la Universidad Nacional de San Juan. Rep.Argentina. szapata@iinfo.unsj.edu.ar

Interacción con problemas reales: la aparición de situaciones extra-académicas, propias de la ejecución de un proyecto de software real, entrena a los alumnos en la toma de decisiones poniendo en práctica sus capacidades ingenieriles. Estas capacidades no serían posible exponerlas en proyectos académicos de "juguete".

La propuesta aquí presentada ha sido experimentada, analizada y mejorada anualmente, a partir del año 1998. Para ello se contó con la colaboración de los propios alumnos que a través de encuestas de satisfacción dieron indicios de oportunidades de mejoras del curso, que en muchos casos luego se implementaron.

PROPUESTA

Ambiente de aplicación

Se trabaja con alumnos de 5° año de la Licenciatura en Informática de la Universidad Nacional de San Juan. Esta Licenciatura es de 5 años, por lo cual se considera que los alumnos tienen una adecuada base, adquirida a lo largo de la carrera, de conocimientos en temáticas de la Ingeniería de Software como metodologías de Análisis y Diseño, Implementación y Planificación de Proyectos.

El curso se llama 'Sistemas de Información III', pertenece al Área Sistemas y es dictado en el último cuatrimestre de la carrera. El cuerpo docente contempla un profesor titular y un jefe de trabajos prácticos.

Con respecto a infraestructura, se dispone, para los alumnos, un gabinete con 12 equipos en red NT, que es el aula donde toman clases.

Objetivos del Curso

El objetivo principal del curso, es formar al alumno en los estándares internacionales de calidad de software. El alumno, que ya está capacitado a raíz de haber aprobado otros cursos del área, en metodologías de desarrollo de software, etc, necesita adquirir conocimientos de conceptos, técnicas y estrategias de calidad de software, con el fin de alcanzar una formación profesional con alta conciencia y conocimientos prácticos con respecto a la excelencia en el proceso de desarrollo de software.

Los objetivos específicos por unidad temática son:

- **Calidad**: Lograr que el alumno adquiera un conocimiento profesional del concepto de calidad, calidad del producto y calidad del proceso.
- **Administración de Requisitos**: Lograr que el alumno valore la importancia de esta etapa dentro de ciclo de desarrollo de software adquiriendo conocimientos prácticos de formalización de documentación de requisitos, a través de un estándar utilizado para tal fin.
- **CMM**: Lograr que el alumno conozca el alcance de CMM/SEI como herramienta de evaluación y auto mejora de la calidad del proceso de software. Que el alumno conozca los fundamentos y lineamientos generales de los niveles 3, 4 y 5 de CMM/SEI, y conozca en profundidad, por medio de la experiencia práctica, los objetivos y bondades del nivel 2 de madurez de CMM/SEI.
- **Administración de Riesgo**: Lograr que el alumno comprenda, identifique y gestione factores de riesgo del producto, del proyecto y del negocio, en forma práctica sobre el proyecto que comienzan a desarrollar.
- **Inspecciones de software**: Lograr que el alumno conozca los conceptos y fundamentos de inspecciones de software, cuya práctica es desarrollada durante todo el curso.
- **Testing de Software**: Lograr que el alumno adquiera conocimientos teóricos y prácticos de las distintas técnicas de testing de software aplicadas en el proceso desarrollo de software.
- **Satisfacción del cliente:** Lograr que el alumno tenga otra perspectiva de la calidad en donde el cliente-usuario del software tenga un papel protagónico.

Metodología

La primer clase expositiva del curso es introductoria sobre las temáticas abordadas por el curso, modalidad del cursado y la forma de trabajo en el taller, enseñándoles pautas de comportamiento para lograr una adecuada interacción grupal.

Luego existe una serie de clases de exposiciones teórico-prácticas sobre Calidad, analizando diferentes bibliografías, estándares de calidad, etc. Se les brinda a los alumnos un panorama sobre la filosofía conceptual del CMM/SEI, estructura y niveles, en forma general, haciendo hincapié en los fines de cada nivel, las metas de cada área y los objetivos de las prácticas claves.

Al finalizar estas exposiciones se realiza un breve relevamiento en donde cada alumno expresa sus experiencias, conocimientos y preferencias que tienen, con respecto a las etapas, metodologías, técnicas y herramientas, dentro del ciclo de desarrollo de software.

Los alumnos realizarán una presentación en detalle de cada área del nivel 2, agrupándose por afinidad entre ellos en 6 grupos en donde a cada grupo se le asigna un área clave. La presentación de cada área se realiza en clase frente a todos los compañeros. Se evalúa a los alumnos durante la presentación, por conocimiento, claridad y esfuerzo demostrado en la realización de la presentación.

En este punto del curso se toma una evaluación para controlar los conocimientos adquiridos y nivelarlos.

En base a la cantidad de alumnos y a los datos obtenidos en el relevamiento previo, se dividen a los alumnos en 1 o 2 grupos y se les asignan roles, ya sea del área de CMM/SEI nivel 2 en la que deben trabajar, como rol dentro del equipo de desarrollo de software. Cada alumno tiene responsabilidad por dos roles, en un área y en el equipo de desarrollo del software. Cada grupo se transforma en una empresa desarrolladora de software, a la que se le asigna un proyecto real y deben trabajar en pro de ello, durante los 3 meses de cursado que restan.

Durante la ejecución del proyecto, se van dando clases teórico-prácticas, de las diferentes temáticas que se van necesitando a lo largo del mismo. Se les entrega a los alumnos el Manual de Procedimientos de cada área, manual que respeta el estándar CMM/SEI y que fue generado y mejorado por los mismos alumnos en años anteriores.

La primer temática que se aborda es la Administración de Requisitos, en donde, además de prepararlos en técnicas de entrevistas, se enseña y se aplica el estándar de la ESA (Agencia Espacial Europea) para la formalización de Requisitos de Usuarios y Requisitos de Software.

A este punto, los alumnos están listos para recibir la visita del 'cliente real', todos los alumnos del grupo participan, pero son los analistas los encargados de guiar la entrevista. Esta primer visita se realiza en el aula, con el objetivo que todos los participantes del grupo se sientan involucrados en el proyecto desde los inicios y conozcan el objetivo del sistema a desarrollar, pedido por el cliente.

Las entrevistas subsiguientes que sean necesarias, ya son pactadas entre los analistas y el cliente y el lugar de reunión no necesariamente sea la facultad. Los analistas deben elaborar un completo y consistente documento de requisitos de usuario, planteando todo aquello que el cliente necesita y respetando los lineamientos del estándar de la ESA.

Paralelamente, el resto de las Areas se van involucrando en las tareas que deben realizar, estudiando el Manual de Procedimientos que se les entrega para tal fin. Las áreas comienzan a realizar las tareas asignadas. También se les da una clase teórica de Inspecciones de Software, en donde se lo instruye en la forma de realizarlas y de los beneficios consecuentes de aplicar dicha técnica a lo largo de todo el proyecto.

Se realiza inspección al documento de requisitos de usuario. Cuando este es aprobado los analistas deben generar el documento de requisitos de software, planteando todo lo que el sistema realizará, para satisfacer las necesidades enumeradas en el documento anterior y presentar la matriz de trazabilidad correspondiente. Este documento también pasa por el control de una inspección.

El área de Administración de la Configuración debe presentar su plan, generado para este proyecto y acatando lo previsto en el Manual de Procedimientos, para que todas las áreas conozcan los mecanismos con los que se deberán manejar para solicitar información o para entregar documentación para configuración.

Todas las inspecciones son registradas en actas, y estas son ingresadas al área de Administración de la Configuración, bajo el procedimiento formal consignado en el Plan de Administración de la Configuración,

El área de Planificación, ya puede ir comenzando a acordar y establecer tiempos y esfuerzos, a esta altura se les brinda clases teórico-prácticas sobre Administración de Riesgos, y sobre la técnica de Puntos de Función, con el objetivo de que puedan realizar una planificación con calendario y agenda lo más ajustadamente posible.

Las áreas de Seguimiento y Control y de Administración de la Calidad también deben presentar su respectivos planes para el proyecto y deben informar semanalmente, a todo el grupo, sobre los informes de seguimiento y actas de calidad realizados, de acuerdo a lo planificado, con el objetivo de determinar si es necesario tomar medidas correctivas.

Una vez que los documentos de requisitos de usuario y requisitos de software son formalmente aprobados, los diseñadores, que ya vienen avanzando sobre este aspecto, deben tratar de llegar a un diseño con el mayor detalle posible. Generan un documento en donde se describe como hará el sistema para obtener lo especificado en el documento de requisitos de software. Este documento no solo refleja la arquitectura del software y diccionario de datos, sino también el diseño de las interfaces, el mapa de navegación y detalle de programas particularmente complejos, este documento es una versión adaptada de los documentos de diseño del estándar de la ESA.

Una vez aprobado formalmente, el documento de diseño, con una inspección, los implementadores, que previamente se han familiarizado con el lenguaje y entorno de programación, e incluso haber realizado algún prototipo, comienzan a trabajar fuertemente en implementar todo lo indicado en el documento de diseño y se planifican las fechas de inspecciones de código.

En este punto se da una clase de Testing de Software y técnicas de testing. Los encargados de realizar el testing ya pueden comenzar a planificar el testing del software, tomando como base los documentos anteriores aprobados. Este plan de testing debe ser presentado en clase.

Una vez que el sistema es terminado y se realiza la presentación formal, los encargados de testing deben comenzar a testear el software y presentar un informe de resultados de testing.

A esta altura, nos encontramos al final del período de cursado de la materia, se les enseña otra forma de medir calidad, como es la medición de la satisfacción de los usuarios del software.

Se hace un cierre de la materia con una clase en donde los exponen su experiencia, sus sugerencias, su grado de satisfacción y proponen 'mejoras' que se podrían realizar a los Manuales de Procedimientos, de acuerdo a la experiencia obtenida por su uso.

Consideraciones generales

No está de más aclarar que todas las clases teóricas y teórico-prácticas y exposiciones se realizan para todos los alumnos, no solos los involucrados en las temáticas. Las inspecciones también son practicas obligatorias para todos los alumnos del curso.

Algunas veces se puede plantear que en lugar de realizar presentaciones de los planes de las áreas, pueden realizarse Inspecciones a los planes. Esto lo hemos realizado, sobre todo, con el Plan de Planificación del Proyecto.

Los alumnos deben satisfacer un mínimo de 75% de asistencia a clases y exposiciones tórico-prácticas, como así también a las presentaciones de planes, inspecciones, sistema, etc. El resto del tiempo asignado a la materia se destina para que los alumnos trabajen en las tareas que les han sido encomendadas, en aula o en el lugar que ellos dispongan. Estos días no se computan en la asistencia.

CONCLUSIONES

El resultado de aplicar la modalidad de taller para este tipo de currícula, es realmente satisfactorio. Los resultados obtenidos son de muy buen nivel académico y de desarrollo. Los alumnos mismos ven superadas sus expectativas.

No es una tarea fácil, requiere de un dedicado seguimiento al trabajo de los alumnos, muchas veces exigir y tratar de hacer respetar la planificación original, para que vaya de acuerdo a la restricción temporal del cursado.

Las encuestas que miden el nivel de satisfacción reflejan un grado de satisfacción que va del bueno al elevado.

La participación de un cliente externo al ámbito académico es un factor importante de motivación para los alumnos, imponiéndoles restricciones reales en donde las capacidades ingenieriles de los alumnos se pueden llevar a la práctica.

EVALUACIÓN DE ASIGNATURAS DE TIPO TECNOLÓGICO

Marc Barracó-Serra[1] , Mª àngels adrià-Casas[2], Ricard Torres-Cámara[3],Pere Surià-Lladó[4]

Abstract — *The technical syllabus of technological matters modifies their contents and their methodologies, introducing new tematic subjects or suppressing others.*
The justification of such changes must be centered in approaches of educational effectiveness and adjustments to the industrial world reality in each moment.
The way to proceed, according with this exposed sense, is making particular and general evaluations of the matters, in the aspects of motivations, objectives, methodologies, resources, etc.
It is necessary to keep in mind that the succession of changes is done with very big speed, because their foundations are based in the development of the new information and communication technologies. For this reason a value systematic analysis is proposed.
The creation of an "educational protoplasm" that contact universitary Departments, educational Institutions, scientist and industrial world professionals., favors the discussion of the question and facilitates the taking of decisions in the sense of profiling a curricular reality more adapted to the moment.
A specific mention about the creation of an "educational proptoplasmatical structure" in the "Departament de Mecànica de Fluids" of the "ETSEIB-UPC", as well as the perspectives of its operativity, is treated.

Index Terms — subject evaluation, educational protoplasm, technical curriculum, University-Industry.

INTRODUCCIÓN

Los Planes de Estudios varían sus contenidos periódicamente introduciendo o modificando asignaturas. Quiere esto decir que se está asistiendo a la implantación de asignaturas total o parcialmente nuevas respecto a los contenidos curriculares anteriores.
Las razones que provocan estas modificaciones han de ser justificadas desde un punto de vista de mejora de la eficacia docente. Se han de esgrimir, por tanto, argumentos de peso para producir estos cambios.
La única manera objetiva de proceder es mediante una evaluación de toda la asignatura, desde las motivaciones iniciales hasta los objetivos, metodologías, soportes utilizados en su desarrollo, criterios de evaluación , etc.
El contenido de lo que se apunta es de tipo general, pero es obvio que en materias tecnológicas las velocidades de cambio son tan altas que se puede asegurar que las actuaciones en los Planes de Estudio han de ser continuadas.

Establecimiento, modificación o supresión de una asignatura

La razón que inicialmente se puede dar para la aparición o modificación o desaparición de una materia, es la voluntad de la Administración que, asesorada convenientemente, publica en sus medios de comunicación los nuevos contenidos, indicando ligeramente la metodología de enseñanza (tiempo, prácticas,...). Esta realidad, a pesar de ser la que ha prevalecido tradicionalmente, es la menos importante desde el punto de vista docente, siendo de tipo oficialista y tendiendo a obtener criterios para poder facultar para el ejercicio profesional a quienes han seguido las enseñanzas que se hayan derivado.
La motivación real, de la cual la Administración ha de ser transmisora, ha de ser el estado actual del mundo industrial y su estado previsible en el futuro.
La sociedad demanda técnicos formados para hacer frente a los problemas que la industria presenta y que ha de resolver de manera correcta y de la forma más rápida posible para no interrumpir el proceso productivo y optimizarlo de manera continuada.
Los recursos empleados han de ser utilizados de manera adecuada para garantizar la consecución de los objetivos fijados en su grado máximo.

Objetivos generales

De forma ambiciosa, que es como se han de enfocar las actuaciones, se ha de procurar que se adquiera un nivel de aprendizaje por parte del estudiante suficientemente importante para potenciar sus competencias y habilidades así como un buen bagaje de conocimientos para adquirir el criterio suficiente para dictaminar sobre las situaciones técnicas que se planteen.
Estos objetivos generales hacen énfasis en las actividades de aprendizaje, superando la clásica transmisión de conocimientos del profesor al estudiante y abogando por un aprendizaje mutuo acentuando el matiz formador de la enseñanza.

[4] Pere Surià-Lladó. Universitat Politècnica de Catalunya. ETSEIB. Avda. Diagonal, 647. Barcelona-08028. suria@mf.upc.es

Es preciso considerar que la asignatura en cuestión no se ha de analizar en forma aislada, lo que supondría una concepción micro, sino que se ha de integrar en un sistema de conocimientos diversos y complementarios, lo que supone un análisis global macro del plan de estudios.
Llegados a este punto se ha de ser consciente del volumen de trabajo que supone el cumplimiento de un mínimo de objetivos (adquirir una base sólida y la posibilidad de una cierta especialización). Se hace necesario el establecimiento de unos criterios de priorización de objetivos. Estas opciones propiciadas por el Centro docente son asumidas por el estudiante.
En cursos numerosos la atención del estudiante en el asesoramiento sobre las opciones a elegir es dificultosa, pero se han de implementar sistemas de comunicación para que el Plan de Estudios se realice de manera personalizada y tutelada.

Objetivos específicos

Al ser de características particulares para cada temática se ha optado por enunciar algunos puntos que son aplicables a más de una materia pero más concretos que los mencionados hasta ahora:

- Enseñanzas teóricas. A pesar que el título no es el más adecuado, hace referencia a la exposición del cuerpo doctrinal de la materia. Es preciso indicar que éste contenido es concreto y tomará como base inicial lo que el estudiante sabe de los conocimientos básicos ya cursados.
  Es claro que se trata de entender el núcleo del tema presentado par iniciar de esta manera una fase de discusión, de diversidad de pareceres, de distintas opiniones y de elaboración de bases de actuación.
  El planteamiento de situaciones no analizadas y que se pueden producir en ocasión de la explicación, daran validez universal a la exposición.
  La introducción de nuevos parámetros y el hecho de contemplar problemáticas contrarias a las formuladas completarán el aprendizaje.
- Enseñanzas práticas. Conllevan el contacto con la realidad experimental. El desarrollo teórico de la manipulación a realizar, la manipulación propiamente dicha (con el conocimiento de la instrumentación y las técnicas de medida), el análisis de los resultados obtenidos (con los errores introducidos y la no conservación de las hipótesis iniciales) y las conclusiones finales, constituyen la totalidad de la actividad que se completa con la exposición del conjunto del trabajo con la discusión subsiguiente.
  Las enseñanzas prácticas han de aportar como valor principal el hecho de colocar en su lugar correspondiente la vertiente de aplicación, adquiriendo rigurosidad en las operaciones, espíritu crítico en trabajo realizado y todas las facetas de iniciativa y creatividad necesarias para resolver aspectos conflictivos del problema estudiado.
- Enseñanzas diversas. Bajo este título se engloban un conjunto de actividades que complementan de manera trascendente los conceptos teóricos y experimentales. Se trata de contemplar las visitas técnicas, las conferencias especializadas, debates sobre un tema determinado, trabajos dirigidos de una parte o la totalidad del temario del programa, etc.
  A pesar que han sido consideradas como enseñanzas de segundo orden, cada vez es más intensa la opinión de su eficacia. Factores como el trabajo en equipo, la faceta de discusión de aspectos tecnico-económicos con vistas a realización industrial, así como el contacto y el cambio de opiniones con los responsables científicos y tecnológicos han de representar el bagaje formativo más relevante.

Evaluación de la asignatura

Se ha de entender que efectuar una evaluación de una asignatura, es hacerlo desde todos y cada uno de los condicionantes que han procurado su incorporación al curriculum.
La primera cuestión que se prevee es la manera de realizar la evaluación. En efecto,
¿Quién ha de hacer la evaluación?
¿Cómo se ha de realizar la evaluación?
¿Cuándo se ha de hacer la evaluación?
¿Qué consecuencias se derivaran de la evaluación?
Evidentemente no existe una respuesta precisa para todas estas preguntas, pero es muy claro que han de hacer la evaluación los responsables de la docencia (profesores, estudiantes, centros docentes, entorno industrial,...)
Paralelamente a la información extraida se han de analizar y valorar los resultados docentes (éxito o fracaso en el aprovechamiento, validez o inutilidad de la materia propuesta,...).
La frecuencia de evaluación ha de ser la máxima posible, conservando su significación y la posibilidad de actuación, sea para la introducción de una modificación o para aconsejar su anulación.

- Evaluación del programa.
  Se han de analizar entre otros factores:
  - El equilibrio del tipo de enseñanza (teoría, práctica, trabajos dirigidos,...)
  - La adecuación de la asignatura a la idiosincrasia del Centro
  - La adecuación del programa a las necesidades del entorno industrial
  - La facilidad en el establecimiento de comunicación entre los diferentes grupos integrantes de la enseñanza

- La evolución que se produce entre las sucesivas evaluaciones.
- La eficacia en la utilización de recursos docentes.
- La adaptación a los contenidos del Plan de Estudios.

- Evaluación de los objetivos.

Los puntos más importantes incorporados son:

- La adecuación al Plan de Estudios.
- La consecución de los niveles de formación fundamentales y amplios (visión general y definición del perfil del estudiante analizado colectivamente).
- La concordancia entre la consecución de resultados y los medios empleados en ello.
- La claridad en que han sido planteados los objetivos desde el punto de vista formal.

- Evaluación del contenido

Extraida de la experiencia adquirida en la industria y la aportación de la Universidad, se ha de considerar:

- La correcta situación de las enseñanzas en el total del Plan de Estudios. En el caso presente se trata de garantizar la consecución de los conocimientos básicos necesarios para poder intensificar la característica tecnológica de la asignatura. Con todo, se ha de procurar que el contenido no sea puramente informativo.
  La concreción de lo que se ha expresado indica la necesidad del carácter de aprendizaje de la enseñanza (en materias tecnológicas resulta más problemático).
- La buena organización. Comporta un orden correcto de actividades de dificultad creciente. La incorporación de los trabajos prácticos en el momento idóneo y la realización de trabajos dirigidos (proyectos, estudios,...) de forma eficaz (es corriente el parecer según el cual estas actividades es conveniente programarlas de manera continuada a lo largo de todo el curso -y de toda la carrera- incorporando en cada estadio los conocimientos adquiridos recientemente).

- Evaluación de la metodología

Es el aspecto que puede validar o anular una nueva implantación. En este sentido es preciso:

- Constatar que la forma de impartir la asignatura asegure un verdadero aprendizaje. Es conveniente comprobar cuales son los sistemas que se pueden emplear para este objetivo. Las técnicas de aprendizaje cooperativo y, en general, toda manifestación de participación activa del estudiante ha de ayudar a logro de este propósito
- Insistir en el uso de los recursos más elaborados, sean materiales o estratégicos, para la participación mayoritaria.

- Evaluación del sistema de evaluación

Hace referencia a la calificación que se ha de asignar al Estudiante como medida del aprovechamiento adquirido al haber cursado la asignatura propuesta. Es imperativo que:

- Se adopte un sistema de evaluación que ponga de manifiesto el progreso en la incentivación de conocimientos, habilidades y competencias, antes mencionadas, en el proceso global del aprendizaje
  Resulta claro que este sistema ha de ser continuo con posibilidades de recuperación individual y colectiva en caso de retraso en el aprendizaje.
  La valoración de cada una de las actividades realizadas, con el análisis de los éxitos y las dificultades, facilita la labor evaluadora (incluso la de tipo sancionador)

Evaluación general de la asignatura

Planteada la asignatura y desarrollada (en el periodo de tiempo conveniente para la extracción de conclusiones) se llega a la valoración de los criterios que han motivado su introducción en el Plan de Estudios y/o su posible eliminación del mismo.
Todos y cada uno de los aspectos que conforman el desarrollo han de ser objeto de evaluación. Siendo así cabe sintetizar:

- ¿Se ha desarrollado el programa como estaba previsto?
  Es preciso que ofrezcan su opinión justificada, estudiantes, profesores, responsables de las instituciones académicas y representantes del entorno industrial. La valoración ha de abarcar:
  - la utilidad (aplicabilidad)
  - la coherencia institucional y social
  - La utilización razonable de recursos
  - La adecuación al Plan de Estudis vigente
  - La mejora sucesiva de las evaluaciones efectuadas anteriormente
  - El sistema de incentivación dado a profesores y estudiantes

- ¿Se han obtenido los objetivos previstos?
  Los mismos colectivos protagonistas han de cuestionarse sobre:
  - La adecuación al Plan de estudios
  - El grado de adquisición de los criterios de formación-aprendizaje
  - La caracterización personalizada de cada estudiante
  - La claridad y precisión empleada para que los objetivos sean comprendidos

- ¿Han sido adecuados los contenidos?
  Son la concretización del programa. Se ha de valorar:
  - Su correcta organización.
  - Su concordancia con el Plan de Estudios

- Su buena contribución a la formación-aprendizaje

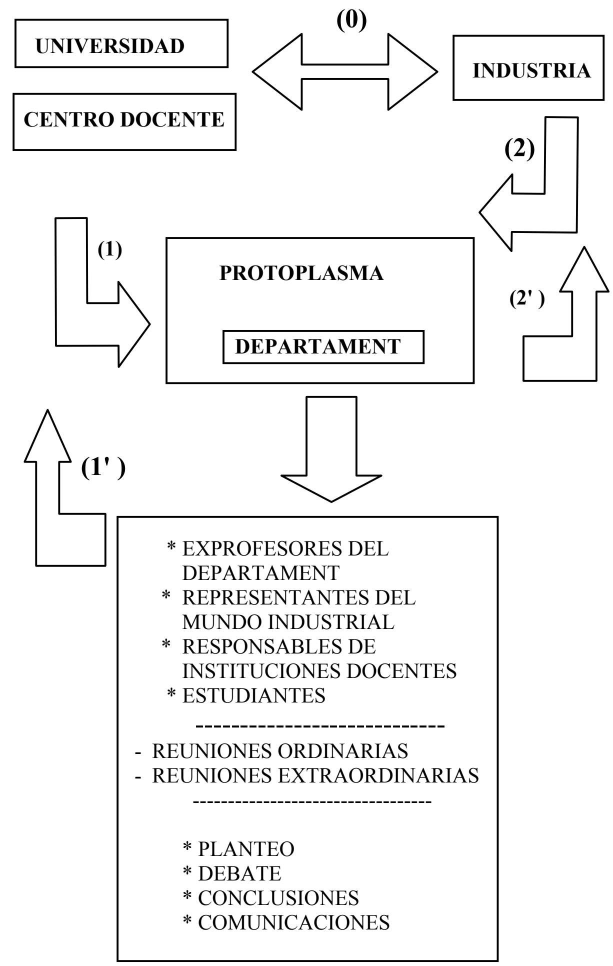
- ¿Se han empleado metodologías docentes eficaces? Representa una buena parte del éxito de la asignatura. Contempla:
  - La consecución del binomio enseñanza-aprendizaje
  - La consecución por parte del estudiantado de los objetivos propuestos

- ¿Han sido idoneos los recursos utilizados? Es, seguramente, el elemento decisorio del éxito (enseñanza-aprendizaje correcto) de la implantación. Es preceptivo analizar:
  - La utilización de recursos materiales idóneos
  - La introducción de estrategias adecuadas.

REFLEXIONES FINALES

En el esquema adjunto se indica la cristalización del contenido expresado realizada en el "Departament de Mecànica de Fluids" de la "ETSEIB-UPC" en sus actuaciones en diferentes etapas de actuación.
El objetivo primordial ha sido el establecimiento de los contactos necesarios: Universidad-Industria (0), a través del "Departament" para incidir en la evaluación de las asignaturas de su área temática (Mecánica de Fluidos y Máquinas hidráulicas fundamentalmente) y decidir las modificaciones que se consideren pertinentes.
La creación de la estructura de "protoplasma docente" se ha realizado con el concurso de ex-profesores del Departamento, representantes del mundo industrial y científico, responsables de las Instituciones docentes, estudiantes, y cualquier persona o estamento con voz propia en la temática en cuestión.
El sistema de funcionamiento es de tipo comisión con reuniones periódicas ordinarias, de control e información y reuniones extraordinarias con motivo de temas puntuales trascendentes.
Los planteos, debates y conclusiones, desprovistos de los aditamentos formales innecesarios conllevan a la elaboración de comunicaciones que redundaran en la solicitud al centro docente -en primera instancia- de ciertas medidas a incorporar en el Plan de Estudios (1').
La respuesta del Centro e Instituciones (1), indicará la conveniencia o no de la incorporación de las medidas propuestas y, en su caso, la provisión de recursos suficientes para ello.
La manifestación de las opiniones del mundo industrial y la respuesta que, despues del proceso, ofrecerá el "Departament" se señalan mediante (2) y (2').
Los resultados obtenidos, a lo largo de los años, por la actuación del protoplasma docente en forma directa o como consecuencia se centran en:

- Remodelación de las prácticas de laboratorio de Mecánica de Fluidos según criterios de mayor contenido experimental.
- Visión de la asignatura de "Centrales hidroeléctricas" desde el aspecto de maquinaria hidraúlica, reduciendo el contenido eléctrico y económico (los Departamentos correspondientes ya lo incorporan en sus programas)



- Planteamiento de introducción de una asignatura de mantenimiento de máquinas hidráulicas (en el futuro se ha presentado como una asignatura reglada)
- Establecimiento de criterios de uniformización de definiciones, clasificaciones, nomenclatura y simbología de los elementos de todas las asignaturas impartidas por el "Departament"
- Participación del sector industrial en las tareas docentes (conferencias, seminarios,...etc). De especial interés en las asignaturas de "Centrales hidroeléctricas" y "Ventiladores industriales y compresores"
- Planteamiento de creación de criterios concurrentes en la formulación de las ecuaciones fundamentales (acción conjunta con los Departamentos que imparten Elasticidad y Transmisión de calor y que

ha concluido en la introducción en el Plan de estudios de la asignatura "Mecánica de medios continuos")

CONEXIÓN NORMALIZADA DEL EQUIPAMIENTO EN LOS LABORATORIOS DE ENSEÑANZA DE CONTROL

Roberto Saco[1]*, Aníbal Zanini*[2] *y Carlos A. Godfrid*[3]

Abstract *— En este trabajo se describe una forma de interconexión normalizada de diferentes procesos y plantas de laboratorios para la enseñanza de control automático. El sistema de adquisición y control es común para todos los prototipos y se implementa con una PC estándar provista con software para control en tiempo real. La conexión de las diferentes plantas con las PC's, usadas como controladores, se realiza mediante una red CAN (Controller Area Network), y de esta forma se logra hacer intercambiables a las diferentes plantas existentes mediante una conexión normalizada. Además se garantiza que las futuras plantas incorporadas al laboratorio podrán ser controladas con cualquiera de las PC's que posean la interfaz CAN. Para el diseño de los algoritmos de control se utiliza los paquetes Simulink, Real Time Workshop y Real Time Windows Target de MATLAB. El manejo del protocolo CAN, se realiza mediante una S-Function de Simulink la cual es transparente para el diseño del algoritmo de control. En base a los resultados satisfactorios obtenidos se propone una normalización para interconexión de procesos y plantas de laboratorio basada en la red CAN.*

Index Terms — CAN networks, control education, equipment interconnection, MATLAB, real-time control, Simulink.

INTRODUCCIÓN

En los últimos años se encuentra una tendencia generalizada a incorporar más trabajo experimental en la formación en control automático. Tradicionalmente esta formación se centraba en cursos con fuerte contenido teórico, pero cada vez más se reconoce la importancia de enfrentar problemas de la práctica profesional en el marco de los estudios de ingeniería. En este sentido, se citan frecuentemente las conclusiones del Workshop de la National Science Foundation y la Control Systems Society de la IEEE (NSF/CSS) con nuevas directivas para la educación en control automático, que impulsan a modificar los actuales métodos de enseñanza [1]. Un primer acercamiento a los problemas de la práctica se consigue con el uso de herramientas de simulación. En este sentido se han desarrollado varios "Laboratorios Virtuales" aprovechando las posibilidades y recurso de Internet [2],[3].

En cambio, no hubo un desarrollo similar en lo relativo a experimentos reales. Y son las aplicaciones y el control en tiempo real los ingredientes esenciales en el aprendizaje de la ingeniería en automatización. Creemos que un factor limitante en el desarrollo de experiencias en este campo se debe a que cada aplicación implica, además del experimento en sí, un trabajo considerable de interfaces, conexionado y software dedicado. Además, estas tareas requieren frecuentemente, del aporte de especialistas de diferente orientación. Por ello entendemos que disponer de una interfaz normalizada, común a las distintas experiencias de un laboratorio, permitirá desentenderse de los aspectos laterales, para concentrarse en el experimento de interés.

Por otra parte, la internacionalización de la educación universitaria se expande día a día, tanto en las carreras de grado como en las de postgrado. La necesidad de compatibilizar las herramientas usadas en las distintas disciplinas es un punto importante para facilitar la integración de los estudiantes. La estandarización de los métodos de trabajo e interconexión en el terreno experimental facilitará la posibilidad de cooperar y compartir experiencias entre instituciones tanto nacional como internacionalmente.

En este marco la idea propuesta en este trabajo es la estandarización, a nivel educativo, de sistemas de control en tiempo real y aplicaciones experimentales. La utilización del software MATLAB/SIMULINK juntamente con el paquete para control en tiempo real RTW ya está siendo utilizada como un estándar por varias instituciones [4]. Este paquete permite generar algoritmos, juntamente con su código para la ejecución en tiempo real, en forma gráfica. De esta forma se logra que los estudiantes y profesores se pueden concentrar en el diseño del sistema de control, su implementación y evaluación sin necesidad de entrar en la tediosa tarea de programación con lenguajes de bajo nivel e interfaces a hardware [5].

LA RED CAN

La red CAN (Controller Area Network) es una red de comunicación serie que fue originalmente diseñada para su utilización en la industria automotriz, aunque actualmente, también se ha hecho una red popular en la industria de la automatización y otros campos. La red CAN se utiliza principalmente en sistemas embebidos y ofrece una excelente solución para manejar la comunicación entre múltiples microprocesadores. Es una red de dos hilos, half duplex (un sentido a la vez) apropiada para aplicaciones de

[1] Roberto Saco, Universidad Nacional de Quilmes, Av. Calchaquí Nro. 5800, Fcio. Varela (1888), Buenos Aires, Argentina, rsaco@unq.edu.ar
[2] Aníbal Zanini, Universidad Nacional de Quilmes, Av. Calchaquí Nro. 5800, Fcio. Varela (1888), Buenos Aires, Argentina, azanini@unq.edu.ar
[3] Carlos A. Godfrid, Universidad de Buenos Aires, Av. Paseo Colón 850, Capital Federal (1063), Buenos Aires, Argentina, cgodfri@fi.uba.ar

alta velocidad utilizando mensajes cortos. El protocolo CAN utiliza identificadores de mensajes (ID) que pueden ser asignados en diferentes categorías de información de control [6]. Estos ID son a su vez indicadores de la prioridad de cada mensaje. En caso de disputa de la red, los mensajes de menor ID prevalecen respecto a los mensajes de mayor ID. Estos hace que la red CAN sea adecuada para su utilización en control en tiempo real. La velocidad de comunicación puede llegar hasta 1 Mbits/seg en distancias de aproximadamente 40 metros. El protocolo es ampliamente utilizado en aplicaciones sobre vehículos aunque su uso se está ampliando rápidamente a aplicaciones de todo tipo debido a su bajo costo. Los puntos a destacar de las redes CAN son los siguientes:

- Capacidad de control en tiempo real, gracias a la posibilidad de asignar prioridades a sus mensajes y a la no destrucción de mensajes en el caso de una disputa del bus.
- Capacidad de comunicación multi-maestro. Cualquier nodo puede iniciar una comunicación en forma independiente en cualquier momento.
- Bajo costo de implementación debido a la disponibilidad en una gran cantidad de microcontroladores de diferentes fabricantes como Intel, Motorola, Philips, Dallas, etc.
- Posee diferentes mecanismos de detección de errores que la hace muy robusta e ideal para trabajar en ambientes ruidosos.
- Es fácil de configurar y modificar.

Estos son los puntos que se tomaron en cuenta a la hora de elegir una red para interconectar los procesos de laboratorio con las PC's. Las beneficios de inerconectar plantas y PCs con las red CAN en los laboratorios son enormes. Entre los puntos que podemos resaltar de estos beneficios son:

- Un protocolo de comunicación estándar simplifica y reduce los costos al conectar diferentes plantas y subsistemas de varios vendedores en una red común.
- El algoritmo de control es realizado por la CPU o DSP en la PC dejando tareas como adquisición, protección, y generación de señales al nodo. De esta manera, la CPU o DSP encargado del algoritmo de control tiene más tiempo para tareas específicas de control.
- La red CAN, multiplexa todos los mensajes mediante un cable de sólo 2 conductores, esto elimina la tediosa tarea del conexionado punto a punto de todas las señales entre la PC y la planta, ahorrando tiempo, dinero y facilitando las tareas a la hora de la interconexión.

HARDWARE

Existen varias maneras de implementar el hardware necesario, con capacidad de comunicación CAN. Si se consulta la documentación on-line de Mathwork se pueden encontrar soluciones para varios sistemas embebidos

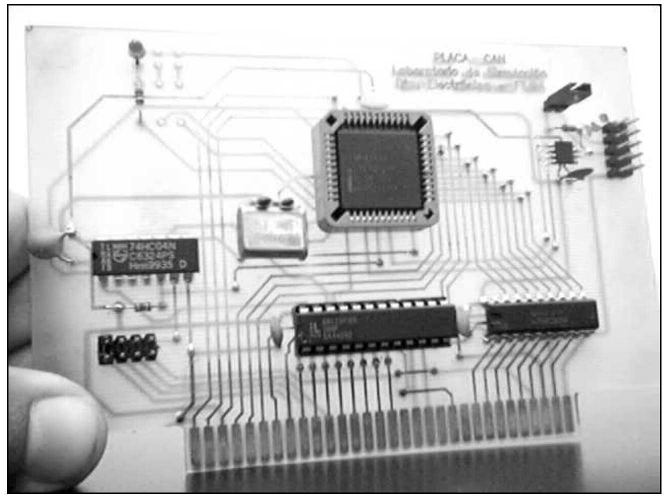

FIGURA. 1
PLACA DE RED CAN PARA PC

posibles. En nuestro caso la comunicación CAN con las PC's se logra mediante una placa ISA en un slot de la PC (Figura 1). Esta placa contiene un controlador CAN AN82527 de Intel, el cual maneja completamente todos los detalles del protocolo CAN. Para la capa física de la red se utilizó un integrado UC5350 que cumple el estándar ISO11898 y maneja velocidades de hasta 1 Mbits/segundo.

Las estaciones remotas (nodos) fueron realizados con el mismo controlador CAN AN82527. Además los nodos poseen un microcontrolador MC68HC11 que se encarga de las tareas específicas de adquisición como conversiones A/D, D/A, generación de PWM (Modulación de Ancho de Pulso), sistemas de protección de la planta y supervisión de bajo nivel. El microcontrolador se comunica con el controlador CAN para su configuración, recepción y transmisión de mensajes. Cada nodo además maneja la capa física de la comunicación con el estándar ISO11898.

SOFTWARE

Todo el software de simulación utilizado pertenece al entorno MATLAB, herramienta de uso generalizado en los cursos y proyectos de control. Se describen a continuación dos componentes importantes de MATLAB [7] utilizados para la simulación y control en tiempo real de los sistemas y el hardware que se empleó para el control de los ejemplos.

Simulink

En términos generales, Simulink es un paquete de software que permite modelar, simular, y analizar sistemas dinámicos. Soporta sistemas lineales como no lineales, modelos en tiempo continuo, discretos e híbridos. Para diseñar los modelos, Simulink provee una interfaz gráfica (GUI) que permite construir los modelos como diagramas de bloques, de la forma habitual en que se plantea el diseño de sistemas en el ámbito del control automático. Simulink incluye un conjunto de bloques de librería. Algunos de estos bloques están incluidos en el paquete principal, otros son "toolbox"

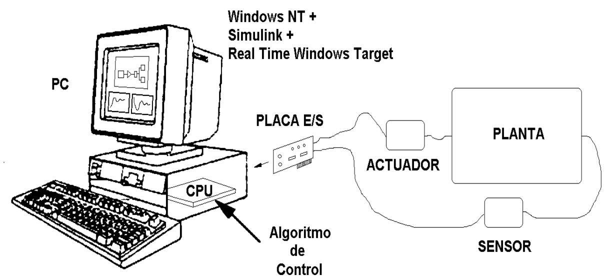

FIGURA. 2
CONTROL EN TIEMPO REAL CON EL REAL TIME WINDOWS TARGET.

específicos de determinados temas, que enriquecen la capacidad de Simulink [8]. Un vez definido un modelo, se puede simular eligiendo diferentes métodos de integración y observar los resultados de la simulación mediante bloques especiales, que muestran las variables del modelo en función del tiempo, de igual forma que un osciloscopio.

RTW

El RTW (Real Time Workshop) genera código "C" directamente del modelo realizado en Simulink. También puede generar en forma automática programas que pueden ser ejecutados en plataformas de tiempo real sin la necesidad de que estén instalados el MATLAB o el Simulink. Esto permite la ejecución de modelos continuos, discretos e híbridos en una variedad de computadoras, e interactuar con el hardware para la adquisición y generación de señales. De esta forma, se pueden construir fácilmente, no sólo controladores, sino también se pueden simular plantas que están operando en tiempo real, de modo que las señales de entrada y salida de dicha simulación, son una aproximación de las señales de la planta real.

Una opción del RTW es el Real Time Windows Target [9]. Este paquete permite utilizar una PC con sistema operativo Windows 95/98/NT como plataforma para las simulaciones en tiempo real (Figura 2). Una serie de bloques de librería para placas de adquisición son incluidas en el mismo. Si se tiene alguna de estas placas, la interfaz al hardware es directa. En caso contrario, se puede escribir en código "C" la interfaz específica para la placa hardware por medio de una S-Function [10]. Las S-Functions son bloques dinámicos del Simulink, que cumplen distintas funciones en una simulación. Entre ellas, tareas de entrada y salida, si se las programa en lenguaje "C".

DRIVER DE LA PLACA CAN

Para permitir la interfaz entre el algoritmo realizado en Simulink y la placa CAN se utilizó una S-Function. Esta función realiza la configuración del CI AN82527 así como la configuración de los ID de mensajes, su recepción y transmisión. Los detalles de la configuración y manejo de mensajes son transparentes para el usuario, el cual sólo utiliza un bloque S-Function configurado como entrada o salida de la planta. Desde Simulink, los detalles de la configuración y manejo de mensajes es transparente para el usuario, el cual sólo utiliza el bloque S-Function como entradas o salidas de las señales de la planta.

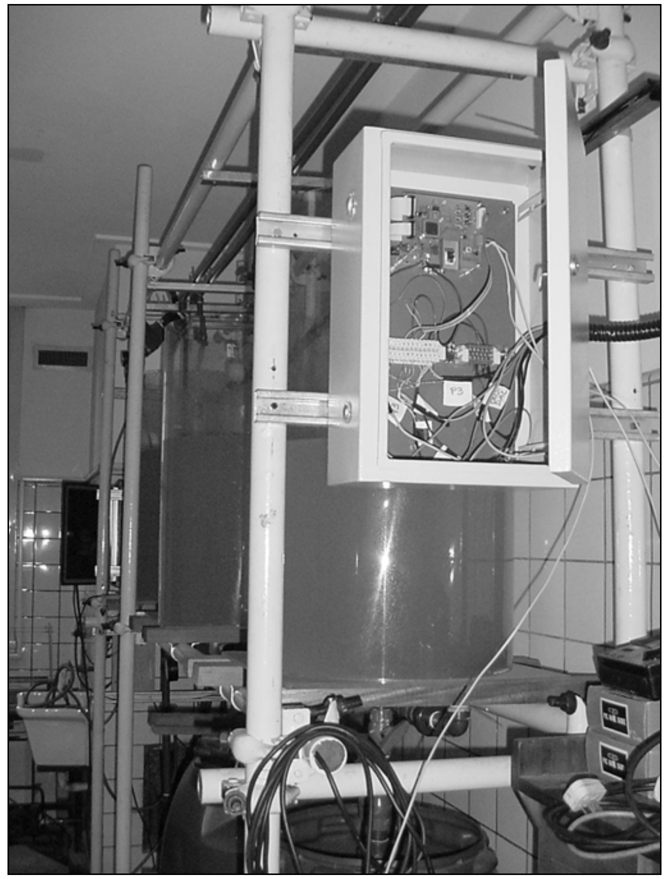

FIGURA. 3
PLANTA PARA CONTROL DE NIVEL DE LÍQUIDOS Y NODO CAN

LAS APLICACIONES EXPERIMENTALES

Hasta el momento se han integrado dos aplicaciones con la red CAN. Una primera aplicación es una planta experimental para control de nivel de líquidos (Figura 3). Consiste en tres tanques que descargan su contenido (agua) a un depósito. Los tanques están interconectados y provisto de válvulas manuales para regular su descarga o intercambio de líquido entre ellos. Cada tanque posee un transmisor de nivel de líquido realizado con un sensor de presión diferencial. Una bomba centrífuga aspira el agua del depósito y la envía a uno de los tanques a través de una válvula neumática. El experimento consiste en controlar el nivel de líquido del primer, segundo o tercer tanque mediante el control de la válvula neumática. El nodo CAN, se encarga de adquirir las señales de los sensores de nivel y generar la señal para la

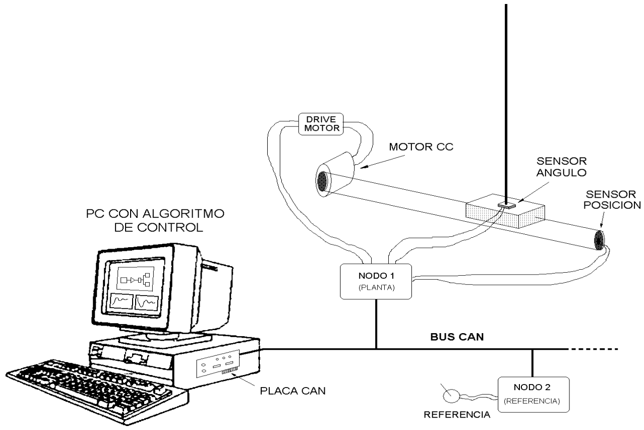

FIGURA. 4
CONTROL DE UN PÉNDULO INVERTIDO A TRAVÉS DE LA RED CAN.

válvula neumática. Por otro lado, el nodo se encarga de comunicar estas señales con la PC a través de la red CAN.

La segunda planta es un péndulo invertido el cual debe ser mantenido en posición vertical mediante un adecuado algoritmo de control (Figura 4). El nodo se encarga de adquirir la señales del ángulo del péndulo y la posición del carro así como la generación de la señal de modulación de ancho de pulso (PWM) utilizada para controlar el motor que mueve el carro. Este nodo envía y recibe estas señales a la PC a través de la red CAN.

Las dos plantas del laboratorio están conectadas a dos PC mediante una red CAN común a ambas. Cada PC puede controlar indistintamente a cualquier planta. Otra configuración posible es que una de las PC controle una planta y la otra PC utilizarla como monitor del proceso y adquisición de datos o como ajuste de los parámetros del algoritmo de control.

CONCLUSIONES

Los trabajos realizados demuestran la conveniencia de disponer de una interfaz normalizada para vincular desarrollos experimentales.

En el caso presentado, un proceso de laboratorio para control de nivel de líquidos y un sistema mecánico para estabilizar un péndulo invertido, fueron controlados usando la interfaz CAN propuesta.

Los resultados demuestran que la red se comporta en forma apropiada para el control de ambos experimentos.

En el caso de la operación de ambas plantas en forma simultánea el tráfico en la red resultó transparente para el control de las mismas. La facilidad a la hora de la conexión de la PC's con los experimentos justifica ampliamente el uso de la red. La posibilidad de que en un futuro todas las plantas del laboratorio de control, así como de otros laboratorios, pueden ser conectadas bajo el mismo protocolo común CAN nos alienta a seguir profundizando aún más en el tema.

INTRODUCTION OF MICROCONTROLLERS OF INTEL MCS-96 FAMILY IN EDUCATIONAL PROCESS

Nataly Yu.Ershova[1]

Abstract — Embedded microcontrollers are used in various apparatus, measuring devices and other machinery. Students of physical-technical department study the architecture of Intel MCS-96 family microcontrollers at lectures and practical classes. During tuition students become familiar with ASM-96 assembler language and acquire knowledge in programming of built-in microcontroller devices such as timers, analog-digital converters, pulse width modulator, high speed input output devices, peripheral transactions server and programmable interrupt controller. Microcontrollers are widely used in implementation of student's research and degree works. Students design microprocessor systems and automatic experimental equipment connected to computer. Some results were reported in students conferences. Electronic textbook on modern microcontrollers and instruction for laboratory classes on microcontrollers theme were created.

Index Terms — *built-in devices, embedded microcontrollers, microprocessor systems.*

The versatility and low cost led to fast development and distribution of one-crystalline microcontrollers (MCU). Modern MCU have all resources for solving tasks of control. Microcontrollers are made in such a variety, that they can satisfy any requirements. For example, the development of the new Texas Instruments firm microcontroller takes from 8 to 12 weeks.

Special attention is presently given to the introduction of microcontrollers providing the solution of automation control tasks regarding mechanisms, devices and equipment. The adaptation of microcontrollers to specific features of a particular task is carried out by creating the necessary software and hardware.

At Petrozavodsk State University, physical-technical faculty students carry out practical work within the course "Microprocessor devices", using the microcontroller 8XC196KC/KD of the Intel MCS-96 family. These microcontrollers are designed to be used in control systems as built-in microprocessor devices.

Laboratory models and an integrated environment for programming of the controllers were developed on the basis of MCU 8XC196KC/KD at the "Microprocessor Technology" (St.Petersburg).

The integrated environment includes the following modules: the built - in window text editor, debugger, means for compilation of the programs and creation of executive files, and also an information subsystem (Help). All these allow to organize interactive loading of program code in the microcontroller. The program code may be executed continuously or with stop point and in a step-to-step manner. The microcontroller, block of external memory consisting of microcircuits ROM and RAM, driver of the serial channel RS-232, block of light and sound indication, sockets of expansion are located on the laboratory model. Therefore, this laboratory model may be used as an embedded device.

An electronic textbook and the instruction for practical work on microcontrollers were written. The structure and general characteristics of Intel MCS-96 family, memory addressing mode and command system are considered there. Structure and technical parameters of MCU 8XC196KC/KD are described in more detail. The schemes of the built - in peripheral devices and the algorithms of their functioning and programming are also considered in the textbook.

During tuition students become familiar with ASM-96 assembler language and acquire knowledge in programming of built-in microcontroller devices such as, 16-bit timers, analog-digital converters, pulse width modulator, high speed input/output devices, peripheral transactions server and programmable interrupt controller.

For example, students realize a stopwatch on the basis of the 16-bit counter Timer1. The number of seconds is displayed in a binary-coded decimal code on the block of light indication. This block is integrated with the 8-bit first parallel input/output port. In another work, the first counter Timer1 sets the time of luminescence of the microcontroller light matrix. The second counter Timer2 sets the delay of light matrix switching. Thus, brightness of the light matrix luminescence may be slowly changed.

The 8XC196KC/KD have three Pulse Width Modulator (PWM) modules. These outputs may be filtered to produce a smooth analog signal. Students receive a sine wave signal, while programming duration

The research described in this publication was made possible in part by Award No. PZ-013-02 of the U.S. Civilian Research & Development Foundation for the Independent States of the Former Soviet Union (CRDF) and of Ministry of Education of Russian Federation.

of pulses. The shape of the signal is observed on the oscilloscope.

Students learn how to program the analog-to-digital (A/D) converter and to read the conversion results. The A/D converter module converts an analog input into an 8- or 10-bit digital representation. Students restore an entrance analog signal (amplitude and frequency) using results of ADC during the work.

Some programs are devoted to the organization of service of interruptions from internal peripheral devices. Programmable interrupt controller is used for service of interruptions and peripheral transaction server is used for service of interruptions without interrupting the basic program. Enclosed interruptions are served in the programs, too.

The most advanced students develop methodical instructions to some new interesting work independently. For example, a student offered the work " The reactor chamber temperature control". In the given work the microcontroller should trace the temperature of an object and on the basis of the data received from ADC to carry out the following actions:

- At an increase of temperature, to increase the voltage applied to the digital-analog converter (DAC);
- At an increase of temperature above critical, to disconnect the object by a 6-second pulse;
- At a reduction of temperature, to reduce the voltage on DAC.

Microcontrollers are widely used by students in their research and degree work. Students design microprocessor systems and automatic experimental equipment connected to computer.

The first applications of the microcontroller were connected with control of step motors. Then, more interesting projects appeared, such as an independent device for temperature and light exposure measurement indoors, "intellectual" monochromator and colorimeter, system for spectral investigations.

Some developments were used for industrial orders. The control system of the electric drive of knife shaft of the machine tool cross was produced for a company.

The laboratory model of the device was created in one of the diploma works. This device controls the electrical power of burning of headlights of the automobile depending on the time of the day (i.e. brightness) and the level of accumulator charge (Figure 1). The user himself can set the current values of the brightness and charge level of accumulators with the help of variable resistors. The values of voltage are converted with ADC. Then there are transferred to the control program in MCU.

The program calculates the number of steps of the step motor. Then this number is given out through the high speed input/output device to the step motor controller. The step motor can move the variable resistor, which changes resistance in the circuit. Electrical current and power in the circuit change also.

The software of this system realizes fuzzy control algorithm. Fuzzy logic facilitates design of system that mimics human reasoning. A fuzzy system accepts data input from sensors, and then makes decisions based on that input. These decisions are the basis for a control system. The package FuzzyTECH was used for control program.

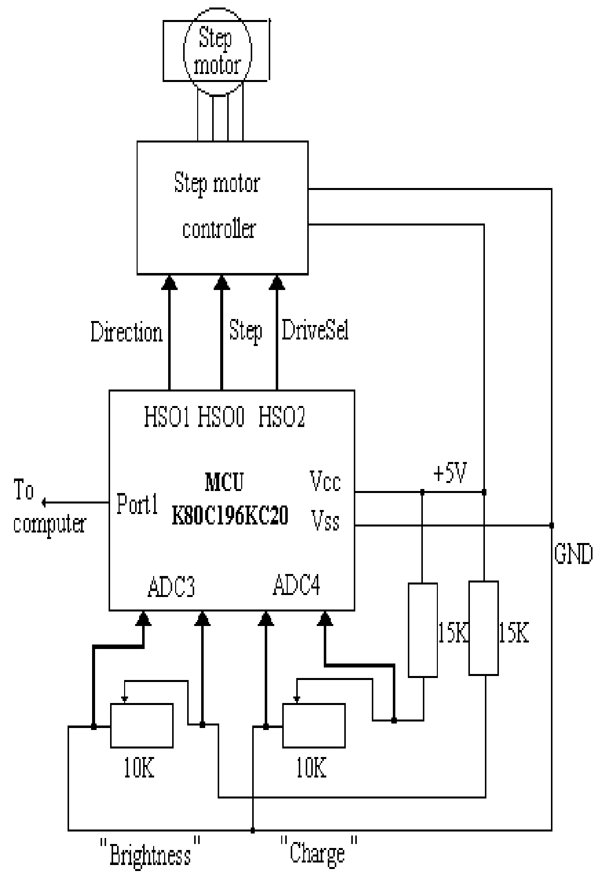

FIGURE 1
A LABORATORY MODEL OF THE DEVICE TO CONTROL THE CAPACITY OF AUTOMOBILE HEADLIGHTS BURNING, DEPENDING ON THE TIME OF THE DAY AND THE CHARGE LEVEL OF ACCUMULATORS.

The three elements required to realize a fuzzy system are fuzzyfication, rule application and defuzzification. Fuzzification is the scaling of input data to the universe of discourse (the range of possible values assigned of fuzzy sets). Rule application is the evaluation of fuzzyfied input data against the fuzzy rules written specifically for the system. Defuzzification is the generation of a specific output value based on the rule strengths that emerge from the rule application. The values of the voltage from variable resistors are converted into the fuzzy format. So, the current values of brightness, level charge of accumulators and values of electrical power are defuzzyficated (Figures 2, 3, 4).

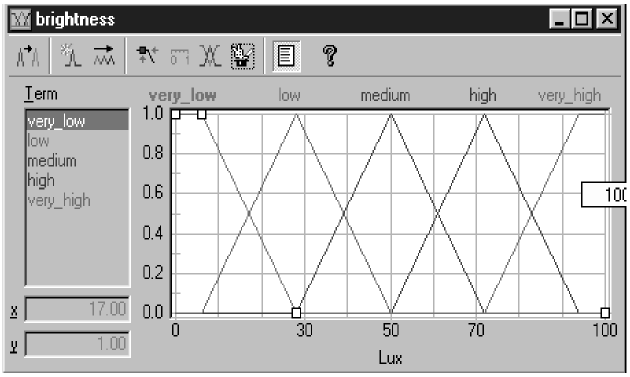

FIGURE 2
CURRENT VALUES OF BRIGHTNESS.

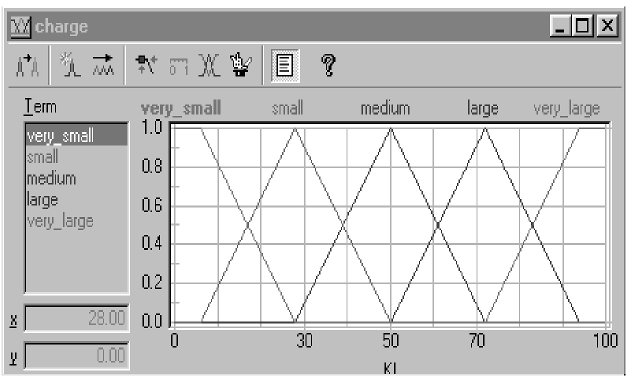

FIGURE 3
THE CHARGE LEVEL OF BATTERIES.

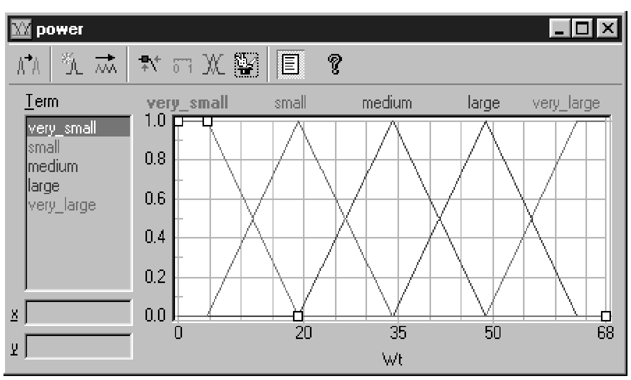

FIGURE 4
THE VALUE OF POWER.

X-axis values on figures 2 –4 have not been obtained as a result of a measurement. They have been choosen arbituarily.

Then, the table of rules for the fuzzy value of electrical power is calculated. Figure 5 shows the relationship between fuzzy input values and fuzzy output value.

Spreadsheet Rule Editor - RB1

#	IF brightness	charge	THEN DoS	power
1	very_low	very_small	1.00	medium
2	very_low	small	1.00	large
3	very_low	medium	1.00	large
4	very_low	large	1.00	very_large
5	very_low	very_large	1.00	very_large
6	low	very_small	1.00	medium
7	low	small	1.00	medium
8	low	medium	1.00	large
9	low	large	1.00	large
10	low	very_large	1.00	very_large
11	medium	very_small	1.00	small
12	medium	small	1.00	medium
13	medium	medium	1.00	medium
14	medium	large	1.00	medium
15	medium	very_large	1.00	large
16	high	very_small	1.00	very_small
17	high	small	1.00	small
18	high	medium	1.00	small
19	high	large	1.00	medium
20	high	very_large	1.00	medium
21	very_high	very_small	1.00	very_small
22	very_high	small	1.00	very_small
23	very_high	medium	1.00	small
24	very_high	large	1.00	small
25	very_high	very_large	1.00	medium

FIGURE 5
THE TABLE OF RULES FOR FUZZY VALUES OF ELECTRICAL POWER.

For example, if the value of brightness is very low (i.e. very dark) and the charge level of batteries is very large (accumulators are completely charged), then the value of electrical power should be very large.

This fuzzy value of electrical power is already understandable to the user, but not to the executive device. Therefore, it is defuzzyficated (i.e. it is converted into digital form) and it is transferred to the step motor controller.

The students created electronic textbook on modern microcontrollers and an instruction for laboratory classes on microcontrollers are created.

New microcontrollers constantly appear on the world market of microprocessor, however, it is possible to claim with confidence, that the skills received in programming MCU of Intel MCS-96 family today will help to master programming other one-crystalline microcontrollers tomorrow. The skill to design and to create microprocessor systems will allow our graduates to shows themselves as competent specialists in their future profession.

ENGINEERING EDUCATION AND THE ROAD TOWARD PROFESSIONAL REGISTRATION

Yolanda Guran-Postlethwaite, Oregon Institute of Technology

The technological advances permeating our life in the 21st century made the engineering profession extremely competitive. Engineers and technologists must be more specialized and skilled technically. In addition to this they have to compete in a global market and interact with a new society. For many engineering disciplines, the seal of approval is the professional licensing granted by different states. Engineering students should be encouraged to consider the path of obtaining professional engineering registration. To be a Professional Engineer is an honor and a warranty of professional competency and high ethical standards, recognized all over the world.

The first step in becoming licensed as a Professional Engineer in United States is the Fundamental of Engineering (FE) examination. Many universities started to use this examination as an assessment tool for engineering programs.

The paper will describe the process of obtaining professional registration in the United States. It will also discuss how colleges and universities could encourage and prepare students for become licensed. It will also show the value of professional registration for transfer of engineering knowledge and ethical standards around the world.
